KEY TO PRONUNCIATION

For a full explanation of the various sounds indicated, see the KEY TO PRONUNCIATION in Vol. I.

ā	as in <i>ale</i> , <i>fate</i> .
â	“ “ <i>senate</i> , <i>chaotic</i> .
â	“ “ <i>glare</i> , <i>care</i> , and as <i>e</i> in <i>there</i> .
ă	“ “ <i>am</i> , <i>at</i> .
ä	“ “ <i>arm</i> , <i>father</i> .
à	“ “ <i>ant</i> , and final <i>a</i> in <i>America</i> , <i>armada</i> , etc.
α	“ “ <i>final</i> , <i>regal</i> , <i>pleasant</i> .
a	“ “ <i>all</i> , <i>fall</i> .
ē	“ “ <i>eve</i> .
ē	“ “ <i>elate</i> , <i>evade</i> .
ē	“ “ <i>end</i> , <i>pet</i> .
ē	“ “ <i>fern</i> , <i>her</i> , and as <i>i</i> in <i>sir</i> , etc
e	“ “ <i>agency</i> , <i>judgment</i> .
i	“ “ <i>ice</i> , <i>quiet</i> .
ī	“ “ <i>quiescent</i> .
ī	“ “ <i>ill</i> , <i>fit</i> .
ō	“ “ <i>old</i> , <i>sober</i> .
ō	“ “ <i>obey</i> , <i>sobriety</i> .
ō	“ “ <i>orb</i> , <i>nor</i> .
ō	“ “ <i>odd</i> , <i>forest</i> , <i>not</i> .
o	“ “ <i>atom</i> , <i>carol</i> .
oi	“ “ <i>oil</i> , <i>boil</i> .
ōō	“ “ <i>food</i> , <i>fool</i> , and as <i>u</i> in <i>rude</i> , <i>rule</i> .
ou	“ “ <i>house</i> , <i>mouse</i> .
ū	“ “ <i>use</i> , <i>mule</i> .
ū	“ “ <i>unite</i> .
ū	“ “ <i>cut</i> , <i>but</i> .
u	“ “ <i>full</i> , <i>put</i> , or as <i>oo</i> in <i>foot</i> , <i>book</i> .
ū	“ “ <i>urn</i> , <i>burn</i> .
y	“ “ <i>yet</i> , <i>yield</i> .
B	“ “ <i>Spanish Habana</i> , <i>Cordóba</i> , where it is like English <i>v</i> but made with the lips alone.

ch	as in <i>chair</i> , <i>cheese</i> .
D	“ “ <i>Spanish Almodovar</i> , <i>pulgada</i> , where it is nearly like <i>th</i> in English <i>then</i>
g	“ “ <i>go</i> , <i>get</i> .
g	“ “ <i>German Landtag</i> = <i>ch</i> in <i>Ger. ach</i> , etc
h	“ “ <i>j</i> in <i>Spanish Jijona</i> , <i>g</i> in <i>Spanish gila</i> ; like English <i>h</i> in <i>hue</i> , but stronger.
hw	“ “ <i>wh</i> in <i>which</i> .
κ	“ “ <i>ch</i> in <i>German ich</i> , <i>Albrecht</i> = <i>g</i> in <i>German Arensburg</i> , <i>Mecklenburg</i> , etc.
ŋ	“ “ in <i>sinker</i> , <i>longer</i> .
ng	“ “ <i>sing</i> , <i>long</i> .
N	“ “ <i>French bon</i> , <i>Bourbon</i> , and <i>m</i> in the <i>French Étampes</i> ; here it indicates nasalizing of the preceding vowel.
sh	“ “ <i>shine</i> , <i>shut</i>
th	“ “ <i>thrust</i> , <i>thin</i> .
th	“ “ <i>then</i> , <i>this</i>
zh	“ “ <i>z</i> in <i>azure</i> , and <i>s</i> in <i>pleasure</i> .

An apostrophe ['] is sometimes used as in *tā'b'l* (*table*), *kāz'm* (*chasm*), to indicate the elision of a vowel or its reduction to a mere murmur.

For foreign sounds, the nearest English equivalent is generally used. In any case where a special symbol, as *g*, *h*, *κ*, *N*, is used, those unfamiliar with the foreign sound indicated may substitute the English sound ordinarily indicated by the letter. For a full description of all such sounds, see the article on PRONUNCIATION.

A PARTIAL LIST OF THE LEADING ARTICLES IN VOLUME II.

- ARAMAIC.**
 Professor Nathaniel Schmidt.
- ARBITRATION, INTERNATIONAL.**
 Professor Alvin Saunders Johnson.
- ARCHÆOLOGY.**
 Professor James Morton Paton.
 Professor Oliver S. Tonks.
- ARCHÆOLOGY, AMERICAN.**

Phelps Hall; Professor Dana Carle-
ton Munro; Mr. Edward Lathrop
Engle.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

ARABIN. The chief constituent of gum-arabic, obtained by precipitating an acidulated aqueous solution of gum-arabic with ordinary alcohol.

ARABI PASHA, â-râ'bê pâ-shâ', properly AHMED ARABI (c.1841-1911). Leader of the national party in Egypt in 1882. He was born of fellah parents in lower Egypt, and his early youth was spent as a laborer. He served for 12 years as a private soldier in the Egyptian army and gradually rose to the rank of colonel. He took advantage of the discontent which prevailed in Egypt on account of the foreign influence to organize a rebellion on the issue of "Egypt for the Egyptians." The lack of energy shown by the Khedive Tewfik permitted Arabi to acquire great influence. He participated in the revolt against Nubar Pasha, obtained the removal of the ministry, and entered the new cabinet as Minister of War (1882). In this position he became a virtual autocrat, setting aside the Anglo-French financial control. England now intervened, and a war ensued. On July 11-12, 1882, an English fleet bombarded Alexandria. Arabi withdrew, and the British undertook a vigorous campaign against him, completely defeating him Sept. 13, 1882, at Tel-el-Kebir. He surrendered the following day, and a sentence of death was passed upon him, but it was commuted to life exile in Ceylon. The movement he had headed collapsed, and its only result was the permanent establishment of British control in Egypt. He was pardoned by the British government, returned to Egypt in 1910. His death occurred on Sept. 21, 1911. Consult: Long, *The Three Prophets—Chinese Gordon, Mohammed Ahmed (el Mahdi), Arabi Pasha* (New York, 1884); Broadley, *How we Defeated Arabi and his Friends* (London, 1884). See EGYPT.

ARABKIR, â'râb-kêr', or **ARABGIR**. A town of Asiatic Turkey, about 170 miles northwest of Diarbekr (Map: Turkey in Asia, H 3). It lies on the route from Aleppo to Trebizond and is of considerable commercial importance. Cloth is manufactured and fruit, grown in the vicinity, is exported. The population is estimated to be between 20,000 and 30,000. This includes a considerable number of Armenians, who have been subject to frequent persecution. There was a severe massacre in 1895.

ARABY. A poetical form, especially current in the Renaissance, for Arabia.

ARACAJU, â-râ'ká-zhōō'. The chief port, and since 1855 the capital of the Brazilian state of Sergipe, situated about 7 miles from the coast on the river Cotindiba, which furnishes good anchorage to ships of less than 12 feet draught (Map: Brazil, K 6). The city is regularly built and contains an agricultural school. Hides and sugar are exported. It is connected by rail with Capella and Signão Diaz in the interior, and has an estimated population of 6000, including Indians.

AR/ACAN'. See ARAKAN.

ARACARI, â-râ'ká-rê' (Portug.). A toucan of the genus *Pteroglossus*. See TOUCAN.

ARACATÍ, â-râ-cá-tê'. A city in the state of Ceará, Brazil, on the river Jaguaribe, 10 miles from its mouth, and 75 miles southeast of Ceará (Map: Brazil, K 4). Its harbor is shallow, with a shifting bar at the entrance, but can be entered at high tide. Its exports are cattle, hides, cotton, and sugar. It maintains regular steamship communication with Pernambuco and has a population of about 10,000. It was founded in 1723.

ARA/CEÆ. See ARUM.

ARACHIS, â-râ'kis. See PEANUT.

ARACHNE, â-râk'nê (Gk. Ἀράχνη, *arachnê*, lit. spider). The mythical Lydian girl who ventured to challenge Athens to a contest in weaving. The goddess, angered at finding no flaw in the girl's work, changed her into a spider. Her fate, and especially her skill with the shuttle and the loom, have been a favorite theme among the poets.

ARACHNIDA (Gk. ἀράχνη, *arachnê*, a spider). A class of air-breathing arthropods including the mites, scorpions, spiders, and a few other less well-known groups. The typical Arachnida have the head and the thorax more or less fused into a "cephalothorax," four pairs of legs, and no antennæ, the maxillary palps functioning as antennæ. The eyes are all simple and vary in number from 2 to 12. By the number and arrangement of these eyes the species of spiders are determined. The abdomen possesses no true legs, but the three abdominal spinnerets of spiders are homologous with legs. Besides the spinneret glands in the abdominal region of spiders there are poison glands in the last abdominal segment of scorpions, located at the base of the sting. In other forms the poison is emitted through the hollow jaws. The Arachnida breathe by means of tracheæ, like other insects,

or by means of sacklike bodies called "lungs" that open on the under side of the abdomen; but some forms breathe by both tracheæ and lungs. All the Arachnida are carnivorous save some of the mites, which live on plant sap. Most of the animal feeders prey upon other insects and hence are the friends of agriculture. A few forms are parasitic on warm-blooded vertebrates and fish and cause or accompany such diseases as itch and mange. The history of this class goes back to Palæozoic times.

Classification.—The Arachnida are divided into seven or more orders: (1) Solpugida, or wind scorpions; (2) Scorpionidea, or scorpions; (3) Pseudoscorpionidea, or Chernetidea, book scorpions; (4) Pedipalpi, or whip scorpions; (5) Phalangidea, or harvest men; (6) Araneæ, or spiders, and (7) Acarina, or mites. The following groups are believed by many to fall into the class Arachnida, but their relationships are doubtful: Linguatulida, or tongue parasites of the dog; Tardigrada, or water bears. Pycnogonida, or sea spiders; Xiphosura, or king crabs. See MITES; SCORPIONS; SPIDERS; HARVEST MAN.

ARACHNOID MEMBRANE (Gk. ἀραχνοειδής, *arachnoidēs*, like a spider's web). One of the three coverings of the brain and spinal cord. It is a thin, glistening membrane, which lies loosely between the dura mater externally and the pia mater internally. Between the pia mater and the arachnoid membrane in some situations there are considerable intervals (sub-arachnoid spaces). The corresponding interval between the arachnoid and dura mater is called the subdural space. See NERVOUS SYSTEM AND BRAIN.

A'RA CŒ'LI (Lat. Altar of Heaven). The name given to the famous church of the Virgin erected on the summit of the Capitoline Hill in Rome. It was the only Christian edifice on the Capitol, and was for centuries called Sancta Maria in Capitolio; but popular legend connected it with the possession by Christianity of the stronghold of paganism, and the Middle Ages imagined a dream of Augustus, to whom the Sibyl announced that here was the altar of the Son of God; hence *Ara Cœli*. The church took over all the celebrity of the pagan Capitol, and was the meeting-place for the city council and the people. The present edifice is a basilica dating chiefly from the ninth century, with a handsome Renaissance ceiling.

ARAD, ör'öd. Two towns of the kingdom of Hungary. 1. *Old Arad* (Hung. *O-Arad*). The capital of the county of Arad, situated on the right bank of the Maros, a tributary of the Theiss, about 37 miles north of Temesvár (Map: Hungary, G 3). The town has many handsome streets and fine modern buildings, such as the theatre, town hall, and the palaces of justice and industry. The former strong fortifications are now rather out of date. Arad is the seat of a Greek-Oriental and of a Rumanian bishop. It is one of the most important commercial and industrial towns of Hungary. Its manufactures include alcohol (one of the largest distilleries in Europe), starch, leather, and machinery. There is a considerable export trade in grain, tobacco, wine, and cattle. Pop., 1890, 42,050; 1900, 56,260; 1910, 63,166.

During the seventeenth century it was often captured by the Turks. Fortifications erected in 1763 made Arad an important position in the Revolutionary War of 1848-49, when it was occupied for a considerable time by the Austrian

general, Berger, who capitulated here in July, 1849. From this place Kossuth issued the last proclamation to the Hungarian patriots. After the capitulation at Világos, Aug. 13, 1849, Arad was surrendered to the Russians by the order of Görgey. Here, on October 6 of the same year, a number of Hungarian generals were executed by order of the Austrian commander, Haynau. A beautiful monument commemorating this event stands in Liberty Square. In 1909 a bronze monument to Kossuth was erected.

2. *New Arad* (Hung. *Új-Arad*). A town in the county of Temes, on the left bank of the Maros opposite Old Arad, with which it is connected by a long wooden bridge. It has a large trade in flour and wood. Pop., 1900, 6000.

AR'ADUS. See ARVAD.

ARÆ'OSTYLE. See INTERCOLUMNATION.

ARAF, är'áf, or more accurately AL A'RAF. The name given in the Koran (Sura vii, 44) to the partition separating heaven from hell. Mohammed vividly portrays those standing by the partition saluting the happy inhabitants of Paradise without being able to enter it, while on the other hand they are also terrified at the sight of those who are condemned to the tortures of hell-fire. In Mohammedan theology al-Araf is a sort of limbo for those whose good and evil works so balance one another that they cannot enter Paradise until the last day of judgment, but in addition to this class, there are others who, according to the views of some theologians, are resigned to al-Araf.

ARAFAT, är'áf-at', MOUNT, or JEBEL AL-RAHMAH (Mount of Mercy). A granite hill some 12 miles east of Mecca. According to a Mohammedan legend, when Adam and Eve were cast forth from Paradise for eating the wheat which deprived them of their pristine purity, Adam fell at Ceylon, and Eve on Mount Arafat; and after much wandering Adam finally joined Eve on this mountain, where they recognized each other (*ta'arafa*). The object of this story is to account for the name; but other etymologies have also been proposed by Arabic authors. The mount is about 200 feet high and a mile and a half in circuit. It is the real goal of the Mohammedan pilgrimage to Mecca, for while the visit to the Kaaba—the sanctuary at Mecca—may be made at any time, it is known as the "small pilgrimage." The "great pilgrimage," which ends with a visit to Arafat, can only be made in the month *Dhu'l-Hijjah*, i.e., 'month of pilgrimage.' The ninth day of this month, the most sacred of the year, is spent by the pilgrims at Arafat, to which they proceed in a body on the evening of the eighth day. The day is spent in prayers and in listening to a sermon which always lasts many hours. On the top of the mount, above the platform where the *wukuf*, or sacred assembly is held, there was once a shrine which was destroyed by the Wahabites (q.v.). This shrine is said to have had the name of Ilal, though this may have been the name of the god worshiped there in pagan times. Consult Burton's account in his *Pilgrimage to El-Medina and Kaaba, Mecca and Medina*, chap. xxviii; Snouck-Horgronje, *Het mekkaansche Feest* (1884-89).

ARAGO, är'á-gô; Fr. pron. à'rà'go', DOMINIQUE FRANÇOIS (1786-1853). A celebrated French astronomer and natural philosopher, born at Estagel, near Perpignan, in the Department of Basses-Pyrénées. At the age of 17 he entered the Ecole Polytechnique at Paris, where the

spirit, promptitude, and vivid intelligence he exhibited in his answers to the questions of Legendre excited the admiration of every one. In 1805 he became secretary to the Bureau des Longitudes at Paris. Two years afterward he was engaged, with Biot and others, by the French government, to carry out the measurement of an arc of the meridian, which had been commenced by Delambre and Méchain. Arago and Biot had to extend it from Barcelona to the Balearic Islands. The two savants established themselves on a lofty summit near the eastern coast of the Spanish peninsula, where they lived for many months, communicating by signals across the Mediterranean with their Spanish collaborators in the little isle of Iviza. Before Arago completed his calculations, Biot had returned to France, and war had broken out between France and Spain. Arago was now held to be a spy, his signals were interrupted; and with great difficulty he succeeded in making his escape to Majorca, where he voluntarily imprisoned himself in the citadel of Belver, near Palma. At last he obtained his liberty on condition of proceeding to Algiers, which he did; but on his way back to France was captured by a Spanish cruiser, and sent to the hulks at Palamos. He was, however, liberated after a time and sailed once more for France; but almost as he was entering the port of Marseilles, a tempest arose which drove the vessel across the Mediterranean all the way back to the coast of Africa, landing it at Bougia. He went by land to Algiers, where he was compelled to remain about half a year, and whence he again set out for Marseilles in the latter part of June, 1809. After having narrowly escaped another capture by an English frigate, Arago finally found his way to Marseilles. As a reward for his sufferings in the cause of science, the Paris Academy of Sciences suspended its standing rules in his favor; and though only 23 years of age, he was elected member in the place of Lalande, who had just died, and was appointed professor of analytical geometry and geodesy in the Ecole Polytechnique. Afterward his attention was devoted more to astronomy, magnetism, galvanism, and polarization of light. In 1811 he read before the Academy a paper of fundamental importance on chromatic polarization. In 1812 he began his extraordinary course of lectures on astronomy, etc., which fascinated all Paris—the savants by their scientific rigor and solidity, the public by their brilliancy of style. In 1816, along with Gay-Lussac, Arago established the *Annales de Chimie et de Physique* and demonstrated the value of the undulatory theory of light. In the same year he visited England, making the acquaintance of various persons distinguished in science, especially Dr. Thomas Young. In 1818 appeared his *Recueil d'observations géodésiques, astronomiques, et physiques*. In 1820 he turned his facile and inventive genius into a new channel and made several important discoveries in electro-magnetism. Oersted had shown that a magnetic needle was deflected by a voltaic current passing along a wire. Arago pursued the investigation and found that not only a magnetic needle, but even non-magnetic substances, such as rods of iron or steel, were subject to deflection, exhibiting during the action of the voltaic current a positive magnetic power, which, however, ceased with the cessation of the current. Some time after, he demonstrated that

a bar of copper and other non-magnetic metals, when moved circularly, exert a noticeable influence on the magnetic needle. For this discovery of the development of magnetism by rotation, he obtained in 1825 the Copley Medal of the Royal Society of London, and in 1834, when he again visited Great Britain, especial honors were paid to him by the friends of science in Edinburgh and Glasgow. Four years previous to this second visit to Great Britain he was made perpetual secretary of the Academy and director of the observatory, a position which he retained till his death. As secretary of the Academy he wrote his famous *éloges* of deceased members, the beauty of which has given him so high a place among French prose writers. In politics, too, his career was remarkable. He was a keen Republican and took a prominent part in the July Revolution of 1830. In the following year he was elected by Perpignan as member of the Chamber of Deputies, where he occupied a position on the extreme Left. In the February Revolution of 1848 he was chosen a member of the Provisional government, and appointed Minister of War and Marine. In this position he resisted the proposed measures of the Socialist party, regarding the Constitution of the United States as the ideal of democracy. His popularity in his own department was the means of preventing the discontented population of Basses-Pyrénées from proceeding to lawless and violent measures. He opposed the election of Louis Napoleon to the presidency, declared himself against the policy of the new ministry, and refused to take the oath of allegiance after the coup d'état of 1851. Napoleon, in a letter, paid a high tribute to his talents and virtues and excused him from taking the oath as director of the observatory. In his general character Arago was sociable and a brilliant conversationalist. He was the intimate friend of Alexander von Humboldt. His collected works, edited by Barral, were published in Paris (17 vols., including a biography of Arago, 1854-62). Alexander von Humboldt wrote an introduction to the German translation of Arago's works.

ARAGO, ETIENNE VINCENT (1802-92). A French dramatist and politician, a brother of the famous astronomer, Dominique François Arago, born near Perpignan, Basses-Pyrénées. He was the author, with various collaborators, of about 100 comedies and vaudeville pieces which were successfully produced in Paris, among them *Les Pages de Bassompierre* and *Les Mémoires du diable*, and was director of the Vaudeville from 1829 to 1840. As a journalist, he was one of the founders of *La Réforme*, an advanced Republican newspaper. His poetical comedy, *Les Aristocraties* (1847), the success of which at the Théâtre Français was ended only by the Revolution of 1848, was an expression of the same radical sentiments which made him, as a member of the Constituent Assembly, an opponent of Louis Napoleon's pretensions and caused his own exile (1849-59). His highest political station had been that of director-general of the post office for several months in 1848. Upon the restoration of the Republic in 1870 he resumed a position of influence, being for a short time mayor of Paris. In 1871 he was elected to the National Assembly, but soon resigned. He became archivist of the Ecole des Beaux-Arts in 1878, and later director of the Musée du Luxembourg. Besides his dramatic

works he also wrote several volumes of historical and other verse and a novel.

ARAGO, FRANÇOIS VICTOR EMMANUEL (1812-96). A French politician, son of the astronomer. He became an ardent Republican, and on Feb. 24, 1848, when the abdication of the King was announced in the Chamber, Arago, who had penetrated thither, demanded the deposition of the Orleans family and protested in the name of the people against a regency. Under the provisional government he was sent to Lyons as commissary-general and prevented a serious insurrection by applying half a million francs to relieve immediate distress. A little later he was elected to the Constituent Assembly and was soon sent as envoy to Prussia, where he interested himself for the oppressed Poles, procuring the liberation of General Microlawski. He resigned as soon as Louis Napoleon was elected to the presidency and became in the Constituent, and later in the Legislative Assembly, one of the future Emperor's most active opponents, vigorously protesting against the expedition to Rome. After the coup d'état (Dec. 2, 1851), he quitted political life and returned to his law practice, but in 1870 became a member of the Government of National Defense, first as Minister of Justice, and later as Minister of the Interior, replacing Gambetta in the latter office. In 1871 he was elected a member of the National Assembly, and on the organization of the Senate in 1876 he was elected to that body, where he sat until his appointment as Ambassador to Switzerland in 1880. He retired in 1894.

ARAGO, JACQUES ETIENNE VICTOR (1790-1855). A French traveler and writer, brother of the astronomer. In 1817 he accompanied an expedition, under Freycinet, in a voyage round the world. Afterward he wrote plays, poems, and novels, and in 1835 undertook the management of the theatre at Rouen, but having become blind in 1837, he resigned. His early voyage he described in two books of travel, *Promenade autour du monde* (1822) and *Voyage autour du monde* (1838). In 1849, though deprived of sight, he formed a company of prospectors and started for California in search of gold. But his companions deserted him at Valparaiso. On his return he published his painful experiences under the title, *Voyage d'un aveugle en Californie et dans les régions aurifères* (1851). He died in Brazil.

ARAGON, ár'a-gon. A captaincy-general of Spain and former kingdom, situated in the northeastern part of the country, and bounded on the north by the Pyrenees, which separate it from France, on the east by Catalonia and Valencia, on the south by Valencia and New Castile, and on the west by New and Old Castile (Map: Spain, E 2). It comprises the three provinces of Saragossa, Teruel, and Huesca, with a total area of 18,298 square miles. The southern and northern parts of the country are mostly mountainous, while the central portion is occupied by a plain, intersected by the Ebro and its tributaries. The climate is varied, owing to differences in elevation. In the mountains it is cool, while in the lower parts it is exceedingly hot and dry. This difference of climate is accompanied by corresponding variation in vegetation, and the agricultural products of the region embrace the hardier grains, such as corn and wheat, as well as delicate fruits like the olive and vine. Agriculture is in a backward

state owing in part to scarcity of population, but chiefly because of the burdens laid by the government on agrarian communities. In the province of Teruel are found deposits of sulphur, copper, lead, and salt, which are mined to some extent. The manufacturing industries are confined to the production of linen and woollens and some leather goods. The commerce of the region is insignificant on account of the agricultural and industrial backwardness, as well as of the lack of transportation facilities. Pop., 1887, 912,197; 1897, 892,513; 1900, 912,711; 1910 (census of December 31), 952,743. Capital, Saragossa, pop. commune (1910), 111,704.

Aragon came into the possession of Rome after the overthrow of the Carthaginian power in Spain, and was made a part of the province of Hispania Tarraconensis. It was conquered by the Visigoths early in the fifth century, and these in turn were subdued by the Moors after 711. A remnant of the Christian inhabitants who escaped to the mountains and settled in the region between the Sierra de la Peña and the Pyrenees managed to maintain their independence. For a long time Aragon was ruled by counts of Gothic origin. Subsequently it was incorporated with Navarre, but in 1035 it attained its independence under Ramiro I, the son of Sancho the Great, and now made its appearance as a kingdom. A long conflict was carried on with the Arabs, amounting, perhaps, to nothing more at times than mere guerrilla raids, but resulting in the gradual acquisition of individual strongholds and towns. On the capture of Huesca in 1096, the capital of the country was removed from the mountain valleys to the plateau of northern Spain. The conquest of Saragossa in 1118 brought the valley of the Ebro under the rule of the kings of Aragon. In 1137 Aragon was united with Catalonia by the marriage of Petronella, the daughter of Ramiro II, with Count Raymond Berengar IV of Barcelona. This union at once raised Aragon to a prominent position in the Iberian peninsula. Through the activity of the seafaring population of Catalonia, the kings of Aragon gained possession of the Balearic Islands, Sicily, Sardinia, and Naples in the course of the two following centuries. At the same time the consolidated strength of the kingdom was directed against the Mohammedans, and in 1238 the important city of Valencia, with the surrounding region, fell into its power. Aragon has been noted for its free political institutions in the Middle Ages; as a matter of fact, the great mass of the population was without any political rights; only a few had the privileges. But the power of the king was greatly limited by the privileges enjoyed by the towns, which in effect formed a republican state within the monarchy. Their affairs were administered by municipal officers, and their representatives met in *juntas*, which were charged with the maintenance of public safety and the control of common affairs. At the head of the united towns stood the justiciar of Aragon, to whom, on certain questions, even the king had to yield. The towns availed themselves of the king's financial embarrassments to wring charters of privileges from the crown. Pedro IV, in the fourteenth century, first attempted to assert the power of the crown over the cities; but though he was partially successful, the task was not completed until after the union of Aragon with Castile. During this period Barcelona developed into

one of the greatest Mediterranean ports and entered into rivalry with the Italian cities, and especially with Genoa, against which continual wars were waged. By the marriage of Ferdinand of Aragon with Isabella, heiress to the crown of Castile, in 1469, the two states were united in 1479. The bond between the two, however, was only a personal one until 1516, when, on the accession of Charles I, the states were definitely merged into a new Spain, with which the subsequent history of Aragon is identified. During the later Middle Ages the history of Aragon was closely connected with that of Sicily (q.v.).

ARAGONA, a'rà-gō'nà. A city of Sicily, 78½ miles by rail south of Palermo, and 6½ miles by rail north of Girgenti (Map: Italy, H 10). In its vicinity are rich sulphur mines, and the mud-volcano of Maccaluba, 135 feet high and 860 feet above the sea, which emits carbureted hydrogen gases. Pop., 1900, 11,985; 1911, 15,961.

ARAGONITE (named after Aragon, see below). An anhydrous calcium carbonate, identical with calcite (q.v.) in composition but differing from it by crystallizing in the orthorhombic system. Aragonite occurs in prismatic crystals, sometimes pseudo-hexagonal in shape. It is also found in radiated aggregates of needle-like forms. Further, stalactite, incrusting, columnar, and coral-like forms occur, the last named being known as *flos ferri*, from its occurrence in beds of iron ore. The prevailing color of aragonite is white, shading into violet, yellow, and pale green in some varieties. Its lustre is vitreous. A silky, fibrous variety is known as *Satin spar*. Aragonite was first found in Aragon, Spain, whence its name. In the United States aragonite is found in several localities in California, Connecticut, Illinois, Missouri, New Mexico, Pennsylvania, and New York. The well-known varieties of Mexican onyx, largely used by architects for wainscoting and interior decoration, are forms of aragonite.

ARAGUATA, a'rà-gwā'tà (native name). The ursine howler. See **HOWLER**.

ARAGUAYA, a-ri'gwā-yū', or **RIO GRANDE**. A large river of Brazil, rising in the Sierra Cayapo, in lat. 18° 10' S. and long. 51° 30' W. (Map: Brazil, H 5). It flows northeasterly between the states of Goyaz and Matto Grosso, inclosing in its course the large island of Bananal (q.v.). Near San Francisco, in lat. 5° 30' S., the Araguayá joins the Tocantins, which empties into the Atlantic Ocean about 50 miles to the east of the main estuary of the Amazon. The Araguayá is more than 1300 miles long and navigable in stretches for more than half that distance, but falls and rapids hinder its use as a route of trade. A line of small steamers plies its waters to the rapids of Santa Maria.

ARAI HAKUSEKI, a'ri hā'kōō-sā-kē (1657-1725). One of the most noted of modern Japanese scholars, Confucianists, and stylists, who, by his life and writings, illuminated and adorned the ideas that long molded Japanese society. When Iyeyasu "caused confusion to cease and order to prevail," native and Chinese learning revived in Japan, and a brilliant group of scholars in Yeddo set forth the philosophical doctrines of Chu-Hi. Of these, Hakuseki is best known. He became more liberal than his master, Seiga, but he was still orthodox, as against the Kogaku, or (in government view) "heretical" school of philosophy. As patronized by Iyeyasu and his successors, the Tycoons, from

1615 to 1868, this philosophical system became a sort of established church, and heretics were made to feel severe political opposition, which sometimes ended in imprisonment and death. Yet scattered over the country, the pupils of Hakuseki and other masters instructed young gentlemen and helped powerfully to mold the public opinion by which the Mikado was restored to power in 1868. Hakuseki left an autobiography (written in 1716), a very rare kind of literature in Japan, which, however, was not destined for publication. In 1701 he composed his greatest work, the *Hankampu*, a history of the Daimios of Japan from 1600 to 1680. This work is in 30 volumes, and though requiring immense research, it was completed in a few months. After this his most important work is the *Tokushi Yoron*, a general view of Japanese history for 2000 years. His *Seiyō Kibun*, or 'Annals of the Western Ocean,' which was translated by S. R. Brown, in the *Transactions* of the North China Branch of the Asiatic Society (London, 1827-31), is the first attempt of a Japanese writer to give an account of Europe. Consult Aston, *History of Japanese Literature* (New York, 1899), and Florenz, *Geschichte der japanischen Literatur* (Leipzig, 1906).

ARAKAN, a'rā-kin', or **ARACAN**. The northern division of Lower Burma, British India, extending along the Bay of Bengal from about 18° to 21° 33' N. lat., and covering, with the adjacent islands, an area of 18,540 square miles (Map: Burma, Siam, B 3). The surface is very mountainous in the interior, which is traversed by several parallel ridges. There are vast forests and marshes covered with a thick growth of grasses and underbrush. The lower part of the country is intersected by many streams from the hills and is especially well adapted to the cultivation of rice, indigo, pepper, and raw sugar. Many tropical fruits grow wild. Petroleum, iron, and coal are found, and the chief articles of export are rice, salt, and teak wood. The chief port is Akyab (q.v.). The town of Arakan, situated in the interior to the northwest of Akyab, which before the British conquest is said to have numbered nearly 100,000 souls, is a place of ruins. The natives of Arakan are shorter and somewhat less round-headed than the Burmese proper, with whom they belong by race and language. A caste system with monogamy prevails among them. The population increased from 671,899 in 1891 to 760,848 in 1901. About 70 per cent of the inhabitants are Buddhists, while the remainder are chiefly Mohammedans. Arakan was once an independent kingdom, but began to decline at the end of the seventeenth century because of internal strife. A century later it fell into the possession of Burma, from which it passed to Great Britain in 1826. Anthropological details concerning the peoples of Arakan will be found in Lewin, *Wild Races of Southeastern India* (London, 1870), and Risley, *Tribes and Castes of Bengal* (Calcutta, 1891).

ARAKTCHEYEFF, a'rāk-chā'yēf, **ALEXEI ANDREYEVITCH**, COUNT (1769-1834). A Russian statesman. Of noble though poor family, he rose rapidly to high rank under the favoritism of Paul, who made him commandant of his bodyguard at Gatchina. On his accession to the throne, Paul made him commandant of St. Petersburg, conferred upon him the baronial title, dismissed him in a short while, made him Count in 1799, and again retired him in eight

months. After Paul's assassination, Arakche-yeff was kept near the person of Alexander I, became Minister of War in 1806, and in the late years of that Emperor's reign was his all-powerful adviser in matters of internal policy. The will of the Emperor, whom he almost worshiped, was carried out at all hazards, and as the energetic Arakcheyeff did not stop short of any cruelty, his name became synonymous with terror to all liberal thinkers. In 1833 he deposited 50,000 rubles, of which three-quarters of the principal and accumulated interest is to be awarded in 1925 for the best history of Alexander's reign. It was provided that the remainder shall cover the expense of printing the work, to form a second prize, and to be paid for translations of the work into French and German. As he left no heirs and made no will, Nicholas I granted his estate at Gruzino and all his possessions to the Novgorod Corps of Cadets, henceforth known as Arakcheyeff Corps, so as to perpetuate the memory of the statesman.

ARAL, *ār'al* (*Russ. pron. ā-rāl'*), or **ARAL-DENGIS**, **LAKE** (for derivation, see below). A lake between 150 and 200 miles east of the Caspian Sea, within the limits of Russian central Asia, between lat. 43° 43' and 46° 45' N., and traversed by the meridian of 60° E. long. (Map: Asia, E 4). It lies in the Aralo-Caspian lowlands, is bounded by the steppes and deserts of Khiva, by the land of the Kirghis, and by the plateau of Ust-Urt, separating it from the Caspian. Its greatest length is about 230 miles; its greatest width is 182 miles; and its area, according to Strelbitski, is 25,050 square miles; this does not include its four large islands, occupying about 1000 square miles. After the Caspian Sea it is the largest lake in the Eurasian continent, and, next to Lake Superior and the Victoria Nyanza, it is the fourth largest in the world. It lies at a height of 163 feet above the level of the ocean and about 250 feet above that of the Caspian. Its numerous islands gave rise to its name of Aral-Dengis (Kirghiz, Turk. *aral*, island + *dengiz*, sea, lake). The largest of these is Nikolai. The bluish tinge of its water suggested to the Russians the name of Blue Sea. In ancient times it was called the Lake of Oxiana, and during the Middle Ages the Sea of Khovaresm, or Khuarism. It is fed by the Syr-Darya (the ancient Jaxartes) on the east side and the Amu-Darya (or ancient Oxus) on the south. It is shallow, its average depth hardly reaching 50 feet. There are unmistakable signs of its drying up, especially in its southern part. It is a salt-water lake, but contains less salt than the ocean, and freezes to a considerable distance from the shore. It is very rich in fish, which are caught here in great quantities, sturgeon, herring, carp, and some seals being the most important. In spite of the fact that there are many kinds, it is remarkable that there are none of the salt-water variety. In the affluents the Scaphirhynchus species has recently been discovered, a variety not found anywhere else in the world at present, but abundant in the Tertiary period. Owing to the shallowness of its waters, navigation is difficult; but Russian steamers have been launched upon it, and took part in the operations against Khiva in June, 1873. Its history is very remarkable. Sir Henry Rawlinson and Colonel Yule collected references made to it in Greek, Latin, Arabic, and Persian writers and tried to establish the fact that the

area it now occupies has been dry land twice within historical times—the Jaxartes and the Oxus then running south of the Sea of Aral to the Caspian. It is very remarkable that the Amu (Oxus) changed its bed considerably within one decade, as is proven by a comparison of the maps carefully prepared in 1859 and 1870. See *Proceedings of Royal Geographical Society*, vols. xi, xvi, and i (N.S., 1879); also *The Shores of Lake Aral*, by Major Wood (London, 1876); *Nachrichten über den Aral-See und den unteren Lauf des Amu-darya, von den ältesten Zeiten bis zum XVIII Jahrhundert*, von Dr. W. Barthold (from the Russian original by H. von Foth, Leipzig, 1910).

ARALIA (derivation uncertain). A genus of plants, the type of the family Araliaceæ. These plants are dicotyledonous, and consist of trees, shrubs, and herbaceous plants, resembling the Umbelliferae, both in their general habit and in their botanical characters, but differing essentially in the fruit, which is not formed of two separable carpels as in the Umbelliferae. The fruit of the Araliaceæ consists of several one-seeded cells and is often succulent. The family contains about 400 known species, natives of tropical, temperate, and cold climates, generally possessing stimulant and aromatic properties. The principal genera are *Aralia*, *Panax*, *Hedera*, and *Patsia*. Poisonous qualities are not developed as in the Umbelliferae. The herbage of many species affords good food for cattle, and some are used for human food. The genus *Aralia* contains a considerable number of species—trees, shrubs, and herbaceous plants. *Aralia nudicaulis*, commonly called wild sarsaparilla, is a native of the United States. It is a species of low growth, having a solitary radical leaf with a trifid stalk and ovate serrated segments, the scape is shorter than the leaf. The root is said to be equal in value to sarsaparilla as an alterative and tonic. *Aralia racemosa*, well known as spikenard, has large, spicy, aromatic roots. *Aralia spinosa*, and *Aralia hispida*, also natives of North America, produce an aromatic gum-resin. *Aralia spinosa* is sometimes called toothache tree; it also bears the name of angelica tree. It is a native of moist woods in Virginia and Carolina, growing to a height of 10 or 12 feet, with a single stem, spreading head, doubly and trebly pinnate leaves, and ovate leaflets, and is very ornamental in a lawn. *Aralia polaris*, found in the southern island of New Zealand, and in the greatest abundance and luxuriance in the Auckland Islands, is a herbaceous perennial, 4 to 5 feet high, with large orbicular masses of green foliage and waxy flowers, which present a very striking appearance. *Aralia edulis*, now called *Aralia cordata*, is employed in China as a sudorific. Its shoots are very delicate and pleasant when boiled; and the roots, which have an agreeable aromatic flavor, are used by the Japanese as carrots or parsnips are by Europeans. This plant has recently been introduced into cultivation in the United States under the name "Udo." Aralias abound in the warm valleys of the Himalaya. The natives collect the leaves of many as fodder for cattle, for which purpose they are of great value in a country where grass for pasture is scarce; but the use of this food gives a peculiar taste to the butter. Chinese rice paper is cut from cylinders of the pith of *Aralia papyrifera*, or *Tetrapanax papyrifera*. Ginseng, the root of *Panax quinquefolium*, is one of the most impor-

tant products of the family Araliaceæ. Large quantities of ginseng are collected and shipped to China, where wonderful medicinal qualities are attributed to it. For fine specimens almost fabulous prices are paid. Modern pharmacy does not consider it of great value. The astringent roots of *Gunnera scabra*, sometimes classed with the *Aralias*, are used in tanning, and its fleshy leaf-stalks are eaten like those of rhubarb. It has been seen on the sandstone cliffs of Chile with leaves nearly 8 feet in diameter, each plant bearing four or five of these enormous leaves. It has been introduced into Great Britain and is found to succeed well in the climate of Edinburgh. The only representative of this family in the British flora is the ivy (q.v.), *Hedera helix*. *Fatsia horrida*, a member of this family, is common along the Pacific coast, extending well into Alaska. It has slender, rope-like stems, crowned with large leaves. Stems and leaves are covered with prickles that sometimes make severe sores upon persons who come in violent contact with them. The popular name for the plant is Devil's Club.

Fossil Forms. The genus *Aralia* and an allied genus, *Aralaphyllum*, have been described from many localities in the Cretaceous and Tertiary rocks of North America and Europe, where they are represented by about 25 species.

ARAM, EUGENE (1704-59). An English schoolmaster and scholar, born at Ramsgill, Netherdale, in Yorkshire. His father was a gardener and could afford to keep Eugene at school for only a short time, but even while assisting his father the boy found time for study. He married early and became a schoolmaster, first in Netherdale and afterward at Knaresborough, where he continued to teach till 1745. At Knaresborough lived one Daniel Clarke, a shoemaker, and an intimate acquaintance of Aram. On one occasion Clarke happened to buy a quantity of valuable goods, which he easily obtained on credit; but, to the surprise of everybody, he soon after disappeared, and no trace of him could be discovered. Suspicion lighted upon Aram, not as Clarke's murderer, but as his confederate in fraud. His garden was searched, and in it were found some of the goods which Clarke had bought. Aram was arrested and tried, but acquitted for want of evidence. He now left his wife at Knaresborough and went to London and other parts of England, teaching here and there, and, in spite of his roaming life, contrived to acquire a knowledge of botany, heraldry, Chaldee, Arabic, Welsh, and Irish and planned a comparative dictionary of all the European languages. His most important scholastic achievement was his discovery of the similarity of the Celtic to other European languages. He was at work on his dictionary when he was suddenly dragged away from his ushership at Lynn Academy, in Norfolk, and committed to prison on a charge of murder. The remainder of the story is well known. In 1759 a skeleton was dug up near Knaresborough, which the inhabitants suspected to be that of Clarke; for they had now come to the conclusion that the unfortunate man had met with foul play, especially as Aram's wife had, on several occasions, made strange statements to the effect that her husband and a man named Houseman knew more of Clarke's disappearance than they chose to tell. Houseman was now confronted with a bone of the skeleton which had been discovered. He very emphati-

cally denied that it was Clarke's. People naturally wondered how he could be so positive, and they became convinced that if the skeleton was not Clarke's, Houseman must know where Clarke's body was. At last he confessed that he had been a spectator of the murder of Clarke by Aram and one Terry. He named the place where the body had been hidden. The skeleton was dug up, and Aram was tried at York for the murder of Clarke, on Aug. 3, 1759. He conducted his own defense and attacked, with great acumen, the doctrine of circumstantial evidence; but to no effect, for a verdict of guilty was returned, and he was condemned to be executed within three days. In the interval he confessed his guilt to two clergymen. While in the condemned cell he wrote a defense of suicide, but failed in a practical illustration of the doctrine. For further details consult N. Scatcherd, *Memoirs of Eugene Aram* (London, 1838), and for an idealized portrait, Bulwer's novel, *Eugene Aram* (London, 1832); also Hood, *The Dream of Eugene Aram* (London, 1845).

ARAMEANS. A branch of the Semites (q.v.). The remarkable spread of Aramaic speech beyond the limits of the kindred groups that originally developed and employed it (see ARAMAIC) renders it often difficult to determine the true ethnic relations of peoples whose language might lead to their classification as Arameans. But a number of important states in north Syria and in Mesopotamia and many nomadic or semi-nomadic tribes south of Assyria and east of Babylonia are so distinctly referred to as Arameans (Heb. *aram*, pl. *aramim*, 'am *aram*, 'people of Aram'; Ass. *aramu*, *aramc*, *arime*) in our oldest sources that there is little room for doubt in regard to their character. Thus Damascus is called Aram-Damascus or only Aram in the Bible; in the inscription of Zakir, King of Hamath and Laash, Bar Hadad of Damascus is styled "king of Aram," and Pognon is perhaps right in reading one of the Assyrian designations of the Damascene territory, 'mat Aram, 'the country of Aram.' Aram Zobah occurs as well as Zobah (Coele Syria), Aram Beth Rechob and Beth Rechob (south of Lebanon), Aram Beth Muakah and Beth Muakah (south of Hermon), in Hebrew sources; and Geshur (in Jolan) is said to be "in Aram" (2 Sam. xv. 8). As Zakir distinguishes Bar Hadad as "king of Aram," it may perhaps be inferred that neither Hamath nor any of the other north Syrian states mentioned in the inscription, such as Hadrak, Unki, Gurgum, and Kue, was Aramean in the ninth century. The distinction in language between the earlier Hadad and Panamu inscriptions and the later Bar Rekub inscription suggests that neither Samal nor Jaudi was peopled by Arameans, but that an Aramaic-speaking military colony was put in Samal. Aram Naharaim, the Narima of the Tel el-Amarna tablets, and Naharin of the Egyptian inscriptions, was clearly located between the Belich, the Chabur, and the Euphrates, and between this river and the Orontes. After the downfall of the Mitannian (q.v.) power this region became definitely Aramean. The most important city was Harran (q.v.). Bit Adini (see BETH EDEN), between the Belich and the Euphrates, with its capital, Tell Barsib, was perhaps the most formidable Aramean state with which the Assyrians had to cope. North-east of it were Shupria and Bit Zamani, with its capital Amida, and south of it Bit Chadippe,

Lake, Hindan, and Suḥu, with its fortress Suru, immediately above the Babylonian border. Between the lower Zab and the Diyala were the Itu and the Gurumi; between Elam and Babylonia, farther south, the Bagdadu, the Hindaru, the Tukudu, and the Gambulu. Over 40 tribes are mentioned as belonging to the Arumi, or 'the Aramaic hordes' (*ahlamē aramaiē*). Some of them also lived in Babylonia between the Tigris and the Euphrates; and large numbers crowded into the cities, especially Sippar, Nipur, Uruk, Kish, Kutha, and Babylon itself.

It is not known where the original home of the Aramæans was. Amos (i. 5) threatens the Aramæans of Damascus, Bikat Aven (Coele Syria), and Beth Eden with deportation to Kir and declares (ix, 7) that Yahwe has brought Aram from Kir, Israel from Egypt, and the Philistines from Caphtor (Crete). In Isa. xxii. 6, 7, Kir is mentioned along with Aram, Elam, and apparently Shot (Suti). Winckler has suggested that Kir may refer to the Kares (*Kāpes*) mentioned by Arrian (iii, 8, 5) together with the Sittakenes (Suti), and the city of Karai (*Kāpai*) is said by Diodorus (xix, 12, 1; xvii, 110, 3) to be four days south of Sittacene. There was probably a tradition in the time of Amos that the Aramæans of Syria and Mesopotamia had come from this region between the Tigris and the mountains of Elam; and he held out the prospect of their return from present prosperity to former poverty, barbarism, and insignificance. Other traditions seem to be represented by the genealogies of Aram (Gen. x. 22, 23) and Nahor (Gen. xxii. 21-24). Few of the names can be identified with known tribes or localities, but they apparently point to north Syria, the Syrian Desert, and Mesopotamia. As one of the sons of Nahor is Kesed, the eponym of the Chaldeans (Kasdim), this may explain the statement in Deut. xxvi. 5, "A nomad Aramæan was my father." Modern scholars generally assume that the Aramæans pushed their way from northwest Arabia into Syria, Mesopotamia, Assyria, Babylonia, and the district beyond the Tigris, and the movement is supposed to have begun in the middle of the second millennium B.C. In the course of time they gave their language to many nations, spread the use of the alphabet far and wide, and exercised a profound influence on the development of civilization. Consult: Nöldeke in *Zeitschrift d. Morg. Ges.*, xxv, 113, and article "Aram" in *Encyclopædia Biblica* (1899); Ed. Meyer, *Die Israeliten*, p. 235 (1906); Sina Schiffer, *Die Aramaer* (1911).

ARAMAIC. The language spoken by the Aramæans (q.v.) and by a number of peoples adopting their speech. It is doubtful how much of the inscriptional material or of the later literature can be regarded as coming from men of Aramæan blood. The Nerab priests may have been Aramæans, but Zakir, of Hamath, clearly distinguishes himself in this respect from Bar Hadad, of Damascus, whom he calls "king of Aram," and the kings of Samal and Yaudi do not seem to have been Aramæans. The Elephantine papyri were written by Jews and Samaritans. The Nabateans were Arabs. While the common people in Palmyra were Aramæans, the aristocracy, consequently the literary class, were also Arabs. In the kingdom of Osroene, the Aramæans no doubt formed an important ethnic element, but the reigning family and the dominating circles were of Arabic origin. Akkadians, Assyrians, Mitannians, and Hittites had left

their strains in the blood, and large masses of the old Aramæan population had been put to death or deported by the Assyrians. In southern Babylonia, where the Gnostic sect of the Mandæans chiefly made its converts, the population was at all times very mixed.

Used as a medium of international communication already in the time of the later Assyrian (cf. 2 Kings xviii. 26) and Chaldean empires, and adopted as the official language of the Achæmenian Empire, the Aramaic gradually became the vernacular of many nations. It was employed in daily life, while the native languages, Assyrian, Akkadian, Hebrew, Phœnician, and others, became less generally used, being restricted to certain localities and circles of society, the public worship, and the assemblies of the learned. A language thus perpetuated by foreigners naturally developed many dialectical differences. Religious reasons also occasionally accentuated these. Both Jews and Mandæans spoke Babylonian Aramaic, but the former were influenced by the language of the Hebrew Bible. Monophysitism caused a break between Jacobites and Nestorians which affected to some extent the dialects they spoke, and the religious exclusiveness of the Jews and Samaritans tended to make their dialects diverge. Nevertheless, Aramaic has everywhere certain morphological and syntactical peculiarities that differentiate it from other Semitic languages. Perhaps the most characteristic is the emphatic ending *a* of the noun, originally a post-positive definite article, though it later lost this force and was employed even in the case of an indefinite noun. The only analogy in Semitic to this *status emphaticus* is the enclitic demonstrative or post-positive article *an* in Minæo-Sabaean. Between the Aramaic dialects spoken in the Tigris and Euphrates valley, from the Armenian mountains to the Persian Gulf, and all the western dialects there is the striking difference that the former used an initial *n* (sometimes even an *l*) for the *y* of the latter in 3 masc. sing. and pl. of the imperfect.

As regards the script the old North Semitic alphabet was substantially the same during many centuries, whether it was used for Phœnician, Moabitish, Aramaic, or Hebrew. (See ALPHABET.) On the part of Aramaic-speaking peoples, however, there grew up a tendency to give to the letters a *square* form. The development of this type can be followed most clearly in Egypt, where it appears as early as on the Sakkarah (482 B.C.) and Carpentras (fourth century) steles and, in spite of the more cursive hand, in the Elephantine papyri (fifth century). It had reached a high degree of perfection in the Palmyrene and Nabatean inscriptions of the first century B.C., and was used by Hyrcanus, son of Tobias (183-176 B.C.) in his inscription at 'Arak el Emir. The Syriac inscription in the tomb of Queen Helena of Adiabene (q.v.) shows that Estrangelo was used among the Aramæans to the east of Osroene. Estrangelo is closely allied to cursive Palmyrene. It was retained by the Nestorians, while a more cursive hand was cultivated by the Jacobites. Montgomery thinks that the script used on some Babylonian incantation bowls published by him is an earlier adaptation of cursive Palmyrene. The Mandæans employed a script that is closely akin to that on pre-Sasanian coins and the earliest forms of Pahlavi; and the Manichæan texts in Persian language found at Turfan in Chinese

Turkestan are written in an alphabet derived from a later Syriac type.

Our oldest Aramaic inscription is that of Zakir, King of Hamath and Laash (c.800 B.C.), discovered in 1903 by Pognon and published by him in 1907. (See HAMATH.) To the beginning of the eighth century belongs the inscription by Panamu, son of Karil, King of Yaudi, on a stele dedicated to Hadad, found at Gerjin in 1890. From the reign of Tiglath Pileser IV (745-728) come the inscription on the monument to Panamu erected by Bar Rekab and found at Tachtali Bunar in 1888 and that of Bar Rekab found at Zinjirli in 1891. A number of Aramaic inscriptions are found on Assyrian weights discovered by Layard in 1853 at Calah, the modern Nimrud. They come from the reigns of Tiglath Pileser IV, Shalmanzer V (728-722), Sargon (722-705), and Sennacherib (705-681). The two inscriptions from Nerab, near Aleppo, come from the seventh century. There are observations in Aramaic on Babylonian documents from the last Chaldean dynasty (625-539). The bronze bowl found at Olympia, now at Athens, inscribed to Nagid, son of Mepha, may come from the seventh century. From the sixth comes the great inscription discovered at Taima in northwest Arabia, and also those of Senk Kaleh between Teheran and Tabriz, and Wladikawkaz in the Caucasus. Those found in Mysia, Lycia, Cappadocia, and Cilicia date from the fifth century.

Of very great importance are the Aramaic papyri found on the island of Elephantine at the southern end of Egypt in 1903-06. (See ELEPHANTINE PAPYRI.) In addition to records concerning the affairs of the Jewish community and its Yahu temple, they contain also the Achikar story and a translation of the Behistun inscription. Most of these documents are dated and cover the period from 494 to 400 B.C. The Papyri Blacasiani from Sakkarah and the Papyri Dravettiani from Memphis were probably written in the fifth and fourth centuries. Dated Nabataean inscriptions cover the period from 40 B.C. to 95 A.D. of the Sinaitic, which are also Nabataean; three are dated in 190, 211, and 231 A.D. The earliest of the Palmyrene is dated in 9 B.C., the latest in 271 A.D.

We possess literary remains of the Judæan, Samaritan, and Galilean dialects of Aramaic spoken in Palestine. In the Judæan dialect are written the documents in Ezra vi. 8-vi. 18; vii. 12-26, some of which may go back to the fifth century; Dan. ii 4b-vii. 28, probably written in the second century B.C.; the Book of the Hasmonæans; some of the Aramaic words in Josephus and the New Testament; the Fast Rolls; Aramaic sayings in the Mishna; the Targum Onkelos to the Law, and the Targum Jonathan to the Prophets. Only the translation of the Pentateuch is of importance for the Samaritan dialect. The Aramaic sections in the Palestinian Talmud are our chief documents in the Galilean dialect; some sections in Palestinian Midrashim, and a mosaic inscription in Kefr Kenna are also written in this dialect. There is an unmistakable kinship between the Galilean and Christian Palestinian dialects. The latter is now known to us not only through the Jerusalem Lectionary, since in the last few years a number of other works have been discovered. Unfortunately the first Aramaic gospel, written in the Galilean dialect, is lost; and no part of the Christian Palestinian literature

seems to be older than the breach between Malikites and Nestorians or Jacobites in the fifth century.

No Aramaic dialect has furnished us with a richer literature than that spoken in Osrhoene. Edessa became one of the great centres of Christianity in the East. Through the translation of the Bible in the second century A.D. the literary language of Edessa spread throughout Mesopotamia and northern Syria, and even into Egypt, as the recently discovered Nile liturgy shows. Until the fourteenth century an extensive literature was produced, embracing not only exegetical, doctrinal, and homiletic expositions, rituals, and religious poetry, but also history and romance. Even after the Arabic conquest Syriac continued for some time to be the current language in Mesopotamia and northern Syria. Among the Sabians of Harran, which remained pagan, a philosophical and scientific literature developed in classical Syriac. Of this literature, however, nothing has been preserved in the original tongue. Thabit ben Korrah wrote 16 works in Syriac which were highly praised by Bar Hebræus.

Ten thousand Judæans were deported in 597 and settled in or near Nippur. Several thousand more were carried away in 586 and 581. They adopted the Aramaic dialect spoken in Babylonia, and had used it for many centuries when the academies of Sura, Pumbeditha, and Nehardea were established. The discussions concerning the Law and the interpretations of the Tannaim by the scholars in these academies are recorded in the Babylonian Gemara. (See TALMUD.) The text of the Bible and of the Mishna is in Hebrew, the comments of the Babylonian scholars in Aramaic; and the latter covered the period from c.200 to 600 A.D. Differences are perceptible in the language used at various centres of learning. The Jewish incantation bowls found at Nippur show what the popular dialect was c.600 A.D. Even the later Gaonim at Sura still cultivated it, though the Arabic was gaining ground.

Closely allied to Babylonian Talmudic is the dialect spoken by the Mandæans. A number of their sacred books, such as the Ginza, the Qolasta, the Sidra Yahiya, and many inscriptions on incantation bowls, have been preserved. (See MANDÆANS.) The Mandæic is important, not only because of the insight it affords us into the peculiarities of the faith of these pagan Gnostics, but also because it exhibits the Aramaic speech of Babylonia uninfluenced by the Bible.

Aramaic is still spoken as a living language in a few places. In the villages of Malula, Bakha, and Jubb Adin, northeast of Damascus, a dialect is used which has a marked resemblance to the Christian Palestinian Aramaic of 13 centuries ago. The Turani spoken by the Jacobites of Tur Abdin, the Fellahi of the Nestorians around Mosul, and the Urmi, which has now, in the hands of the American missionaries at Urmia, developed into a literary language, have been more influenced by the neighboring tongues of Arabs, Kurds, Turks, and Persians. All of these dialects, save possibly that of Urmia, seem to be dying out. See SEMITIC LANGUAGES.

AR'AMIN'TA. A favorite name among the Restoration dramatists, although never given by them to very prepossessing characters. Vanbrugh, in *The Confederacy*, christens with it the wife of Moneytrap, a snobbish creature with a weakness for titles, and Congreve gives it to the principal female character in his comedy of *The Old Bachelor*.

ARAMIS, á'rámés'. The least sympathetic of Dumas's *Three Musketeers*, and the one never really loved by the author. His valor and resource were marred by his insincerity. He attains high Church honors, finally becoming the head of the Jesuits.

ARAN, ár'an, SOUTH ISLES OF. Three small islands situated near the entrance to Galway Bay, off the west coast of Ireland. The principal and the most northerly of them is called Inishmore and is 7 miles long and 2 miles broad. The next is called Inishman, and the third, lying to the southeast, Inisher. Their total area is about 18 square miles, and they all form the barony of Gore. The soil is for the most part sandy, and the only remarkable feature of the islands is the number of antiquities it contains. The islands contained at one time about 20 churches and monasteries. There exist remains of old fortresses, supposed to have been built in the first century A.D. The main industry is fishing, and the principal village is Kilronan, on Inishmore, with a population of 460. Total pop., 1911, 2679. The islands are memorable as the scene of dramas, notably *Riders to the Sea*, by the Irish playwright, J. M. Synge.

ARANDA, á-rán'dá, DON PEDRO PABLO ARAÚCA DE BOLEA, COUNT (1718-99). A Spanish statesman, born in Saragossa, of a distinguished Aragonese family. He at first followed a military career, and rose to the rank of general. In 1760 he was appointed by Charles III Ambassador to the court of Augustus III, King of Poland. In 1766 he was recalled to Madrid on account of its disturbed state, and became President of the Council of Castile and Prime Minister. He soon restored order in the capital, expelled the Jesuits from Spain, suppressed the banditti in the Sierra Morena, and promoted a liberal policy. In 1773 he was removed from his post through the influence of the clergy and sent as Ambassador to France, where he remained until 1787. In 1792 he was again made Prime Minister, but was soon deposed through the agency of Godoy, Duke of Alcudia, the Queen's favorite. He remained President of the Council of State, which he had organized; but upon opposing the foreign policy of Godoy he was banished to Aragon, where he died.

ARANEÆ, or AR'ANE/IDA. An order of Arachnida. See SPIDERS.

ARANGO Y PARREÑO, á-rán'gó ē pá-rá-nyô, FRANCISCO DE (1765-1837). A Cuban statesman. He was born at Havana, was admitted to the bar in 1789, and twice represented Cuba in the Cortes of Spain. It was through his exertions that the tobacco monopoly was done away with and the ports of Cuba were opened to foreign trade. He is best known for his works treating of Cuban economies, many of which have been translated into other languages. Consult, for biography, the preface of *Obras del Excmo. Señor Don Francisco de Arango y Parreño* (Havana, 1888-89).

ARANJUEZ, á-rán-hwéth' (from Lat. Ara Jovis, altar of Jupiter). A town in the province of Madrid, Spain, situated on the left bank of the Tagus, 28 miles south-southeast of Madrid, in a beautifully wooded valley, 1500 feet above sea level (Map: Spain, D 2). The town is built in the Dutch style and has broad and regular streets intersecting each other at right angles. It is famed for its palace and gardens, the latter in one of the most beautiful parks in the world. The place owes its existence to an idiosyncrasy of Philip II. He erected a splendid palace where had been but a shooting villa, and for several months of the year Aranjuez became the seat of government. The place naturally acquired more or less importance from this circumstance, its population at one time reaching 20,000. The various sovereigns who occupied Aranjuez beautified it by erecting new structures or extending the gardens. Aranjuez is known historically for the treaty of alliance concluded here between France and Spain on April 12, 1772, and as the scene of the abdication of Charles IV on March 19, 1808. Agriculture, and especially the raising of horses and mules, are the leading industries. Pop., 1900, 12,670; 1910, 12,175.

ARANSAS, á-rán'sas, BAY. An inlet of the Gulf of Mexico, on the coast of Texas, about 15 miles northeast of Corpus Christi Bay (Map: Texas, F 6). It has a length of about 18 miles, and its greatest width is about 8 miles. It is connected with the gulf by a narrow channel, known as Aransas Pass. It has a sandy bar, which detracts from its commercial importance, and is protected by a lighthouse. On Nov. 20, 1864, the pass was the scene of a battle between the Confederate and the Federal troops, which resulted in the capture of the former's fortifications at the pass.

ARANSAS PASS. See ARANSAS BAY.

ARANY, ár'ó-ny', JÁNOS (1817-82). Next to Petöfi, the greatest of modern Hungarian poets. He was born at Nagy-Szalonta, March 1, 1817. His parents were simple peasants and very poor, but he was their only son and they spared no effort to give him an education. At four he had already learned to read from letters traced in the ashes on the hearth, and the Psalms were his first spelling book. From the first he was an indefatigable reader and had soon exhausted the resources of the local library, both in Hungarian and in Latin. At the age of 15 he entered the college at Debreczin, where he quickly distinguished himself, but his dreams were of a romantic career. Like Petöfi, he had felt the fascination of the stage, and in 1836 joined a company of strolling players; but after a few months poverty and hunger brought him, footsore and discouraged, back to his father's house. Here he put aside romantic aspirations

and, having obtained an appointment as notary, settled down to a life of routine. It was not until the summer of 1845 that certain absurdities in the life of the county officials "awoke the voice of satire within him" and inspired his first poem, a satirical epic, *Az elveszett alkotmány* ('The Lost Constitution'), and, the Kisfaludy Society of Pesth having offered a prize for the best humorous poem, he submitted it and was successful. Two years later he obtained a second prize with the first part of his great trilogy, *Toldi*, an epic founded wholly upon Magyar traditions, which immediately brought him into widespread popularity and won him the friendship of the leading men of letters of his day and country. Petöfi, among others, wrote to him, saying: "While others win their laurels leaf by leaf, we must grant you at once the full crown." Arany's popularity soon extended to the lowest ranks of the people, for he had saturated himself in childhood with the folklore of his race, and he excelled above all in the art of weaving these old legends and traditions into the fabric of his poems, and in appealing to that spirit of national pride which is a leading characteristic of the Magyar race. From this time on his career was determined. In 1860 he removed to Pesth, becoming first director and then secretary of the Kisfaludy Society, and in 1870 general secretary of the Hungarian Academy of Science, a position which he held until shortly before his death, Oct. 22, 1882. A monument was raised to his memory at Pesth in 1893. Among his more notable works should be mentioned *Murány ostroma* ('The Siege of Murány'); *King Buda's Death*, an epic in 12 cantos; the second and third parts of the *Toldi* cycle, *Toldi's Love* and *Toldi's Evening*; some exquisite ballads, which many Hungarian critics think have been unsurpassed, and numerous translations, including Aristophanes, and portions of Goethe, Tasso, Shakespeare, and Burns. Petöfi is often called the poet of youth, and Arany the poet of mature life. Arany's own estimate of his worth is interesting. "My talent," he wrote, "is always urging me onward, but my lack of energy constantly drags me back; and so I remain, like the greater part of my work—a fragment!" This verdict falls far below that of his countrymen, who unite in regarding him as the poet who raised Hungarian poetry to a hitherto unknown height, as unequalled in his versatility and artistic finish and in his power of combining the spirit of the primitive Magyar folksong and the classic polish of his own verse in perfect harmony. There are numerous German translations of his poems; among others, Kertbeny (Leipzig, 1851); L. Kórodi (Kronstadt, 1863); Sponer (Leipzig, 1880); and Dux (Pesth, 1861).

ARA PACIS AUGUSTÆ. The Altar of Peace was erected by the Roman Senate in the Campus Martius to commemorate the establishment of universal peace by Augustus. The corner-stone was laid July 4, 13 B.C., when Augustus returned from Spain and Gaul, but the monument was not dedicated until Jan. 30, 9 B.C. Fragments of it have been discovered from time to time beneath the Palazzo Ottoboni-Fiano on the Corso; an excavation of the site, begun by the Italian government in 1903, was never finished. The altar stood in an oblong court, 31 × 27½ feet, surrounded by a wall 21 feet high, with a wide door in each of the long sides. All the extant fragments of sculpture

in relief are from this wall, which bore as its principal decoration a series of beautiful panels occupying the upper portion of the outer face. Interest attaches chiefly to two friezes, each of which represents a group of men, women, and children about to take part in a sacrifice; as the faces are highly individualized, it is fairly certain that they are portraits from life, and many scholars hold that one frieze represents members of the imperial family. In technique these sculptures give us the high-water mark of Roman achievement.

ARAP'AHŌ (probably, tattooed people). An important Algonquian tribe of the North American plains, living in three principal divisions, viz., the Hitunena, 'Beggars' or Gros Ventres, associated with the Assiniboin in northern Montana (600); the northern Arapahos, living with the Shoshones upon a reservation in Wyoming (800); and the southern Arapahos, associated with the Cheyennes in Oklahoma (980). These last, together with the Cheyennes, sold their reservation by treaty in 1892, and are now citizens, holding allotments in severalty. In character the Arapahos are friendly and accommodating and display a superior adaptability to civilization. They are also of a fervent religious spirit and were among the principal adherents and propagators of the ghost-dance religion in the winter of 1890. In the early border wars they were usually friendly or neutral, notwithstanding the fact that their allies, the Cheyennes, were among the most determined of the hostiles. (Consult Kroeber, *The Arapaho* (New York, 1904).)

ARAPAIMA, ä'rä-pi'mä (probably native name). A genus of South American river fishes, closely related to the herrings, and having the body covered with a mosaic of strong, bony, compound scales. They are the largest freshwater fishes in the world, attaining a length of 15 feet and a weight of 400 pounds. They are much valued as food, both in the fresh and in the salted condition, by the people of Brazil and Guiana. The principal species is *Arapaima gigas*, which is taken by spearing.

ARAPILES, ä'rä-pē'lās. A village of Spain in the province of Salamanca, situated about 4 miles southeast of the town of Salamanca (Map: Spain, C 2). It was famous as the place of the battle of Salamanca, in which the French forces under Marmont were defeated by the allied troops under Wellington, on July 22, 1812. Pop., 1910, 543.

ARARAT (*Airarat*, in the old Armenian dialect *Aiarat*, i.e., the plains of the Aryans). The ancient name of the fertile plateau through which flows the river Aras, or Araxes. Ararat appears in the Old Testament (2 Kings xix. 37) as the place to which the sons of Sennacherib fled after murdering their father. In Assyrian texts the country is also mentioned frequently from the ninth century B.C. onward under the form Urarti, though it would appear that the name was used somewhat indefinitely for a larger district than the Ararat of classical writers. It was the ambition of the Assyrian kings to include Urarti in their dominions, and frequently military expeditions were made against *Nairi*, as the vast tract to the north and northeast of Assyria was commonly termed, or the land of the Chaldi. (See CHALDEANS.) It occupies the centre of the mountainous region of Armenia, belonging partly to Turkey and partly to Russia. According to Genesis (viii. 4) it

was on the "mountains of Ararat" that Noah's Ark rested after the Deluge, from which it appears that Ararat was properly the designation of an entire district. Such, however, was the general interest in the biblical tradition that the name "Ararat" became attached to a particular mountain, the one called by the Armenians *Masis leusar*, or 'mountains of the ark'; by the Turks *Aghri-Dagh*, 'steep mountain'; and by the Persians, *Koh-i-Nuh*, 'Noah's mountain.' It rises in two volcanic cones, known as the Great Ararat and the Little Ararat: the former, which attains the height of 16,912 feet (according to another measurement, 17,212 feet) above sea level, is covered with perpetual snow. The latter rises to a height of 12,840 feet. Mount Ararat is, next to Mount Demavend, the highest elevation of western Asia, and since 1827 it forms the point where the Russian, Turkish, and Persian territories meet, its summit being in Russian territory. In 1840 the form of the mountain was partially changed by a frightful and destructive earthquake. Previous to this period, at the base of the mountain and at a point where a stream runs from a wild gorge, there stood the village of Arguri, or Aguri. It was surrounded by gardens and orchards and had upwards of 1000 inhabitants. In the ravine, 2300 feet above the village, stood the Armenian convent of St. James. The beauty and mild air of the district made Arguri a favorite summer resort of the richer inhabitants of Armenia. It was destined to undergo a great change, however. On July 2, 1840, dreadful shocks of earthquake were felt. Great masses of the mountain were thrown into the plain, the ravine was closed, the convent and chapel disappeared, and the village and the gardens which surrounded it were buried under rocks, earth, and ice, with all the inhabitants. The mountain was climbed by Dr. Perrot of Dorpat in 1829, and since then by many others. Consult: J. J. Perrot, *Reise zum Ararat* (1839); D. N. Freshfield, *Travels in the Central Caucasus and Bashan* (1869); J. Bryce, *Transcaucasia and Ararat* (1896); H. B. Lynch, *Armenia* (1911).

ARARAT, or **PILOT MOUNTAIN**. A mountain about 3000 feet high, situated in Surry Co., N. C.

ARARIPE, ñ'rà-rê'pá, SERRA. A low mountain chain forming the southwestern boundary of the states of Ceará and Piauí, Brazil (Map: Brazil, J 5). It forms part of the mountain system that extends southward from the northeast coast at a point just to the west of the mouth of the Parahiba River. It is, besides, the watershed between that river system and the São Francisco, to the eastward.

ARARÓBA POWDER, or **GOA POWDER** (q.v.). A substance found deposited in the wood of *Andira araroba*, a Brazilian tree. From Goa powder is extracted a drug, chrysarobin (q.v.), used in medicine as a stimulant in chronic skin diseases, especially psoriasis, and as a parasiticide in ringworm. It is a pale orange-yellow, finely crystalline powder, odorless and tasteless, or slightly bitter.

ARAS, á-rás' (the ancient Gk. 'Αράξης, *Araxēs*). A river in Caucasus, formed by the junction of the Bingol-Su and the Kaleb-Su, and formerly uniting its waters with those of the Kura (ancient *Cyrus*), at Zhevad, after a course of about 500 miles, but since 1897 it has resumed an ancient course, from near Karadonly, to the Bay of Kizil-agach of the Caspian, almost par-

alleling for this distance the Kura through which its waters flowed before. In the time of Strabo these rivers were separated in this manner, and they had been united, for their lower course, only in comparatively modern times. The old bed was visible at places, and on an island once stood an old capital of Armenia, Artaxata. The main stream is the Bingol-Su, which rises in the Bingol-Dagh Mountains, Asiatic Turkey, in lat. 41° 30' N. and long. 41° 10' E. and, flowing north-northeast, is joined a little below Hasan-Kaleh by the Kaleb-Su, after which the combined stream is called the Aras (Map: Turkey in Asia, M 3). About 52 miles west of Kazyman it crosses the Russian frontier, traverses the territory of Kars and the government of Erivan; then forms for a long distance the boundary line between Russia and Persia. On its banks are found many traces of ancient canals and other proofs that the surrounding country was once densely populated.

ARATOR. A Christian Latin poet of the sixth century. He was born in Liguria, studied at Milan, became a jurist under Theodoric, and was an official under Athalaric, Theodoric's successor. About 540 he took orders as a subdeacon of the Roman church. He is best known for his *De Actis Apostolorum*, a poem in very creditable hexameters, but much overweighed with reflective and allegorical passages. He also wrote an *Epistola ad Parthenium* in the elegiac distich. Consult Max. Manitius, *Geschichte der christlich-lateneischen Poesie* (Stuttgart, 1891).

ARATUS (Gk. Ἀράτος, *Aratos*) (271-213 B.C.). A distinguished statesman and general of Sicyon. At the time of Aratus's youth Sicyon was in the hands of tyrants, who were chiefly partisans of the Macedonian kings. Chnias, the father of Aratus, was an active supporter of the opposite side, and in the course of a party struggle was assassinated (264). Many members of his party were obliged to flee from the city, and Aratus was rescued by a relative and taken to Argos. Here he spent his youth and, through his strength of body and of mind, became a recognized leader of the exiled band. In his twentieth year (251), putting himself at the head of a few followers, he made his way to Sicyon, secretly entered the town, drove out the tyrant, and reestablished a government of the people. Owing to the long rule of the tyrants, he at first met with many difficulties in his efforts at reorganization, but he successfully overcame these and was recognized as the first man in the state. Under his lead Sicyon joined the Achæan League, in which it soon rose to a position of first importance. In 245 he was made general of the league, an office which he held in the course of his career 17 times. Through his influence many other Greek cities joined the confederacy. In 224 the league was hard pressed by the Spartans under Cleomenes, and Aratus found himself obliged to join hands with Antigonus, King of Macedonia. An alliance was made, and the Spartans were defeated at Sellasia, in 221; but through this step the Macedonians gained a foothold in Peloponnesus. Aratus was greater as a statesman than as a general, but he was sincere throughout his life in his efforts to enlarge and strengthen the league. He was finally poisoned, in 213, by order of Philip, the successor of Antigonus. Two annual festivals (the *Aratea*) were instituted by his countrymen in his honor. Near the end of his life he wrote his memoirs, in 30 books. Consult Müller,

Fragmenta Historicorum Græcorum (Paris, 1868-74).

ARATUS OF SOLI. A Greek physician and poet of Cilicia. About 270 B.C., at the request of the Macedonian King, Antigonos Gonatas, he wrote a Greek didactic poem, entitled *Phænomena*, founded on the astronomical system of Eudoxus, of Cnidos, and appended to it another poem, *Diosmeia*, giving rules for prognostication of the weather. A pure style and correct versification mark both poems, which were translated into Latin by Varro, Cicero, Caesar Germanicus, and Rufus Festus Avienus. In his *Georgics* Vergil was somewhat indebted to Aratus for material. Aratus was a native of the same province as St. Paul, who quotes from him in his speech on Mars Hill (Acts xvii. 28). Critical edition by Maass (Berlin, 1892).

ARAU'CAN, or **AR'AUCA'NIAN STOCK**. An important South American Indian people, calling themselves *Mapu-che* ('people of the land') and their language *Chilidugu*. Their territory included at one time the whole of modern Chile, which overflows beyond the Andes, some bands straggling as far as Buenos Ayres, and latterly southward over the Argentinian Pampas. The Chilean Araucanians number some 70,000, and much intermixture with the Spanish population has taken place. The Araucanians were rather loosely organized, but a warlike and independent race. The story of their heroic resistance to the European invaders has been told in verse in A. de Encilla's famous epic *La Araucana*, and in prose by T. Guevara, *Historia de la Civilización de Araucanía* (3 vols., Santiago, 1898-1905). They still show themselves hostile to many aspects of foreign culture, Christianity in particular. To the Araucanian (the *Aucan* of Brinton) stock belong the Picuñche ('people of the north'), Pehueneche ('píñon people'), Huilliche ('people of the south'), Moluche ('people of the east'), or Manzañeros ('crabapple people'), Ranqueles (at the source of the Rio Chahileo), etc. The Puelche, Chono, and Tehuelche are entirely separate peoples, and not Araucanian. Consult Lenz, *Estudios Araucanos* (Santiago, 1895-97), the writings of Guevara, Latcham, Medina, Schuller, etc.

ARAUCANIA, a'rou-kä'né-ä. The country of the Araucos or Araucanian Indians, a territory in the southern part of Chile, occupying portions of the provinces of Arauco, Bio-Bio, Cautin, and Malleco. The country is divided from north to south into four parallel regions, which were formerly administered by hereditary *toguis*, or hereditary princes. The total number of Araucanians cannot be given with accuracy, but in 1907 it was estimated at 101,000. In physical type they resemble their kindred of the pampas. Their language is of such harmonious and adaptable character that a serious attempt was once made by a missionary student to introduce it into Europe to supersede Latin. The Araucanians remained independent longer than any other native tribe on the American continent and fought for their liberty, with intervals of precarious truce, from 1537 to 1773. During the war between Spain and the Chilean colonists, Araucania remained neutral. In 1861 a French adventurer named Antoine Tounens was elected King of Araucania, under the name of Orélie Antoine I, but was deposed and sent back to France by the Chilean government. The rule of Chile was recognized by the Araucanians in 1870. Consult A. Polakowsky, "Die heutigen

Aurakamen" in *Globus*, No. 74. (Brunswick, 1898.)

AR'AUCA'RIA (from *Araucania*, a territory in the south of Chile). A genus of plants of the family Pinaceæ, or pines, consisting of lofty trees, natives of South America and Australasia. The species, of which there are 15, are all evergreen. The leaves are broader than those of pines and firs, which, however, the trees resemble in their general manner of growth. *Araucaria imbricata*, sometimes called the Chile pine, a native of the Andes of Chile, forming forests on their western declivities, attains a height of 150 feet. Its trunk is quite straight and free from knots. The bark of the young trees is studded with leaves from the base upward, even until the tree is 12 or 15 years of age. The branches are in whorls of 5 to 8. Young trees have branches almost from the ground; old trees have tall naked stems, with a crown of branches. The female strobile (cone) is roundish ovate, 6 to 8 inches in diameter, with scales terminated by a long awl-shaped point, and seeds wedge-shaped and more than an inch in length. The outer and inner bark of full-grown trees are each 4 to 6 inches in thickness. From both outer and inner bark, and indeed from all parts of the tree, resin flows readily and in great abundance. The leaves are lanceolate, about an inch in length, and half an inch in breadth near the base, sharp-pointed. The timber is heavy, solid, hard, fibrous, yellowish-white, and beautifully veined. It is suitable for masts of ships. The resin, which is white, has a smell like frankincense and a not unpleasant taste. The seed is pleasant to the taste, not unlike the chestnut, and is a most important article of food among the natives. It is eaten raw, boiled, or roasted. A spirituous liquor is distilled from it. A single strobile sometimes contains between 200 and 300 seeds, and one tree may be seen loaded with 20 or 30 of these great strobiles. This *Araucaria* was introduced into Great Britain at the end of the eighteenth century and is now pretty frequently planted. *Araucaria brasiliana*, the Brazil pine, has loosely imbricated lanceolate leaves and a looser and more spreading habit than *Araucaria imbricata*. The seeds or nuts are sold as an article of food in Rio Janeiro. The resin which exudes from the tree is mixed with wax to make candles. *Araucaria cæcelsa*, the Norfolk Island pine, a native of Norfolk Island, New Caledonia, etc., attains a height of 160 to 220 feet, free from branches to 80 to 100 feet, with a trunk sometimes 11 feet in diameter. The wood is white, tough, close-grained, and so heavy as almost to sink in water. The leaves of the young trees are linear and spreading; those of the adult are ovate and closely imbricated. The cones are 4 to 5 inches in diameter, nearly globular. *Araucaria cunninghamii*, the Moreton Bay pine, a native of the shores of Moreton Bay and banks of the Brisbane River in Queensland, very much resembles the last. It attains a height of 150 to 200 feet, and a diameter of 3 to 6 feet. The leaves of the adult trees are lanceolate and imbricated. The wood is yellowish and is used for boat building, house carpentry, and the common kinds of furniture. *Araucaria bidwillii*, the Bunya Bunya, is an important tree of Queensland, where it attains a height of 100 to 150 feet and a diameter of 3 to 4 feet. The timber is not quite so valuable as that of the Moreton Bay pine. The seeds, of which there is said to be

an abundance every three years, are as much as 2 inches long and three-quarters of an inch broad, and are much used for food by the aborigines. An important resin is obtained from this tree.

There are a number of species and varieties grown in greenhouses in the United States, where they are prized for their graceful appearance. This is especially true of *Araucaria excelsa*. The species do not flourish in the open, except in the southern States. Nearly all the leading species are successfully grown as ornamentals in California. See Plate ASH AND ARAUCANIA.

Fossil Forms. Araucaria, and several allied genera, have been found abundantly in rocks of Mesozoic and Tertiary ages in nearly all parts of the world. The oldest representative of the group is the genus *Walchia*, which occurs in rocks of Permian or uppermost Carboniferous age, and which grew to a great size, equaling that of the tallest spruces of modern times. Throughout Mesozoic rocks of America, Europe, and Asia, the genus *Araucaria* and its allies have been widely recognized by their leaves, branches, fruits, and in some cases by even large trunks. The type genus *Araucaria* appears first in rocks of Lower Jurassic Age; it reached a considerable degree of expansion in Cretaceous time all over northern Europe and Greenland, and at the end of the Eocene Tertiary it became extinct over that region, probably because of climatic changes which forced it to migrate farther to the southward. It will hence be seen that the modern representatives of this genus are mere relics of a once extensive group of plants which in those earlier times furnished the great forest trees that covered a large part of Europe and Asia, and to a lesser degree portions also of the American continent.

Consult: F. von Mueller, *Select Extra-Tropical Plants Readily Eligible for Industrial Culture* (Melbourne, 1895); G. Bentham, *Flora Australiensis* (London, 1863-78); G. Nicholson, *Illustrated Dictionary of Gardening* (London, 1888); L. H. Bailey, *Cyclopædia of American Horticulture* (New York, 1900-01).

ARAUCO, á-rou'kô. A province of Chile, bounded by the provinces of Concepción, Bio-Bio, Malleco, and Cantin, and the Pacific Ocean (Map: Chile, C 11). Its area is 2457 square miles. It has a fertile soil and contains some coal. There are extensive forests, and cattle-raising is an important industry. The population in 1910 was 62,259. Capital, Lebu, with a population of about 3500. See ARAUCANIA.

ARAÚJO DE AZEVEDO, á-rou'zhôô dâ ü'zâ-vâ'dôô, ANTONIO DE (Conde da Barca) (1754-1817). A Portuguese statesman and diplomatist born at Sa, near Ponte de Lima. In 1789 he was appointed Ambassador to The Hague. In 1797 he negotiated at Paris a treaty with France, but it was rejected by the Directory. A few months later he went as Ambassador to Berlin. After the Peace of Amiens he served as Ambassador to St. Petersburg. In 1803 he was recalled to Lisbon, to assume the office of Minister of Foreign Affairs. As head of the state he did much for its material advancement; but with the capture of Lisbon by Napoleon and the dethronement of the royal family in 1807, he accompanied the court to Brazil. During the first years of his residence in the New World he devoted himself to scientific and literary pursuits. He founded at Rio de Janeiro a school of fine arts and one of medicine and chemistry.

He introduced the cultivation of tea and in many ways encouraged agriculture and industries. In 1814 he was Minister of Marine for the colonies of Brazil, and the next year received the title of the Count of Barca. At his death he was Minister of Foreign Affairs. Among his literary works were two tragedies, and translations from Horace, Gray, and Dryden. He died in Rio de Janeiro.

ARAÚJO PORTO-ALEGRE, pôr'tô à-lâ-grâ, MANOEL DE (1806-79). A Brazilian architect and poet. He was born at Rio Pardo, in the province of São Pedro, studied art at Rio de Janeiro, and art and architecture in Paris and Italy, and in 1837 was appointed professor in the Academy of Art at Rio de Janeiro. He was appointed consul general at Stettin in 1859. He designed the church of Santa Ana and the Rio Bank, wrote a number of moderately successful comedies, *Colombo* (an uncompleted epic), and a volume of poems entitled *Brasilianas* (1863).

ARAUNA, ä-rou'nâ. A South American tribe of Tacanan stock, living along the Madre de Dios, a northern tributary of the Beni River, on the Peru-Bolivia frontier. Although evidently of considerable importance, contemporary accounts concerning them differ radically. Heath (1883) asserting that they are naked cannibals, ugly and ill-formed, while Labre (1885) describes them as sedentary agriculturists, and Armentia (1887) says that they are gentle and friendly and of remarkably light complexion. According to Labre, also, they have temples with images of wood and polished stone, and hold women so impure as to exclude them from religious rites and not even to permit them to know the names of the gods. See TACANA.

ARAURE, ä-rou'rá. A town in the state of Lara, Venezuela, on the Acarigua River, 20 miles south of Barquisimeto (Map: Venezuela, D 2). The surrounding region is noted for its fertility in the production of cotton, coffee, and cattle, while near by is the scene of the battle of Araure, Dec. 4, 1813. Population, 4000.

ARAVALLI, ä-rä'vü-lé. A mountain range in Rajputana, British India, extending from about lat. 22° 40' N., long. 74° E. to lat. 26° 50' N., long. 75° E. (Map: India, B 3). It is about 300 miles long, with a width ranging from 6 to 60 miles. The river system of the Aravalli mountains is very extensive, especially on the north and south slopes. The vegetation is poor, and the valleys inclosed between the hills are mostly sandy and utterly devoid of vegetation.

ARAWAK, ä-rä-wik. A tribe living on the Corentyn River in Dutch Guiana, from which the great Arawakan stock (q.v.) derives its name. The word signifies 'meal eaters,' in allusion to cassava bread, which forms a principal article of diet with the tribe (they call themselves simply *lukkunu*, i.e., 'men'). The Arawak cultivate both cassava and corn, but depend largely also on hunting and fishing. They have the clan system, with descent in the female line, and practice the couvade.

ARAWAKAN, ä-rä-wü'kan, **STOCK**. The most widely extended linguistic stock of South America, its tribes formerly reaching, with interruptions, from southern Brazil and Bolivia to the northernmost extremity of the continent, and including also, until the irruption of the Caribs, the whole of the West Indies, several villages being even established upon the mainland of Florida. Columbus made his first landing and

ARAUCARIA

1. ASPHODEL (*Asphodelus albus*).

2. JERUSALEM ARTICHOKE (*Helianthus tuberosus*), showing tubers.

3. A WESTERN ASTER (*Aster townsendii*).

7. GLOBE ARTICHOKE (*Cynara scolymus*).

4. A FOSSIL SPECIES OF NORFOLK PINE (*Araucaria*).

5. NORFOLK PINE (*Araucaria excelsa*).

5A. TIPS OF BRANCHES OF NORFOLK PINE.

6. CONE AND BRANCH OF A FOSSIL ARAUCARIA.

earliest discoveries in Arawakan territory, and the names preserved from Haiti, Cuba, and the Bahamas are readily explained from the existing dialects of this stock. The Arawakan tribes were pressed upon by the Caribs from the lower Orinoco, and these fierce invaders had already seized many of the southern Antilles at the time of the discovery, the occupation being then so recent that the women of the island Caribs, most of whom were Arawak captives, still spoke that language. Physically, the Arawakan tribes are rather undersized, with apparently low vitality. They include several different types. Their plane of culture is rather above that of their neighbors. Those of the islands cultivated corn, manioc, and cotton, as well as tobacco, which came first to European knowledge through them. They were skillful weavers and artisans in wood, stone, and native gold. Considerable study has been made of the mythologies of the stock. Of more than a hundred existing Arawakan tribes, the most important are the Anti, Arawak, Baniva, Baré, Baure, Goajiro, Guaná, Manaos, Maneteneri, Maipure, Marauha, Moxo, Passé, Piro, Taruma, Wapishana. In their recent studies of the languages of Ecuador, northern Peru, Bolivia, northwest Brazil, and southern Colombia, Rivet and Beuchat seek to extend very much the original territory occupied by the Arawakan stock. Consult recent writings of Rivet and Beuchat, Chamberlain, Koch-Grünberg, M. Schmidt, K. von den Steinen, etc., particularly Koch-Grünberg's *Die Aruak-Sprachen Nordwestbrasilien* (Vienna, 1911), and a list and discussion of the tribes of the Arawakan stock by Chamberlain in the *Journ. de la Soc. d'Amér. de Paris*.

ARAXES, á-rák'séz. See ARAS.

ARAYAT, á-ri'át. A town of Luzon, Philippines, in the province of Pampanga, about 12 miles northeast of Bacolor (Map: Luzon, E 6). It was occupied by American troops under General Young on Oct. 12, 1899, during the Filipino insurrection. Near by, in the fork, and at the junction of the Grande and the Chico de la Pampanga rivers, is an extinct volcanic cone 3564 feet high. Pop., 1903, 12,904.

ARBACES, ár'ba-séz (Gk. Ἀρβάκης, *Arbakēs*). According to Ktesias, a general of Sardanapalus, King of Assyria, who in connection with Belesys, commanding the Babylonian troops, organized a conspiracy against Assyria, and after defeating Sardanapalus founded the Median Empire, establishing a dynasty that lasted until its overthrow by Cyrus. Sardanapalus is Astrbanipal (668-625 B.C.), after whose death Cyaxaras of Media and Nabopolassar of Babylonia made their first attack upon Nineveh, which was frustrated by the aid of Madyas, Protothyas's son, the Scythian King. Ktesias seems to have confused Asurbanipal with Sinsariskun, who was overthrown by the two allies (c.606 B.C.). Since he identifies Astyages, whose kingdom was taken by Cyrus in 550 B.C. with Aspadas, it is possible that Artæus, Artynes, and Astibaras represent the private names of the predecessors of Astyages, Deioeces, Phraortes, and Cyaxares, while the first five names in his list are those of rulers over the petty Median principality whence Deioeces came. There seems to be, in his account, a confused memory of the first struggles between Median princes and Shalmaneser III (860-825 B.C.) and the advance of a united Media upon Assyria after Elam's fall (c.640 B.C.) leading to the destruction of this great power. See MEDIA.

ARBACES. 1. The King of Iberia in Beau-

mont and Fletcher's *King and No King*. 2. The ruler of Media in Byron's *Sardanapalus*.

AR'BALEST (Lat. *arcus*, bow + *ballista*, a military engine, from Gk. βάλλειν, *ballein*, to throw), ARBALIST, ARCUBALIST, ARBLAST. A weapon of indefinite antiquity, known also as crossbow or bow-gun. Some Roman forms are depicted on extant monuments, and it was from the Romans, possibly indirectly, that the arbalest in use in the Middle Ages was derived. It was employed chiefly in the twelfth century and later, although it was not unknown in the tenth and eleventh centuries. There were at least eight distinct forms, varying in size and construction. Some were carried by foot soldiers, others were permanently fixed on fortifications like modern cannons; some hurled short, thick arrows (called "quarrels," or bolts); others shot stones, leaden balls, or other projectiles. The larger ones were worked by placing the foot in a loop, drawing the cords up with the hands, while the gun was maintained in an inverted position. When the weapon became so improved that the bow was made of steel, it required, in order to bend it, a separate machine called a "moulmet." In the crude formations of mediæval tactics the arbalestiers, or crossbowmen, were an important branch, and were usually advanced to the first line of battle. They were divided into two branches, the mounted and unmounted, and their supplies of arrow ammunition were carried in carts. The use of the arbalest against Christians was prohibited by the Lateran Council of 1139 on the ground that it was "a thoroughly diabolical weapon." But this prohibition was ineffective. Richard the Lion-Hearted was noted for his skill with the arbalest. One clause of the Magna Charta prohibited King John from employing foreign crossbowmen. In the fourteenth century the arbalest was superseded in England, to a great extent, by the long-bow. See ARCHERY.

ARBE'LA (Gk. Ἀρβηλα, Assy. *Arbailu*, the city of four gods, from *arba*, four + *il*, god). An ancient town of Assyria, now the Turkish town of Erbil or Arbil, situated in lat. 36° 9' N., long. 44° 4' E., to the southwest of Mosul. It is famous as having given name to the battle in which Alexander the Great finally defeated Darius, 331 B.C. The battle was really fought near Gaugamela, some 70 miles to the northwest of Arbela. See ALEXANDER THE GREAT.

AR'BER, EDWARD (?—). An English scholar, Fellow of King's College, London, and emeritus professor of English literature in Mason College, Birmingham. To him English scholarship is greatly indebted for 30 careful reprints. They comprise *Tyndale's New Testament*, 1525 (1871); *A Transcript of the Registers of the Company of Stationers of London, 1554-1640* (1875); *English Reprints* (14 vols., 1868-71); *An English Garner* (8 vols., 1877-96); *An English Scholar's Library* (16 nos., 1878-84); *British Anthologies* (10 vols., 1899-1900); *The First Three English Books on America* (1885); *The Story of the Pilgrim Fathers, 1606-23* (1897); *British Anthologies* (1899-1901); *A Christian Library* (1907).

ARBITRAGE, ár'bi-trázh or ár'bi-tráz' (Lat. *arbiter*, umpire, judge). A term applied to transactions which take advantage of differences of prices for the same articles in different markets. At the same time that the trader buys in the cheaper market, he sells in the dearer. The margin between the two prices must be suffi-

cient to do more than cover the costs of exchange to insure a profit. The rate of profit is of necessity small, being frequently measured in small fractions of 1 per cent. The objects of such arbitrage transactions may be bullion or coin, bills and exchanges, or stocks and bonds.

ARBITRATION (Lat. *arbitratio*, judgment, from *arbitr*, umpire, judge). The submission of a dispute, which might otherwise be the subject matter of a civil litigation, to the decision of a private person instead of a court of justice. This is not permitted in criminal cases; nor are the parties to a civil dispute necessarily bound by an agreement to arbitrate, even though the agreement be upon a valuable consideration. At common law, contracts for the adjustment and settlement by arbitration of all disputes and differences between the contracting parties are not treated as binding so as to oust the jurisdiction of the courts. For example, if a landowner grants to another the privilege of laying waterpipes across certain land, in consideration of the latter's payment of a specified sum and of his agreement to pay all damages caused by the breaking or leaking of the pipe, a stipulation that the damages shall be fixed by arbitration is not enforceable. The landowner can maintain an action at law for any damages so caused and refuse to abide by his agreement to arbitrate them. This, it has been judicially declared, both in England and the United States, rests "upon the general policy of the law, that parties cannot enter into a contract which gives rise to a right of action for the breach of it and then withdraw such a case from the jurisdiction of the ordinary tribunals." On the other hand, if a property owner and an insurer enter into an agreement that the former shall pay a certain premium, in consideration of which the latter, upon the destruction of the property, shall pay the former such a sum of money as shall be settled and ascertained by arbitration, the contract is binding in all of its provisions, and the insured has no cause of action until an arbitration has been had, or it has been prevented or dispensed with by the insurer. The legal distinction between these two classes of cases is well established, but it is not always easy to determine within which class a particular controversy falls. If it falls within the first class, either party has the power to revoke the arbitration, even after his submission of the dispute to the arbitrator; although by so doing he subjects himself to an action for damages for breach of contract, if his agreement to arbitrate was upon a valuable consideration.

This power of revoking a submission has been modified by statute in England and in many American jurisdictions. It is provided, in some of our State constitutions, that the legislature shall enact laws providing for arbitration or shall establish courts of conciliation. The tendency of modern statutes is to extend the limits of private arbitration, to conform the proceedings therein, so far as practicable, to those of a court or an official referee, and to give to an award of arbitrators the force and effect of a judicial decision. In the absence of legislation, however, a judgment cannot be entered on an award, nor can the determination of an arbitrator be enforced by execution. If the defeated party refuses to carry out the award, his opponent must sue upon it. There is no appeal from an award, as there is from the decision of an inferior court; but it may be corrected in some

cases, and it may be set aside for various reasons, such as fraud practiced by the prevailing party, or misconduct on the part of the arbitrators, or their failure to conform to the terms of the submission. As a rule, however, an award will not be set aside for purely technical or formal defects. Unless some flagrant error in the proceedings is disclosed, courts are disposed to uphold an award in an arbitration to which the parties have assented, and on which they have been fairly heard. Consult: Morse, *Law of Arbitration and Award* (Boston, 1872); Russell, *A Treatise on the Power and Duty of an Arbitrator and the Law of Submissions and Awards* (8th ed., London, 1900).

ARBITRATION, INTERNATIONAL. The settlement of disputes between states by judges of their own choosing and in conformity with their respective rights. Arbitration tribunals may be special or general, temporary or permanent, restricted or open. It is essential that the contracting states formally agree to refer their differences to an independent tribunal and bind themselves to abide by its award. The persons or states chosen as arbitrators should formally accord their consent and accept the obligation. The reference is usually made by special agreement signed on behalf of the contending parties, stating the questions to be submitted, summarizing the points of law or fact involved, defining the limits of the arbitration, and in cases indicating the course of procedure. In case the matters in dispute are of vital importance, their arbitration is usually based upon a special treaty, sanctioned by the legislative body to which the treaty-making power is intrusted—in the United States, the Senate. In case of mere financial claims of private citizens of one state against another, arbitration may be based upon mere executive agreements. In many cases an agreement is reached in advance by the executives of the countries concerned that some pecuniary damages shall be paid; the only question remaining for decision being the amount of damages. The tribunals appointed to determine this question are usually made up of representatives of the two nations involved, although representation of disinterested nations may be employed. Under The Hague convention of 1899 provision is made that in case of questions in dispute affecting neither the vital interests nor the honor of the nations involved in controversy, international commissions of inquiry shall be appointed to examine and report upon the local circumstances. Such commissions have no power of making decisions, but their reports may serve as the basis either of direct diplomatic settlement of disputes or of formal arbitration. Such a commission was appointed in 1904 under agreement between Great Britain and Russia, to inquire into the questions arising from the firing upon British trawlers in the North Sea by the Russian fleet. All its findings were accepted by the two powers. In 1913 it was proposed by the United States Secretary of State to the diplomatic representatives of foreign powers at Washington that the principle of international commissions of inquiry be extended to all questions whatsoever, and that the Powers bind themselves not to declare war or begin hostilities pending the investigation of such a commission.

Arbitration is largely an outgrowth of relations between jurisdictions independent politically, but closely interdependent in respect to religion, culture, and economic interests, between

jurisdictions in the same plane of civilization, and the consequent development and recognition of international duties and liabilities. The attitude of Greek civilization toward the barbarian world rendered conciliation with non-Greeks impossible; among the Greeks themselves, however, arbitration was freely employed. Questions relating to religion, commerce, and boundaries were frequently submitted to arbitrators, and in some cases treaties of alliance made express provision for arbitration of all disputes. The foreign policy of Rome, contemplating universal conquest, precluded the employment of arbitration. During the Middle Ages arbitrations again became frequent. The breakdown of the Roman Empire had destroyed political unity; the growth of the Church had reconstituted the cultural unity essential to arbitration. The predominance of the popes, as delegates of God, constituted them the natural judges of all international causes, and brought to their tribunal many of the differences between kings and peoples. Some of the treaties of mediæval times stipulated that all disputes should be referred for settlement to the Pope, and that excommunication should be the penalty for failure to accept his decision. The great prelates were often chosen as voluntary arbitrators, though perhaps oftener on occasions involving private interest and internal policy than on those of actual international conflict. One of the most celebrated of arbitration decisions is that of Pope Alexander VI, tracing an imaginary line from pole to pole in his division of all lands discovered in the New World between Spain and Portugal. Even after the decline of papal supremacy, Gregory XV acted as arbitrator of the question of the "Valtelline" forts in the seventeenth century, and Pope Clement XI gave the casting vote as umpire between Louis XIV and Leopold I, the chosen arbitrators by Article 8 of the Treaty of Ryswick. Under the feudal system vassals were naturally predisposed to look to their lords for the determination of their conflicting claims. The efforts of the emperors of the Holy Roman Empire to succeed to the position of the popes in this regard resulted in an occasional recognition of their jurisdiction—never of their supremacy. With the establishment of absolute monarchies, and the religious schisms of the Reformation Period, arbitration declined.

The change in international relations produced by modern means of transportation, with the resultant complex social and political intercourse and the vast economic loss involved in modern war, has tended more and more to the employment of the method of arbitration in international disputes, and its gradual recognition as the most humane, economical, and enduring method for their determination. The questions submitted involve not only the adjustment of claims relating to the rights of nations as between themselves, but also those of individuals against foreign governments. During the nineteenth century there were over 130 important arbitrations, and almost as many more minor commissions for the settlement of purely financial claims. Both in the numbers and the questions involved the United States and Great Britain have unquestionably led the way. The most important of these is the Treaty of Washington (q.v.), of which one article instituted a Joint High Commission, which at Geneva in 1871 determined the questions relating to the

Alabama Claims (q.v.). Hardly inferior in numbers or importance have been the arbitrations between states of Latin America. In both cases the conditions of arbitration, as described above, have been fully met: essential identity of culture, despite political independence. As a result of the increasing cultural homogeneity of the world at large, the possible field of arbitration is becoming world-wide.

Disputes that may arise between nations fall into three general classes: (1) those which involve the national independence, the vital national interests, or the national honor; (2) those which concern the interpretation of treaties between nations; (3) those involving financial claims of citizens of one nation against the government of another. It is generally admitted that the graver questions under (1) are not susceptible of arbitration. It would have been impossible to induce the Boers to submit to arbitration the question at issue between themselves and Great Britain—the independence of the Boer republics. In general treaties of arbitration it is customary to exclude such questions from the scope of arbitration. The second class of questions is normally disposed of by arbitration, and the third, which accounts for four-fifths of all international disputes, is now universally handled through arbitral tribunals, in so far as they cannot be settled through ordinary diplomatic negotiations.

There are no general principles that will determine, in all cases, whether the national independence, vital interests, or honor is involved in a dispute. The Hague convention in 1899 left the determination of this question to each nation, and this manifestly leaves many opportunities for rupture of international relations. The current tendency appears to be in the direction of narrowing the range of non-arbitrable questions. The *Alabama Claims* settlement is especially significant as extending the range of arbitration. It is to be borne in mind that for many years Great Britain refused to submit the claims to arbitration, on the ground that the national honor was involved.

Arbitration may be based upon a special treaty or convention, or upon a general treaty covering all cases of a given kind. General arbitration treaties are especially common in Latin America. Such treaties have been concluded between Great Britain and France (1903); France and Italy, Great Britain and Spain, France and Spain, and France and Italy (1904). While the above-mentioned treaties except questions of national independence, vital interests, and honor from arbitration, the treaty between Holland and Denmark (1904) covers all questions whatsoever.

In 1904 arbitration treaties were negotiated by the United States with Germany, Great Britain, Italy, Spain, and Portugal, for the submission of judicial disputes and disputes relating to the interpretation of treaties to The Hague Tribunal, but were not ratified by the United States Senate. In 1911 arbitration treaties were signed by the United States Secretary of State and by the ambassadors of the United Kingdom and France, providing for the submission to The Hague Tribunal, or to some other arbitral tribunal, of all disputes arising out of claims of rights made by the one party against the other under treaty or otherwise, and susceptible of decision by the application of the principles of law or equity. The treaties provided further

for the creation of Joint High Commissions of Inquiry, to which any controversy might, by the request of either party, be submitted for impartial investigation, before being submitted to arbitration; such commissions to report on the facts in controversy and to make recommendations. The reports of the commissions were not to be regarded as decisions either as to the facts or as to the law. The treaties further provided that in case the parties disagreed as to whether a difference was subject to arbitration or not, the question was to be submitted for decision to an international Joint High Commission of Inquiry. The latter provision was stricken out by the United States Senate, in consequence of which action the treaties were allowed to lapse by the Executive.

The following is a list of some of the principal arbitrations and adjustments to which the United States has been a party:

1. Between the United States and Great Britain, under the Jay Treaty of 1794, providing for three mixed commissions: one to settle the identity of the St. Croix River, on the north-eastern boundary; one to determine the compensation for impediments imposed by some States to the collection of debts by British creditors, in violation of the treaty of peace; a third to settle the question of contraband, rights of neutrals, and finality of decisions of prize courts.

2. Between the United States and Great Britain under the Treaty of Ghent, 1814, providing for three commissions: one to settle the ownership of certain islands in Passamaquoddy Bay and the Bay of Fundy; a second to determine the boundary of the United States from the St. Croix to the St. Lawrence; a third to determine the boundary of the United States along the middle of the Great Lakes to the water communication between Lakes Huron and Superior and to the Lake of the Woods.

3. Between the United States and Great Britain, in 1818, regarding the obligation of Great Britain to restore slaves in the British possessions at the time of signing the Treaty of Ghent. Referred to the Emperor of Russia, who decided that the United States was entitled to compensation for slaves transported from territories restored under the treaty. Two mixed boards created to determine the claims disagreeing, the sum of \$1,204,960 was finally accepted by the United States.

4. Between the United States and Spain, in 1819, regarding the satisfaction of American claims against Spain during her occupation of Florida. By the terms of the Treaty of Florida, the United States agreed to settle these claims.

5. Between the United States and Great Britain, in 1827, for the settlement of the north-eastern boundary. The King of the Netherlands was chosen arbitrator, but his award was not accepted by the United States. The matter was compromised in the Webster-Ashburton Treaty.

6. Between the United States and France the claims of American citizens growing out of French depredations at sea during the Napoleonic wars, and the French Beaumarchais Claim, and claim to special commercial privileges under the Louisiana Cession Treaty, were adjusted by Minister Rives in 1831 by an indemnity to the United States of \$5,558,108.07.

7. Between the United States and Great Britain in 1855 to determine by a mixed commission the "Reserved Fisheries Rights" under the Reciprocity Treaty of 1854, which renewed the

privileges renounced in 1818, of taking and curing fish in "unsettled bays, harbors, and creeks" along the Canadian shore. The commission defined "rivers and river-mounts" reserved under the treaty, and concluded its work in 1866.

8. Between the United States and Great Britain, in 1871, by the terms of the Treaty of Washington, providing for the submission to arbitration of: (1) The San Juan water boundary. Referred to the Emperor of Germany, who sustained the American claim. (2) The Nova Scotia fishery rights. (3) Claims and counter-claims growing out of the Civil War, other than the *Alabama* Claims. (4) The *Alabama* Claims. Under the second, an award of £1,100,000 was given to Great Britain, and under the third, £386,000.

9. Between the United States and Great Britain, and Germany in 1889, to determine their claims in the island of Samoa. The appointment of the Chief Justice of Samoa was referred to the King of Sweden and a joint commission established. In 1899 complications arose, resulting in a joint high commission proceeding to the Samoan Islands. There resulted an agreement for their partition, signed in Washington, Dec. 2, 1899.

10. Between Great Britain and the United States, in 1892, regarding the Bering Sea seal fisheries. The commission gave a divided award, mainly in favor of Great Britain, in 1893; but in favor of the United States' admission of the necessity for regulation of pelagic sealing and the proposal for such regulations. Later, in 1896, a further commission was created to award the amount of damages due to Canadian sealers under the former decision. This was fixed at \$471,151.

11. Between Great Britain and the United States, in 1897, to determine the boundary between Alaska and Canada. After a decision was reached, the commissioner's work was interfered with by an Act of the British Columbia Legislature. A subsequent determination of the question was reached on the same lines in 1899.

12. Between the United States, Great Britain, and Germany in 1899 for the adjustment of claims of German citizens arising out of the bombardment by American and British warships of Samoan villages.

13. Between the United States and Russia, in 1902, in the Russian Seal Cases. The dispute grew out of the seizure in 1891 by a Russian cruiser of four American vessels in Bering Sea. The arbitrator decided in favor of the United States, laying down the principle that a war vessel may not pursue a vessel of another nation beyond territorial waters.

14. The settlement, in 1903, of the Alaska Boundary dispute, by a joint commission representing the United States and Great Britain.

See HAGUE CONFERENCE; HAGUE

TRIBUNAL; INTERNATIONAL PEACE MOVEMENT; INTERNATIONAL LAW; ALABAMA CLAIMS.

ARBITRATION, LABOR. See LABOR AND CAPITAL, RELATIONS OF.

ARBOGA, är-bō'gā. An ancient city in Sweden, in the province of Westmannland, 10 miles from the mouth of the Arboga River, by which, with the aid of a canal, the lakes Hjelmar and Mälär are united (Map: Sweden, E 7). Of all the churches, cloisters, and chapels, there remain only the town and parish churches, the former with an altar-piece of Rembrandt. Church assemblies were held here in 1396, 1412, 1417, 1423, and 1474; diets in 1435 (the first in Sweden), 1440, 1471, 1529, and 1561, at the last of which certain articles, known as the Arboga Articles, were passed. By these Eric XIV was enabled to limit the power of the nobles. In 1625 Gustavus Adolphus here issued an edict commanding that copper coin of the realm should maintain full value of that metal. Pop., 1901, 5250.

ARBOGAST, ARBOGASTES (?-394). A Frank who, banished from his country, became a distinguished general in the Roman service. During the reign of Gratian he successfully commanded an expedition against the Germans, in 381; under Valentin II he was commander in Gaul. After winning the favor of his army by his ability and his victories over the Gauls, he defied the authority of Valentinian, who killed himself in 392, though a later story declared that he was murdered by Arbogast's orders. Eugenius, Arbogast's client, was proclaimed Emperor, since he himself, as a barbarian, could not gain the throne; but after suffering a defeat at the hands of Theodosius, near the river Frigidus, north of Aquileia, Arbogast killed himself.

ARBOIS, är'bwi'. A town of France in the department of Jura, France, 6 miles northeast of Poligny (Map: France, N., F 6). It is situated in the valley of the Cuisance, which is noted for its excellent wine. Pasteur spent his boyhood in Arbois, and there is a statue in his honor. Pop., 1911, 3926.

ARBOIS DE JUBAINVILLE. See JUBAINVILLE, MARIE FRANÇOIS D'ARBOIS DE.

ARBOLEDA, är'bō-lä'vá, JULIO (1817-62). A Colombian poet and political leader. He was born at Barbacoas and was educated in Europe. In 1856 he joined the Conservative revolt in Antioquia and soon became the leader of his faction. He concluded an alliance with President Moreno, of Ecuador, and made war upon the Federalist dictator, Mosquera. With the support of the states of western Colombia, he assumed supreme power, but soon afterward was assassinated. In a literary way he is chiefly known for his poems, which, including *Dios y la virtud*, *Estoy en la cárcel*, and *Me ausento*, gave him high rank among Spanish-American poets. The manuscript of his most important work, *Gonzalo de Oyón*, was almost completely destroyed by an enemy, and only fragmentary copies are preserved.

ARBOR DAY (Lat. *arbor*, tree). A day set apart by the legislatures of most of the States and Territories of the United States for the annual planting of trees by the people and more especially by the school children. B. G. Northrop, while secretary of the Connecticut Board of Education, seems to have been the first—in 1865—to suggest the annual planting of trees under the direction of a State government. J. Sterling

Morton was probably the first, however, to propose the setting apart of a certain day annually for the purpose, and in 1872, largely through his efforts, the custom was instituted in Nebraska. At present Arbor Day is observed in nearly every State and Territory; in some as a legal holiday, in others as a school holiday. In addition, several States, including New York, publish an Arbor Day manual. The exact date is not uniform throughout the country, though it generally falls late in April or early in May in the northern States, while in the southern States the day occurs in December, January, or February.

ARBOR DIA'NÆ (Lat. tree of Diana, the alchemic name of silver). An arborescent precipitate of metallic silver from a solution of silver nitrate, produced by the addition of a metallic element such as mercury.

ARBORETUM (Lat. from *arbor*, a tree). A park or nursery containing a collection of specimen trees. See BOTANIC GARDEN; FORESTRY; HORTICULTURE; NURSERY.

ARBORICULTURE (Lat. *arbor*, tree + *cultura*, care, cultivation). A term referring to the scientific cultivation of trees. It embraces that part of horticulture which treats of the planting and cultivation of ornamental and fruit trees and that part of forestry known as silviculture. The horticultural growing of various trees is discussed under the corresponding special headings. Forest practices are described under FORESTRY.

ARBOR VI'TÆ (Lat. tree of life), *Thuja*. A genus of plants of the family Pinaceæ, allied to the cypress, and consisting of evergreen trees and shrubs with compressed or flattened branchlets—small, scale-like, imbricated leaves. Species of arbor vitæ are found in the north temperate zones of both hemispheres. The common arbor vitæ (*Thuja occidentalis*) is a native of North America, especially between lat. 45° and lat. 49°, but has long been well known in Europe. It is a tree 40 to 50 feet high; its branches are horizontally expanded, and the strobiles (cones) small and obovate. The young leafy twigs have a balsamic smell, and both they and the wood were formerly in great repute as a medicine; the oil obtained by distillation from the twigs, which has a pungent and camphor-like taste, has been recommended as a vermifuge. The wood of the stem is reddish, soft, and very light, but compact, tough, and durable, bearing exposure to the weather remarkably well. The tree is common in Great Britain, planted chiefly as an ornament. It seldom attains so great a size as in its native country. It flourishes in cool, moist localities. The Chinese arbor vitæ, *Thuja orientalis*, a native of China and Japan, which is immediately distinguishable from the former species by its upright branches and larger, almost globose, and rough strobiles, is also, in Great Britain and upon the continent of Europe, a common ornament of pleasure grounds; but it does not attain so great a size as the preceding, and is more sensitive to the cold of severe winters. The balsamic smell is very agreeable. The tree yields a resin with a pleasant odor, to which medicinal virtues were once ascribed; hence the name, "arbor vitæ," given to this species and extended to the genus. There are several other species of *Thuja*, some of which seem well suited to the open air in the climate of Great Britain. Among them are *Thuja plicata*, California to Alaska, and *Thuja*

dolabrata, a native of Japan, a tree of great height and thickness. In favorable forest conditions *Thuja plicata* becomes a rather large tree, 150 to 200 feet tall, the timber of which is very valuable. There are about 60 horticultural varieties of the American species, that vary in habit of growth, color of foliage, or other characteristics. Many of these are popular in landscape gardening. A tree common in North America and there known by the name of white cedar is sometimes included in the genus *Thuja*, under the name of *Thuja sphaeroides*, but is more generally ranked in the genus *Cupressus* as *Cupressus thyoides*. (See CYPRESS.) Closely allied to the genus *Thuja* is *Callitris*. See SANDARAC.

Fossil Forms. The genus *Thuja*, like many other forms of conifers, is represented by ancestral forms in Cretaceous rocks of northern Europe, and with the advance of time is found to have migrated from northerly to more southerly regions, till during Miocene time it disappeared from Europe. *Thuja* is also known in the Miocene beds of Dakota.

AR'BOS, FERNANDEZ (1863—). A Spanish violinist and composer, born in Madrid, Dec. 25, 1863. He received his first instruction on the violin from Monasterio in Madrid, later studying with Vieuxtemps and Joachim. Soon after becoming concertmaster of the Berlin Philharmonic Orchestra he resigned in order to accept a position as teacher of violin at the Conservatory in Hamburg. At the request of the Queen of Spain he returned to his native city in the capacity of principal professor of violin at the Conservatory of Madrid. In 1890 he settled in London where he appeared as soloist and conductor with signal success, acting also as professor of violin at the Royal College of Music. He began in 1902 to spend three months of every year in Spain, visiting the principal cities as conductor of the Madrid Symphony Orchestra. His compositions include a comic opera, *El Centro de la Tierra* (1895); three trios for piano, violin, and 'cello; some orchestral works, and numerous compositions for violin.

ARBROATH, ăr-brōth' (Celt. *aber*, confluence, mouth + *Brothock*), ABERBROTHWICK, ăb'ër-brōth'ik, or ABERBROTHOCK, -ûk. A seaport town in Forfarshire, Scotland, on the North Sea, about 17 miles by rail east-northeast of Dundee (Map: Scotland, F 3). Here King William the Lion founded a Tyronesian abbey in honor of Thomas à Becket in 1178. The King was interred in it in 1214. In the abbey, Bruce and the Scottish nobles met in 1320, to resist the claims of Edward I to Scotland. Its ruins, which are cruciform, 270 by 160 feet, are very picturesque, presenting lofty towers, columns, Gothic windows, etc. The chief industries of Arbroath include flax spinning, jute spinning, the manufacture of sail cloth, boots and shoes, and tanning. There are chemical and iron works. The harbor admits vessels of 400 tons and is protected by a breakwater. The chief exports are grain, potatoes, fish, pork, and paving stones. Arbroath is a royal burgh, and, in conjunction with Montrose, Brechin, Forfar, and Bervie burghs, returns one member to Parliament. Pop., including St. Vigeans, 1901, 24,677; 1911, 22,730. The famous Bellrock lighthouse stands in the sea 12 miles southeast of Arbroath.

AR'BUCKLE, JOHN (1838-1912). An American capitalist and philanthropist, born in Scotland. He came to the United States with his

parents when he was still a child, and was educated in the public schools of Allegheny, Pa. In 1871 he removed to New York City, where, with his brother Charles, he established a coffee business. The sale of coffee in packages, a specialty of the house, having proved immensely profitable, Arbuckle soon conceived the idea of selling sugar in the same way. To further his plan he made an agreement with H. O. Havemeyer, by which the latter was to provide the sugar to be sold. But the retailing of this commodity in package form was so successful that the American Sugar Refining Company, of which Mr. Havemeyer was president, decided to go into the business itself and refused longer to supply Arbuckle. The latter thereupon began the refining of raw sugar for himself, initiating a bitter struggle of many years with his rival. After Arbuckle had been shown that the Sugar Company could sell coffee, as well as sugar, in packages, for the sake of retaliation, a compromise was at last effected in 1901. The Sugar Company had not found the sale of coffee profitable and was ready to give up handling it. Mr. Arbuckle then expanded both departments of his business until he was one of the leading merchants of the United States. In addition to his sugar and coffee enterprises, he was engaged in the wrecking business, and, after spending many years in working out a system for the floating of sunken ships, at length succeeded in putting into operation a device which expelled the water by means of compressed air. Among the ships raised by this method were the United States cruiser *Yankee* and the United States collier *Nero*. During his later years Mr. Arbuckle devoted much of his great fortune to philanthropy and was particularly interested in making life easier for working girls. On a farm of 800 acres at New Paltz, N. Y., he gave occupation to many men from New York and Brooklyn, to whom outdoor air was a necessity.

ARBUÉS, ăr-bwäs', PEDRO (1441-85). A Spanish inquisitor. He was born at Epila, Aragon; became a member of the Augustinian College at Saragossa, and in 1484 was appointed first inquisitor of Saragossa by Torquemada, inquisitor-general. He was a tireless persecutor of all heretics, real or suspected, and was finally slain through a conspiracy of those who feared that the Inquisition might reach them. He was canonized by Pope Pius IX in 1867.

AR'BUTHNOT, JOHN (1667-1735). A Scottish author and physician, the contemporary and friend of Pope and Swift. He was the son of an Episcopal clergyman, and was born at Arbuthnot, Kincardineshire. He studied medicine at Aberdeen, but took his degree at St. Andrews. Arbuthnot's father lost his preferment at the outbreak of the Revolution. His sons' prospects being thus blighted in their own country, the family were compelled to go abroad to seek their fortune. John went soon after to London and there supported himself by teaching mathematics. In 1697 he published an examination of Dr. Woodward's account of the Deluge, which brought him into notice as a person of unusual ability. Accident called him into attendance on Prince George of Denmark, who thenceforth patronized him. In 1709 he was appointed physician in ordinary to the Queen, and in 1710 was elected a member of the Royal College of Physicians. On the death of Queen Anne, in 1714, he lost his place at court, and his cir-

cumstances were never so prosperous afterward. In 1717 Arbuthnot, with Pope, helped Gay in a farce, entitled *Three Hours after Marriage*, which, however, proved a complete failure. In 1723 he was chosen second censor of the Royal College of Physicians, and in 1727 he pronounced the Harveian oration for the year. He died at Hampstead in 1735.

Arbuthnot's literary fame rests upon two humorous pieces. In 1712 he published the *History of John Bull*, one of the most amusing of political satires. After his death appeared (in Pope's Works, 1741) the *Memoirs of Martinus Scriblerus*, in which every kind of pedantry is ridiculed. John Bull as a nickname for the typical Englishman has been traced back farther than Arbuthnot, but *Scriblerus* is one of the important sources of Sterne's *Tristram Shandy*. Arbuthnot was one of the most amiable of men. To him Pope addressed his best *Epistle* and Swift said that if there were a dozen Arbuthnots in the world he would burn his *Gulliver's Travels*. Consult G. A. Aitkin, *Life and Works of Arbuthnot* (London, 1892).

ARBUTHNOT, MARRIOT (1711-94). A British admiral. He became a commander in 1746 and a captain in 1747; was commissioner of the navy at Halifax, N. S., from 1775 to 1778; became a rear-admiral in 1778, and in 1779 was appointed vice-admiral and placed in command of the North American Station. In conjunction with Sir Henry Clinton he captured Charleston, S. C., after a long siege, in 1780 (May 12), and in March, 1781, fought an indecisive engagement with a French fleet off Cape Henry. He surrendered his command to Rear-Admiral Graves in July, 1781, returned to England, and though he saw no more actual service, he became by seniority Admiral of the Blue in 1793. As a naval officer he was absurdly inefficient, being ignorant of even the rudiments of naval tactics, and as a man he seems to have been known to his contemporaries as a coarse and blustering bravo. Consult Ralfe, *Naval Biography* (London, 1820).

ARBUTUS, ar'bŭ-tŭs or ăr-bŭ'tŭs (Lat. the wild strawberry tree). About 10 species of shrubs and trees belonging to the family Ericaceæ, natives of western Europe and western North America. In many species the leaves are evergreen and shining, the branches usually smooth and red. Such a species is *Arbutus Unedo*, the 'strawberry tree,' extensively planted as an ornament in parks. It is a native of the south of Europe and is not hardy in the colder parts of the United States. It is highly valued in California. The flowers, which are white, are produced in great abundance; the fruit, which resembles a strawberry in size and color, is ripened the second year. In this way flowers and fruits occur together, and, with the bright green leaves, make the tree very attractive. The fruit is edible and often utilized, especially in Spain, where sugar and a spirit are manufactured from it. A second species, *Arbutus menziesii*, is the madroña of California. It is fairly hardy, and as a tree often attains a height of 80 to 100 feet. *Arbutus arizonica*, a tree 40 to 50 feet high, has the bark of the trunk white, of the branches red, which, together with the pale-green leaves, makes a pleasing contrast.

ARBUTUS, TRAILING (*Epigæa repens*). A prostrate or trailing plant, called Mayflower in New England and ground laurel in the southern States, with evergreen leaves, rusty, bristly

shoots, and axillary clusters of fragrant, rose-colored or white flowers, opening in early spring; found in sandy or rocky soil, especially in the shade of pines. It grows from Newfoundland to the Saskatchewan, and south to Florida, Kentucky, and Wisconsin.

ARC (Lat. *arcus*, a bow). Any part of a curved line. It is usually limited to a part not including a cusp, and more particularly is applied to part of the circumference of a circle, as in the following statements: The straight line joining the ends of an arc is called its chord. Arcs of different circles are similar when they subtend equal central angles of their respective circles; if these circles are equal, so are the similar arcs. Circular arcs have the same numerical measure as the central angles which they subtend, and hence are commonly said to measure and to be measured by those angles. Like their subtended central angles, arcs may be considered as positive or negative and as exceeding 360°. (See ANGLE.) An arc is distinguished as major or minor, according as it is greater or less than a semi-circumference. The arc equaling in length the radius of a circle is called a *radian*; it is nearly 57° 17' 44.8". There are, therefore, 2 π radians in a circumference.

ARC, ELECTRIC. See ELECTRIC ARC, ELECTRIC LIGHTING.

ARC, JOAN OF. See JOAN OF ARC.

ARCAÇON, ăr'kă'shôn'. A charming French town and favorite watering place on the Bay of Biscay, in the department of Gironde, on the south side of a lagoon, the Basin d'Arcachon, 34 miles southwest of Bordeaux by rail (Map: France, S. C 4). Its popularity as a resort began in 1854. Its fine broad sands are admirably adapted for bathing, and the place is sheltered by sand hills covered with extensive pine woods of the Landes. Its main street stretches 2½ miles along the shore, with the pine forests immediately behind. The climate is always temperate, averaging in summer 47° F. and in winter 41°. Its numerous villas among the firs are much frequented in the winter by invalids afflicted with lung disease. Scientific oyster culture is practiced here on a large scale. The trade is chiefly with England and Spanish towns. Pop., 1901, 8259; 1906, 9279; 1911, 10,266. Consult *Arcachon* (Paris, 1899).

ARCADE (Fr. from Lat. *arcus*, bow, arch vault). A row of arches supported by columns or piers. In Roman architecture, which first made use of the arcade systematically, the arches were invariably supported on piers, which were adorned with engaged columns carrying entablatures in structures like the Coliseum (q.v.), but left plain in utilitarian structures like the aqueducts. The earliest use of columns to support an arcade was in the palace of Diocletian at Spalato in Dalmatia (c.300 A.D.). In the early Christian basilicas columnar arcades were used to separate the nave and aisles; in Byzantine architecture both piers and columns were used as arch supports, as occasion demanded. The builders of the Romanesque and Gothic periods developed the clustered pier as an arch support and made admirable decorative use of arcades in the triforium (q.v.) galleries or passages and on the west fronts of their churches; of this the most noted example is the cathedral of Pisa. Very beautiful are the arcades inclosing the cloisters of many cathedrals and abbeys. The Renaissance employed both the columnar

and the Roman type of arcade, the former being especially common in the courtyards, loggias, and cloisters of Florence, northern Italy, and Spain. The street arcades of Bologna and of the Rue de Rivoli, Paris, are famous.

The term is often applied not merely to a row of arches, but to the entire passage or structure of which they are the front. It is also used, improperly, of any glass-roofed street or alley flanked by shops or stalls. A small decorative arcade applied against a wall is called an *arcature* (q.v.).

ARCADELT, JACOB. A Flemish composer who assisted in founding the classical Italian school of music. The date of his birth is uncertain, but is believed to have been during the first quarter of the sixteenth century. His works are among the masterpieces of contrapuntal music of the Middle Ages. He was the most popular composer of his day, and his popularity induced many persons, for business reasons, to add his name to works written by others. During a residence in Rome (1539-55), as teacher and as singer in the Papal Chapel, he composed many madrigals. His works also include motets and masses. Arcadelt probably died about 1570-75, while in Paris with Cardinal Charles, Duke of Guise, whose service he entered in 1557. Consult Burney, *General History of Music*, vol. iii (London, 1789), and Ambros, *Geschichte der Musik*, vol. ii (Leipzig, 1909).

ARCADES, ár'ká-déz. A masque written by John Milton in 1634 and published in 1645. It was acted shortly after *Comus*, before the Countess Dowager of Derby, wife, first of Fernando, Earl of Derby, and afterward of Thomas Egerton, Lord Ellesmere, when she was living at Harefield, near Uxbridge. It was set to music by Mr. Lawes at the same time. In it the Countess's guests appear on the scene in pastoral habit and move toward the seat of state with a prefatory song of compliment. A "genius of the wood" then comes forward and describes the significance of the occasion, after which the piece closes with two more songs of flattery.

ARCADIA (Gk. 'Αρκάδια, *Arkadia*). The middle and highest part of the Peloponnesus, bounded on the north by Achaia, on the east by Argolis, on the south by Messenia and Laconia, and on the west by Elis. According to Pausanias, it derived its name from Arcas, the son of Callisto. Next to Laconia, Arcadia was the largest country in the Peloponnesus. It had an area of 1800 square miles and was girt round by a circle of mountains, which cut off to a large extent its communication with the rest of the peninsula. Mountains also intersected it in different directions, forming a number of small cantons. The western part of what was anciently Arcadia is wild, bleak, and rugged, and covered with forests; the eastern is more fertile; and in the southeast are two plateaus, in which lay the chief ancient cities. The loftiest peak in Arcadia is Mount Cyllene, in the northeast, 7790 feet. The small rivers are either tributaries of the Alpheus, or empty into inland lakes drained by underground channels (*kata-rothra*). The chief cities were Tegea and Mantinea in the southeast, and the great city, Megalopolis, founded in 370 B.C. by Epaminondas as the capital of the Arcadian Confederacy. Farther north were Orchomenus, Pheneus, Clitor, and Psophis. Owing to its isolation, Arcadia remained little affected by the Dorian conquest of the Peloponnesus, and its inhabitants were re-

garded as belonging to the original population of the peninsula; a belief confirmed by their dialect, which preserves some early forms and shows strong resemblances to the Cyprian. The nature of the country also prevented any lasting union among the inhabitants and enabled the Spartans to maintain their supremacy until the battle of Leuctra. The confederation organized by Epaminondas had no real permanency, and until the Roman conquest the country was the scene of civil strife. The inhabitants were brave, hardy, and fond of fighting, so that they were in great demand as mercenaries. Among their shepherds and hunters the chief deities seem to have been Pan, Artemis, and Zeus, who was worshipped with human sacrifices on Mount Lycæon till a comparatively late date. A form of pastoral poetry seems to have developed in Arcadia, which was at first crowded into the background by the Sicilian bucolics of Theocritus; but later revived and influenced the Roman poets, whence Arcadia, or Arcady, has become a synonym for an idyllic pastoral country of peace, innocence, and simplicity.

ARCADIA. The title of various pastoral romances, suggested, doubtless, from the use of the word in Vergil's *Ecloques*, where it is spoken of as a realm of bucolic content. One of these romances is by Sannazaro, and appeared at the close of the fifteenth century; another is by Sir Philip Sidney, and was published in 1590; a third is by Robert Greene, published in 1589; and a fourth by Lope de Vega, in 1598. In 1640 Shirley wrote a dramatization of Sidney's tale. Consult W. W. Greg, *Pastoral Poetry and Pastoral Drama* (London, 1906).

ARCA'DIUS (c.377-408). The first Emperor of the East (395-408). He was born in Spain, and was the son of the Emperor Theodosius, after whose death the Roman Empire was divided into the Eastern and the Western Empires. Arcadius lived in Oriental state, and his dominion extended from the Adriatic Sea to the river Tigris and from Scythia to Ethiopia, but the real rulers over this vast Empire were, first, the Gaul Rufinus, later the eunuch Eutropius, who openly assumed the reins of government and the command of the army, while Arcadius reposed in luxurious indifference. In 399 Eutropius was deposed by another usurper, Gamas, who, in his turn, soon fell a victim to his own ambition. Afterward Eudoxia, the wife of the Emperor, assumed the supremacy. One really great man adorned this period, the virtuous and eloquent Chrysostom (q.v.), who was persecuted by Eudoxia, and through her influence exiled in 404, on account of his firm opposition to Arianism, which the Empress herself favored. During the reign of Arcadius his territories suffered by barbarian incursions, earthquakes, and famine, but nothing could disturb the indifference of the monarch. He died, unlamented, in 408. See HONORIUS, and consult *The Cambridge Medieval History*, vol. i (New York, 1911).

ARCA'NI DIS'CIPLI'NA. See DISCIPLINA ARCANI.

ARCA'NUM, THE GREAT. In the Middle Ages the Latin word *arcanum*, literally meaning 'secret,' was used of any of the most valued preparations of alchemy (q.v.); but the name "great arcanum" was especially applied to the highest problems of the science, the discovery of such supposed great secrets of nature as the elixir of life or the philosopher's stone.

AR'CATURE (Fr. *arcature*, Lat. *arcus*, a bow, arc, curve). In architecture, especially that of the Middle Ages, a small or subordinate decorative arcade applied against a wall or built into it. The most common occurrence of arcatures is on the interior of side-aisle walls under the windows, especially in French Romanesque and Anglo-Norman churches of twelfth and early thirteenth centuries (e.g., Durham, Peterborough); rarely on exteriors as at Christchurch. In the Gothic styles beautiful arcatures occur on choir inclosures as well as under side-aisle windows. The attic wall under the eaves and above the main cornice of Rheims is decorated with an arcature of unusual beauty.

ARC DE TRIOMPHE DE L'ETOILE, *ark de tré'ôn'f' de là'twál'* (Fr. triumphal arch of the star). The largest triumphal arch in the world. It stands at the head of the Champs Elysées, Paris, and was begun by Napoleon in 1806 and completed by Louis Philippe in 1836. It was designed by Chalgrin and is profusely ornamented with reliefs representing the Napoleonic victories, in commemoration of which it was erected. See ARCH, TRIUMPHAL.

ARC DE TRIOMPHE DU CARROUSEL, *ark de tré'ôn'f' du ká'rô'sé'zél'* (Fr. triumphal arch of the tilting-match). An arch built by Napoleon I at Paris, in the square inclosed by the Tuileries and the Louvre, in commemoration of his victories during 1805-06. It is a smaller copy of the Arch of Constantine at Rome. See ARCH, TRIUMPHAL.

AR'CE, *Sp. pron. ár'thá*, FRANCISCO (1822-78). A California pioneer. He removed to Alta, Cal., in 1833, and soon afterward became secretary to Gen. José Castro, then commanding the Californian forces and an officer in the Mexican army. In 1846, while bringing a number of horses, supposed to belong to the Californian government, from Sonoma to the south, he was attacked (June 6) by a company of Americans, supposedly instigated by Capt. John C. Frémont. The "Arce affair" attracted widespread attention and marked the beginning of the Bear-Flag Revolt, which resulted in the seizure of California by the Americans.

ARCEL'LA. A genus of amœboid protozoans, having a chitinous test or shell which is single and circular in shape, somewhat like the umbrella of a jellyfish. There are two nuclei and more than one contractile vacuole. These organisms have the power of secreting carbonic-acid gas in the form of minute bubbles in the cytoplasm, by this manner floating near the surface of the water. They are common among bog-mosses and confervas.

AR'CESILA'US (Gk. Ἀρκεσίλαος, *Arkesilaos*) (316-241 B.C.). A Greek philosopher, founder of the Middle Academy. He was born at Pitane, in Æolis; studied philosophy at Athens, first under Theophrastus the Peripatetic, and afterward under Crantor the Academician, and through the latter became acquainted with Polemon and Crates, by whom, as well as by Crantor, he was profoundly influenced in his philosophic views. After the death of Crantor he became the head of the Academic school. Arcesilaus marks a reaction against the dogmatism of the Stoic school of philosophy, and an intended return to the method and attitude of Plato and Socrates. He denied the Stoic doctrine of a "convincing conception," which he affirmed to be, from its very nature, unintelligible and contradictory. He also denied the certainty of intel-

lectual and sensuous knowledge, and recommended abstinence from all dogmatic judgments. In practice, he maintained, we must act on grounds of probability. Though Arcesilaus confined his activity to teaching by the Socratic method and wrote nothing, his influence on the future course of philosophic thought was far-reaching. He had clearness of thought, cutting wit, and readiness of speech; his frank and generous disposition charmed his opponents as well as his disciples. Consult Zeller, *Geschichte der griechischen Philosophie* (Leipzig, 1893).

ARCESILA'US. The name of four kings of Cyrene. See BATTIADÆ.

ARCH (Lat. *arcus*, anything curved, a bow, vault, arch). A structural device for spanning an opening by means of a number of wedge-shaped units arranged in a curve convex upward; and hence, also, any structure having the form or appearance of an arch. The supports of an arch may be walls, piers, or columns; the capstones from which it springs or on which it rests are its *imposts*; the wedge-shaped pieces composing it are called *voussoirs*; the upper part of the arch is its *crown*, the portions near the impost are the *haunches*; the two lowest *voussoirs* are the *springers*; the central or crowning *voussoir* is the *keystone*; the inner outline or edge of the arch is its *intrados*, the outer line or edge is its *extrados*, and its under surface is its *soffit*. The molded band which often surrounds the opening is called an *archivolt* (q.v.). The wall spaces on either side of an arch, or between adjacent arches, are *spandrels*; a flat vertical slab or filling under an arch, above a lintel or beam set at or near the impost-level, is its *tympanum*. An arch composed of only two stones leaning against each other is an *Egyptian* arch. A *segmental* arch is one whose curve is less than a semicircle; a *horseshoe* arch, one whose curve is more than a semicircle; a *stilted* arch, one whose imposts are set below its actual springing; a *pointed* arch, one whose intrados is formed by intersecting curves, drawn from two opposite centres; a *Tudor* or *Persian* arch, one whose curves are drawn from four centres. A *cusped* or *foiled* arch is one whose soffit is adorned with pointed projections (cusps) bounded by tangent circular curves (foils). A *horizontal* or flat arch is one in which, though radiating *voussoirs* are used, the intrados curve has been flattened nearly or quite to a straight horizontal line. A *corbeled* or false arch is one formed by horizontal courses successively projecting till they meet at the crown. All true arches exert outward lateral pressures called *thrusts*; the masses of masonry which receive and resist these are *abutments*. *Discharging* or *relieving* arches are those which, imbedded in a wall, relieve the weight on the structure below. *Inverted* arches are employed in foundations to distribute the weights of the piers that rest on them. A *vault* is an arched construction extended to cover an inclosed space and not merely an opening in a wall. The term "arch" is applied not only to masonry structures, but to curved roof-ribs or trusses of timber or metal; it is also loosely used of the whole opening spanned by an arch, and even (see ARCH, TRIUMPHAL) of the entire structure containing an arch as its chief feature.

History.—The Egyptians knew the round arch, but relegated it to works of engineering and private architecture; the same is true of the

Greeks. The arch in the Assembly Hall at Priene (time of Alexander) is supposed to be the only decorative Greek arch found. But the Babylonians and Assyrians knew and used both the pointed and the semicircular arch in their palaces, tombs, and temples. All the openings in Assyrian palaces were arched. In ancient Italy the Pelasgic and Etruscan populations used the arch in the same way for secular and sepulchral buildings; only in temple architecture, borrowed from the Greeks of the historic age, was the architrave supreme. It was the Romans who first developed the arch as a dominating feature of external as well as internal design, especially in secular buildings, and applied the vault to cover spacious interiors in temples, baths, and halls. Etruscans, Romans, and early Christians knew only the semicircular arch. But the Persians and Mohammedans, beginning in the sixth and seventh centuries, brought into use a variety of other forms: the pointed, the horseshoe, the ovoid, the stilted arches. The pointed arch became, in fact, the favorite Mohammedan form. It was, perhaps, a knowledge of this Oriental usage that suggested to French builders of the time of the first crusade the use of this form in vaulting; and thus was laid the basis for one feature of Gothic construction, though otherwise there cannot be any connection between the styles of the East and Gothic architecture. In Europe the round-arched style of the Romanesque period was succeeded by the more flexible pointed style of Gothic. Gothic architects produced the greatest number of sub-forms and by-forms of the arch, not all of them pointed. Then the Renaissance returned to the round arch. Modern architects have no style to hamper them and therefore use all kinds. See ABUTMENT; ARCADE; ARCH; TRIUMPHAL; ARCHITECTURE; ARCHIVOLT; BRIDGE; SPANDREL; TIMBREL; VAULT.

ARCH, TRIUMPHAL, or MEMORIAL. Usually a free-standing arch, spanning a road; though sometimes city gates and monumental doorways are turned into memorial arches. These arches are erected to commemorate triumphs or successful campaigns, or even great peaceful events, or an entire reign, or even a great family. They appear to have originated with the Romans. Nearly 150 such Roman arches remain wholly or in part, of which about 60 are in north Africa. At Rome they were placed along the Triumphal Way followed by the triumphing general and his army from the Field of Mars to the Capitol. The earliest arches mentioned at Rome are those of Stertinius (196 B.C.) and Scipio Africanus (190 B.C.). Then the Fabian gens erected one to itself (c.120 B.C.). But it was under Augustus that the custom took root everywhere, as is shown in the Roman Forum, at Aosta, Susa, Rimini, Fano, etc. From that time until the fall of the Empire in the fifth century such arches followed Roman dominion throughout the civilized world, and they are found in France (Saint-Rémy, Reims, St. Chamas, Orange, etc.), Spain (Caparra, Bara), north Africa (Timgad, Tebessa, Thugga, Haidra), Syria (Palmyra, Gerasa, Baalbek), Asia Minor, etc. The early arches were of stone and without much carving, being mainly arched bases for a group of triumphal statuary. But under the Empire, though still crowned by the triumphal quadriga and other figures in bronze, the arches themselves became of great artistic importance and often represent the most successful effort of

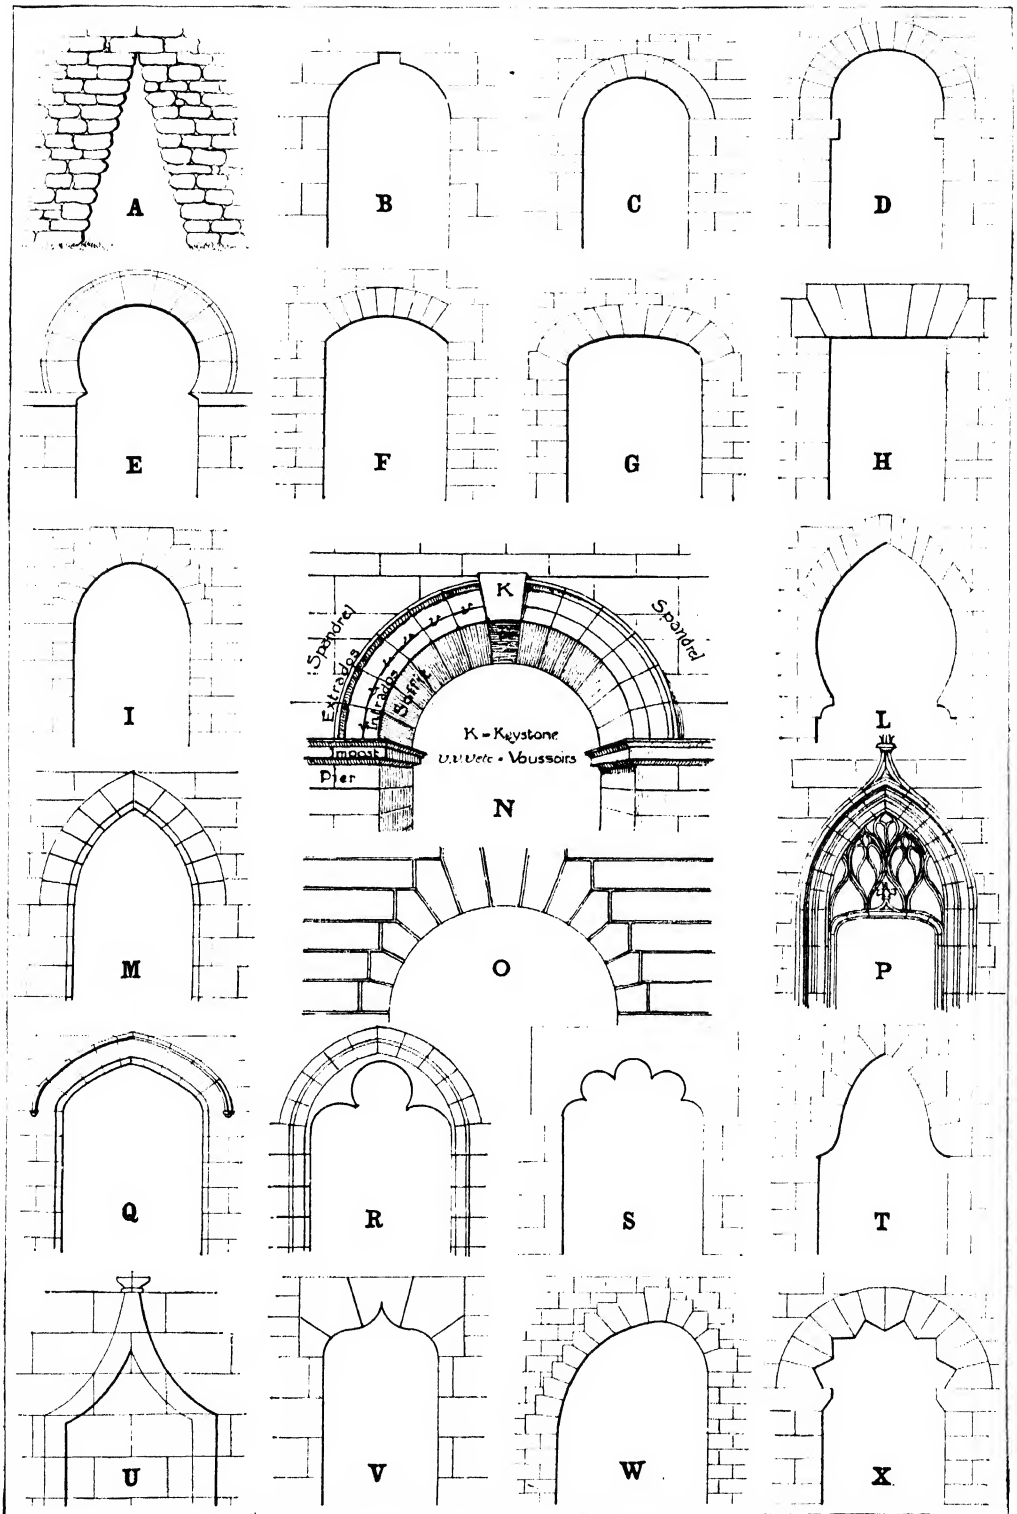

Roman genius at combining architectural and sculptural design. They were then built of marble. The number of openings varied from one to four, according as special arcades were or were not made for foot passengers, or two main arches provided for vehicles in place of one. Still another favorite form was the Janus arch, or Tetrastylon, a solid cube, with arches at right angles, usually placed at the intersection of avenues, as at Philippiopolis, Gerasa, and Rome. Few cities were built under the Empire without one or more of these arches, but only in Italy and south France were they profusely decorated with relief sculptures. The most perfect of all such sculptured arches is that of Trajan, at Benevento (114 A.D.); then come those of Titus (80), Septimius Severus (203), and Constantine (312) at Rome, and that of Tiberius at Orange. The sculptures commemorated events of these emperors' reigns, and the attic contained the dedicatory inscription. One of the slenderest and most elegant is the one erected on the Mole at Ancona, to celebrate the enlargement of this port by Trajan. The Renaissance resurrected the arch after a lapse of 1000 years (Arch of Alfonso at Naples, fifteenth century), and it has since the seventeenth century steadily increased in popularity in Italy (Arco della Pace, Milan); France (Arc de l'Etoile, Arc du Carrousel); Germany (Brandenburger Thor, Berlin; Siegesthor, Munich), and America (Memorial Arch and Bridge, Hartford, Conn.; Washington Arch, New York; Memorial Arch, Brooklyn).

The term is also used to designate, in early Christian basilicas, the arch with its spandrels which incloses the upper part of the opening of the apse; this was usually decorated with an important mosaic picture. Consult: Baumeister, *Denkmäler des klassischen Altertums* (Munich, 1885-88); Daremberg and Saglio, *Dictionnaire des antiquités grecques et romaines* (Paris, 1881-92); Bellori, *Veteres Arcus Augustorum* (Rome, 1690); and Philippi, *Ueber die römischen Triumphalreliefe* (Leipzig, 1874); Frothingham, *Roman Arches of Triumph* (New York, 1909).

ARCH, JOSEPH (1826—). An English labor leader. He was born in humble circumstances; was a farm laborer; educated himself, and became a Primitive Methodist preacher. In 1872 he headed the movement for the betterment of the condition of farm laborers in England and founded and was president of the National Agricultural Laborers' Union. In 1873 he visited Canada and the United States to study the condition and prospects of labor and the question of emigration. In 1885 he was elected to Parliament from northwest Norfolk as a Liberal; was defeated in 1886, and reelected in 1892 and in 1895. In 1898 his autobiography, edited by the Countess of Warwick, was published.

ARCHÆOLOGICAL (är'kè-ô-lôj'î-kal) **INSTITUTE OF AMERICA.** A society for the promotion of archæological investigation and research. It was organized in Boston in 1879, and now has 18 affiliated societies, with headquarters in different American cities. The Institute founded the American School of Classical Studies in Athens in 1881; the American School of Classical Studies in Rome in 1895; the American School in Palestine in 1900, and the School for American Archæology in 1907. These are supported partly by private subscription and partly by the aid of several American colleges. The Carnegie Institution of Washington sup-

ARCHES

A. TRIANGULAR.
 B. FALSE OR CORBELLED
 C. SEMI-CIRCULAR, With keystone.
 D. STILTED.
 E. HORSESHOE.
 F. SEGMENTAL.

G. SURBASED OR OVAL.
 H. FLAT OR HORIZONTAL.
 I. ELLIPTICAL.
 J. KEYSTONE.
 K. LANCE SHAPED.
 M. GOTHIC.

N. TYPICAL OR ROMAN ARCH, With parts named.
 O. RUSTICATED.
 P. FLAMBOYANT.
 Q. TUDOR.
 R. CUSPED.

S. FIVE-LOBED.
 T. REVERSED OGEE.
 U. INFLECTED, COUNTER CURVED.
 V. OGEE.
 W. RAMPANT.
 X. ZIGZAG.

ports a fellowship in the American School of Classical Studies at Athens, and grants \$1500 annually for excavations. In 1912 the School of Classical Studies in Rome was absorbed by the American Academy at Rome (q.v.). The society conducted important excavations of the site of ancient Assos in 1881-83, and has aided the school at Athens in its excavation of Grecian sites, notably that of the Heræum, in the Argolid. A summer field session of the School of American Archæology is held in the southwestern part of the United States, and many important studies of the archaeology of this region have been made. Valuable investigations have been made also in several parts of Central America. Besides the *American Journal of Archæology*, a bi-monthly magazine, the society publishes various papers and supplemental reports, and more important publications are in course of preparation, notably a facsimile reproduction of the Codex Venetus of Aristophanes, and important descriptions of the results of special archæological investigations. The society has about 2000 members. Its presidents have been: Prof. Charles Eliot Norton, 1879-90; Seth Low, 1890-96; Prof. John Williams White, 1896-1903; Prof. Thomas D. Seymour, 1903-08; Prof. F. W. Kelsey, 1908-12; Prof. H. L. Wilson, 1912—.

ARCHÆOLOGY, ár'ké-ól'ô-jī (Gk. ἀρχαιολογία, *archaiologia*, antiquarian lore, from ἀρχαῖος, *archaios*, ancient + λόγος, *logos*, science). The science of antiquities—that is, of the material remains of ancient peoples. But from the fact that in its origin and development it has been primarily and chiefly concerned with the artistic and architectural remnants of the Græco-Roman world, archæology is often taken to mean the science of Greek and Roman antiquities, in which sense the term will be used in this article, without losing sight of the connection subsisting between these monuments and those of the more ancient peoples to whom they owe in great measure their inception.

As a science, archæology cannot justly be said to have existed before the last century, although the way had been gradually paved for it from the time of the Italian Renaissance. The passion for the artistic relics of Græco-Roman civilization, which at the end of the fifteenth century took such surprising hold upon the cultured classes of Italy under the papal sway, led to the foundation of museums, in which were gathered statues of bronze and marble, vases, inscriptions, gems, jewelry, and coins, affording material for study and comparison. The spoils brought over from Greece by her Roman conquerors, and the mania for collecting treasures from the same source which had been displayed by many Roman amateurs, as well as the great artistic and architectural activity in imperial Rome under the guidance of Greek masters, rendered that city a mine for the early archæologists; and, furthermore, much filtered in from Greece itself. (Cf. Lanciani, *Ancient Rome in the Light of Recent Discoveries*, Boston and New York, 1889.) It must be admitted that these collectors were enthusiastic rather than scientific, and that the works of art discovered were ruthlessly restored to present a pleasing appearance, often at the complete sacrifice of accuracy. Heads and bodies of totally different style were frequently joined in hybrid combinations which still mislead the uninformed.

The father of modern archæology is Johann Joachim Winckelmann (1717-68) (q.v.), whose writings, although superseded in many points, are still of value; by his genius he marked out the field since so successfully cultivated. He was the first to present to European scholars an authentic account of the discoveries made in the Campanian city of Herculaneum (q.v.), and, more than all, was the first to write a systematic history of ancient art (*Geschichte der Kunst des Alterthums*, 1764; see Winckelmann's complete works, edited by Meyer and Schulze, Dresden, 1808-20). By a passage in Winckelmann's writings, Lessing (q.v.) was stimulated to the composition of his great æsthetic essay, "Laocoön," and Goethe also was powerfully influenced by him. Thus the seed of the new science was planted, to develop after the era of the wars of the French Revolution. Like his predecessors, Winckelmann knew Greek art only through the copies of the Roman period, or the few originals of later times; but even through this haze he was able to distinguish some of the characteristics of the period, so that his works prepared the way for the better appreciation of the discoveries of the early nineteenth century.

Then came Napoleon's invasion of Egypt, which opened the treasures of the Nile valley to European scholars, while the discovery of the key to hieroglyphic writing threw new light on the early history of the East. In Greece itself English scholars were at this time accomplishing all that could be done under the Turkish régime. The most notable achievement was the splendid work of James Stuart (q.v.) and Nicholas Revett, *The Antiquities of Athens* (4 vols., 1762-1816). The expedition sent out by the Society of Dilettanti (see DILETTANTI SOCIETY) to continue their work, however, accomplished but little. At length the true character of the art of the fifth century B.C. became clear when, in 1803-12, Lord Elgin brought the sculptures of the Parthenon to London. (See ELGIN MARBLES.) In 1811 the English and German explorers recovered the remains of the remarkable pedimental groups of the temple on the island of Ægina. These were purchased by Prince Ludwig of Bavaria and placed in the Glyptothek at Munich. (See ÆGINETAN SCULPTURES.) In the following year the same explorers recovered the reliefs from the temple of Apollo Epicurius at Bassæ, near Phigalia, in Arcadia, which were subsequently acquired by the British government and form a most important part of the archæological treasures of the British Museum. The successful termination of the Greek War of Independence (1821-29) opened a new mine from which something was immediately realized by the French exploration of the Morea (Peloponnesus) in 1829, which brought to the Louvre the first specimens of the Olympic sculptures. Soon after this the little temple of Athena Nike was rescued from the Turkish bastion, in which it had been incorporated, and replaced again at the western end of the Acropolis of Athens. In Sicily the exploration of the many Greek sites led to the discovery of the early sculptures of Selinus (q.v.), while the systematic excavation of Pompeii (q.v.) brought to light the paintings and household ornaments of the first century. At about the same time the discovery of the great necropolises of Etruria, especially that of Vulci, in 1828, not only opened the whole field of Etruscan art, and especially of mural painting,

to study, but also added thousands of vases, Greek and Etruscan, to the material available for reconstructing the life and thought of the past. The importance of the vases, not for art alone, but for the study of daily life and mythology, was at once recognized; but unfortunately the strict methods of scientific interpretation were not at first followed, and for many years the wildest subjectivity sought to find a whole system of mystic symbolism in these gifts to the dead. Fortunately this has now been superseded by a careful study of the language and methods of the Greek potter. (See VASE.) This growth of material, making necessary some organization of the laborers in the new science, brought about the foundation in Rome, of the "Istituto di Corrispondenza Archeologica," by Bunsen, Gerhard, the Duke of Luynes, and others, on Dec. 9, 1828. This was one of the most important steps in the history of archæological progress. This institution, now the Imperial German Archæological Institute (Kaiserlich-Deutsches Archæologisches Institut), has, by its publications and by the training of young scholars, been of inestimable value. The French School of Archæology, established at Athens in 1846, as well as the activity which began to be displayed by certain Greek savants under the Bavarian régime, had also an important influence on the development of archæology. A large part in this development was played by the pupils of F. A. Wolf, especially by A. Boeckh, whose aim was a complete reconstruction of ancient life, and who were therefore ready to welcome light from other sources than the literary monuments which had so long absorbed the attention of classical scholars. The discoveries of Layard at Nineveh (1845-46), and the subsequent decipherment of the cuneiform inscriptions (q.v.), revealed the ancient civilization of Assyria and Babylonia and gave new material for a more accurate estimate of the relative position of Greek culture and art. Important contribution was made to the British Museum by the discoveries of Sir Charles Fellows in Lycia (1840), of Wood at Ephesus (1867-74), and of Newton at Branchide, Halicarnassus, and Cnidus.

The study of Greek inscriptions (see INSCRIPTIONS) under Boeckh and Franz, and of comparative linguistics under Bopp and his successors, contributed their share to the modern archæologist's equipment. This narrative brings the account down to the last 30 years of the nineteenth century, during which a series of discoveries were made whose full importance cannot perhaps yet be fully estimated.

The first place in this series of discoveries must be given to the excavations of Heinrich Schliemann (q.v.) at Troy, Mycenæ, and Tiryns, which brought to light the remains of pre-Homeric Greece and revolutionized our conceptions of the development of the early Ægean civilization. These finds have been supplemented and explained by the work of Flinders Petrie and others in Egypt, of the English on Melos, and especially by the most recent explorations in Crete. The peculiar Cypriote civilization, which first attracted attention through the finds of de Vogüé in 1862 (now in the Louvre) and the collections of Cesnola, has since been studied scientifically in 1883 by Ohnefalsch-Richter and by other German and English scholars.

Of the greatest importance in the development of archæological study in Greece has been

the establishment of other foreign schools besides the French Institute in Athens. The first of these was the Athenian branch of the German Archæological Institute (1874), which was followed by the American School of Classical Studies (1882), the British School (1886), and a branch of the Austrian Archæological Institute (1897). Italy, Russia, and Denmark have also made provision for their archæologists who desire to study in Greek lands. Through the aid of foreign archæologists many of the most important excavations in Greece and Asia Minor have been made possible. Thus, the Germans have excavated Olympia (1875-81), Pergamon, Priene, and Miletus; the French, Delos and Delphi; the Americans, Eretria, the temple of Hera, near Argos (1892-95), and Corinth (see HERÆUM; CORINTH); the British, Megalopolis and Melos, and the Austrians, Ephesus. Side by side with the foreigners, has worked the Greek Archæological Society ('Ελληνική Ἀρχαιολογική Ἐταιρία, *Hellenikē Archaiologikē Hetairia*), founded in 1836, and always one of the most active agencies in the exploration of Greek soil. To it is due the excavation of the northern and southern slopes and the summit of the Acropolis, the great sanctuaries of Eleusis, Epidaurus and Oropos, and the palace and many graves at Mycenæ (q.v.).

In Italy the progress of discovery has been somewhat limited by a refusal to permit foreigners to engage in the work; but archæological study flourishes not only among the Italians, but under the direction of the German and French Institutes and the American School established in 1895.

As may be inferred from this brief outline, archæology is an eminently progressive science and in all its departments subject to constant revision. The steady increase of material and the filling of gaps in the general structure, as well as continual correction or rejection of hastily formed theories and insufficiently supported conclusions, will occupy savants for generations to come. We can deal only provisionally with the most certain and generally accepted data, supplementing the statements of ancient writers, by the monuments and interpreting the monuments in turn by our literary sources.

Bibliography. For the history of archæological study: Stark, *Systematik und Geschichte der Archæologie der Kunst* (Leipzig, 1880); Sittl, *Archæologie der Kunst* with atlas (vol. vi of Müller, *Handbuch der klass. Alterthumswissenschaft*, Munich, 1895); this work must be used with caution. On the general subject. Müller, *Ancient Art and its Remains*, trans. by Leitch (London, 1850), is still valuable; Collignon *Manual of Greek Archæology*, trans. by J. H. Wright (New York, 1886); A. S. Murray, *Handbook of Greek Archæology* (London, 1892); Baumeister, *Denkmäler des klass. Alterthums* (Munich, 1885-88); Perrot and Chipiez, *Histoire de l'art dans l'antiquité*, seven volumes published (Paris, 1881 et seq.). For the history of discoveries, besides the works mentioned under the separate places, good brief accounts are to be found in P. Gardner, *New Chapters in Greek History* (London, 1892), and Diehl, *Excursions in Greece*, trans. by E. R. Perkins (London, 1893). For a summary of recent results, see Hogarth, *Authority and Archæology* (London, 1899). The record of discoveries is preserved chiefly in periodicals, of which the

most important is the old series of the German Archæological Institute; *Annali and Bolletino dell' Istituto di Corrispondenza Archeologica* (Rome, 1829-85), and the *Monumenti inediti* (12 vols. and supplement, Rome, 1829-85; Berlin, 1891); *Archäologische Zeitung* (Berlin, 1843-85) which has been succeeded by the *Jahrbuch des kaiserlich deutschen archaologischen Instituts* (Berlin, 1885 ff.). Other important periodicals are the *Mittheilungen des kaiserlich deutschen archaologischen Instituts, Athenische Abtheilung* (Athens, 1876 ff.); *Römische Abtheilung* (Rome, 1886 ff.); *Antike Denkmäler, folio* (Berlin, 1887 ff.); *Jahrbucher des Vereins der Altertumsfreunde im Rheinlande* (Bonn, 1842 ff.); *Compte Rendus de l'Academie des Inscriptions et Belles Lettres; Monumenti Antichi dei Lincei; The Year's Work in Classical Studies*. For the Roman antiquities of Germany, *Archäologisch-epigraphische Mittheilungen aus Oesterreich* (Vienna, 1877-97), superseded by *Jahreshefte des österreichischen archaologischen Instituts* (Vienna, 1898 ff.). In French, *Revue archéologique* (Paris, 1884 ff.); *Gazette archéologique* (Paris, 1875-89); *Bulletin de correspondance hellénique* (Athens, 1877 ff.). In Italian, *Monumenti antichi* (Milan, 1889 ff.); *Notizie degli scavi di Antichità* (Rome, 1876 ff.). In Greek, *Ἐφημερίς Ἀρχαιολογική, Ἐφημερίς Ἀρχαιολογική* (Athens, 1837-60, 1862-74, 1883 ff.). In English, *Journal of Hellenic Studies* (London, 1880 ff.), *Annual of the British School in Athens* (cf. Annual), *the British School in Rome*, and *American Journal of Archaeology* (Baltimore, Boston, Princeton, Norwood, 1885 ff.). The American School of Classical Studies at Athens has published volumes of papers (1885-97) and the British School an *Annual* since 1895.

For our purpose we may divide the general subject of classical archaeology, from an historical point of view, into the following periods:

I. Neolithic Period from about 10,000 B.C. to 3315 B.C.

II. Minoan, or Ægean Period, from 3315—the time of the first dynasty of Egypt (?), to 1450 B.C.

III. Mycenaean Period, from c.1450 B.C. to the Dorian conquest, c.1200 B.C.

IV. Earlier Hellenic Period, from 1200 B.C. to the era of the Persian Wars, c.500 B.C.

V. Period of Hellenic Ascendancy, from c.500 B.C. to the Macedonian supremacy, c.350 B.C.—the period of Phidias and Praxiteles.

VI. Period of Hellenic Dissemination and Decline, from c.350 B.C. to the Roman conquest, c.150 B.C.—the period of Lysippus and of the Rhodian and Pergamene schools, so called.

VII. Roman Period, from c.150 B.C. to c.150 A.D. or later—the period of the union and united achievement of Greek and Roman civilization. For convenience, the consideration of Roman art, properly so called, will be reserved to the last period.

I. **The Neolithic Period.** The beginnings of this period in the Eastern Mediterranean are only tentatively dated by evidence deduced from the finds at Cnossus in Crete (see later). But it does not seem fantastic to give the tenth millennium B.C. as perhaps approximately the correct date for the starting point of this period. Its termination is marked by the introduction of bronze, and this metal probably came into use in the Ægean in the neighborhood of the close of the fourth millennium B.C. This primi-

tive culture was of longer duration in some places than others: in Cyprus it lingered on until a fairly late date. Remains of this period have been discovered in the second city so called, at Troy, on the Acropolis at Athens, at Tiryns, and in many of the Ægean Islands such as Amorgos, Syros, Sophnos, Naxos, Paros, and in Thera and Melos. The pottery is the most common type of remains from this period. It is hand-made with decorations as a rule consisting of incised lines at times filled with some white substance. The color of the ware produced by firing is usually gray or red; the surface is hand-polished. Besides the pottery particularly characteristic are the rude "idols," either of clay or stone, which represent commonly a nude female. By some this type of statuette has been associated with the cult of the great eastern goddess Ishtar, or Astarte. The burials of this age are in cist graves. See MELOS; SANTORIN; TROY.

In the West this period is represented by the pre-Sicel, and first Sicel graves in Sicily, and the earlier remains of Italy. The developments of the Bronze Age in Italy are independent of the Mycenaean Period. The products of Mycenaean art reached the West only as importations, apparently late and in small quantities.

II. **Minoan, or Ægean, Period.** The period of Eastern Mediterranean culture which has here been termed Minoan, or Ægean, derives its name "Minoan" from the fact that the chief seat of this civilization, so far as is known at present, was located at Cnossus in Crete, and from the additional fact that Minos was the legendary King under whom Crete rose to the position of thalassocrat of the Eastern Mediterranean. The name "Ægean" has been added as an alternative perhaps to be preferred because the same culture which manifests itself in Crete has been discovered to have existed in other islands of the Ægean, and the name seems more appropriate than the more local one of Minoan. One other name, Carian, had been recently put forward as the proper designation of this culture; but the evidence for the acceptance of this name, as will be seen later, does not appear to be very strong.

Up to the time of Schliemann's discoveries at Mycenæ in 1876, knowledge of the inhabitants of the Greek mainland and the islands of the Eastern Mediterranean who lived there back of the fifth century was largely derived from literary sources. With the opening of the wonderful shaft graves of the acropolis at Mycenæ, the discovery of the great tholos tombs there and elsewhere in Greece, and the uncovering of the palace and citadel of Tiryns, a vista was opened up which reached several centuries beyond the time of the Dorian invasion. So much did the evidence presented point to Mycenæ as the seat of this culture that, in spite of the fact that remains of the same civilization were found widely distributed over Greece, the name "Mycenaean" was attached to it. The assumption was even made, and at the time with much show of reason, that it was from the mainland of Greece, and particularly from Mycenæ, that this culture spread to the islands. For the reason, furthermore, that this same culture was the only one known to antedate the coming of the Dorians, the custom established itself of designating as Mycenaean the whole period from the time of the arrival of this folk back to the close of the Stone Age.

In 1900, however, Dr. A. J. Evans began a series of excavations at Cnossus in Crete, which have been followed by others of various scholars in that island and elsewhere, notably in Melos, and which made it clear that the name "Mycenæan" as applied to the culture of the Eastern Mediterranean of the second millennium before our era was a misnomer. At Cnossus the distinguished English scholar found traces of an unbroken continuity of occupation extending from a time well in the Neolithic Age down to the last years of the second millennium B.C. At this latter date a disturbance occurred which argues for the intrusion of a stock from elsewhere, probably from the Greek mainland. From these same excavations it was also learned that what had been regarded at Mycenæ as the choicest expression of its culture here at Cnossus followed the real florescence of Cretan life and represented in reality a decadent stage of culture. For this reason Evans felt justified in considering the civilization shown at Mycenæ as a late form of Cretan culture. This view, as will be seen presently, is not exactly correct.

It is true, nevertheless, that the finds at Crete and Melos, to mention no others, render it imperative that the name "Mycenæan" be lifted from the civilization belonging to the greater part of the second millennium B.C. and the two millennia before that, and that some other name be substituted. While it is true that the name "Minoan" has many arguments in its favor on the grounds of picturesqueness and tradition, perhaps it would be better to use the more general one of "Ægean," which makes it clear that this culture was not confined to Crete, but diffused throughout the Ægean Sea. The name "Carian" may be disregarded until the question of the origin of the people who produced this civilization is considered.

Disregarding the Neolithic Age in the Ægean basin, which has left almost nothing behind but stone implements and rude pottery, the makers of the Minoan or Ægean culture were a people who from first to last moved forward to a high plane of civilization. At Cnossus and Phæstos in Crete the remains of great palaces have been uncovered. At Cnossus the excavations have shown a great engineering people who were capable of building intricate structures, who understood drainage, and actually supplied the building with a latrine quite modern in its arrangement. The walls of the palaces at Cnossus (for there were two—one built upon the remains of an earlier structure) were decorated with frescoes which show that the people who dwelt here lived in luxury in a highly organized and even mannered society.

The questions therefore at once arise: when did these people live, were they autochthons, and, if not, whence did they come? An attempt will now be made to answer these questions.

First, as to the dating of the Minoan Period; of the nine divisions into which, for convenience of classification, Evans has separated the Minoan Period, the stratum representing the first—i.e., the stratum following immediately after and resting upon the last of the Neolithic deposit—was found to contain black, hand-polished pottery which, on the authority of Petrie, is not to be distinguished from certain vases found in tombs of Egypt dating in the first dynasty. This discovery to a certain extent defines the beginning of the Minoan Period; for according as one accepts Petrie's dating,

5510 B.C., for the first dynasty, or that of Lepsius, 3892 B.C. or that of Meyer, 3315 B.C., the beginning of the Minoan Period will reach back to 5510 B.C. or come down to as comparatively late a date as 3315 B.C. Evans himself, perhaps by way of compromise, elects 3892 B.C. as correct. It is best perhaps to be even more careful still and accept the more conservative date 3315 B.C. as given by Meyer. For the chronology of later periods Egypt has again afforded material. In a tomb containing seals which bear the cartouches of Senusert II and Amenemhat III (both kings of the twelfth dynasty) were found polychrome vases characteristic of the second division of the second trio of periods which Dr. Evans has classified as middle Minoan. This would mean that the middle of this period is to be located probably in the nineteenth century before our era. Meyer gives 2000–1800 as the time of this dynasty. It is this middle Minoan Period which saw the arrival of the first age of bronze in the Eastern Mediterranean, and it is in the middle of it that the palaces of Cnossus and Phæstos were built. The third division of the middle Minoan Period, in which comes the florescence of Minoan culture and the erection of the second palace, appears to be dated by the discovery at Cnossus of a diorite figure belonging to the twelfth dynasty (which, according to Meyer, begins with the year 1788 B.C.) and by the finding of a vase bearing the name of the Hyksos King Khyan. The time of the supremacy of these invaders of Egypt seems to have lasted from the eighteenth to the seventeenth century B.C. The middle period of the next division, Late Minoan, is synchronized with the eighteenth dynasty of Egypt (which began 1580 B.C.), and it lasted down to the year 1450 B.C. The last period of Minoan culture at Cnossus includes the time of the eighteenth and the nineteenth dynasties, or, in other words, the time between 1450 and 1200 B.C. This is the moment, so to speak, when the hegemony of the Eastern Mediterranean passed from Crete to the Greek mainland; it is the period which, from the great discoveries of Schliemann at Mycenæ, has been and may properly be called Mycæan.

In a word, there is reason to believe, on the most conservative grounds, that the period of Minoan culture reached with unbroken continuity from about the fourth millennium B.C. to the neighborhood of 1200 B.C. How far beyond the fourth millennium it may be assumed these people lived here during the Neolithic Age is not certain. But one might postulate perhaps, without too great a risk, a date somewhere in the neighborhood of 10,000 B.C. as that which marked the arrival of the first dwellers on the site at Cnossus. From that time until practically the beginning of the first millennium B.C. there is evidence for the continuation, with certain vicissitudes, of the same race as occupants of the site. This must be taken into consideration during the endeavor to discover whether or not the culture of the Ægean in those early days was autochthonous or alien.

The question now arises whether these people are indigenous or invaders. In answer it may be noted that, in Greece proper, in the Ægean, and particularly in Crete, as well as in Asia Minor, certain pre-Hellenic features appear in Greek speech seemingly having no relationship with Aryan or Semitic sources. If this means anything, it is that in pre-Hellenic days in this

part of the Mediterranean there was in use a pre-Greek speech which had no affiliations with the Aryan or Semitic tongues. Moreover, as Mackenzie argues (see "Cretan Palaces," *Annual of the British School in Athens*, vol. xii, pp. 216 ff.), since the origins of writing in the Aegean can be traced back to a period close to the fourth millennium before our era, there must have been a unity of language in this quarter which, in its turn, would speak for a racial unity. In other words, there seems to have been, at least in Minoan times, one race occupying the mainland of Greece and the islands of the Aegean.

That Caria could have been the original habitat of this race is unlikely, for, rather than bringing any influence into the Mediterranean, Caria, on the contrary, received influences from the Mediterranean, and even then not until the period of Mycenaean supremacy.

Two other sources have been suggested as those from which this Aegean, or Mediterranean, race may have come, viz., the north and the south. Phœnicia may be disregarded in any serious consideration. Fortunately for the solution of the problem, the remains from the Minoan Period are sufficient to afford means for arriving at a possible answer.

In the first place, while anthropometry is not infallible, the majority of the measurements of skulls of the earlier Minoan Period in Crete show the race as a whole to have been dolichocephalic. That some skulls are mesocephalic and a fewer number still are brachycephalic may simply indicate that certain contaminations were beginning to creep in. The race, moreover, was black-haired and of a dark complexion. If this people had been of northern origin, perhaps one might have expected to find some indication of fair hair and of broad skulls.

To approach the matter from another side, it is interesting to note that Mackenzie (see above) has shown most convincingly that the loin cloth, which is so distinctive a dress of the Minoan man, is the normal costume of a inhabitant of a warm climate. If therefore it is worn so constantly by the Minoan men, and it can be shown furthermore that the elaborately flounced dress of the Minoan women is only an evolution from the loin cloth, the only apparent explanation for its use by the Minoans is that the Aegean man must have brought it with him from his original home into a colder climate; for it is not likely that so light a costume would have been developed in a locality which, like the Mediterranean, demands some warmth in clothing. That he did cling to his original form of dress is to be explained by the fact that people are slow to adopt new costumes when moving out of their normal environment. The northerner, for example, who finally found his way into Greece from the cooler regions of the north continued to wear the tunic or shirt which he had found so necessary in his original home. The loin cloth, on the other hand, was the persistent form of dress in Crete worn from the beginning of the middle Minoan Period to the time of the end of the later Palace Period. It is, furthermore, the regular male attire in Egypt from the time of the earliest dynasties downward. It is therefore more than probable that the continuation of this form of apparel in Crete, which is a type of dress so characteristic of Egypt and appropriate to it as a warm climate, affords sufficient reason for supposing

that its presence in the Mediterranean means that the wearers brought it with them when they migrated perhaps from this warm country to a colder environment. On the other hand, those who adhere to the northern-Achaean theory for the origin of the Aegean people are compelled to explain how it is that upon the appearance of this folk upon the shores and in the islands of the Aegean Sea it elected to wear a style of dress not only unfamiliar to them in their original home but appropriate only to a warmer climate than that of Greece and the adjacent islands.

Finally, the type of palace in use with these people speaks rather for a race which moved northward than for one which had migrated in a southerly direction. So it is that the type of palace found in the late Minoan Period, which is identical with the contemporary Mycenaean type of the Greek mainland, is distinguished from the earlier form of palace by the introduction of a central hearth in the hall, or megaron. In other words, the earlier palace at Crete, without a hearth, is a type appropriate to a warmer climate, whereas the form which appears later on at Crete, Melos, and Tiryns, and was the one apparently developed by people of the same stock which had penetrated farther to the north, has, for the sake of meeting the conditions imposed by the cold of the more northern land, introduced a central hearth, in the megaron or hall. The occurrence of this type of building later in Crete seems to indicate that in the late Minoan times, when the Greek mainland conquered Crete, either the conquerors imported this type from their home in Greece or the conquered borrowed from their invading kinsfolk this more appropriately northern form of palace.

There is, then, every reason to believe that the eastern Mediterranean in Minoan times was in close contact with the south. That it owed anything, on the other hand, to the north is much to be doubted. But whether this affiliation is to be understood to mean that the Minoans, so called, or, better, the Aegean people, were to a large extent of Africo-Libyan stock cannot be definitely stated. It is to be noted, however, that in the earlier years of this culture the race is preponderatingly dolichocephalic and that only as time progresses does its character in this direction change until late in the Minoan Period the broad-headed, or brachycephalic, stock predominate. Since the craniological evidence, although not infallible, seems therefore to support at the start Egypto-Libyan relations, it seems reasonable to think that this gradual change in the form of the head means a slow infusion of the broad-headed types from the north.

This dark-skinned, black-haired, long-headed race has been one of great vitality. It has persisted in spite of the various fusions of other people, and it is one capable of great artistic achievement. It is perhaps this stock which is responsible at a later date for the wonderful productions of Greece of classical times.

If, as noted above, architecture was so successfully practiced by the Aegean people, it is quite as true that the handicrafts were successfully prosecuted. The pottery of the best Minoan style, for example, is a style possessing a daintiness of fabrication which loses nothing by comparison with works of classic times. The minor arts in general were quite as cleverly followed,

and it may be assumed that work in the precious metals was also of a high order. But this can be only surmised because of the unfortunate sack of the palaces of Crete by a people who took practically all that was wrought in gold or silver.

The Minoans were, then, a people of a highly matured civilization, using both linear and pictographic forms of writing. (See WRITING.) For amusements the upper classes at least enjoyed boxing contests and bull baiting. At Cnossus is a theatral area that might have well served for some of these events, as they were pictured in the frescoes and by the other arts.

Pastimes, however, did not occupy all their time. Cnossus has furnished abundant evidence which, supplemented by material from other sources, shows that these Ægean people were as distinctly religious as their successors in the Mediterranean basin. So far as can be made out the Minoans worshiped, above all others, a nature goddess whose symbols are sometimes serpents, at others doves—possibly to signify her two aspects as a chthonic and a heavenly deity. With her seems to have been associated a male god who perhaps occupied the indeterminate position of son or consort. This god may have been the divinity whose manifestations were the thunder and lightning, for his attributes were the double axe and the bull's head or even merely the horns. This god may be the one who later in Greek religion appears as Zeus, and who, as a result of the later invaders' worship of a male divinity, usurped the high place previously occupied by the mother goddess. Other divinities, less intelligible, however, were in the Minoan theogony, among whom may be classed the demonic creatures which at times are anthropomorphic and at others zoöomorphic. Even inanimate objects, such as trees and betyls, or pillars, seemed to have found a place in the Ægean religion.

This religion apparently was not free from outside influences. There is, in fact, a possibility that the Dove goddess of the shrine found in the palace at Cnossus is to be associated in some way with the Dove Cult of the Syrian Semiramis, or Astarte of the Phœnicians. But there is no way by which it can be determined whether Crete was in this instance the borrower or the giver. So, too, there seems to be reason for associating the fantastic demons mentioned above with certain Egyptian religious types. Even the figure with the sistrum on the Harvester Vase points in the same direction toward Egypt. But whatever was the situation, it is likely that the Ægean religion was primarily indigenous and only tintured by outside influences.

The painted sarcophagus from Hagia Triada in Crete shows what seems to be the celebration of some religious rite at a tomb, thereby suggesting that in common with other primitive people the Minoans practiced ancestor worship.

Both cremation and inhumation were practiced, the latter custom predominating. This, as well as the fact of three forms of tomb—the tholos or chamber tomb, the shaft, and the pit grave, would seem to hint at the fusion of stock referred to above. The latter type of tomb consists of a deep well from the bottom of which opens a cavity for the reception of the body. Since burial customs are very slow to change, and there is no reason to look for more than one form in a completely homogeneous race, the

suggestion lies at hand that these three forms of tomb suggest three elements in the race itself. When they came in, no one can say.

This, then, is the race which dominated the Ægean from practically the fourth to the first millennium B.C. Its forebears seem to have resided in the same area for a period reaching well back to the tenth millennium B.C. What occasioned its blotting out is a question. But so far as can be discerned, Cnossus was sacked at the end of Evans's late Minoan II Period, and Crete itself as a whole together with other places in the Ægean felt the force of the same conquest. If any reason for the disaster may be given, it would seem to be that the gradual movement southward from Europe of northern people led to an exodus, so to speak, from the Greek mainland to the islands of the Ægean of the folk kindred to the Ægean population. This southward migration was not sudden. There are echoes of it in the chronicles of Rameses III (about 1200 B.C.) which speak of the restlessness of the "isles of the sea." It is likely that these waves of discontent which were breaking so faintly upon the shores of Egypt were occasioned by some disturbance at an earlier date. In some cases the incomers in small groups may have blended with the older folk; in other instances, large forces may have entered as conquerors. In either situation the intrusion must have occasioned some disturbance which may have at times expressed itself in migrations of the older inhabitants. In other words, the movements had been going on probably for several centuries, although it was not until the disturbance had penetrated into the Mediterranean that Egypt heard rumors of it. But the final result of these intrusions from the north must have been disastrous to Minoan culture, for after this time the Cretans are no longer distinguished in Egyptian records by the name of Kefti. In place of this appellation other tribal names appear. Gradually Egypt pays less and less attention to the Mediterranean people until from the tenth to the seventh century there is no contact between the two peoples. When at the latter date Greece again resumes relations with Egypt, she has fused into an entity which has produced the Greeks of historic times. The final cause of the blotting out of Ægean civilization in all probability was the invasion of the Dorians. These warriors, armed with iron weapons, soon overran the country held by a bronze-using folk; and the succeeding centuries, from the time of their appearance to the seventh century, were necessary before the invaders could be fused with the older stock into the race known as the Greeks.

It is of this Minoan-Mycenæan culture that the poems of Homer seem to preserve a reminiscence. This does not mean, of course, that all the descriptions in the poems are accurate pictures of the life of this time; for, as a matter of course, the poet nodded, and anachronisms dealing with the culture of his own time slipped in. It is, as a fact, unfair to expect in Homer more than a traditional account of the general conditions of life in the times of which he sang.

The most complete record of this civilization, as already seen, is to be found in the island of Crete, and especially at Cnossus, where the excavations of Dr. Evans have made it clear that the culture enjoyed there the greatest longevity and the most unbroken continuity. An understanding of this Minoan culture, as it has been

1. THE VAPHIO CUP.
2. GOLD INTAGLIOS.

3. INLAID SWORD BLADE.
4-5. TWO CUPS.

1. ISLAND IDOL.

3. SIEGE SCENE FROM SILVER VASE.

4. GOLD MASK.
5. SILVER PIN AND GOLD ORNAMENT.
6. GEM.

called, is best obtained by considering the finds at Cnossus.

On the eastern slope of the hill Kephala, Cnossus, primitive pottery of blackish clay was found, hand-made, hand-polished, and decorated with incised designs filled with white chalk. The same kind of ware was discovered by Schliemann at Hissarlik, and that coupled with the fact that it is always found at Cnossus associated with stone celts, and perforated maces of serpentine and other stone, shows that the civilization we are dealing with is that of a very primitive people. Furthermore, the deposit of yellow clay in which these finds have been made leads to the supposition that the race had advanced no farther than a form of living in which the houses were built of wattles daubed over with wet clay, the disintegration of which gave rise to the deposit already mentioned.

This early civilization lasted down to the period when copper and other metals began to come into use in the *Ægean*. At this time, without any break in the continuity of occupation—if one may judge from the finds—the people passed from their more primitive state, and began to use painted pottery instead of the polished, incised ware. This pottery, so distinctive of Crete, and called "Minoan" by the discoverers, is characterized by the use of brilliant colors on a shiny black. The decoration is of two kinds—rectilinear and curvilinear—and is usually done in lustreless cream, or cream-white, yellow, orange, red, and crimson, on a slip that runs through gray-brown and to purple-black. The style often shows in the earlier stages a direct translation of the incised patterns of the Neolithic to the painted designs of the Minoan Age. This argues for an uninterrupted transition from the Neolithic into the Minoan civilization.

The people who now turned out the polychrome Minoan pottery became the builders of great architectural constructions. At Cnossus is the same story of superimposition that one reads in the ruins of Hissarlik. An earlier palace rests on the neolithic remains, and on top of this first palace comes another later one. Gypsum blocks denote the earlier parts of the palace, while the later structure is shown by rubble work. This great structure, which might well have been the abode of Minos, ruler of the sea, speaks of a powerful people, whose magnificence must have far excelled that of the princes of Mycenæ. Curiously enough, very little gold has been found; but this is probably to be accounted for by the invasion that seems abruptly to have broken in upon the life at Cnossus.

The later changes that appear in the palace seem to be due to people of the Mycenaean Age. At this time the ceramic style becomes less primitively naturalistic and exhibits more Egyptian influences. The discovery of a small Egyptian figure, dating about 2000 B.C., is of great value in giving the later phases of the life at Cnossus. It was found on top of the neolithic stratum in connection with fragments of "Kamaraes" style, just antedating the Mycenaean. This is a polychrome ware taking its name from its first place of discovery in Crete. At a still later date come the frescoes which show men with vases, who closely resemble the Kefti ('People of the Sea') of the Egyptian monuments of the sixteenth to fifteenth century B.C. Moreover, the roundels found in the "throne room" of the palace approach in style

the plaques of Tell El Yehudieh, which date from the early thirteenth century. Inasmuch as this room belongs to the latest period of the palace, we have a definite date for the close of the Cretan-Minoan civilization. The pottery of this time is that of the developed Mycenaean style. Since there is a remarkable absence of remains later than the best Mycenaean period, it is fair to assume that at this date the centre of gravity was transferred elsewhere, probably to the Greek mainland.

The excavations at Cnossus have thrown a deal of light on the question of the Mycenaean, or Homeric palace. Here the building of the ruling prince is grouped around a great central court. On either side of this is a complex of rooms, sometimes grouped around their own halls, sometimes opening out as magazines from long corridors. The building, moreover, shows numerous stories, and in it are many of the conveniences that would conduce to the comfort of its occupants. In a retired part of the building is a series of rooms that seem to have been the private apartments of the prince, and associated with them a bathroom, and a latrine connected by an elaborate system of drain pipes with a sewer that led outside of the building. Elsewhere in the palace is the so-called "throne room" with its *sella*, and bench for the councilors. Opening from the room is a tank, used perhaps for supplying water for some ceremonial rite. The double ax, the significance of which has already been discussed, appears frequently in the frescoes and carved upon the stones of the palace. A shrine devoted to its cult was found in the building. Attached to the palace is a theatre (see above), which seems to have been devoted to such spectacles as the bull fights and boxing matches mentioned above.

Of the artistic development of these Minoans we can form a fair estimate from the numerous wall paintings, the ivory carvings, seals, and the few bits of gold work. The paintings, which are often done with a beauty of facial expression not achieved again for centuries, include the cupbearers, already cited as resembling the figures of the Rekhmara tomb in Egypt, or marine scenes, or a whole field of lilies, with a touch of naturalism in its wind-blown petals.

The discoveries at Cnossus (and the same civilization was found not only throughout the island but elsewhere in the *Ægean*) point to a highly developed race which, taking its origin perhaps as far back as 10,000 B.C., in the Neolithic Age, lorded it in the eastern Mediterranean before the rise of Mycenæ. Indeed the culture represented by the finds at the latter place seems to point to a degeneration of the Minoan civilization. Perhaps, with Evans, we should call Mycenaean civilization "late Minoan."

III. Mycenaean Period. The remains of this period were first brought prominently into view by the excavations of H. Schliemann at Mycenæ, and from this fact is derived the name adopted for this civilization. It is not to be supposed that Mycenæ was the centre from which the art spread, though the characteristic series of vases is more completely illustrated in Argolis than at any other single site. The characteristic products of this period have been found on the mainland of Greece in Boeotia (Orchomenus, Gha), Attica (Athens, Eleusis, Sparta, Thoricus), Thessaly (near Volo), and especially in Argolis and Laconia (Amyclæ); Delphi and the island of Cephallenia have also

yielded Mycenaean remains. It will be noticed that these sites are for the most part in eastern and southern Greece. The same civilization is found on Melos, Thera, Amorgos, and at Ialysus, in Rhodes; other remains are in Crete, which plays a prominent part in the heroic legends, and is now known to have had cities and palaces far finer than anything yet found on the mainland. Troy is also a Mycenaean site, but with this exception Asia Minor has not been brought within the sphere of influence of this culture.

The remains of this period fall naturally into several groups: 1. The fortifications, represented by the walls of the sixth city at Troy, a large part of those of Mycenae, and especially the well-known wall surrounding Tiryns, as well as the defenses of many other less important sites. These walls are built of huge stones, roughly hewn and laid in clay mortar. In general, there is only one great gate, though there are also smaller gates, or mere sally ports. The gate is flanked by a large tower and is often approached by a narrow and crooked passage. 2. The dwellings, chiefly the royal palaces. The latter are best seen at Tiryns, Mycenae, and, above all, at Knossos, in Crete. The usual plan shows a court, on one side of which is situated a great hall, containing the hearth and approached through a vestibule. Around this hall and the court is arranged a complex of lesser rooms, and the whole structure is carefully placed inside the great fortification, which in general seems to have contained little but the residence of the ruler and his immediate dependents. The palace was built of wood and sun-dried brick, but the walls were stuccoed and painted, and metal incrustations and decorations of carved alabaster and glass paste were often employed. The palaces at Knossos and Tiryns have yielded remarkable specimens of wall painting, and the plan at Crete shows a much greater extent than is found in Greece, although it is not as yet (1914) wholly cleared. The smaller houses found in some places, as at Melos, Troy, Crete, and Mycenae, also show the large hall and its vestibule, but as a rule no further rooms. A house of circular plan, perhaps serving as the prototype of the tholos, or "bee-hive" tomb, has recently been discovered in Crete: in its origin it may possibly go back to the tent form of dwelling. Additional accommodation in the conventional type seems to have been obtained by juxtaposition of unconnected buildings, rather than by a series of connected rooms. 3. The tombs form the third great class of Mycenaean buildings. The most important are the "bee-hive" tombs, of which the most notable examples are those of Mycenae and the so-called "Treasury" at Orchomenus in Boeotia. These tombs are built of huge, carefully squared stones, laid in regular courses of superposed rings, so arranged that each course projects inward beyond the course below, thus making the interior a dome. The side of a hill is usually hollowed out to receive the building, which is wholly concealed by the replaced earth. The approach is always by a long passage, with side walls of stone, and the façade of the tomb was richly decorated with columns and adornments in colored stone, elaborately carved. The interior was carefully smoothed and apparently decorated with metal plates or rosettes. This type of tomb, although square in plan and elevation, occurs in Crete. In some cases a small side chamber for the dead is found. Besides the great tombs, a series of simi-

lar grave chambers, cut in the rock or excavated in the hillsides, and approached by similar passages, shows the common Mycenaean mode of disposing of the dead. Burning seems to have been unusual at this time. 4. It is, however, in the products of its art, even more than in its architectural triumphs, that this period is sharply characterized. The excavation of Mycenae and Tiryns yielded a series of painted vases, which still occupy a place by themselves in the history of Greek ceramics. Made on the wheel, of graceful form, they are decorated with marine plants and animals, birds, and, in the later work, rude drawings of men and animals. The decoration is by means of a "glaze" paint, varying from brown to black, or under intense heat becoming red. (For details, see VASES.) Even more marked are the gems and gold work of this time. The drawing is often rude, but the spirit and vigor are astonishing. The gold cups of Vaphio (see Plate), with scenes in relief representing the capture and taming of wild bulls, show an art uncontaminated by the influences of Assyria and Egypt, and at the same time distinguished by the spirit which marks the later Hellenic products. It is an indigenous, Aegean outgrowth. More foreign in technique and decoration are the sword blades, inlaid with scenes of hunting and wild life, which much resemble objects found in Egyptian tombs. If we omit the purely ornamental spirals and other motives forming part of the decoration of the façades of buildings, of larger works of art, the lions over the gate of Mycenae, and the rudely carved slabs which once marked the site of shaft graves, were for a long time the only representatives. Crete, however, has yielded reliefs of bulls and other sculptures which show that the Aegean art did not confine its skill to small objects only. Space does not permit a detailed description or even a list of the Minoan and Mycenaean works; they may be found fully illustrated in the published works mentioned below.

IV. Early Hellenic Period. The dark age, from the Dorian invasion to the rise of sculpture in the seventh century B.C., is bridged, from an archaeological point of view, chiefly by the painted vases, the earliest varieties of which have been already mentioned. It seems clear that we are now in the presence of a new element, and nowhere can this be better studied than in the pottery. The whole style of ornamentation is changed. Gold ornaments are much rarer. The prevailing decoration, not merely on vases, but on metal ornaments, is the "geometric," i.e., meander patterns, circles, and various combinations of straight lines. Instead of the Age of Bronze we now find the Age of Iron. The artistic situation thus well agrees with the overturning of the old Achaean kingdoms by the invading Dorians, as pictured in Greek legend.

The funeral urns and other representatives of the so-called "Dipylon style" (from the Dipylon gate of Athens, near which in ancient tombs the finest specimens of this class have been discov-

ered) appear to extend over a period from about 1000 to about 700 B.C. at latest. The patterns upon this pottery are "geometric," derived apparently from weaving and textile fabrics, rather than from nature, as in the Mycenaean ware. The human and animal figures upon them are eminently schematic and conventional. Pictures of nautical scenes (sea fights and the like) and funeral processions are prominent. The figured examples seem to have been introduced later than those with merely a geometric pattern, though this style continues in use till the end. It is not improbable that Athens was the chief seat of its manufacture.

The Mycenaean influences seem to have survived on the islands and the Asiatic coast, where also the connection with the Orient was maintained, and in consequence we find in these regions the development of a number of local types, all strongly influenced by Oriental motives and yet with well-marked peculiarities. The favorite decoration is with rows of animals; lions, boars, panthers, cattle, deer, as well as griffins and sphinxes, appear, either in procession or grouped heraldically. By the seventh century these have crowded back the geometric types, and, further, the merely ornamental decoration begins to give place to actual scenes, either of daily life or from the legends of the past. For the pottery, see *Vases*.

About the opening of the seventh century begins the class of Corinthian vases still at first strongly Oriental, but later exhibiting the mythological scenes. The commercial importance of Corinth during the seventh and sixth centuries gave this ware a wide distribution, and many of the best specimens have been found in Italy. Chalcis also developed a local style of wide distribution, and both Corinth and Chalcis contributed to the formation of the Athenian style, which, taking its rise early in the sixth century B.C., as the result of a gradual transition from the Dipylon methods rapidly became so popular as practically to drive out of the general market all other styles. The reddish color of the clay was artificially heightened, and the decoration was applied in a very lustrous black glaze, relieved only by the occasional employment of purple, red, and white. Toward the end of the sixth century a new style, the "red-figured," begins to displace the "black-figured" technique. Here the body of the vase is covered with the black glaze, the figures being left in the color of the clay, while details are represented by fine black lines. The greater delicacy which this style made possible brought it at once into favor, and in it were executed the great masterpieces of Greek ceramic art.

Painting in Greek archaeology can hardly be separated from ceramics, architecture, and sculpture before the time of Polygnotus (fifth century B.C.). We therefore take up next the consideration of these two latter developments, in brief outline, referring for details to the special articles on GREEK ART and ARCHITECTURE.

The history of the origin of Hellenic architecture rests largely upon conjecture and reasoning from analogy. Although in its development, as known to us from existing monuments, we have to deal with it as manifested chiefly in temple-building (private dwellings being of comparatively little account among the Greeks and those known dating from comparatively late times), it is plain that we have to seek for its primitive principles in domestic structures, which were of

wood and sun-dried brick. It is during this period that the temple forms became fixed, and the oldest stone buildings were erected, though the full perfection of architecture is not manifested till the fifth century. The point, however, which chiefly concerns us in this place is the rise of the two great orders, the Doric and the Ionic, connected, as their names imply, with the two great branches of the Greek race, the Dorians and the Ionians. One of the distinguishing marks of these orders is the form of the columns employed; and it is to these that we must turn our attention here, leaving the discussion of the several varieties of temple, whether *in antis* (with the front recessed and columns between the projections of the side walls), prostyle (with columns across the front), amphiprostyle (with a front at either end), or peristyle (surrounded by columns), as well as the details of the architrave and roof, for another page.

The Doric column, which we find to have been employed in the Heraeum at Olympia, in the old temple at Corinth, and in those of Selinus, as well as in other buildings of this and the succeeding periods, is traceable at least to the seventh century B.C. It is characterized in general by the absence of a distinct base (though this seems clearly to have been an original element of this species of column), by an outward sweep at the top called the echinus, and by a square plate (the abacus) between the echinus and the architrave, as well as by the fact that the edges of the fluting (q.v.) are sharp, and not flat, as in the Ionic. The nearest prototypes of this form of column, which is marked, particularly in the oldest examples known to us, by great heaviness of proportion, seem to be Egyptian, although Doric architecture offers a new element in the *entasis* (or slight bulge) in the shaft, which serves to correct a familiar optical illusion of concavity.

The Ionic column, on the other hand, which is of lighter and more ornamental design, has always a distinct base, with a succession of moldings above it, while the grooves in its shaft do not meet in arrises, but are separated by flat bands. Its chief point of interest, the capital, consists of double spirals, parted in the earlier forms by a palmette device. On the origin of this form of capital much has been written; although the question is not as yet settled, it seems likely that the Ionic capital goes back to an Oriental prototype, whether a conventionalized Assyrian palm form or a derivative of the Egyptian lotus. Consult *American Journal of Archæology*, 1886, pp. 1-20, "A proto-Ionic Capital," by J. T. Clarke; id., pp. 267-285, "A Doric Shaft and Base Found at Assos," by the same author (there is a full bibliography in both articles); Goodyear, id., pp. 271 et seq. (an attempt to derive all palmette as well as lotus patterns from the Egyptian lotus, cf. id., *A Grammar of the Lotus*), and especially Puchstein, *Das ionische Capital* (Berlin, 1887).

The Corinthian capital, with its acanthus leaves, so extensively used by the Romans on account of its more elaborate character, may be considered a variety of the Ionic influenced by metal work. It does not come into use until the next period, and was never very common until after the fourth century B.C. (Cf. Baumeister, op. cit., the article "Baukunst," with the authorities there cited.)

While in painting, metal work, and architec-

ture it is possible to trace the connection with the Mycenaean Age, in sculpture the line seems abruptly broken. It is not till the latter part of the seventh century B.C. that monumental sculpture, whether in the round or in relief, again begins to develop among the Hellenes. We find shapeless fetiches of wood and stone venerated in various parts of Greece down to the second century A.D. and later. A step beyond this primitive worship brings us to rude cultus statues of wood and stone. We should expect the same Oriental influences to manifest themselves here as in the case of ceramic art; and when we look to the early statues themselves, such as the various so-called Apollo-figures of the seventh and sixth centuries (typical is the famous "Apollo of Tenea," in Munich), we seem to find unmistakably Egyptian elements. The frontality of the figure, the heavy masses of hair, the high set of the ears, the advancement of the left leg in such statues are unmistakable reminiscences of Egyptian works, with which the Greeks were especially brought into contact about this period. On the other hand, statues like the "Nicandra" of Delos, the "Hera" of Samos, and other closely draped female figures, with the feet just appearing below the drapery, may be compared with the seated statues from Branchidæ, in the British Museum, and with what seem to be their older Chaldean prototypes from Tello. The closely draped standing female figures show markedly the influence of sculpture in wood; either from the flat board, as the "Nicandra," or the round log, as the "Hera." Such works are frequently spoken of as *Xoana*. Though the inspiration for these types may have been derived from the Asiatic connections of the Ionians, and the trade with Egypt through Naucratis, the Greek artist was by no means a mere imitator, but early began to strive after development and variety along many lines.

The series of works of archaic sculpture from the period under discussion has rapidly increased through recent excavations, and we are able to trace with tolerable clearness the attempts made by the vigorous Greek artists to gain increased naturalness and lifelikeness in their figures, while gradually acquiring the full mastery of material and technique requisite for the free exposition of the sculptor's ideal.

To the opening of the marble quarries of Naxos and Paros we owe much. The marble thence obtained is a wonderfully fit material, easily worked, and in its very hue imitating human flesh. The earlier material had been wood or coarse limestone, the so-called "poros," which could not be finely carved, and needed to be painted in order to show details. The early marble statues show that the technique of wood carving, easily available for the softer "poros," was at first used for the new and harder material, and at all times color was largely employed in Greek sculpture.

Of inestimable value for the study of the sculptures of this period are the archaic statues discovered on the Acropolis of Athens, which undoubtedly antedate (how much we cannot say) the Persian invasion of 480 B.C. The tyranny of Pisistratus in the sixth century formed an epoch in the artistic as well as literary life of Athens, only to be paralleled by the Periclean Age. Material and style show that we have to do with various schools, partly the marble sculptors from the islands, partly

the native Attic artists, developing along the lines of the heavier "poros" style, but largely influenced by the more delicate and elaborate Ionian developments. For an account of the painted decoration of some of the female statues, consult an illustrated article by Russell Sturgis, in *Harper's Magazine* for September, 1890.

But the development of the period was not confined to Attica alone, nor merely to sculpture in the round. The pedimental groups of the gigantomachy from the Megarian treasure-house at Olympia, and of "Heracles and the Hydra" from the Acropolis of Athens, wrought in high relief from poros, a sort of tufa, and, like all such work, stuccoed and painted, are also of special note, together with the early metopes of Selinus in Sicily; while the elaborate grave stelæ of the wrongly so-called "Marathon Warrior" type, with complete polychrome decoration supplementing the details of the bas-relief, are the forerunners of the exquisite monuments of the Ceramicus to be mentioned hereafter. To this period also belong the Æginetan marbles (see *ÆGINETAN SCULPTURES*) and the reliefs from the treasuries of Cnidus and Athens at Delphi.

Figures like the "Winged Victory" of Archermus, and the sphinx, if not also the lion, show the influence of the East, particularly of the Asiatic Orient, in the sculpture of this epoch. But we feel, in contemplating the Acropolis statues, that we are on Greek ground and that the artists are rapidly bringing in a nobler native art.

We have hardly entered upon the list of these important monuments; but it must suffice to have indicated in some degree their relations.

We now pass to the mention of the kindred class, bronze works.

Together with the rude terra-cotta dedicatory figurines of early workmanship, we find also many small bronzes, which exhibit a gradual development from the rude and primitive to the delicate and refined. An elaborate and truly remarkable technique, however, is manifested in such consummate works of archaic Greek art as the bearded bronze head found on the Acropolis, or the similar head of Zeus from Olympia. The art of hollow casting in bronze, long known in Egypt, seems to have been brought to Greece by Samian artists and by the end of the sixth century was adopted for larger works. Ægina early attained fame for its artists in bronze, of whom Onatas was the chief, and the influence of this technique, with its sharp lines and fine engraving, is plainly seen in the marble sculptures of the Æginetan temple. The new art came to be regarded as more noble than the cutting of marble, and was especially cultivated in the Argive and the Sicyonian schools.

To the period under discussion belongs another development in metal work, viz., the minting of coins. The earliest coins, properly so called, seem to date from about the beginning of the seventh century B.C., and to have been struck by the Lydian monarchs (possibly first by Gyges). Their material is electrum, or 'white gold,' a native alloy of gold and silver, in about the proportion of three to one. Phidon of Argos, a tyrant of uncertain date, but not earlier than the seventh century, is said to have been the first to issue coins among the Greeks, Ægina being the seat of their mintage. The name "tortoiseshell" was bestowed upon them from the figure on the obverse, the reverse (which

was the side struck by the upper die in minting) having upon it the familiar "incuse-square," or punch-mark so prevalent in archaic coinage.

In Greece proper sprang up, subsequent to the Æginetan, a coinage at Corinth, the so-called "colts," from the Pegasus on the obverse, and at Athens the so-called "maidens," or "virgins," from the Athena-head of the obverse, also called "owls," from the type of the reverse. We see in all these types a sacred symbolism, which continues unbroken in coinage till the Macedonian Period.

The greatest Greek cities in this early period were the Achæan colonies of Magna Græcia, foremost among which was Sybaris, afterward overthrown by her great rival Croton. The coinage of the Achæan Confederacy, which seems to have existed in this region, is far superior in artistic workmanship to that of eastern Hellas, and is distinguished by having, instead of an incuse square on the reverse, an incuse type, generally the same as that of the obverse (Poseidon, bull, boar, etc.).

Sicilian coinage, notably that of Syracuse, which in the fifth and fourth centuries reached so high an artistic position, also began in the sixth century.

All the coinage here mentioned, except the Lydian, is of silver. For a full discussion of ancient coins, with exhaustive bibliography, consult Head's *Historia Numorum* (Oxford, new ed.); also particularly Percy Gardner's admirable *Types of Greek Coins* (Cambridge, 1883), and G. F. Hill, *Greek and Roman Coins*, (London, 1899). The period here outlined corresponds to Head's archaic period, 700-480 B.C. See also NUMISMATICS.

The minting of money became gradually diffused through the Greek world, so that there was hardly a town of any consequence without a coinage, some towns being known to us only from their coins.

Intimately connected with die cutting is gem-engraving, for the details of which consult the work of Middleton, *The Engraved Gems of Classical Times* (Cambridge, 1891).

V. Period of Hellenic Ascendency. The period which we now enter upon is naturally subdivided by that great convulsion of the Greek world, the Peloponnesian War (431-404 B.C.), into an earlier and a later half, in which diverse social and political influences are at work, wherefore it will be of advantage to keep this subdivision in mind. The most noteworthy development of this time for us is that of sculpture and statuary, for the great monuments of the painter's art have irretrievably perished. It must be borne in mind that no hard and fast line separates these Greek periods, such as divides the Mycænæan from the later times. The great development in Greek art is indeed later than the Persian wars, but the germs are in the later sixth century, and many works, which artistically belong to the archaic period, were made after 500 B.C. The same remark applies to all the later periods; the dates given are merely convenient approximations.

In the early part of this period the development of bronze statuary was continued chiefly by the so-called Argive-Sicyonian school. We find Ageladas of Argos and Canachus of Sicyon famous as statuaries in bronze about the end of the sixth century. Gold and ivory (in the famous chryselephantine work) and marble were

more popular in Attica, where the quarries of Pentelicus furnished inexhaustible material. Pythagoras of Rhegium (the author of the limping "Philoctetes"), and Calamis and Myron among Attic artists, the latter famed for his "Discobol" and bronze cow, are the forerunners of Phidias in the development of the great art of the fifth century. Here also belong the sculptures from the temple of Zeus, at Olympia, whose artistic origin has been sought in many schools, perhaps with most probability in Ionia.

Greek sculpture, however, reached its highest ideal development, though not its full legitimate growth, in Phidias, son of Charmides, pupil of Ageladas, of Argos, the superintendent of the Parthenon sculptures, and the artist of the chryselephantine Athena Parthenes, who was as well the creator of the highest anthropomorphic type of Greek religion in the great chryselephantine Zeus at Olympia, of whose calm and marvelous beauty and dignity we can now, unfortunately, gain but feeble conception.

We have noticed Phidias's activity in connection with the Parthenon, but we must not leave unmentioned the other great buildings of the time, the Propylæa, the so-called Thesæum, the Erechtheum, the temple at Eleusis, and that at Rhamnus. Meanwhile a like architectural activity was going on across seas in Ionia, Sicily, and Magna Græcia.

Painting as a great and independent art was developed contemporaneously with Phidias, by Polygnotus, of Thasos, whose paintings in the *Lesche* (portico) at Delphi have been fortunately described to us by Pausanias. He must have powerfully influenced the art of the ceramic painters, as we seem to be able to trace in their works. After him may be mentioned Agatharchus, of Samos; Apollodorus, the first painter of pictures in the more modern sense (i.e., on flat, movable surfaces, anciently not of canvas, but of board); Zeuxis, the contemporary of Socrates, whose "Centaur Family" is minutely described to us by Lucian, and Parrhasius, of Ephesus.

The work of the Argive-Sicyonian school was carried forward by Polyclitus. He was the author of the "Doryphorus" (spear-bearer), and "Diadumenus" (youth binding on headband), which are known to us through Roman copies; and he established a canon of proportion characterized by a certain squareness and heaviness.

After the stormy period of the Peloponnesian War we find Cephisodotus and Praxiteles, probably his son, carrying Greek plastic art to its legitimate and logical conclusion and to fullest bloom and perfection. The "Eirene" (Peace) with the baby "Plutus," preserved in Munich, a replica of a work of Cephisodotus, is a gracious and lovely figure; but Praxiteles's marble "Hermes," with the baby "Dionysus," found in the place designated by Pausanias, the Heraeum at Olympia, in exquisite sensuous beauty, in perfection of manly strength and grace, and in the combination of the divine ideal with human form, as well as in complete mastery of technique, surpasses all that is left us of ancient art, while the pensive expression of the god's face indicates but too clearly the speculative thought that was undermining the old faith. There is no more perfect image of the period than this marvelous statue. It is to Praxiteles that we are to attribute the development, if not the invention, of languid but not

yet effeminate figures, with hand supported on hip, such as the famous "Faun," of which several replicas exist, perhaps even the torso of the original. Praxiteles is preëminently the sculptor of youthful beauty, not merely in man but also in woman, as proved by his famous "Cnidian Aphrodite," inadequately preserved in replicas.

Side by side with Praxiteles must be mentioned Scopas, of Paros, whose art was rather that of the Peloponnesian school, while Praxiteles is Attic. The remains of his work from the temple of Athena Alea at Tegea, though scanty, make it possible to recognize his style in a number of other sculptures, such as the Meleager, the Ares Ludovisi, and a head of the youthful Heracles. These show distinctly his power in "tragic intensity of expression."

To the last half of the fifth and first half of the fourth century we may assign those most exquisite funeral monuments of the Athenian Ceramicus, such as that of Dexileos and the deeply pathetic relief of Hegeso. The early reliefs show decidedly the influence of Phidias, while later the work of Scopas evidently became the model. Indeed many archæologists are disposed to see the actual work of this master in some of the best of these monuments.

Portraiture also began in this period with Silanion, and from this time probably date the beautiful Lateran Sophocles and some of the types of Socrates and Plato. Heretofore the statues set up in honor of men had been ideal in their type rather than a portrayal of the real features of those honored.

The growth of the Attic drama in the fifth century led to the architectural development of the theatre, though most of the theatrical buildings known to us belong at the end of this period or early in the next. For a consideration of the form and development of these structures, see THEATRE.

In ceramics we must consider the Attic development, which in this period is of absorbing interest, and gives us much light on painting on a larger scale, as well as on contemporary manners and customs. The rise of Attic black-figured ware has already been mentioned. As a special form of this we must mention particularly the fine Panathenaic amphoras, with figures of the armed Athena, in which the sacred oil was presented to victors at the Panathenaic games. These vases are interesting as being continued in an archaistic form into the fourth century (cf. Baumeister, *Denkmaler*, article "Panathenaia" and Branchitsch, *Die Panathenaischen Preisamphoren*). A special class of peculiarly Attic vases are the beautiful white *lecythi* (oil or perfume flasks), which were interred with the dead, and which exhibit scenes from the burial and also from daily life, exquisitely depicted in colors on the white slip with which the body of the vase is covered. The series begins early in the fifth century, and continues during the fourth, in the variations of style throwing much light on the development of painting, and forming an interesting parallel to the contemporary series of grave reliefs.

In the "red-figured" ware, which far surpasses in artistic merit the black-figured, and of which the rise as a separate variety has already been mentioned, scenes from the myths, while not excluded, yet make room for delightful bits of social and domestic life. In the development of this style the "cylix," or shallow cup on a rather high foot, plays an important part, es-

pecially in the early part of the fifth century, when such masters flourished as Euphronios, Duris, Hieron, and Brygos. Consult Hartwig, *Griechische Meisterschalen* (Stuttgart and Berlin, 1893).

Various grotesque forms of vases, such as the rhyton (in the shape of a head, generally that of an animal), later came into use, and we find numerous examples of the pyxis, or woman's toilet box. But the art gradually sank, and vase painting was fast dying out at the beginning of the Alexandrian Period.

In the domain of numismatics we must briefly mention the periods of transitional art (480–415 B.C.) and of finest art (415–336 B.C.). We have here not to deal particularly with Athenian coinage, which, like the Panathenaic amphoras, keeps a designedly rude and archaic character in order to maintain its position among foreign peoples, with whom the Attic State came in contact through its wide maritime relations and commercial dealings, but rather with such beautiful work as that of the Syracusan die-cutters Eumnetus and Cimon, in the period subsequent to 415 B.C., whose splendid decadraclms are justly reckoned among the highest achievements in this branch of art. We may trace, however, through the coins of this entire epoch that same gradual mastery of material and development from the more severe to the more graceful style, which is marked in other lines of art. But coinage still maintains the symbolism which characterized it from the beginning, the purely human and individual element appearing distinctly only in the special marks of magistrates and mint masters, which are kept subordinate to the main design.

VI. Period of Hellenic Dissemination and Decline. The development of Macedon under Philip and the conquests of Alexander changed the entire aspect of the Greek world. We have henceforth to consider a Hellenism synonymous with civilization rather than the geographical Hellas with her outlying colonies.

In Greece itself the greatest influence is exerted at the opening of this period by Lysippus of Sicyon, who not only continued the prestige of the Argive-Sicyonian school, but also introduced a new canon in statuary, making the figure more slender and the head proportionally smaller than in the preceding art and forming a marked contrast to the canon of Polyclitus. His work is known to us from copies of his "Apoxyomenos" (a youth scraping himself with the strigil); and a marble copy at Delphi of one of a series of statues of the family of Daochus, of which the bronze originals were at Pharsalia. This is the figure of Agias. Lysippus was also in a way court sculptor to Alexander the Great, as Apelles was his painter. His influence extends immediately to Rhodes in Charles of Lindus, one of his best-known pupils, and artist of the famous "Colossus of Rhodes."

The splendid "Victory of Samothrace," now in the Louvre, which may be dated about the beginning of the third century, is one of the greatest monuments of this period, and deserves to be ranked with such splendid figures as the "Victory of Pæonius of Mende," set up at Olympia a century or more earlier, and with the Victories from the balustrade of the Temple of Athena Nike, at Athens.

The Pergamene art, cultivated especially under the Attalid kings, of which we see such astonishing examples in the frieze of the great

altar of Zeus at Pergamon (q.v.), belong to the earlier part of the second century B.C. This represents a colossal gigantomachy and exhibits great mastery of technique, violence of action, and the free expression of physical suffering, of which qualities the latter two belong rather to sculpture than painting. Somewhat earlier than the great altar are the well-known statues of the "Dying Gaul" (misalled the "Dying Gladiator"), as well as the Gaul and his wife in the Ludovisi Gallery. As intimated above, this is as it were the grand finale of Greek sculpture, in which this art, though overstepping its due bounds, still appears great. To this period also belongs probably the development of the Rhodian school, though some scholars prefer to date the great product of that school, the Laocoön group, now in the Vatican, at the end of the second century or beginning of the first century B.C. To this school in its Asiatic development belongs the "Farnese Bull," the great work of Apollonius and Tauriscus of Tralles.

Single statues which seem to belong to this period, but cannot be assigned with certainty to any definite artist, are the "Aphrodite of Melos," one of the most beautiful works of the later classical art: the "Apollo Belvedere" (q.v.); and the "Torso of the Belvedere," a noble fragment, whose correct restoration, though often attempted, has probably not yet been found. To this period also belongs the full development of genre scenes, though this begins still earlier. Such are the group of the "Boy and the Goose," the "Drunken Old Woman," the "Fisherman," the fine "Old Market Woman" of the Metropolitan Museum of Art, New York City, and especially the large mass of reliefs, which seem to owe their origin to Alexandria and to be the product of the same tendencies which led to the bucolic poetry. Portraiture also flourished, not only in statues and busts of the living, but in ideal portraits of the great men of the past, as Homer and Anacreon.

With the painting of the Alexandrian Period we come more closely into contact than with the earlier art of this kind through the wall decorations of Herculaneum, Pompeii, and Rome, which follow the traditions of this epoch. Apelles (q.v.) of Colophon represents the highest development of Greek painting. His idealized portraits of Alexander were as famous as Lysippus's statues. Protogenes of Caunus, who worked at Rhodes about the end of the fourth century, is also distinguished in this department. Antiphilus at the court of Ptolemy is characterized as "most eminent in facility." But the list of great Greek painters closes with Theon of Samos, of the third century (cf. the article "Malerei," in Baumeister, *Denkmale*).

Among other species of art we find the eminent gem-engraver Pyrgoteles, employed by Alexander; and this branch of the sculptor's profession, ever excessively popular among the ancients, was fostered by that monarch's successors.

In vase painting we note little else than decline, the latest development manifesting itself in Magna Græcia, Etruria, and Campania. The painted vases of southern Italy, which present a distinctly funereal element side by side with a marked influence from the drama, give us much valuable archaeological material. Asteas (of Pæstum?), Pytho, and Lasimus are its only masters known to us by signature. We have also some Campanian vases with Latin inscriptions of the third century. The end of vase-

painting seems to fall about the beginning of the second century B.C.

We may here depart from our chronological order to consider briefly the peculiar ware of Etruria. When side by side with primitive geometric pottery, continued seemingly over a long period, and more or less skillful imitations of Greek painted ware (particularly Attic), we find the so-called *vasi di bucchero*, a peculiar class of pottery of black clay, about which we have but little exact knowledge and of which examples have been found not merely in Etruria, but also in the Orient, in Cyprus, in Greece proper, and on the coasts of the Black Sea. The earliest of such vessels in Etruria are made without the potter's wheel, but in the manufacture of the later (and darker) ware, this was employed. The earliest figures are incised; subsequently relief decoration appears. In the latter case Greek types are employed, at first roughly, afterward more skillfully and with a mold or incised roller. In individual cases polychrome painting occurs. This art seems to have continued into the sixth century.

Before leaving the subject of pottery we must also notice the Megarian relief ware, assigned to the third and second centuries B.C., and the Aretine ware, apparently of the first century B.C. and later. See AREZZO.

In numismatics the new development under Alexander and his successors, designated as "the period of later fine art from the accession of Alexander to the death of Lysimachus" (336-280 B.C.), and marked by the influence of Lysippus, is succeeded by a period of decline in art extending to the Roman conquest (280-146 B.C.). Excellent likenesses of sovereigns, first that of the deified Alexander, then those of other and living princes, make their appearance upon coins, and continue down to the later Roman Empire, giving a valuable series of historical portraits. Gold coinage now begins to occupy a prominent position, and continues side by side with silver and bronze to be a medium of exchange under the Roman Empire.

In the minor arts our attention is particularly drawn to the terra-cotta figurines of this period, particularly those of Tanagra in Bœotia, which in their charming shapes and lovely coloring give us so many delightful pictures of Greek life. Such figures have their origin in very early times, but from the time of Praxiteles, whose style they often reproduce, down to the Roman period and later, they formed a favorite household decoration, and were buried in great numbers with the dead. See TERRA-COTTA.

Bronze mirrors may also be alluded to here before we pass out of the domain of Greek classic art. Of these some most beautiful specimens exist, their lids forming a class of *chefs-d'œuvre* in metal-graving, while their handles are often statuettes of finest workmanship.

VII. Roman Period. The Roman connoisseurs had a passion for objects of Greek art, but in the period upon which we are now entering certain other elements demand our attention. As among the Greeks the introduction of foreign art was met by a native element, which at first colored and afterward completely overpowered, by the strength and vigor of its own development, external influences, so we find in Italy among the Etruscans, the masters in so much of the Romans, and makers of the peculiar bucchero ware already mentioned, a native element which reacted upon the art from without,

though in a much slighter degree than that of Greece and with inferior genius. This Etruscan art was not the oldest in Italy; for we find specimens of *situlæ* (pails) of beaten metal, perhaps to be designated as Umbrian, the decoration of which, while it seems to show certain elements derived through the Greeks, has but little affinity with Etruscan art.

The influences at work among the Etruscans, as we have noticed in the case of their figured pottery, were principally Greek. The native elements were chiefly their sombre religious tendencies, and a marked aptitude for portraiture. We find "realism combined with poverty of style." The chief Etruscan monuments are funereal, consisting of decorated tombs, sarcophagi, and ash urns, upon which Greek ornamentation and Etruscan portraiture are not very happily blended.

The same tendency to portraiture appears among the Romans, fostered by the importance attached to ancestral *imagines* (portraits in wax), which played so marked a part in their funeral ceremonies. Their masters in this were Etruscan artists.

Hand in hand with the art of plastic portraiture, in which Roman artists learned from Etruscan masters, went that of honorary statuary in bronze, which after the Second Punic War were to be seen at Rome in large numbers. Most Romans of any distinction were honored in this way. It was just after this time that their Greek conquests began to bring the Romans decidedly under the sway of Hellenic art.

In architecture the markedly Roman characteristic is the great employment of the arch and its natural development, the vault. The former, although not unknown to the Greeks, was but rarely used by them. These features rendered possible such great works as the aqueducts, to say nothing of the Colosseum, the Pantheon, and the other huge structures of imperial times. In temple construction we find Etruscan influence at work in the earlier period in both form and decoration. Later Greek architecture is combined with native elements in elaborate and luxuriant structures.

The so-called Attic Renaissance in sculpture about the beginning of the period we are now considering, i.e., when Greece had been brought under Roman dominion, introduced no new elements, but carried on with enfeebled ability the old. This revival is best known to us through the "Farnese Hercules," an exaggerated work of which the motive is derived from Lysippus.

The school of the first century B.C., founded by Pasiteles, a native of southern Italy, and continued by his pupil Stephanus, and Stephanus's pupil, Menelaus, deserves mention as exercising somewhat of independent influence. It is characterized by a return to the types and style of the end of the archaic period, but combines them with types and technique belonging to its own time. During this period we also find the growth of the archaistic style, which imitated the stiff drapery, awkward smile, and other peculiarities of the archaic art.

Asia Minor supplied most of the sculptors at Rome in the time of the late Republic and Early Empire. Best known among such is Agasias (q.v.), the artist of the so-called "Borghese Warrior."

From the time of Augustus on, we meet, side by side with a vast importation of ancient

Greek works and reproductions of them in copies, a host of portrait statues and busts, triumphal arches and elaborate public and private buildings of all kinds. A most splendid specimen of Roman portrait-statuary, now in the Vatican, is that of Augustus in general's uniform. In it are admirably combined grand and realistic portraiture and rich decorative effects. Especially noteworthy also are the reliefs of the *Ara Pacis Augustæ* (q.v.) and of the triumphal arches, such as that of Titus. In these fields of portraiture and historical relief the art of Roman times offers much that shows originality and strength, but in general it is imitative of the Greek. Consult Wickoff, *Roman Art*, translated by Eugénie Sellers Strong (London and New York, 1900), H. B. Walters, *Art of the Romans* (New York, 1911), and E. S. King, *Roman Sculpture* (New York, 1907).

Of idealistic bronze statuary we have a beautiful example in the "Victory of Brescia" of the first century A.D.

The era of Hadrian is the last period of vigorous impulse in art among the Romans. That Emperor's passion for ancient art, both Egyptian and Greek, and his encouragement of new works, both at home and abroad, are well known. To his reign are to be assigned the various idealized portraits of his famous Bithynian favorite Antinous.

In numismatics the last period of continued decline, 146-27 B.C., and that of the coinage of the Roman Empire down to Gallienus (27 B.C. to 268 A.D.) falls in here. The material is vast, and here, too, the element of realistic portraiture is prominent.

The luxury of the Romans manifested itself in the multiplication of elaborate mosaics, rich jewelry, wonderful intaglios, both in stone and in paste, costly glassware and the like. But of all this art, which cannot be fully discussed here, suffice it to say that it involves no new principles. It is merely the bloom of that decay which was fast consuming the ancient world.

Further information concerning single branches of archæological research is presented under the titles of ancient countries. The articles on these countries include the art, monuments, language, religion, laws, etc., of the early inhabitants. Among such articles are: ASSYRIA; BABYLONIA; EGYPT; PHENICIA; CHINA; JAPAN; PERSIA; CEYLON and INDIA. For information with regard to the arts of ancient countries, the reader is referred to the series of special articles on ASSYRIAN ART; BABYLONIAN ART; EGYPTIAN ART; BIBLE ANTIQUITIES; CHINESE ART; JAPANESE ART; INDIAN ART; ANGLO-SAXON ART; ETC. More specific information about discoveries at particular places is included under the titles of those places—as, for example, KARNAK; KOYUNLIK; PERSEPOLIS—and under the names of the excavators, such as BOTTA; DÖRFFELD; LEDYARD; LEAKE; PÉTRIE; PETERS; MARIETTE; MASPÉRO; EVANS; SCHLIEHMANN; ETC. See further the articles on AGRICULTURE; AQUEDUCT; ARCHITECTURE; ARMIES; NAVIES; BRICK; BUILDING; COSTUME; CUNEIFORM INSCRIPTIONS; GLASS; HIEROGLYPHICS; NUMISMATICS; ROSETTA STONE; AMARNA LETTERS. For biblical archæology, in addition to the general title, see ATONEMENT, DAY OF; BAAL; DAGON; ESSENES; FESTIVALS; JUDGES, BOOK OF; LEVITES; MAGIC; NAZIRITE; PRIESTS; PROSELYTE; PURIM; REMPHAN; RIMMON; SABBATH; SACRIFICES; SADDUCEES;

SCRIBES; TABERNACLE; TAMMUZ; TEMPLE; TERAPHIM; URIM AND THUMMIM; VOWS.

ARCHÆOLOGY, AMERICAN. The purpose of archæological research is to contribute to the history of man in the world, and of American archæology to contribute to the history of the American race. The principal problems are those of origin, characteristics, and relationships, migrations, geographical distribution, culture history, and chronology. In many respects the western hemisphere forms a distinct archæological field, and one of peculiar interest to the student. In the first place the two great continents, with their insular appendages, form a single ethnic province. From the earliest times the lands were inhabited by a race of mankind unknown to the Old World till the Caucasian discovery, and though the province is vast, yet throughout its extent the tribes and their works bear in a striking degree what may be called the family resemblance. In the second place, the American aborigines, from the Arctic to the Antarctic, were remarkably similar in cultural development. True, some of the tribes discovered by Caucasians represented lower savagery, while others occupied the planes of higher barbarism verging on civilization, yet the cultural range represented by their works is narrower than that of any other important ethnic province except Australia. Furthermore, the aboriginal tribes survived until the spirit of inquiry among the European invaders of the Continent had been developed and until observation and records were well advanced. By reason of the several conditions a distinctive science of archæology has grown up in the western hemisphere. Thus, in America prehistoric artifacts are interpreted in the light of the observed uses of historic examples, recorded by early explorers or studied by present-day investigators. The modern works are interpreted in the light of primitive arts, industries, laws, languages, and faiths, and thus the ancient and the modern, the prehistoric and the historic, the living and the dead, are correlated in a simple yet comprehensive scheme at once coextensive with the world's greatest ethnic province and sufficiently definite to outline a considerable part of the early course of human development.

The subject matter of research comprises every material resource from which significant information may be drawn and more particularly the materials of antiquity. These include all remains of man and his works not directly connected with the people of to-day and thus fully explained by that association. The vast extent of the material is indicated by the following partial synopsis:

I. Human Remains—mummies, skeletal, and other parts found imbedded in natural formations or variously deposited in tombs, earth and stone mounds, caverns, and simple graves of varied type.

II. Art Remains—the work of man's hands developed in stone, metal, clay, wood, bone, shell and other materials; built, carved, woven, modeled, etc.

MAJOR WORKS (fixed). 1. *Inhabited sites*—village sites, middens, towns. 2. *Habitations*—earth, wood, bone, stone, concrete. 3. *Defensive works*—walls, stockades, forts. 4. *Burial places*—graves, mounds, pyramids, tombs. 5. *Religious works*—altars, shrines, kivas, temples, monumental sculptures. 6. *Civic structures*—council houses, kivas. 7. *Diversional structures*

—chunky grounds, ball courts. 8. *Fixed records*—rock inscriptions, pictographs. 9. *Mines, quarries, workshops*. 10. *Agricultural remains*—old fields, terraced fields, canals, aqueducts. 11. *Highways and bridges*. 12. *Storage facilities*—granaries, cisterns, reservoirs, enclosures.

MINOR WORKS (portable). 1. *Implements and utensils*—knives, scrapers, axes, adzes, chisels, picks, hammers, abrading stones, projectile weapons; mortars and pestles, receptacles, textile appliances, lamps, musical instruments, etc. 2. *Recording devices*—wampum, quipu, inscriptions on bark and skins, in books, etc. 3. *Transporting devices*—boats, litters, cradles, sleds, etc. 4. *Furniture*—stools, chairs, tables, benches, beds. 5. *Clothing*—skins, bark, grass, textiles, etc. 6. *Embellishments*—personal and non-personal. 7. *Sacred and ceremonial objects*—totems, talismans, idols, etc. 8. *Problematical objects* (use undetermined).

By the study of this diversified material the archaeologist seeks to contribute to the solution of the various problems of the American race. It is impossible, however, to present more than a very brief review of the material in the present connection.

Human Remains. Bones of prehistoric men are exceedingly common in the mounds and other burial places of central and eastern United States; skeletons, with and without integument, have been found in caves throughout nearly the whole extent of both Americas, and are fairly common in the arid districts; and mummies of prehistoric bodies with complete wrappings have been found in large numbers, especially in Peru. The chief lesson taught by these remains is that the prehistoric inhabitants of the various regions correspond more or less closely, in most cases exactly, with the tribes found there by Caucasian explorers, the correspondence extending to the preparation of the body, the mode of burial, and the mortuary sacrifices, as well as to the somatic or physical characteristics of the individuals. In some cases diversities between the living and the dead have been found of such sort as to indicate migrations or displacements of tribes, and in a few instances these have thrown useful light on early movements of the aborigines; but in a general view these indications are of minor importance. By some students numbers of prehistoric crania have been grouped by types—e.g., dolichocephalic and brachycephalic—assumed to represent distinct genetic stocks or races, but since the types merge in very large series, since both are sometimes found in the same mound or cemetery and even in the same living clan, the value of the cranial classification would seem but secondary at the best. In some instances certain features of the prehistoric skeletons, especially the crania, throw light on customs. Thus, large numbers of crania taken from the burial places of Peru bear testimony to the fact that the critical operation of trephining was practiced more frequently even than in a modern military hospital, and with a degree of success hardly exceeded by that of the best modern surgery. Similarly the distribution of deformed crania throws light on cradle customs and on the half-intentional flattening of infantile heads in prehistoric times, while the pathologic conditions occasionally revealed by the buried bones serve to extend our knowledge of certain diseases and wounds and of the medical practice of the early tribes.

Art Remains. It should be kept in mind that the mere classification and description of the artifacts is but a preliminary step to their employment in the solution of the real problems of man and his activities. By comparing them with the works of living peoples and of historic tribes and nations, we determine the culture status of the people to whom they belonged at successive periods and develop from their study a clear understanding of the arts and industries involved in acquirement of materials, in manufacture, in distribution, and in utilization.

Major Works. Inhabited Sites.—The very general occupancy of the inhabited areas of the continent in early times is attested by the almost universal distribution of ancient village sites, kitchen middens, and ruins of substantial pueblos, some of which may well be ranked as cities. The simpler village sites and middens mark the dwelling places of the more primitive communities and contain the refuse of dwelling and food consumption and various minor relics telling of the arts and industries and manner of life of the people. These sites are most numerous along the shores of land-locked waters and the banks of rivers, where the hunter and the fisher found abundant supplies of aquatic game. The dwelling places of the more advanced peoples are marked by more substantial traces, the extent and character of the remains, industrial and architectural, signaling them as the centres of culture and tribal dominion. They retain in many instances the remains of earth, wood, stone, and concrete construction illustrating every class of architectural achievement known to semi-civilized peoples, such as dwellings, civic and religious structures, tombs, fortifications, playhouses, agricultural works, quarries and mines, reservoirs, aqueducts, milling places, bridges, roads, and prisons. Between the simplest sites and the most advanced may be found examples illustrating every stage of the native civic development, all, however, presenting close analogies to the occupied sites of the tribes and nations existing on the arrival of Old World peoples; while widely diversified in character, all fall well within the culture range of the American race.

As a rule, the deposits of refuse called "middens" mark the sites of villages or of temporary periodical residence where at suitable seasons edible shell fish of numerous varieties were gathered and consumed. They contain many species of shells, but the more marked traces are those of the remains of oysters, clams, and the like. Middens are so numerous on some of the shores as to be practically continuous for many miles. The accumulations in places are so large as to be referred to as hills, the largest reaching perhaps 100 feet in height and covering tens or even hundreds of acres. Their mass is, in some cases, so great as to indicate long periods of occupation, and the inclosed artifacts are so distributed as to confirm this impression. The middens are especially prevalent along the Atlantic shores of North and South America and portions of the Pacific shores of the northwestern United States and Chile.

Habitations.—The dwellings of the aborigines comprised structures of diversified characteristics. Regarding the houses of the more primitive peoples, constructed of leaves, bark, brush, bones, mats, skins, earth, and snow, archaeology

can furnish but meagre data and must infer their nature from a study of the works of the post-Columbian tribes. Of the structures of durable materials such as stone, concrete, and adobe bricks, there are abundant traces in southwestern United States, in Mexico, and in Central and South America. It is not possible,

MAYA ORDER, YUCATAN.

however, always to separate the domiciliary from the religious, defensive, and civic structures, and a difference of opinion has arisen especially with respect to the purpose of some of the greater buildings of middle America. Morgan considered these community dwellings, whereas others believe them to have been devoted to religious orders; in either case, however, they could be classed as dwellings. Of this type are the so-called monasteries and nunneries of the Maya province. That the communal dwelling was an institution of great importance in many parts of America is fully attested by ethnologists and historians. There can be little doubt

MAYA ORDER, YUCATAN.

that a large portion of the earthworks distributed along river valleys and more especially on the lowlands and flood plains of rivers were domiciliary, accommodating villages or the residences of dignitaries or rulers, while they served also as retreats for all the people in times of great flood or as citadels for defense on the near approach of warlike neighbors. Multitudes of

minor mounds of earth and stone found in widely separated regions are merely the refuse of dwellings, as those left by the earth lodges of the Missouri valley, while perhaps a majority are mortuary.

Defensive Works.—Evidence is abundant that the ancient as well as the modern aborigines were often at war, and that the more cultured peoples gave much attention to military affairs, to the perfection of arms, and the construction of defensive works. Safety from the persistent encroachment of foes was often obtained or sought by the selection of strong defensive positions for permanent residence. The picturesque "Cliff Palace," Arizona, the impressive "Hill of Flowers," Mexico, and the wonderful citadel of Machu Picchu, Peru, are excellent examples. Defensive works, pure and simple, are of common occurrence, although it cannot be said that, judged by European standards, any particular military science is indicated. Passes in the hills, steep approaches to inhabited sites, and narrow necks of land connecting village sites

DOORWAY TO MAYA TEMPLES, YUCATAN—WIDE EXTERIOR DOORWAY DIVIDED BY A ROUND COLUMN SUPPORTING STONE LINTELS.

with adjacent highlands were defended by rude walls of stone, and villages were often surrounded by stockades, earthworks, and inclosures of stone built at great expense of time and labor. Examples of military structures are the remarkable earthen inclosures at Newark and at Fort Ancient, Ohio, and the strong masonry fortification at Mitla, Mexico, and of Sacsahuaman, Peru.

Burial Places.—American antiquities contribute most interesting evidence of the mortuary customs of the aborigines. The range of burial methods and of mortuary structures and monuments is so diversified, however, as to make brief presentation difficult. Caverns and rock shelters are natural burial places and were extensively used. Various devices, as the erection of cairns of stone and mounds of earth, were employed by the primitive tribes to secure the bodies of their dead against desecration by wild beasts. In the Mississippi valley mounds were sometimes erected over burial cists of timbers or over the charred bodies and the altars of clay on which precious belongings were sacrificed by burning. In the Middle West the bodies were encased in rude coffins built of slabs of stone, while in some regions graves were dug to great depths, as in Panama, Colombia, and Ecuador. The Mayas often deposited their dead in cists in the faces of their temple pyramids, and the Peruvians erected chulpas

of hewn stone provided with burial cells. Of all the classes of ancient remains, burial places yield the richest and most varied material for the study of the history of the race.

Religious Works.—Most ambitious of the aboriginal works of whatsoever branch are those devoted to the gods and to the rites and cere-

A CLIFF HOUSE, COLORADO.

monies of religion. From the lowest civilized nation the material representatives of the deities—the fetiches and idols—were provided with sacred receptacles or places of abode, and in the higher stages the genius of the native artificer was expended on the shrine, the temple, and the sculptured image. Among the more noteworthy examples of temple architecture are the pyramid temples of Mexico and Central America, while the colossal monolithic sculptures of Mexico, Copan, and Quirigua are marvels of elaboration. Rock-cut temples were not uncommon among the more advanced peoples. The face of the hill of Texcoco, valley of Mexico, displays the battered remnants of colossal figures cut in the living rock, which originally were inclosed in sanctuaries or temples built against the hill. The ruin-crowned Hill of Xochicalco is pierced by a system of hallways and chambers, doubtless devoted to sacred purposes.

Diversional Structures.—The playgrounds of the primitive tribes were level spaces, natural

or artificial. No examples of these have been identified, although the chunky game, played by the tribes of the southern States, is repre-

sented by many of the symmetrical and beautifully finished discoidal stones employed. The Maya peoples and perhaps others had ball courts of elaborate design, imposing dimensions, and architectural pretension. An example in Chichen Itza has two parallel walls of dressed stone, each 274 feet long, 26 feet high, and 30 feet thick, separated by a space 120 feet wide in which the game was played. Surmounting one wall are the remains of a handsome temple with giant serpent columns facing the court, while another remarkable building subjoins this on the east base, and two temples with columned porches face the court at the ends. Two stone rings fixed in opposite walls, 25 feet above the floor, afforded the test of skill. To win the game the ball had to be passed through these rings by a rebound from the hip of the player.

Highways and Bridges.—Without wheeled vehicles and draft animals other than dogs the aborigines had little need of broad highways. Mere trails served the purpose of the primitive tribes who had no more important vehicle than the dog travois, but the Peruvians employed in transportation immense herds of llamas and in times of trouble moved large armies for long distances. The Peruvian highways, traces of which still remain, were built by the Inca rulers to connect the northern with the southern provinces and the highland with the Pacific coast. They are the highest native achievement in this branch. The Sierra road was upward of 1000 leagues in length and traversed one of the most rugged mountain regions in the world. The lowland roads were paved in places with slabs of stone, while those crossing deserts were marked by stakes of wood. In middle America urban paved ways were common, as the "Road of the Dead" at San Juan Teotihuacan and the causeways of Tenochtitlan. Without a knowledge of the keystone arch the aborigines were unable to construct stone bridges of long span, but short spans were effected by means of the offset arch, as at Palenque, where an excellent example in cut stone is preserved. Long spans were accomplished by means of cables of vines or osiers fixed to the living rock or to heavy buttresses of masonry.

Storage.—The requirements of the storage of agricultural produce and other possessions led to the erection of special buildings for the purpose, as in Peru, but underground storage was utilized by most village peoples. The exploration of some of the ancient village sites in Ohio has brought to light a large number of storage pits, or caches. Provision for water conservation was essential in all arid and semi-arid regions. Shallow reservoirs are common in the arid region of the southwestern United States; in Yucatan, where little water is found on the surface, underground cisterns are numerous; and in Peru during the Inca period reservoirs and aqueducts of hewn stone, of extraordinary design and great extent were in use. Deep wells were dug in some regions, as at Manabi, Ecuador, and springs were walled up and terra-cotta pipes laid by various peoples.

Mines and Quarries.—Materials for the manufacture of implements and utensils, and for building were gathered from the surface or quarried from the rock in place. The quarrying of flint and other varieties of brittle stone for implements was a leading industry among the northern tribes. The evidences of this work, still extant, are of astonishing magnitude and indicate

a degree of enterprise and persistence not usually ascribed to the aborigines. The largest quarries, so far as examined, are those at Flint Ridge, Ohio; in the suburbs of Washington, D. C.; at Mill Creek, southern Illinois; in northeastern Oklahoma; in Wyoming; and in the State of Hidalgo, Mexico. The excavations cover many acres and in cases even square miles of the surface. Quarries of soapstone and of mica occur in great numbers in the Appalachian region, and hematite mines, where the ore for weapons and red and yellow oxides for paint were mined on a large scale, have been located near Leslie, Mo. Extensive mining of turquoise was carried on in New Mexico, Arizona, and Nevada, and the ancient Mexicans were probably supplied from these northern sources. The copper mines of the Lake Superior region, especially those of Isle Royal, from which this metal was distributed over half of North America, are of great magnitude. The bits or masses of native metal were removed by breaking up the containing rock matrix with sledges of stone, with the aid of fire. The quarries and mines were not carried far underground, most of them taking the form of deep open pittings, which are now largely filled up. The quarries from which stone for building was obtained in middle and South America as yet have not been thoroughly examined, but those at Mitla, Mexico, make it clear that the great blocks of stone were hewn out with rude stone hammers and picks, and at Ollantaitambo, Peru, blocks of porphyry weighing scores of tons were hewn out and transported over extremely difficult roads and were built into the great fortress, while others much larger were left by the way.

Agricultural Remains.—Most of the aboriginal tribes subsisted to a greater or less extent on the products of agriculture, the most remarkable prehistoric evidences of which are found in Peru, where, especially about Lake Titicaca, the mountain slopes are terraced elaborately to the height of hundreds or even thousands of feet. The Inca system of cultivation was wonderfully developed, and granaries were established for the preservation of stores of corn to be used in times of war or famine. Traces of the ancient agriculture are found in other regions, especially in southern Mexico. In Michigan there still remain ridged fields which, it is believed, were devoted to crop growing. In some regions the remains of reservoirs and irrigating canals are found, as in Arizona and Peru, indicating systematic cultivation of arid areas.

Fixed Records.—Traces of the graphic arts are among the most valuable contributions of the past to the history of culture. Rude attempts at the delineation of living subjects, especially men and animals, have been made by most primitive peoples; where painted on the walls of caves or engraved on rock surfaces these endure for long periods. Countless examples are found throughout America. Although their purpose cannot be fully determined, it is apparent that many of these delineations were designed as records or reminders and that through their employment progress was made in the development of the glyphic systems of the more cultured peoples and toward a system of record in which phonetic elements were gradually coming into use. The greatest advance in this direction was made by the Maya peoples of middle America, whose inscriptions in glyphic characters executed in a style of much maturity

are found sculptured on the faces of colossal images, as at Quirigua and on large slabs of limestone, as at Palenque.

Minor Artifacts. On account of their durability, implements and utensils of stone, more than any other class of relics, are pregnant with the story of the past of humanity. Especially is this true of such of these artifacts as have become associated with geological formations, thus affording a means of determining questions of age, both absolute and relative. Objects of metals, bone, shell, and clay, also, are found in large numbers and extend the range of our information in numerous directions. First of all in the world of craft is the hammerstone—the king of implements—found in countless numbers on ancient sites. In the very early stages of culture fragments of stone and pebbles and boulders were used to do many things with, and finally to shape many things with, and gradually themselves took shape by use, and artificial forms were worked out to increase effectiveness. Stone was quarried and metals were mined with them. Implements, utensils, and sculptures were shaped by them, and finally when nuggets of metal were found and swaged with their aid, the way was opened to civilization. Without the hammerstone no approach could ever have been made to the proud stage of culture known as enlightenment. Axes, hatchets, chisels, scrapers, abrading stones, projectile points, etc., were essential adjuncts of the arts of life among every people and are trustworthy indices of early primitive life and culture. Projectile points—the penetrating heads of arrows, spears, darts, and harpoons—are the most numerous and widely distributed of all artifacts and throw light on the story of the hunter, the fisher, and the warrior of all peoples. Among the articles of especial interest, recovered from caverns and from tombs in arid regions, as Arizona and Peru, are the complete weapons—the bows and arrows, the darts and dart-throwers of the people; and marvelous indeed as works of art are the carved and gilded dart-throwers, or atlatls, of ancient Mexico. Domestic utensils also had a wide range of form and use, and receptacles of stone, clay, wood, and wicker, and the varied milling appliances claim the especial attention of the archaeologist. Spinning and weaving appliances and articles of costume in textile and tissue, preserved in abundance in arid regions, as well as personal ornaments of many materials, are of deepest interest to the historian of the race, as are objects of religious use—fetiches, charms, talismans, idols, and paraphernalia—including many things the precise employment of which is unknown.

As already mentioned, pictographs were engraved on rock surfaces by the primitive tribes, and glyphic inscriptions were carved on monuments by the more advanced nations. Similar ideographic designs were executed on bark and skins by the ruder tribes, while among the more cultured peoples paper made of the maguey plant came into use, and the long sheets filled with ideographic inscriptions in brilliant colors, complex design, and masterly execution were folded and bound in book form after the manner of the Orient. Most of these codexes were destroyed by the Spanish invaders or were otherwise lost, but fortunately a few excellent examples found their way into the libraries of Europe. Students are now engaged in the in-

terpretation of these writings as well as of the inscriptions sculptured in stone and wood and modeled in stucco, and have made much progress in determining their general significance and application, although thus far no key has been found by means of which they may be read. It is now known that these writings are not largely historic records in the ordinary sense of that term, but rather are calendaric in function, fixing the routine day by day, and the season of the elaborate religious practices of the priesthood, or connected with the affairs of state, recording dates, duties of officers and servitors, titles to land, concessions, tributes, etc. Many of the characters used retain recognizable traces of the pictorial originals, while some have become wholly conventional, resembling in a measure the alphabetic characters of the Chinese. It is clear that some of the characters at least stand for sounds, syllables, or words, rather than for ideas, and that a system of phonetic writing was in process of formation. This manifest approach to such a system marks the highest cultural achievement of the American race.

Arts and Industries. Having classified and described the diversified antiquities, the various activities involved in acquiring the materials used and in the shaping, distribution, and utilization of the things made should receive the attention of the archæologist. Among these activities the following are especially noteworthy: 1. *Food-acquiring arts*—hunting, fishing, agriculture. 2. *Food-preparing arts*—dressing, preparing, cooking, serving. 3. *Material-acquiring arts*—collecting, quarrying, mining. 4. *Building arts*. 5. *Sculptural arts*—fracturing, crumbling, scraping, carving. 6. *Plastic arts*—modeling. 7. *Metallurgic arts*—swaging, casting. 8. *Tissue-working arts*—hide dressing, tanning. 9. *Textile arts*—basketry, weaving, knitting, etc. 10. *Graphic arts and writing*. 11. *Arts of war*—use of weapons and offensive and defensive works. 12. *Transportation arts*. 13. *Clothing arts*. 14. *Embellishing arts*.

The character of each of these activities is recorded with varying fullness by the available materials of antiquity. In arid regions even the most fragile and perishable of art materials, as cotton, wool, and feathers, and the fabrics made of them, are preserved from pre-Columbian times almost without change, as in Peru, and serve to show what the peoples used, what they made, and how it was made. The story of the food-acquiring industries is told by weapons of the chase, especially those of stone, metal, and bone, and that of agriculture by the simple tools employed in cultivating the soil and by built and excavated storage places. The food-preparing arts are well represented by nut-cracking, meal, and cooking utensils, and by the countless tools for cutting, rubbing, and pounding.

The varied activities connected with the acquirement of the materials employed in the arts, and with the preparation of these to serve the needs of man are of the greatest interest, but would require a volume for adequate presentation. Quarrying, mining, and transporting are included in this group, while the industries connected with the manufacture of implements and other articles of use and beauty are receiving of late years attention proportionate to their importance among the industries responsible for culture advancement.

The remains of the products of the building

arts tell with great clearness the story of the varied activities in this connection of the ancient people and the sculptural, plastic, metal working, textile, and tissue-working arts are amply revealed in the multitude of implements which have been found. The activities connected with the graphic arts and writing, naturally varied and highly specialized, may be readily inferred from the nature of abundant remains.

The activities of war are practically unceasing among primitive tribes and employ the energies of the peoples in countless ways—in the preparation of weapons and the erection of defenses and in expeditions of offense—and are amply illustrated by the remains of antiquity. The remains of devices used in transportation tell of enterprises of vast importance, and the transported materials, as in earthworks and buildings, throw much light on the prowess of the people. The distribution of products of manufacture also makes it clear that trade often extended to distant lands.

The remains of the products of the personal arts—clothing and ornament—as well as of the embellishing arts generally reveal a wide range of activities varying in accordance with the materials used, the methods employed, and the æsthetic attainments of the people. It goes without saying that all the activities of the prehistoric peoples resembled closely the corresponding activities of the aborigines of post-Columbian times recorded by the ethnologist and historian.

Problems of the Race. Having assembled the material data of antiquity, as above outlined, and having acquired from the study of such data all that can be learned of the characteristics and activities of the race, the archæologist is prepared to apply his knowledge to the solution of the larger problems of race history—a work which he must share with the ethnologist and the historian and in which he must enlist the aid of students of many other branches of science—the geologist, the palæontologist, the physical anthropologist, the anatomist, the psychologist, and the geographer. The essential problems are those of:

1. *The origin and development of the race.*
 - a. Characteristics and relationships.
 - b. Migrations, distribution, population.
2. *The origin and development of culture.*
 - a. Language and literature.
 - b. Social organization and customs.
 - c. Religion and religious customs.
 - d. Arts and industries.
 - e. Æsthetics.
3. *Chronology.*

The early stages of man's career are naturally unrecorded in traces of his handiwork, and the historian must rely on such skeletal remains as may be encountered. The Old World has supplied numerous well-verified examples of the physical remains of man extending back to the close of the Tertiary Age, but America has yielded no fully accepted data attesting great antiquity. For the present, therefore, it may be assumed that the race originated in the Old World and that America was peopled at a comparatively recent period by aberrant groups. As the land areas of the two continents are related in the present period, the course of migration would seem inevitably to have been by way of Bering Strait, and a study of the physical and

cultural characteristics of the aborigines tends strongly to support the view that they are in the main at least offshoots from northern Asiatic stems. It cannot be said with respect to problems of race origin that skeletal remains thus far discovered furnish data of great value, but the evidences of racial variation within America as exhibited in the several ethnic regions afford a promising field for research—a field as yet but imperfectly worked. Although general migratory movements resulting in the settlement of the continent may be safely inferred, the archæologist is without material evidence of such movements, and the more recent movements of the tribes and stocks which undoubtedly took place are not recorded with any considerable degree of fullness or certainty in the remains of antiquity, physical or cultural. The distribution of man over both Americas must have become general in the distant past, and in recent times the currents of migration have reached such a state of equilibrium that movements go on with equal facility in all directions. It is true that density of population has varied greatly with the regions and that certain large areas yield only meagre traces of protracted occupancy, but this latter condition may be due in part to the fact that the culture of these areas was so primitive as to leave slight traces to attract the attention of the explorer and collector. However, some idea of the density of population may be inferred from the character and abundance of the evidences left. That there were ever more people than at the period of discovery, generally estimated at from 10,000,000 to 20,000,000, does not seem probable.

Problems of the origin and growth of culture—of the intellectual development of the race—may be studied to excellent advantage in America. Investigations relating to the history of culture proceed on the theory that from the simplest possible beginnings in the manual arts gradual advance was made until the highest round of the ladder of culture was reached, and that a study of the entire series must reveal the steps, the processes, and the laws of advancement. The dynamic forces responsible for advancement are primarily the exacting requirements of physical existence, and secondarily the ever-present desire for betterment, increased comfort, and pleasure. The never-ceasing struggle for existence necessarily led to the development of energies and the awakening of ambitions, to steady advance in skill and ability, and to the improvement of the means and methods of winning from nature the necessities of life. The course of this struggle is amply illustrated in the vast range of the material phenomena of the arts—the subject matter of archæological research.

The archæologist does not have to concern himself with the multitude of American languages, except in so far as the methods of recording and writing are concerned, while the problems of social organization and customs are naturally left largely to the ethnologist. At all stages of primitive progress religion has been a chief factor in shaping and advancing culture, and the best products of the human hand and brain have been the offspring of the belief that the powers of nature, personified in a multitude of forms, could be influenced by offerings and appeals. It followed that the more elaborate, costly, and beautiful the offerings, the stronger the appeal, so that all material objects pertain-

ing to worship—implements, utensils, fetiches, images, altars, sanctuaries, and temples—were elaborated and beautified to the limit of capacity and taste. Thus the æsthetic sense and æsthetic art were developed along with the development of religion and religious art. It may be said without fear of contradiction that no people at corresponding stages of culture advancement had a more elaborate system of religious beliefs and a wider range of personified deities than the Americans, and certainly none gave so large a share of their thought to æsthetic elaboration. Their decided genius for embellishment is manifest on every hand. It is further observed that the struggle for advantage through the increase of personal attractiveness and the attractiveness of personal belongings contributed unceasingly to the development of the arts of taste.

While the fundamental force making for progress was the ever-active struggle for enhancement of welfare and pleasure, the direction in which advancement was made and the rate of the movements depended largely on the diversified conditions imposed by environment. Where conditions were favorable, progress was rapid; where unfavorable, stagnation or retrogression followed.

Through the researches of archæology, assisted by the culture phenomena of the present, the remains of antiquity, more especially those of the later "age of stone," the problems of culture are finding solution, not complete in detail, but sufficiently full to satisfy the broader requirements of history.

Chronology. The archæologist is in constant search for evidences of human antiquity in America, and hundreds of suggestive observations bearing on this subject are on record. None of the acceptable observations indicate an antiquity of man at all comparable to that indicated by observations in Europe and Asia. Briefly, there is a strong presumption that mankind existed in North America about, if not anterior to, the last ice invasion of the Pleistocene, 8000 to 30,000 years ago; yet positive evidence is far from complete, as indicated by the fact that not a single reported association of human remains and works of art with even the latest Pleistocene deposits is accepted without reserve by either anthropologists or geologists. In a few instances human bones have been found in such associations as to suggest the high geologic antiquity of man in America. The best known instance is that of the Calaveras skull alleged to have been found imbedded in auriferous gravels near Angels, Cal., interest in which was enhanced by frequent reports of the finding of stone implements in gravels of a corresponding age, and, in cases, beneath heavy sheets of lava. At the time the associations were reported the gravels were supposed to be Pleistocene or Quaternary, and the lava still more recent, so that the accounts bore an air of credibility. Subsequently, it was ascertained that the auriferous gravels, and even the overlying lava beds, are of Tertiary Age, so that the alleged associations would seem unworthy of consideration unless supported by the strongest possible direct evidence. Recent researches have shown (1) that the alleged finds of human relics in the gravel reported may be ascribed, as a rule, to accidental inclusion in comparatively recent times, the contents of superficial village sites having descended into the open mines, to

be discovered there by workmen entirely ignorant of the significance or possible provenance of the finds. These conditions, even if certain of the recovered objects are of great antiquity, since none are distinctive, make separation impossible and render the evidence nil; (2) that at least some of the artifacts alleged to have been found in the gravels were manufactured from the volcanic rock overlying the gravel beds; (3) that the Calaveras skull is of a type corresponding precisely with that of Indians still living in the same vicinity; (4) that its state of preservation corresponds closely with that of modern bones after a few years' burial in the limestone caverns or calcareous earths of the region; and (5) that the contemporary testimony concerning the finding of the cranium is contradictory, with the burden against the original allegation. Other reports of the occurrence of human remains in geologic deposits have come from Trenton, N. J., and other sites, notably at Lansing, Kans., and in Brazil and Argentina. With regard to the Trenton finds of crania, Hrdlicka has shown that most of them are of Algonquian type, while two are of north German type. The Lansing remains are assigned by some authorities to late glacial times, but geologists and anatomists fail to agree as to the period. The evidence obtained in Brazil and Argentina is embodied in a formidable array of literature, but recent critical examinations of the whole body of evidence leave it without any very substantial support. It is a most significant fact that caverns, the natural dwelling places of very primitive men, have yielded thus far in America no trace of man's early presence. On the whole, it may be said that while the human remains and antiquities of America throw much light on the chronologic problems of recent times, they afford but uncertain aid with respect to the beginnings and earlier stages of occupancy down to the close of the last glacial invasion of North America.

Bibliography. The literature of American archæology may best be consulted in the following general works in which extended citations are given: Bancroft, *The Native Races of the Pacific States*, vol. iv (New York, 1875); Naudillac, *Prehistoric America* (New York, 1884); Winsor, *Narrative and Critical History of America* (Boston, 1884); Payne, *History of the New World called America* (2 vols., Oxford, 1892); Hrdlicka, "Early Man in South America," *Bul. 52, Bur. Am. Ethnol.* (1912); Joyce, *Archæology of South America* (1912); Hodge, "Handbook of the American Indians," *Bur. Am. Ethnol.* (1907). Current publications relating to American archæology are cited fully in the *American Anthropologist*.

ARCHÆOPTERIS, ār'kē-ōp'tē-ris (Gk. *ἀρχαῖος*, *archaios*, ancient + *πτερίς*, *ptēris*, fern). A genus including some of the oldest known fossil ferns, originally described by Dawson in 1863 to include species from the Chemung group of the Upper Devonian. The leaves are bipinnate with obovate inequilateral pinnules; the fertile leaves having oval spore cases instead of pinnules. Perhaps the largest species is *Archæopteris jacksoni*, fine examples of which, attaining a length of 5 feet, are often found in the flagstone quarries of the upper horizons of the Catskill group in the central portions of the Catskill Mountains of New York. See FEERN; CARBONIFEROUS SYSTEM; DEVONIAN SYSTEM.

ARCHÆOPTERYX, ār'kē-ōp'tē-riks (Gk. *ἀρ*

χαιος, *archaios*, ancient, primitive + *πτερυξ*, *pteryx*, wing, bird). The oldest known bird, found fossil in the Jurassic lithographic stone of Solenhofen, Bavaria, where it was discovered in 1861. It was a creature about the size of a crow, bird-like in form, having a rather short, blunt beak, the upper jaw of which was furnished with 13 teeth, and the lower with 3 teeth on each side, each planted in a separate socket. Its most extraordinary feature, however, is a lizard-like tail of 20 vertebrae, from each of which springs a pair of well-developed quill feathers. "The vertebrae of the neck and back were bi-concave, the sternum seems to have been keeled, and the manus had three free digits. The tibia and fibula do not coalesce, and the former was furnished with a series of feathers (wing-quills) very similar to those of the tail." These are divisible, as in modern birds, into primaries and secondaries. That it was able to fly is not doubted; the form of its feet, also, indicate arboreal habits, and that it scrambled about, as well as made short flights, is suggested by the fact that each finger of the hand, as well as the toes, was armed with a claw. The tail

ARCHÆOPTERYX MACRURA.

(Specimen from Solenhofen, studied by Owen.)

must have impeded rather than assisted flight, and it is interesting to note that in later birds this cumbersome member soon became modified into substantially the present form before the Cretaceous Era came to a close. (See BIRD.) It was first thoroughly studied by Owen (*Philosophical Transactions*, London, 1863); later information is summarized in Newton, *Dictionary of Birds*, article "Fossil Birds" (New York, 1893-96).

ARCHAIC (Gk. *ἀρχαῖος*, *archaios*, old-fashioned, primitive, from *ἀρχή*, *archē*, beginning, origin). A term applied to the primitive stage of the art of a good period. Archaic art differs from the merely primitive in that it implies promise of future excellence. The term is especially applied to Greek art before c.450. *Archaistic* is applied to an imitation of this style; as when Greek artists under Augustus reproduced Greek sculpture of the sixth and early fifth centuries.

ARCHAN'GEL (Gk. *ἀρχ-*, prefix denoting dignity of rank + *ἄγγελος*, *angelos*, messenger, angel). A term occurring twice in the New Testament, 1 Thess. iv. 16 and Jude 9. The idea contained in the term is due to the Old Testament development of the conception of angels, which, in its earliest stage, was based upon an earlier animism and involved nothing more than the positing of supernatural beings, whose vocation, generally speaking, was to be in varied ways agents of God, with whom they were so closely associated as at times to be distinguished from him

rather by degree than by kind (cf. Gen. xviii. 33 with xix. 1). Gradually, however, the idea of moral distinctions among these angelic beings appeared, from which grew the conception of "evil angels" (Ps. lxxviii. 49; cf. 1 Chron. xxi. 1). Finally, under the Babylonian influence of the Exile and the Persian and Greek influences of post-exilic times, there appeared among these supernatural hosts the idea of ranks and even of names (Zech. ii. 3 f.; iii. 1, iv. 1, 11-14; Dan. iv. 13, viii. 16, x. 13, xii. 1). Both of these developed ideas—moral distinctions and ranks and names—are carried over into the New Testament writings, where use is frequently made of them. The first place in these ranks is evidently intended to be referred to in our term. See ANGEL.

ARCHANGEL. The capital city of the Russian government of Archangel, situated in lat. 64° 33' N., and long. 40° 33' E., on the right bank of the Dvina River, 26 miles above its entrance into the White Sea, and 740 miles northeast of St. Petersburg (Map: Russia, F 2). It is the largest and most important city in the world situated so near the Arctic Circle. The city is of ancient origin, and among its most noteworthy buildings is the handsome cathedral finished in the beginning of the nineteenth century. It is said to be the handsomest and best-lighted cathedral in Russia. The other buildings of interest are the bazaar or mart, the marine hospital, and the wooden "little house" of Peter the Great. The importance of the city is considerable, since it serves as an outlet for the products of the far northern and western part of Siberia. The chief articles of traffic are fish, skins, furs, timber, wax, iron, tallow, bristles, and caviar. At its annual fair, in September, about 14,000,000 rubles' worth of goods changes hands. The value of its exports and imports amounts to about 8,000,000 rubles (\$4,500,000) annually, and it is visited by some 800 vessels from July to September, the only period of the year when the harbor of Archangel is entirely free from ice. Of the foreign vessels visiting the port the British and Norwegian are the most numerous. Considerable inland shipping is carried on by a large number of smaller vessels navigating the Dvina. The fact that the harbor is ice-bound during the greater part of the year has been the greatest obstacle to the commercial growth of the city. The site was visited in 1553 by the English expedition under Chancellor in search of a northeast passage to India. An English factory was erected soon after. The origin of the town dates from 1584, when a fort was erected. Pop., 1911 (est.), 35,414.

ARCHAN'GEL, or ARKHANGELSK, ár-kin'gelsk. A government of Russia, between 61° and 71' N. lat. and 28° to 66° E. long., extending along the White Sea and Arctic Ocean from Finland and Norway east to the Ural, and bounded on the south by the governments of Vologda and Olonetz. Its area, exclusive of large internal waters, is 326,063 square miles. It is the largest government of the Empire, and occupies the entire north of European Russia. Its greatest length, from west to east, is 990 miles; its greatest width, from north to south, is 132 miles. Four large navigable rivers flow through Archangel—the Petchora for 528 miles, the Onega 132 miles, the northern Dvina 265 miles, and the Mesen 265 miles, all emptying their waters into the White Sea. The northwestern and the northeastern parts are mountainous,

reaching a height of more than 4900 feet. The climate of the central part of Archangel is very severe. In the extreme northeast it is perceptibly milder, and the open sea is never frozen. The great wealth of Archangel is in its forests, which cover more than half of its area. Lumbering is therefore the leading industry. Ship-building is also carried on. Some of the inhabitants are engaged in agriculture, which, at its best, is poorly developed; in fishing and hunting along the shores of the Arctic and the White Sea; and in the rearing of deer, which constitutes the almost exclusive occupation of the Samoyeds in the northern districts. Archangel is one of the most sparsely populated governments of Russia. The population was 331,200 in 1890, 426,200 in 1909, and was estimated to be 449,400 in 1911. Ninety-eight per cent of the people are Russians. Of the different tribes, as the Lopars, Zyrians, Samoyeds, etc., there are not more than 6000 persons. Consult A. P. Enlehardt, *A Russian Province of the North* (Westminster, 1889).

ARCHANGEL, New. See SITKA.

ARCHANGELICA, ár-kan-jél'í-ká. See ANGELICA.

ARCHAS, ár'kas. A character in Fletcher's *The Loyal Subject*; a much too "loyal subject" of the unworthy and thankless monarch in that play.

ARCH'BALD. A borough in Lackawanna Co., Pa., 10 miles northeast of Scranton, on the Delaware and Hudson, and the New York, Ontario, and Western railroads (Map: Pennsylvania, K 3). Its chief industry is coal mining, but there are some silk mills. The surrounding region is of interest from a geological standpoint on account of the enormous glacial potholes that have been uncovered here. Hills to the north of the town contain markings made in the Ice Age by the movement of glaciers into the valley below. There is very little timber. Pop., 1890, 4032; 1900, 5396; 1910, 7194.

ARCHBALD, ROBERT WODROW (1848—). An American lawyer and sometime judge of the United States Commerce Court, born in Carbon-dale, Pa. He graduated from Yale in 1871, studied law, and after admission to the bar began practice at Scranton, Pa. In 1885 he was appointed a law judge; in 1888, presiding judge of the 45th Judicial District of Pennsylvania; and in 1901, United States District Judge for the Middle District of Pennsylvania—a capacity in which he served for 10 years. Upon the creation of the United States Commerce Court in 1911 he was commissioned one of its judges by President Taft. Rumors of venality and unprofessional conduct on the part of Judge Archbald were investigated by the Judiciary Committee of the House in 1912. This investigation resulted in the formulation of 13 charges against him, each of which, in effect, charged him with attempting to use his office for financial gain, especially in efforts to purchase at a reduced figure property from coal companies which were then having or would have had litigation before his court. Articles of impeachment covering these charges having been preferred by the Judiciary Committee, and the House, in one deciding vote, having accepted the findings, the articles were at once forwarded to the Senate.

In December, 1912, the Senate, sitting as a Court of Impeachment, found Judge Archbald guilty as charged on five counts of the indictment, but acquitted him on eight. The outcome

automatically removed Judge Archbald from his seat on the Commerce Court bench and deprived him of the right of again holding office under the government. This was the ninth impeachment tried by the Senate within the history of the United States. Consult *Proceedings of the United States Senate and the House of Representatives in the Trial of Impeachment of R. W. Archbald* (1913). See COMMERCE COURT.

ARCHBISHOP, *ärch/bish'öp* (Gk. *ἀρχι-archi-*, chief + *ἐπίσκοπος, episkopos*, overseer). The title given to a metropolitan bishop who superintends the conduct of the suffragan bishops in his province and also exercises episcopal authority in his own diocese. The archbishop was probably originally the bishop of the chief town. The office appears as early as the fourth century. In the Oriental church the archbishops are still called "metropolitans," from the circumstance mentioned. In the African church, on the other hand, the term used was "primus." The great archbishoprics of the early Church were those of Jerusalem, Antioch, Ephesus, Alexandria, Constantinople, and Rome. Since the sixth century the Archbishop of Rome has borne the name of Pope (*papa*). There is an official letter by Justinian, addressed to "John, Archbishop of Rome and Patriarch," and several ecclesiastical constitutions are addressed to "Epiphanius, Archbishop of Constantinople and Patriarch." The Synod of Antioch, in 341, assigned to the archbishop the superintendence over all the bishoprics and a precedence in rank over all the bishops of the Church, who, on important matters, were bound to consult him and be guided by his advice. By degrees there arose, out of this superiority of rank, privileges which at length assumed the character of positive jurisdiction in ecclesiastical matters. Many of these rights passed to the patriarchs (q.v.) toward the end of the fourth and during the fifth century, and still more to the Pope in the ninth. The archbishops still retained jurisdiction, in the first instance, over their suffragans in matters which were not criminal, and over those who were subject to them they acted as a court of appeal. They possessed also the right of calling together, and presiding in, the provincial synods; the superintendence and power of visitation over the bishops of the metropolitan see; the power of enforcing the laws of the Church; the dispensation of indulgences, and the like. The archbishops further enjoyed the honor of having the cross carried before them in their own archiepiscopate, even in presence of the Pope himself, and of wearing the *pallium*.

In the Established Church of England there are two archbishops, both appointed by the sovereign, of whom the one has his seat at Canterbury, the capital of the ancient kingdom of Kent; the other at York, the capital of Northumbria. But though, as ruling over a province in place of a single diocese, both have enjoyed the rank of metropolitans from the first, the Archbishop of Canterbury has all along enjoyed, not merely precedence as the successor of Augustine and the senior archbishop, but as possessing a preëminent and universal authority over the whole kingdom. This preëminence is marked in the titles which they respectively assume—the Archbishop of Canterbury being styled the Primate of All England (*metropolitanus et primus totius Angliæ*), while the Archbishop of York is simply called Primate of Eng-

land (*primus et metropolitanus Angliæ*). It is also indicated by the places which they occupy in processions—the Archbishop of Canterbury, who has precedence of all the nobility, not only preceding the Archbishop of York, but the Lord Chancellor being interposed between them. Previous to the creation of an archbishopric in Ireland the authority of the Archbishop of Canterbury extended to that island. The amount of control which belongs to an archbishop over the bishops of his province is not very accurately defined; but if any bishop introduces irregularities into his diocese or is guilty of immorality, the archbishop may call him to account and even deprive him. In 1822 the Archbishop of Armagh, who is Primate of All Ireland, deposed the Bishop of Clogher on the latter ground. To the Archbishop of Canterbury belongs the honor of placing the crown on the sovereign's head at his coronation; and the Archbishop of York claims the like privilege in the case of the Queen-Consort, whose perpetual chaplain he is. The province of the Archbishop of York consists of the six northern counties, with Cheshire and Nottinghamshire. The rest of England and Wales form the province of the Archbishop of Canterbury. The dioceses of the two archbishops—that is to say, the districts in which they exercise ordinary episcopal functions—were remodeled by 6 and 7 Will. IV, c. 77. The diocese of Canterbury comprises Kent, except the city and deanery of Rochester, and some parishes transferred by this act; a number of parishes in Sussex called "peculiar"; with small districts in other dioceses, particularly London. The diocese of the Archbishop of York embraces the county of York, except that portion of it now included in the dioceses of Ripon and Manchester; the whole county of Nottingham, and some other detached districts. In Ireland there are two Protestant archbishops, elected by their fellow-bishops out of their number, and four Roman Catholic. Of the former, the Archbishop of Armagh is Primate of All Ireland; the Archbishop of Dublin being Primate of Ireland. They formerly sat alternately in the House of Lords; the three bishops who, along with them, represented the Church of Ireland, being chosen by rotation.

The Roman Catholic church in England and Wales has three archbishops; in Scotland two archbishops, while the Episcopal church in that country has no archbishop, but a *primus*. An English archbishop writes himself, "by divine providence"; a bishop being, "by divine permission"; and an archbishop has the title of "Grace," and "Most Reverend Father in God," while a bishop is styled "Lord," and "Right Reverend Father in God." The archbishop is entitled to present to all ecclesiastical livings in the disposal of diocesan bishops, if not filled within six months; and every bishop, whether created or translated, was formerly bound to make a legal conveyance to the archbishop of the next avoidance of one such dignity or benefice belonging to his see as the archbishop should choose.

The only archbishops in the United States are those of the Roman Catholic church, now 14 in number. Up to 1789 the ecclesiastical government of that church in this country continued under the vicar apostolic of the London district, the local superior at that time being Father John Carroll, of Baltimore. In 1789 Baltimore was erected into an episcopal see, and Father

Carroll became bishop. In 1808, after New Orleans, New York, and Boston had been erected into sees, Baltimore was raised to metropolitan rank, Father Carroll becoming the first archbishop, as he had been the first bishop, in this country. The dates of the establishments of other archiepiscopal sees in this country are as follows—the first date being that of the foundation of the see, and the second of its elevation to a metropolis: Oregon City, 1846, 1846; St. Louis, 1826, 1847; New Orleans, 1793, 1850; New York, 1808, 1850; Cincinnati, 1821, 1850; Dubuque, 1837, 1893; San Francisco, 1853, 1853; Milwaukee, 1844, 1875; Boston, 1808, 1875; Philadelphia, 1808, 1875; Santa Fe, 1850, 1875; Chicago, 1844, 1880; St. Paul, 1850, 1888.

ARCHBOLD, JOHN DUSTIN (1848—). An American capitalist, born in Leesburg, Ohio, and educated in the public schools. In 1864 he went to the Pennsylvania oil regions and spent 11 years in the oil industry. At the end of that period he became a director of the Standard Oil Company and served also as its vice president until the dissolution in 1911. He was then made director and president of the reorganized Standard Oil Company of New Jersey. Known to be an officer or director in numerous large corporations, he was for many years recognized as the practical head of the great oil interests of the country. In 1912 he came prominently into public notice by the publication of a series of letters which had been stolen from his files. These communications revealed more or less intimate business relations with several well-known public men and dealt especially with contributions made by the Standard Oil Company to the campaign funds of political parties. An investigation into campaign contributions was at that time being held by a committee of the Senate, and Mr. Archbold was called before it. He declared that he, representing the Standard Oil Company, had made a contribution of \$125,000 to the Republican campaign fund of 1904, and that Theodore Roosevelt was aware that such a contribution had been made. He declared further that a demand for a second contribution of \$150,000 was refused, and that the subsequent prosecution of the Standard Oil Company by President Roosevelt's administration was an indirect result of that refusal. Mr. Roosevelt testified before this committee that Mr. Archbold's assertions were unquestionably false as to his (Roosevelt's) knowledge of contributions by the Standard Oil Company, and he produced letters written by him to his campaign managers directing them to return such contributions if they were offered.

ARCHCHANCELLOR. The highest dignity of the Holy Roman Empire. The title dates from the ninth century, when it was used by the Carolingians. From the tenth century the Archbishop of Mainz claimed the position in the German Empire. In the eleventh century the Archbishop of Cologne claimed the dignity and duties for Italian matters, and he was gradually admitted to be the Emperor's representative in Italy. In the twelfth century the Archbishop of Trier claimed a similar position in Burgundian affairs. The threefold division and the three Archchancellors were recognized in the Golden Bull (q.v.) of 1356. The Elector of Mainz retained the dignity until the end of the Holy Roman Empire in 1806. See Ducange, *Glossarium*, under the word *archicancellarius*.

ARCHDALE, *ärch'däl*, JOHN (fl. 1664–1707).

A Colonial Governor of North Carolina, born in England. He came to New England as the agent for Governor Gorges, of Maine, in 1664; was a commissioner for Gorges (1687–88); and was Governor of North Carolina, of which he was also a "proprietary." He reorganized the administration of the Colony, conciliated the Indians, and introduced the culture of rice. In 1698 he was elected a member of Parliament, but he declined to take the oath because of his Quaker principles. He published *A New Description of the Fertile and Pleasant Province of Carolina, with a Brief Account of its Discovery, Settling, and Government up to this Time* (London, 1707; and in B. R. Carroll, *History of the Colony of South Carolina*, 1836). Consult Alexander Hewatt, *Historical Account of the Rise and Progress of the Colonies of South Carolina and Georgia* (London, 1779).

ARCHDEACON, *ärch'dē'kūn* (Gk. *ἀρχι-archi-*, chief + *διάκονος, diakonos*, servant, minister of the church). An ecclesiastical dignitary whose jurisdiction is immediately subordinate to that of the bishop. The archdeacon originally was simply the chief of the deacons, who were the attendants and assistants of the bishop in church affairs. His duties consisted in attending the bishop at the altar and at ordinations, assisting him in managing the revenues of the church and directing the deacons in their duties. From being thus mere assistants, archdeacons in the fifth century began to share the bishop's powers, and step by step attained to the authority they now enjoy, which from the ninth century became in many respects distinct from that of the bishop. Several synods protested against the innovation, but it was continued in the eleventh and twelfth centuries, when the archdeacons were recognized as the most influential of prelates. In the thirteenth century, their powers were limited by the establishment of episcopal courts. Their dignity and influence are now very much reduced in the Roman Catholic church, and many of their former functions are now exercised by vicar-generals.

In the Established Church of England, each diocese has from two to four archdeacons. No person can be appointed to this office who has not been six years a priest. His duties include visitation of the parishes, holding synods, ordering repairs of churches, and in other ways being, as the canon law calls him, 'the bishop's eye.' He is addressed as 'Venerable.' In the American Protestant Episcopal church the archdeacon exercises analogous functions, but the office is only found in some of the dioceses, and the number in the dioceses where it has been introduced varies from one to six. The office is found in all branches of the Church of England and also in the Lutheran church.

ARCHDUKE, *ärch'dūk'* (*arch* + *duke*, from Gk. *ἀρχι-archi-*, chief + Lat. *dux*, leader). Archduke and archduchess are titles now taken by all the princes and princesses of the house of Austria. The title seems to have originated in the tenth century for Lorraine, when the latter was divided into two duchies of Upper and Lower Lorraine. It was once used for the ruler of Austria about the middle of the twelfth century. Rudolph IV of Austria, who died in 1365, called himself Palatinus Archidux. The title was formally conferred on the Hapsburgs by Frederick III in 1453. Various noble houses, especially that of Bavaria, disputed the title with the Hapsburgs, but since Rudolph II, Ger-

man Emperor from 1576 to 1612, their precedence has been established. Consult Selden, *Titles of Honor* (1672); and Ersch und Grüber, *Encyklopädie der Wissenschaften und Künste* (article, *Erzherzog*).

ARCHEAN (är-kē'an) **SYSTEM** (from Gk. ἀρχαῖος, *archaios*, ancient). A name proposed by J. D. Dana, in 1872, for the entire series of crystalline rocks that forms the oldest underlying fundamental complex of the earth's crust. Earlier names applied to this series were: Azoic, Primitive, Huronian, and Laurentian, of American geologists, and *Urgebirge* and *Primitivgebirge* of the still earlier Germans, Werner and Lehmann. The rocks of this system consist of a complex series of gneisses, granites, and schists, with a host of associated massive igneous intrusions, all of which have suffered profound disturbances and metamorphism to such an extent that it is extremely doubtful if at the present day there exist any traces of their original characters. They form, as a rule, the cores of the great mountain masses and are the original sources from which were derived, by erosion through countless ages, all the forms of later sedimentary rocks, which they underlie with marked unconformity. Various classifications of Archean rocks have been made in the attempt to organize them into stratigraphic groups, but owing to the complex nature of the series, and to the almost complete absence of reliable data for determining the relative age of the component formations, no one classification has as yet received general recognition. These Archean rocks of undoubted primeval origin, together with certain others, which because of their probable sedimentary derivation have been separated under the name Algonkian, antedate in respect of the time of their formation the rocks of the Cambrian system, and can be described to better advantage under the title **PRE-CAMBRIAN FORMATIONS**, to which article the reader is referred for further information. See also **ALGONKIAN SYSTEM**; **TACONIC SYSTEM**.

ARCHEDEMUS, är'kē-dē'mūs (Gk. Ἀρχέδημος, *Archēdēmos*), called **GLAMON** (the 'blear-eyed'). A demagogue and popular speaker in Athens at the end of the fifth century and the beginning of the fourth century B.C. He is said to have been a foreigner who worked his way by fraud into the Athenian franchise, was poor, and was generally disliked by reason of his restless activity and meddlesomeness. By bringing an accusation against Erasinides, he took the first steps toward the impeachment of the Athenian generals who took part in the battle of Arginusæ (q.v.), 406 B.C.

ARCHEGONIUM, är'kē-gō'nī-ūm (Gk. ἀρχέγονος, *archegonos*, first of a race, primal). The peculiar female organ of Bryophytes (mosses and liverworts), Pteridophytes (ferns, club mosses, etc.), and Gymnosperms (conifers, etc.), which together are often spoken of as **Archegoniates**. It is a flask-shaped organ, consisting of a *neck* more or less elongated and a *venter* more or less bulbous. A single egg occupies the venter, and in the process of fertilization the sperm enters by the open neck of the archegonium and comes in contact with the egg. Among the mosses the archegonium is a free and often-stalked organ. Among the liverworts the archegonia are variously disposed on the thallus body, while in mosses they are borne in a cluster at the apex of the leafy shoot or of its branches, the terminal rosette of more or less

modified leaves forming what is often called a "moss flower." Among the ferns the archegonia are usually borne upon the under side of the inconspicuous sexual plant (prothallium), the venters being imbedded in the tissue and the necks more or less projecting. In the water ferns, quillworts, and little club mosses the female plant is developed as a tissue within the spore, whose heavy wall breaks or cracks at a certain place, and in the exposed part of the female plant the archegonia are developed. Among the conifers the spore, with its contained female plant, is retained within the ovule, and hence the archegonia are not exposed, but lie imbedded in the superficial part of the female plant (endosperm), toward the micropyle (the passageway left by the integument of the ovule). Among the conifers the male cells are brought to the archegonium by growing pollen tubes. The pollen grain, containing the male cells, rests at the base of the micropyle, upon the apex of the nucellus (central part of the ovule). The tube penetrates the tissue of the nucellus and reaches the embryo sac (megaspore), just within which are the archegonium necks. It then pierces the sac wall, enters and crushes the neck, and discharges its male cells into the egg.

Among the flowering plants no archegonia are developed, the embryo sac containing a free egg, along with other free cells of a much-reduced female plant.

ARCHEGONIA.

(a) of a moss, (b) of a fern, (c) of a liverwort, showing in each case the neck and the venter containing the egg.

The development of an archegonium and its preparation for fertilization are matters of great morphological interest. It begins as a single superficial cell of the sexual plant. By repeated cell divisions the layer of cells constituting the neck and venter is formed, and this surrounds a single row of axial cells. The cells of this row (variable in number) which lie within the neck are called the "neck canal cells," while the lowest cell of the row, the one within the venter, forms the egg. When the archegonium is nearly mature, the row of neck canal cells breaks down and leaves an open neck; and usually just before fertilization the cell in the

venter cuts off a small cell toward the neck called the "ventral canal cell," which rapidly disorganizes and leaves the egg free and alone in the venter, ready for the approach of the sperms through the neck.

One of the interesting facts in connection with archegonia is that the apical neck cells secrete a substance which attracts the sperms toward them. For example, this substance is not the same in mosses and ferns, so that even if archegonia of the two groups are close together the moss sperms and the fern sperms will be attracted only to their own archegonia.

ARCHEGOSAURUS, är'kê-gô-sq'rûs. See STEGOCEPHALIA.

ARCHELAUS, är'kê-lä'us (Gk. Ἀρχέλαος, *Archelaos*).—1. One of the Heraclidæ who, when driven by his brothers from his native land, fled to Macedonia and founded the town of *Ægæ*. He was the mythical founder of the royal house of Macedonia. See below, under 3.—2. A Greek philosopher and pupil of Anaxagoras. He was born at Athens, and was the son of Apollodorus or Myson. The outlines of his system were those of his teacher, but for the details of his cosmology he went back to the ideas of the earlier Ionic physicists. (See GREEK PHILOSOPHY.) He admitted a primitive matter, consisting of infinite particles similar in nature to the bodies formed from them. He also admitted a ruling Mind. Matter and mind he held to be mingled, and identified the primitive matter with air. Out of this air, thus endowed with mind, there arose, by processes of thickening and thinning, cold and heat, or water and fire—the former passive, the latter active. From the action of fire and water were formed the atmosphere and the mud out of which the heavenly bodies were developed. Living organized beings, at first of low type, sprang from the mud, and gradually the races of animals were formed. Man he held to be superior to other beings, by reason of his artistic and moral powers.—3. King of Macedonia, natural son of Perdiccas II. He came to the throne in 413 B.C., after murdering the rightful heir. Archelaus improved the internal condition of his kingdom, introduced changes for the better in the currency and in the army, and showed himself a warm patron of art and literature. Agathon, Euripides, Zeuxis, and other men of eminence visited his court, and only Socrates refused an invitation to go thither. Euripides wrote a drama, *Archelaos* (now lost), in his honor, introducing his mystical ancestor (see above, under 1). The palace of Archelaus was adorned with magnificent paintings by Zeuxis. Archelaus was either murdered or accidentally slain by his favorite, Crataeus or Crateuas, in 399 B.C.—4. A distinguished general of Mithridates. In the winter of 88–87 B.C. he was sent to Greece with a large fleet and army to oppose the Romans in that quarter. On the way he seized the Cyclades, together with Delos, and, by granting the latter island to Athens, won over that city to the side of Mithridates. On his appearance in Greece, the Achæans, the Laconians, and the Bœotians (except the people of Thespiæ), at once flocked to his standard. A three days' battle was fought in the neighborhood of Thespiæ, with indecisive result, but Archelaus was forced to fall back upon Athens and Piræus. In the summer of 87 B.C., Sulla landed in Greece and proceeded against Archelaus. After long and hard fighting Athens and Piræus were taken, in March, 86 B.C., and Arche-

laus retreated to Chalcis. Here he was joined by reinforcements from Mithridates, but he met with a crushing defeat at Charonea. Of 120,000 men that Archelaus led into battle, barely 10,000 reassembled at Chalcis. In the meantime Mithridates sent into Greece a further force of 80,000 men under Dorylaus. With this force Archelaus faced the enemy at Orchomenus in 85 B.C. His army was almost entirely destroyed, but Archelaus himself, after hiding for several days in a swamp, finally escaped to Chalcis. Peace followed, but Archelaus, by his conduct in the negotiations, awakened the suspicions of Mithridates, and was, as a result, driven to side with the Romans in the second and third Mithridatic wars. (See FIMBRIA; MITHRIDATES; SULLA.)—5. Son of the preceding. He married Berenice, daughter of King Ptolemæus Auletes, in 56 B.C., and ruled over Egypt for the short space of six months during the banishment of Ptolemæus. He lost his life in a battle against Aulus Gabinius, proconsul of Syria.—6. Grandson of the preceding. He obtained from Marcus Antonius the province of Cappadocia, which he retained during the reign of Augustus. Tiberius accused him of political innovations and condemned him to death; but he was already old and broken, and he died at Rome soon after his trial, in 17 A.D.—7. A Greek sculptor, born at Priene, celebrated for his bas-relief representing the "Apotheosis of Homer," which was found in the seventeenth century on the Via Appia, near Bovillæ. The relief appears to be the votive offering of a poet made for a victory won at a poetic contest. Its time is placed all the way from 150 B.C. to the beginning of the first century A.D. The relief was purchased in 1819 for the British Museum.—8. Son of Herod, tyrant of Judæa. He succeeded his father in 4 B.C., and maintained his position against an insurrection raised by the Pharisees. His heirship to the throne being disputed by his brother Antipas, Archelaus went to Rome, where his authority was confirmed by Augustus, who made him Ethnarch of Judæa, Samaria, and Idumæa. After a reign of nine years he was deposed by Augustus, on account of his cruel tyranny, and banished to Vienna in Gaul, where he died. His territories were added to the Roman province of Syria.

ARCHENHOLZ, är'kên-hôlts, JOHANN WILHELM, BARON VON (1743–1812). A German historian. After service in the army, he gained his discharge at the close of the Seven Years' War and passed several years in travel, visiting almost all the principal cities of Europe and supporting himself by authorship. He wrote *Geschichte des siebenjährigen Krieges* (1789; 13th ed., 1892), which, when compared with the generally dry style of his German contemporaries, deserves praise on account of its narrative interest. He also wrote *Annalen der britischen Geschichte* (20 vols., 1789–98), and biographies of Queen Elizabeth of England and Gustavus Vasa of Sweden.

ARCHEOZOIC ERA. The period of geological time compassed by the formation of the rocks of the Archean system (q.v.). It is therefore the earliest of the major time divisions. No fossils or other direct evidences of life have come down to us from the Archeozoic, but the existence of some form of life at that time is inferred from the presence of carbonaceous materials and the probable occurrence of carbonates. Owing to their absence and to the very

great difficulties encountered in establishing any orderly arrangement of the rocks, no estimate of the duration of the era is possible, although it must have been very great.

ARCHER, BELLE (1860-1900). An American actress, named Arabella S. Mingle, but known as Miss Archer after her marriage in 1880 to Herbert Archer, from whom she was divorced in 1889. She was born at Easton, Pa., and made her debut at Washington, D. C., with William Florence in *The Mighty Dollar*. Afterward she appeared in *Pinafore*, *Hazel Kirke*, etc., and for some time played with E. H. Sothern, as Rose in *Lord Chumley* (1888) and in other pieces. She also supported Alexander Salvini, and in Daly's company took the part of Maid Marian in the later productions of Tennyson's *Foresters*. In 1894, after having left the stage for a time, she resumed her career as a star, and afterward was for a while leading woman with Sol Smith Russell.

ARCHER, BRANCH T. (1790-1856). A Texas patriot. He was born in Virginia, where in early life he practiced medicine. In 1831 he went to Texas, took part in the Revolution, and in 1835 presided over the "consultation" called by the American settlers to consider the subject of independence. During the same year he was one of the three commissioners sent to Washington to solicit aid from the United States. In 1836 he was Speaker of the Texas House of Representatives, and from 1839 to 1842 was Secretary of War for the new Republic.

ARCHER, FREDERIC (1838-1901). An American organist, born at Oxford, England. He studied music in London and Leipzig, and held musical positions in England and Scotland until 1880, when he was appointed organist of Plymouth Church, Brooklyn, N. Y. Afterward he became conductor of the Boston (Mass.) Oratorio Society, director of Carnegie Music Hall, Pittsburgh, Pa., and in 1899 organist of the Church of the Ascension, Pittsburgh. He founded, in 1885, the *Keynote*, which for a time he edited. In 1896 he established the Pittsburgh Symphony Orchestra. He published, besides numerous compositions for the organ, *The Organ* and *The College Organist*.

ARCHER, JOHN (1741-1810). An American physician. He was born in Maryland, and graduated at Princeton in 1760, the first man in the United States to receive the degree of doctor of medicine, when he graduated at the Philadelphia Medical College in 1768. He was an officer in the army of the Revolution, a member of the Maryland General Assembly, and a representative in Congress from that State for three terms, 1801-07.

ARCHER, WILLIAM (1856-). An English dramatic critic, born at Perth, Scotland. He received the degree of M.A. at Edinburgh University in 1876, and was on the staff of the *Edinburgh Evening News* from 1875 to 1878. He was a dramatic critic of the London *Figaro* from 1879 to 1881; was called to the bar at the Middle Temple in 1883, and succeeded Dutton Cook as dramatic critic of the London *World* in 1884, where he remained till 1905. Subsequently he was dramatic critic for the London *Tribune* and for *The Nation*. Reinforced by Bernard Shaw and a few others, Archer introduced Ibsen to the English stage, and indeed to the English-speaking world; his efforts gained for *The Pillars of Society* its first London production in 1880, and it was his translation of *A Doll's*

House that was presented nine years later. In 1890-91 he edited and in part translated the prose dramas of Ibsen, and published them in five volumes; this edition was followed by his *Collected Works of Ibsen* in 11 volumes. Archer has been a tonic influence upon the whole course of English and American contemporary drama. Among his works pertaining to the English drama are: *English Dramatists of To-day* (1882); *Henry Irving*, a study (1883); *About the Theatre* (1886); *Study in the Psychology of Acting* (1886); *W. C. Macready*, a biography (1890). He translated from the Norwegian Kielland's beautiful *Tales of Two Countries* (1891), and from the Danish a large part of Georg Brandes's *William Shakespeare* (1898). He visited the United States in 1899 to study the stage here, and after his return published *America To-day* (1900). Later books include: *Poets of the Younger Generation* (1901); *Real Conversations* (1904); *A National Theatre: Scheme and Estimates* (with H. Granville Barker, 1907); *Through Afro-America* (1910); *The Life, Trial, and Death of Francisco Ferrer* (1911); *Play-Making* (1912).

ARCHER-FISH. Any of the small spiny-rayed East Indian fishes of the family *Toxotidae*. They are said to eject from their mouths drops of water aimed at insects. These, when the aim is good, fall to the water and are seized as prey by the fish. Specifically, the name is applied to *Toxotes jaculatoria*, which, because of this interesting habit, is often kept in house aquaria in the East.

ARCHERY (OF. *archerie*, from LL. *arcarius*, bowman, from Lat. *arcus*, bow). The use of the bow and arrow is still practiced by enthusiasts as a means for the capture and destruction of game; but its main use to-day, except in a few remote nations, is as a recreation and healthful exercise. The use of the bow and arrow is coeval with man's authentic history; thus Ishmael "dwelt in the wilderness of Paran and became an archer" (Gen. xxi. 20). The archery of Jonathan is specifically referred to in Holy Writ, and Josephus, the Jewish historian, alleges that the bow was considered the most efficient weapon of the Jews. It was deadly in the hands of their conquerors, the Babylonians, who have left many sculptured memorials of their prowess with it. It is not surprising, therefore, to find that their near neighbors, the Persians, cultivated its practice, or that the Scythians carried the lesson of its value to the Greeks, from whom it passed, with the empire of the world, to the Romans. These, in their turn, were vanquished by the superior skill of the archers of the Goths, Huns, and Vandals.

Both as a weapon of the chase and for military purposes, the bow was for centuries most formidable in the hands of the English. With the longbow they decided the fate of nations, as at Crécy (1346) and Poitiers (1356) and Agincourt (1415). The skill of their hunters and the wonderful feats of their archers have come down to us from many sources. Especially are the ballads rich in incidents of their prowess. One old black-letter ballad, reprinted in Percy's *Reliques*, tells of "Three Archers," one of whom, shooting before the King, split a wand in two at a distance of 400 yards; and then, not satisfied with this example, tied his eldest son, a lad of seven years of age, to a stake 120 yards off, and cleft an apple placed on his head.

In a treatise on martial discipline, by Ralph Smithe, written in the time of Elizabeth, we have a picture of the English archer: "Captens and officers should be skillful of that most noble weapon the long-bow; and to see that their soldiers, according to their draught and strength, have good bowes, well nocked, well strynged, everie stryng-whippe in their nocke, and in the middes rubbed with wax braser, and shutting-glove, some spare strynges trymed as aforesaid; every man one shefe of arrows, with a case of leather defensible against the rayne, and in the same four-and-twenty arrowes, whereof eight of them should be lighter than the residue, to gall or astoyne the enemye with the hailshot of light arrowes before they shall come within the danger of their harquebus shot. Let every man have a brigandine or a little coat of plate, a skull or hufkyn, a maule of leade of five foote in lengthe, and a pike, and the same hanging by his girdle with a hook and a dagger."

In Queen Elizabeth's reign the practice of archery ceased to be a national necessity; yet she was able to offer Charles IX of France 6000 men, one-half of whom should be archers; and shortly before the beginning of her reign the celebrated scholar, Roger Ascham, who was a lover of all kinds of sport, wrote the classic work on archery, *Toxophilus, or the Schole of Shooting*, in 1545, in which he gave minute directions on attitude and the manner of drawing the bow. It is a very practical book; indeed, one point he makes is worth transcribing even to-day. Young archers, he says, generally fall into the fault of fixing the eye on the end of the arrow rather than on the mark. To obviate this evil he advises them to shoot in the dark by night at lights set up at their proper distances—a very shrewd bit of advice.

England had not a monopoly of skill in archery; even in the Middle Ages the Egyptians, Arabs, and Turks ran them close. Baumgarten, indeed, relates that he saw 60,000 Mamelukes assembled in a spacious plain, who exhibited almost incredible agility in shooting on horseback, shooting arrows while in full career, and mounting and remounting on either side of their horses and shooting time and again, yet seldom or never missing their mark. He even asserts that horsemen shot while guiding two horses, one under either foot, as men ride in a circus, and their arrows found their mark.

So universal, indeed, was the skill in archery before the advent of gunpowder that no country has been discovered in which it was not the chief reliance of the natives in the chase and war. Vasco da Gama found it in the East Indies and Columbus in the West. The Amazons of South America opposed the invading Spaniards with it. It was found by Cabral in Brazil, and in the uttermost solitudes of the Arctic regions it was in use among the Eskimos. Even to-day the pigmy Bosjemen, in the far interior of Africa, bring the mightiest of game to earth with their poison-tipped arrows: a very ancient and widespread practice to which Justin bears witness in the time of Alexander, and Pliny among the Gauls, as well as Vergil and numerous other classical chroniclers.

But the introduction of gunpowder gradually put an end to the use of the bow and arrow, notwithstanding valiant efforts to maintain the ancient traditions. The Rolls of Parliament are full of indications of the gradual falling off of the voluntary practice of archery at the town

butts. It was almost unheard of until it came into new life in London in the year 1760 as an exercise conducive to the improvement of health, and as such it met with a very favorable reception—so much so that by 1781 the Royal Toxophilite Society was formed. The almost continuous wars in which Great Britain for the next 30 years was involved put a limit to it; but after the peace of 1813 archery gradually assumed a stronger position, attested even to this day by numerous societies, popular gatherings, and contests. Modern practice in archery is mainly confined to shooting at targets, although a few sportsmen use it for still hunting. The modern targets are set at various ranges, and the concentric rings of gold (in the centre), red, blue, and black and white have a value in counting of 9, 7, 5, 3, and 1, respectively. In America there are annual competitions of the National Archery Association, and other annual contests by the Potomac Archery Association and the Eastern Archery Association. In these there are contests in "Double national rounds" of 96 arrows at 60 yards and 48 arrows at 50 yards; "Double Columbia rounds" of 48 arrows at 50 yards, 48 arrows at 40 yards, and 48 arrows at 30 yards; "Double York rounds" of 144 arrows at 100 yards, 96 arrows at 80 yards, and 48 arrows at 60 yards; "Double American rounds" of 60 arrows at 60 yards, 60 arrows at 50 yards, and 60 arrows at 40 yards; "Potomac rounds" of 24 arrows at 80 yards, 24 arrows at 70 yards, and 24 arrows at 60 yards; as well as competitions for the longest flight and team competitions of 96 arrows at 60 yards for men and 96 arrows at 50 yards for women.

The crossbow, or arbalest, was shorter than the longbow. It was mounted on a stock, and discharged by means of a catch or trigger. This form of archery was chiefly used by the English at the sieges of fortified places and in naval battles. Ultimately its use was, in the reign of Henry VII (1485-1509), forbidden by law, but continued intermittently for a long time.

Partly as the result of the growing popularity of tennis, archery began to lose ground in this country in the early '30s of the last century, but about the year 1905 there appeared definite symptoms of a revival of interest in it, and during the next few years this interest steadily increased, so that by 1913 flourishing archery clubs had been formed in many of the larger cities throughout the United States. The annual meeting of the National Archery Association at Boston, Mass., in July, 1913, brought together one of the largest assemblages of archers ever seen in this country.

Consult: Roger Ascham, *Toxophilus, or the Schole of Shooting* (London, 1868); G. A. Harsard, *The Book of Archery* (London, 1840); E. S. Morse, *Archery, Ancient and Modern* (Worcester, Mass., 1792); Maurice Thompson, *The Witchery of Archery* (New York, 1878)—a charming book, and the standard American treatise on the subject; T. Roberts, *The English Bowman* (London, 1801); T. Waring, *A Treatise on Archery* (London, 1828).

ARCH'ES, COURT OF. The court of appeal of the Archbishop of Canterbury, as metropolitan of the province. The name is derived from the ancient place of sitting, which was in the Church of St. Mary of the Arches, now usually called Bow Church, in London. The judge of the Court of Arches is styled the Official Principal, although he has for several centuries received

the additional title of Dean of the Arches. Appeals from judgments of this court are heard before the judicial committee of the Privy Council (q.v.). The Court of Arches is empowered to hear such suits as are sent up to it by letter of request from the consistorial courts of the bishops of the province of Canterbury after they have issued commissions of inquiry and the commissioners have made their report. The Court of Arches is the only ecclesiastical tribunal which has authority to pass sentence of deprivation against a clerk in holy orders. Since 1875 the judge of the provincial courts of Canterbury and York has performed the functions of official principal of the Court of Arches, under the Public Worship Regulation Act of 1874.

ARCHETYPE, ăr'kê-tîp (Gk. ἀρχέτυπος, *archētypos*; Lat. *archetypum*, a stamp, die, or model). The original design or pattern after which anything is made or modeled. In numismatics an archetype is the standard coin to whose weight, shape, and design all others of the issue must conform. In palæography the name is applied to an original manuscript from which a number of others are copied, these being then described as constituting a single "family." (See TEXTUAL CRITICISM.) In biology the archetype is an assumed system or structure on which any group of living organisms, whether animal or vegetable, is said to have been made.

ARCHEVITES, ăr'kê-vîts. A people mentioned in Ezra iv. 9. The term probably refers to the inhabitants of Erech in Babylonia (see URUK), who were deported to Samaria by "the great and noble Asnappar"—i.e., Ashurbanipal (668-626 B.C.)—possibly because they had united with Babylon in the revolt of Shamash-shumukin.

ARCHIAC, ăr'shê'ăk', ETIENNE JULES ADOLPHE DESNIER DE SAINT SIMON, VICOMTE D' (1802-68). French geologist and paleontologist, born at Rheims. He began the study of geology in 1830, paying particular attention to the geologic formations of France, Belgium, and England. His most important work is *Histoire des progrès de la géologie, 1834-1839* (8 vols., 1847-60).

ARCHIANNELIDA, ăr'ki-ăn-nêl'-î-dă (Gk. ἀρχι-, *archi-*, chief, first, primitive + Neo-Lat. *Annelida*, from Lat. *annellus*, *anellus*, little ring). A group of small primitive marine worms, regarded by Parker and Haswell as a class, embracing only the families Polygordiidae and Histriodrilidae, the latter minute egg-devouring parasites of the lobster.

ARCHIAS, ăr'ki-as (Gk. Ἀρχίας, *Archias*), AULUS LICINIUS. A Greek poet, known only through the famous oration *Pro Archia Poeta*, which Cicero delivered in his behalf in 62 B.C. He was born in Antioch, about 119 B.C., but early settled in Rome, where he gained the patronage of the prominent men of the day, as Marius and Lucullus, by writing poems on their warlike deeds. He had obtained citizenship in Heraclea, a city that had a formal treaty with Rome, and, on the basis of this fact, desired Roman citizenship, in accordance with a law passed in 89 B.C., which had given Roman citizenship to all individuals who could prove that at the time of the passage of the law their names had been included in the list of citizens of a city in Italy that had treaty relations with Rome. However, his status as a citizen of Rome was challenged, and his case was pleaded by Cicero. The decision of the judges is not known.

ARCHIATER, ăr'ki-ă'têr (Gk. ἀρχίατρος, *archiateros*, chief physician, whence Ger. *Arzt*, physician). A title given by the successors of Alexander to their chief physicians; and, later, by some Roman rulers to their favorite medical attendants, who were usually Greeks. It was bestowed also on state physicians. In the latter sense the use of the title spread to all large towns, since in these a certain number of doctors were selected as *archiatri*, with salaries and perquisites from the public treasury; they were required to minister to the poor without charge. They also served in the same capacity as modern health officers. Consult Watson, *The Medical Profession in Ancient Times* (New York, 1856), and Goldhorn, *De Archiatriis Romanis* (Leipzig, 1841).

ARCHIBALD, ăr'chi-băld, SIR ADAMS GEORGE (1814-92). A Canadian statesman. He was a native of Nova Scotia, and was chosen to the Colonial Legislature in 1869 and in 1888. In 1856 he was Solicitor-General, and one of the Liberal leaders. He was active in bringing about the confederation of the British Provinces, and in 1867 was President of the Council in the cabinet formed by Sir John Young, and Secretary of State for the Provinces. During 1870-72 he was Lieutenant-Governor of Manitoba, and afterward served two terms as Lieutenant-Governor of Nova Scotia, and for a short period as Judge of Equity. He was knighted in 1885. In 1886 he was returned to the Dominion House of Commons.

ARCHIBALD, JAMES FRANCIS JEWEL (1871-). An American war correspondent and writer. He was born in New York City and graduated from Ohio Wesleyan University. Having served as war correspondent in the Chino-Japanese War, and with General Miles in several Indian campaigns, he volunteered as an aid-de-camp in the Fifth Army Corps during the Spanish-American War. He was a member of the first scouting expedition that landed in Cuba about a month before the outbreak of hostilities and was the first American wounded in the war. Afterward he saw much varied service as correspondent in all parts of the world: in the Sudan, South Africa, Venezuela, the Philippines, Russia, Morocco, Albania, and Portugal. He became a fellow of the Royal Geographical Society and of the Royal Society of Arts of London. His published writings include *Blue Shirt and Khaki* (1901), *Tales from the Trenches*, and several plays.

ARCHIDAMUS, ăr'ki-dă'mūs (Gk. Ἀρχιδάμος, *Archidamos*) II (?-427 B.C.). A son of Zeuxidamus, and King of Sparta. He became King after the banishment of his grandfather, Leotychides, 469. In the fourth year of his reign Greece was shaken by a terrible earthquake, and Sparta was left a heap of ruins. Archidamus was at that time foremost in crushing the uprising of the Helots. Before the Peloponnesian War he spoke in favor of arriving at a peaceable settlement of the matters under dispute. In 431 he led an army into Attica, and in the three following years conducted campaigns. He was the father of the famous Agesilaus.

ARCHIDAMUS III (?-338 B.C.), son of Agesilaus and King of Sparta. He succeeded his father in 358. In 367 he defeated the Arcadians in the so-called "Tearless Battle." In 362, shortly before the battle of Mantinea, he successfully defended Sparta against Epaminondas.

At the beginning of the Sacred War he attacked the Phocians. In 338 he led an army to Italy to aid the Tarentines, and was killed in battle on the same day on which Philip won the battle of Chæronea.

ARCHIDAMUS IV, a grandson of Archidamus III, and King of Sparta. It is not known when he came to the throne or how long he ruled. He was King in 294 B.C., for he was defeated in battle in that year by Demetrius Poliorcetes.

ARCHIDAMUS V, a grandson of Archidamus IV, brother of Agis IV, and King of Sparta. On the occasion of his brother's murder (240 B.C.) he fled, but subsequently returned with the object of reëstablishing his power. He was, however, almost immediately slain by his brother's murderers, who feared his vengeance. Archidamus V was the last king of the Eurypontid line.

ARCHIDAMUS. A Bohemian lord in Shakespeare's *A Winter's Tale*, appearing only in Act I, Scene 1.

ARCHIL, är'kil (of uncertain origin), or **ORCHIL**, ör'kil (*Orseille*). A coloring substance obtained from various species of lichens. The archil is not originally present in the lichens, but is developed by the following treatment: The lichens, collected from rocks near the sea, are ground into a pulp with water and diluted ammonia is added; certain colorless acids (erythric acid, etc.) contained in the lichens gradually change, under this treatment, into a purple substance, *orcein*, which is the coloring principle of archil. (If in the same process the carbonate of sodium or of potassium is added to the pulp, ordinary litmus is produced in place of *orcein*.) Archil imparts a beautiful and durable violet color to marble. It has also been used in coloring wines, and was formerly used in wool dyeing, yielding red and violet shades. It is brought into the market in three different forms. The name *archil* is commonly applied to the ordinary pasty form. When offered in the form of a dry mass, it is called *persis*, while powdered archil is known as *cudbear*. The lichens used in the manufacture of archil grow on the rocky coasts of South America, Madagascar, Zanzibar, the Canary Isles, and a number of other places. They belong principally to the genus *Roccella*. They are sometimes called orchella weed, or dyer's moss.

ARCHILOCHUS, är-kil'ô-küs (Gk. Ἀρχιλόχος, *Archilochos*). A native of the island of Paros, who flourished in the seventh century B.C., and is regarded as the first of the Greek lyric poets, although the origin of the elegy is ascribed to Callinus, a writer who flourished a short time before Archilochus. Glances of his life, especially of the calamities which befell him, were frequently given in his writings, which are strongly personal throughout. His father's name was Telesicles; his mother was a slave called Enipo. At an early age, becoming entangled in political contests, he abandoned his native town and led a colony of its citizens to Thasos, in 650 or 640 B.C. While here, as he informs us in some extant verses, he lost his shield in a battle against the Thracians, yet not through cowardice. Subsequently he was banished from Sparta, to which he had gone, some say because the Spartans resented the frivolous verses in which he had vindicated his conduct in running away from the fight; others, because of the license of his verses. He is said to have gained the laurel wreath at the Olympic games

by an ode in honor of Hercules, but this is doubtful. Having returned to Paros, he took part in the war which broke out between it and Naxos, in the course of which he lost his life. The Delphian oracle, it was said, pronounced a curse upon his slayer. Variety, novelty, and satirical bitterness, of a narrow and personal sort, characterized his lyric poems, so much so that "Archilochian bitterness" and "Parian verse" became bywords in ancient times. He scourged his enemies in the most merciless fashion and always displayed the most malicious skill in selecting for his sarcasm the points on which they were most sensitive. It is said that Lycambes, who had promised his daughter Neobule in marriage to Archilochus, having failed to fulfill his promise, was so severely satirized by the poet that, to escape ridicule, both father and daughter hanged themselves. The ancients ranked Archilochus with Homer. They dedicated the statues of both on the same day and placed the head of Archilochus beside that of Homer on the same herm. As Homer was the creator of epic poetry, so Archilochus was regarded as the inventor of the poetry of the passions and of biting railery, of iambic poetry; the iambic trimeter Archilochus brought to perfection. He became the model for the Old Athenian Comedy and for later poets—e.g., for Horace in his earlier period, that of the Epodes, which he sometimes calls *iambi*. He is said to have invented many new metrical forms, but his fame and influence were due primarily to his native genius. Only bare fragments of his compositions remain. They have been edited by Bergk, *Poeta Lyrici Graeci* (Leipzig, 1882).

ARCHIMAGE, är'ki-mä-j. 1. The foul magician who, in Spenser's *Faerie Queene*, assumes the guise of the Red Cross Knight and thereby entices Una from her search. He stands in the allegory for the personification of Falsehood. 2. The personification of Indolence in Thomson, *Castle of Indolence* (1748).

ARCHIMANDRITE, är'ki-män'drit (late Gk. ἀρχιμανδρίτης, *archimandritēs*, from Gk. ἀρχι-, *archi*-, chief + μάνδρα, *mandra*, a fold, i.e., a convent). The title of the highest order of superiors of convents in the Greek church, corresponding to abbot (q.v.) in the Latin church; except that, strictly speaking, an archimandrite presides over several monasteries, whereas the *hegumenos* was over only one, and so the latter was nearer to an ordinary abbot. The Russian bishops are chosen from among the archimandrites.

ARCHIMEDEAN MIR'ROB, är'ki-mé'dē-an. See MIRROR.

ARCHIMEDES, är'ki-mé'dēz (from *Archimedes' Screw*; see below). A genus of fossil Bryozoa of the family Fenestellidae, common in some so-called "Archimedes Limestones" of the early Carboniferous Age in the Mississippi valley and in some of the southwestern States. The minute animals of this genus dwelt in colonies attached to the ocean floor and secreted a calcareous framework of spiral form, the axis of which resembles the Archimedes' screw (q.v.). Continuing the comparison, the thread of the screw is produced as a reticulated expansion, upon the upper surface of which are situated the cells that served as dwelling places for the individuals. The cell-bearing portion of the colony is seldom found connected with the spiral axis, having, by reason of its delicacy, been usually broken off by the action of the waves. Some

nearly complete examples have been found in the soft shales of the Keokuk group at Crawfordville, Ind. See also BRYOZOA; CARBONIFEROUS SYSTEM; and for illustration, see Plate of POLYZOA.

ARCHIMEDES (Gk. Ἀρχιμήδης, *Archimēdēs*) (287–212 B.C.). A Greek geometer and mechanic, the greatest mathematician of antiquity. He was born in the State of Syracuse, in the island of Sicily. He studied probably under Conon at the University of Alexandria, spending the major part of his life in Sicily. He was killed in the sack of Syracuse. The most important among his extant works include three on plane geometry, three on solid geometry, one on arithmetic, and three on mechanics. In the treatise on the measurement of the circle, the value of π is given as a number less than $3\frac{1}{4}$ and greater than $3\frac{1}{8}$. He also gave formulas for the area of the circle and the ellipse, and for the sector of a spiral whose equation is $r=c\theta$. His demonstration that the area of a segment of a parabola is two-thirds that of the inclosing parallelogram is the first real example of the quadrature (q.v.) of a curvilinear surface. His method of exhaustion is suggestive of the modern methods of calculus. In the works on solid geometry are treated the volumes of spheroids and conoids. His arithmetical work, known by its Latin title, *Arenarius* ('sand-reckoner'), contains his famous attempt to express the amount of sand required to fill the universe. This work has given rise to the conjecture that Archimedes invented a new and powerful system of notation, all knowledge of which perished with the work itself. Besides his work in pure mathematics, Archimedes also made valuable contributions to applied mathematics, including applications of geometry to the theory of machines, as levers, pulleys, and screws. He also improved the methods of finding centres of gravity. In accordance with a wish of Archimedes, Marcellus raised in his honor a tomb, on which was engraved a sphere inscribed in a cylinder. Cicero, in his *Tusculan Disputations*, gives a charming account of his discovery of the tomb in 75 B.C. The most noted editions of Archimedes' works are those of J. Torelli (Oxford, 1792), J. L. Heiberg (Leipzig, 1881), and T. L. Heath (Cambridge, 1897).

ARCHIMEDES, THE PRINCIPLE OF. One of the most important principles in the science of hydrostatics, so called because the discovery of it is generally ascribed to the Syracusan philosopher. It may be thus stated: A body, when entirely surrounded by a fluid, is buoyed up by a force equal to the weight of the fluid it displaces. This is an immediate consequence of the principles of fluid pressure, which prove also that the line of action of the upward force is vertically through the centre of gravity of the displaced fluid. When bodies lighter than water are wholly immersed in it, they displace an amount of water of greater weight than their own, so that if left free to adjust themselves they rise to the surface and float, only as much of their bulk being submerged as will displace a quantity of water weighing the same as themselves. Accordingly, while bodies heavier than water displace, when put into it, their own volume, bodies lighter than water displace, when allowed to float on the surface, their own weight of the fluid. Bodies of the same density as water, according to the principle of Archimedes, have no tendency to rise or sink in it, for the

water displaced by them weighs precisely the same as they do. Similar statements may be made with respect to bodies surrounded by other liquids or by gases, e.g., the atmospheric air. The buoyancy of balloons is an illustration of the principle of Archimedes as applied to the atmosphere. See HYDROSTATICS.

ARCHIMEDES' SCREW (called also SPIRAL PUMP). A machine for raising water, said to have been invented by Archimedes, during his stay in Egypt, for draining and irrigating the land. Its simplest form consists of a flexible tube bent spirally round a solid cylinder, the ends of which are furnished with pivots, so as to admit of the whole turning round its axis, as is shown in Fig. 1. The machine is placed in an inclined position, so that the lower mouth of the tube may dip below the surface of the water to be raised. The lowest bend of the tube will be filled with water, and if now the handle be made to turn in the direction of the hands of a watch, the mouth of the spiral tube will be raised above the surface; and the water inclosed in the tube, having no means of escape, will flow within it until, after one revolution, it will occupy the second bend. The first bend has meanwhile

FIG. 1.

FIG. 2.

received a second charge, which, after a second revolution, flows up into the second bend and takes the place of the first charge, which has now moved up to the third bend. When, therefore, as many revolutions of the cylinder have been made as there are turns in the spiral tube, each of the lower bends will be filled with water; and in the course of another revolution, there being no higher bend for the water of the first charge to occupy, it will flow out of the tube by its upper mouth. At each succeeding revolution the lowest bend will be charged and the highest discharged. It will be seen that there may be room to dispose a second tube side by side with the first, round the cylinder, in which case the screw would be called double-threaded. In the ordinary construction of these machines the cylinder itself is hollowed out into a double or triple-threaded screw, and inclosed in a water-tight case, which turns round with it, the space

between the threads supplying the place of tubes. It is sometimes found convenient to fix the exterior envelope and to make the screw work within it, the outer edge of the latter being as close as possible to the former without actual contact, as is shown in Fig. 2. This modification of the Archimedes' Screw receives the name of "water screw," and frequently of "Dutch screw," from its use in Holland for draining low grounds.

ARCHIPELAGO, är'ki-pél'á-gō (Gk. ἀρχι-πέλαγος *archipelagos*, chief sea, originally the Aegean Sea, to distinguish it from the other smaller Grecian waters; from ἀρχι-, *archi*-, chief + πέλαγος, *pelagos*, sea). A term now applied to any definite sheet of water interspersed with many islands, but formerly restricted to the Aegean Sea (q.v.), and its islands. The islands are usually divided into two groups, the Cyclades and the Sporades. Of the former group Delos, Lyra, Cythnos, Thera, Andros, and Melos are more prominent; of the Sporades, some of which belong to Turkey, Rhodes, Cos, Patmos, Samos, and Lemnos are the more significant. They are of volcanic origin, have a healthful climate and beautiful scenery. These islands have played an important part in the course of Greek history. For a more detailed description, see CYCLADES; SPORADES; and individual islands.

ARCHITECTS, är'ki-ték'ts, AMERICAN INSTITUTE OF. A society established in 1857. In 1912 it had 34 chapters, 303 fellows, 678 members, and 59 honorary members.

ARCHITECTURE, är'ki-ték'tár (Lat. *architectura*, Gk. ἀρχιτεκτονία *architektonia*, from ἀρχι-, *archi*-, chief + τέκτων, *tektôn*, worker in wood; carpenter, craftsman). In its widest sense this term includes any kind of building such as works of military and naval construction and civil engineering; but, strictly speaking, it is building raised by certain aesthetic qualities to the rank of art, as distinguished from purely utilitarian or mechanical building. Its name shows that it was regarded by the ancients as the chief art, comprising all others, the architect being director of works, and responsible for whatever sculpture and painting was used in connection with the building. This ancient tradition ruled throughout the Middle Ages, and it was not until the Renaissance in the fifteenth century that architecture lost its right to govern the other arts. Because architecture had this character of the most universal art, using sculpture and painting in subordination, the formation of what we call an architectural style—like the Greek or the Gothic style—was a complex and gradual process. For architecture, being one of the earliest and most constant expressions of civilization, is not the artificial product of the free conception of a few artists, but is fundamentally affected, on the one side by the religious and social elements of society, whose demands it must meet, and on the other by the material elements such as the influences of climate, of materials of construction and decoration, which limit or in certain directions stimulate artistic originality. So that in every age architecture is a faithful mirror of contemporary society, and at once the most material and the most ideal of the fine arts.

Egypt. In respect to historic development, Egypt and Babylonia—the valleys of the Nile and of the Tigris and Euphrates—are rivals for seniority in the field, which they seem to have held alone for one or more thousand years, while

the rest of the world went without architecture. It is true that the extant monuments of Egypt between c.5000 and 2500 B.C. are works of mere building rather than of art. The pre-pyramidal tombs; the pyramids themselves; the primitive chapels or temples connected with them (such as the "Temple of the Sphinx"); the early mastaba-tombs and all other works of the Ancient Empire, have few truly architectural features. The pyramids, temples, and tombs have no moldings, decorations, or details that indicate style. It is incontestable that palaces and temples existed in this early age, but the use of perishable materials and subsequent rebuildings doubtless account for their total disappearance. It is only in the Middle Empire (c.2200) that the type of columnar temple was evolved, which became the glory of Egypt, and that tombs were made—as at Beni-Hassan (see TOMB)—where there were columns and other features with a distinct artistic character—such as the "Doric" type, and the clustered-palm type. The destructive invasion of the Shepherd Kings has forever obscured this second stage of Egyptian architecture, and for a knowledge of its possibilities the Golden Age is that of the New Empire, especially between c.1600 and 1300, supplemented by the much later constructions of the Ptolemaic Age, almost equally magnificent. Some of the temples were entirely excavated in the rock like those at Abu-Simbel (q.v. for illustration); others were partly excavated, partly structural, as at Deir-el-Bahari; but the great majority were built entirely in the open and of stone masonry. A few are sepulchral temples, such as the Ramesseum (q.v.) of Rameses II near Medinet Habu, but with these exceptions they are purely temples to the gods. Each temple of the usual type was approached through a long avenue of sphinxes or statues, was preceded by an immense façade of pylons connected with an encircling wall, with an open columnar court, at the opposite end of which was a hall of columns forming the prelude to the sekos or dark inner sanctuary. This is undoubtedly the earliest conception of a large columnar interior in architectural history, and though its proportions may be heavy, the composition was artistic and imposing, and both sculpture and color were used with architectural details to enhance the effect. Karnak, Luxor, the Ramesseum, Edfu, and Philæ are the masterpieces of a period covering some 1500 years (for illustrations of Edfu and Luxor, see those titles). No vaults or arches were used in any part of this architecture—only the straight lintel, the column, and sometimes piers fronted by figures of Osiris. The heavy columns, of so many forms as to rebel at any classification by orders, were placed very close together, so that the effect was not one of spaciousness.

Babylonia and Assyria. The beginnings of Babylonian architecture are, like those of Egyptian art, lost in the mists of antiquity, but it reached its full development long before the Egyptian, and, while the latter remained isolated, stood at the head of a long architectural genealogy, for Elam and Assyria literally copied it; Persia, the Hittites, the Phœnicians and other nations borrowed from it, and its influence was felt even to China and India. Through nearly 5000 years previous to Nebuchadnezzar's time this architecture underwent little change. There could be no sharper contrast than that which it presents to Egyptian types. Owing to the lack of stone and scarcity of timber, brick,

for the most part sun-baked, was the chief building material. Hence the arch and vault, carried by massive walls, took the place of the stately pillared halls, stone lintels and ceilings and sculptured piers and columns of Egypt. The temples had no large interiors, but were stepped pyramids, remarkable mainly for their great height, their external mass, and the brilliant coloring of their receding stories, faced with glazed tiles. Only in the royal palaces did the Babylonians excel, creating a type which the Assyrians developed with numerous halls and chambers grouped around three main courts. The palace at Tello, the temples at Erech and Ur, give the usual types; but the excavations at Nippur and Babylon have disclosed other splendors. Meanwhile the better preservation and more thorough study of the Assyrian ruins enable us to judge somewhat of the details of the earlier style. The temple observatory and the palace of Sargon at Khorsabad were destroyed by some great catastrophe—probably by fire—while they were still occupied, perhaps at the time of the fall of Nineveh; but their plans and decoration in sculpture and color can be reconstructed from extant remains. Glazed bricks and tiles and alabaster slabs carved in relief were the chief means of adornment. Neither the palaces nor the temples, however, could approach the monumental grandeur and stateliness of Egyptian architecture.

Hittites and Phœnicians. The Hittites, the rivals of both Egypt and Assyria, were great builders; like the Egyptians, they used stone and were constructors of fortresses. Of their temple architecture little is known; but their palaces—one of which has been excavated at Senjerli and another at Boghaz-Köi—appear to have been of a type similar to the Assyro-Babylonian. Their works were scattered from the confines of Assyria to the Syrian coast and as far northwest as the interior of Asia Minor. Of the architecture of the Phœnicians very little remains; they also built in stone, and like the Hittites used at first the Cyclopean and polygonal masonry. The great fortifications and ports of Arvad, Tyre, Sidon, and the colonies of Africa and Italy show that the utilitarian side of this architecture was more developed than the religious; for the temples themselves were but small shrines, none of them equaling, apparently, the temple of Jerusalem in size and splendor, though the actual work on this temple was done by Phœnician artisans and artists.

The Ægean Style. It was the migrating Pelasgic tribes of Asia Minor, the Mediterranean islands, Greece and Italy, whose works formed the first link between these early architectures of western Asia and that of the pre-Hellenic and Hellenic world, forming what is called the Ægean style, which flourished mainly between c.2000 and 1000 B.C. The cities of Crete, as Cnossus, and of other islands, of Troy and other cities in Asia Minor, Tiryns, Mycenæ, Argos, and others in Greece, besides many early Italian cities, such as Norba and Lignia, show how impressive and rugged a style of construction was combined by these races with a delicate and varied decoration, especially in the bee-hive domical tombs (Mycenæ, Thoricus, Vaphio, etc.) and in the royal palaces, which were as important in their way as those of the Assyrian kings.

Persia. The second connecting link was Persia. Its great palaces and tombs at Susa, Persepolis (q.v. for illustration), Meshed Mur-

gab, and Pasargadæ, with monuments from Cyrus to Artaxerxes, show the influence of Egypt in their great columnar halls—though they are far more spacious and light than the Egyptian—of Babylon and Assyria in the use of brickwork, sculptured colossi, and friezes of reliefs, and in the curious double-animal capitals and the enameled tiles. From Lycia and the Greeks of Asia Minor came the high stone basements for their structures, the flutings of their columns, and many details. The hall of Xerxes at Persepolis is more than twice the size of the great hall at Karnak, and shows how such columnar interiors, once introduced into western Asia, were appreciated and developed. The later dynasties of Persia—both Parthian and Sassanian—threw off many of these foreign elements in a tendency to return to the brickwork, the domes, vaults, and arches of truly Oriental type, as can be seen in the palaces at Sarbistan, Firuzabad (q.v. for illustration), and Ctesiphon.

Greece. Meanwhile, even before the rise of Persian architecture, the Greeks had originated the Doric and Ionic (for illustration, see these titles) orders in all their essential features. The temple, which is the one central type in this architecture, appears to have developed out of the main hall of the Pelasgic royal palace, as it is seen in Crete, Troy, Tiryns, and Mycenæ, through a middle stage of crude brick walls, wooden columns, architraves, and gables, with terra-cotta revetment and decoration, into the final type of stone temple which was reached as early as the seventh century B.C. It is in Sicily and southern Italy that the earliest works of the Doric style are to be found (Syracuse, Selinus, Metapontum), while the earliest Ionic temples were in Asia Minor, at Samos and Ephesus; but these hardly rival the Doric in age, and their ruins do not belong, like those of the Doric temples, to the primitive structures. The normal type of these temples was a building raised on a three-stepped platform, and consisting of one main cella-chamber (*naos*) usually supplemented at one end by a smaller chamber (*opisthodomos*), and preceded at the other end by a *pro-naos*, the whole being surrounded by a colonnade on all four sides, surmounted by an entablature and covered by a gabled roof terminating in pediments (q.v.). The æsthetic Greeks did not plan great columnar halls or courts like those of the Egyptian temples, but relied on external effects almost entirely; on refined beauty of outline and proportion. Never, until the period of decadence, was there any attempt at impressive size. The Doric style was heavy in proportion and plain in ornament, in comparison with the Ionic, but provided for more considerable figured sculpture in the friezes, metopes, and gables. It prevailed at first over nearly the entire Hellenic world, gaining gradually in delicacy and lightness, especially when handled by artists with Ionian blood, as was the case at Athens, which contains in the Parthenon and the Theseum the two finest works of the developed Periclean Age, though they are almost rivaled by some Italian and Sicilian works, such as the temples of Paestum (q.v. for illustration) and Girgenti. At this time other works, such as the Propylæa at Athens, became worthy to stand beside the temples, and here the two styles—Doric and Ionic—were for the first time combined. The originality and daring of this Attic school were also shown in the Porch of the Maidens in the Erechtheum (q.v. for illustra-

tion). The succeeding Age of Praxiteles, and the Alexandrian Period brought even slimmer Doric proportions, increased favor for the more decorative Ionic style (temples of Miletus and Ephesus), development of the still richer Corinthian order (see COLUMN), and of colossal forms of public, civil, and sepulchral architecture (such as the propylæa, theatres, odeons, stoas, the altar at Pergamus, the mausoleum of Halicarnassus), in which Oriental splendor and love of the colossal overruled Hellenic restraint.

Rome. This prepared the way for Roman architecture. In the Royal and Early Republican Periods Rome had followed the Etruscan and Latin types: wooden temples with terra-cotta revetments in a *quasi*-doric style and civil structures of stone, vaulted and arched. These two types remained fundamental, except that before the close of the Republic stone had replaced wood and terra-cotta in the temples, the Ionic style had been introduced by Greek artists, and the Greek column and entablature had been added as a surface decoration and reinforcement to the constructive arcades in secular buildings. The Greek spirit informed the Roman in the sphere of art, without conquering it, for ordinarily it is not difficult to distinguish the two styles. The Roman temples are rarely peristyles, but prostyles, with a very deep portico or pronaos in front, and this alone would be sufficient to make their appearance differ fundamentally, even without the substitution of the richer and more slender Corinthian and Composite forms for the Doric and Ionic. But the true nature of Roman architecture appears in its civil structures: in theatres and amphitheatres, aqueducts, triumphal arches, palaces, villas, and, above all, in the baths or *thermæ*. The Roman genius for composition shines in such great combinations of structures as the Villa of Hadrian, the Palace of the Cæsars, the Forum of Trajan (see FORUM), and the Baths of Caracalla and Diocletian. And the great vaulted interiors of some of these buildings, such as the Basilica of Maxentius and the Baths of Caracalla, surpass anything previously conceived of in architecture. It was, indeed, the Romans who first conceived the design of vast unencumbered interiors with lofty roofs, and the grandeur of the circular Pantheon of Hadrian (120 A.D.) has never been surpassed. With the Greeks, architecture had been plastic; with the Romans, who developed the ideals of the Alexandrian Greeks, it was pictorial. It also combined, in the highest degree, utility and comfort with imposing and costly appearance. The whole civilized world was filled with the monuments of this art, which fell heir to the cultures of both the Orient and Greece.

Early Christian. With the advent of Christianity architectural development coincided with the building and decorating of churches. The public basilicas of Rome and the basilical halls of private houses offered admirable prototypes for the Christian halls of worship. The early Christian architecture, with thin brick walls, wooden ceilings, and long colonnaded interiors, at first prevailed everywhere, poverty of architectural form and detail being partly concealed by rich mosaic and marble ornamentation.

Byzantine and Basilical Styles. As early as the sixth century, however, the Oriental constructive spirit asserted itself once more in the Hellenic Provinces, and two sharply contrasted styles henceforth flourished side by side: the

wooden-roofed Latin basilical architecture in the West, especially in Italy,—Rome, Ravenna, Salonica, central Syria, North Africa, being full of early basilicas; while in the East, especially Constantinople with St. Sophia (q.v. for illustration) the Byzantine architects developed a new type of church, wholly of masonry of brick or stone, in which a dome borne on pendentives was the central feature. (See DOME.) Ravenna, Greece, Asia Minor, and Syria possess numerous Byzantine churches; but the richest and finest of Byzantine churches, next to that of St. Sophia, is the church of St. Mark at Venice, dating from 1047. While the Byzantine style underwent, in the course of succeeding centuries, certain changes, such as the heightening of the drums of the domes, the decoration of the exterior with marble or alternate courses of stone and brick, the use of accessories like porches, colonettes, etc., these differences were of minor importance.

Mohammedan. In the West, on the contrary, the new civilization resulting from the awakening of the northern races in the eleventh century and their fusion with the old stock created for itself a new architecture of which the first phase is called Romanesque, the second Gothic. But before describing its characteristics, a phase of Oriental architecture which arose in the meantime must not be omitted—that of the Mohammedan peoples in the great empire founded by the Arabs in the seventh century. Syria, Palestine, Persia, Egypt, North Africa, Spain, Asia Minor, and other lands, wrested mainly from the Byzantines, were filled with monuments of a varied and rich style, based primarily on Byzantine and Persian models adapted to new purposes and different ideals. The mosques, mausoleums, minarets, khans, hospitals, bazaars, palaces, oratories, and fountains form a varied group of buildings. The Moorish school of Spain from the time of the mosque of Córdoba to the Alhambra (q.v.) of Granada; and the Egypto-Arabic school of Cairo, from the mosques of Hassan and Tulun to that of Kait Bey, are the best known, but the Syrian and Palestinian school, centred at Damascus, and the Persian school, centred at Bagdad and Ispahan, were fully as important—the latter sending out offshoots as far as distant India and Asia Minor. The development of the dome, the stilted, horse-shoe and pointed arches, stalaetite vaulting, geometrical decoration, particularly in brilliant faience and mosaic—these are characteristics of the Mohammedan schools. The Golden Age began in the tenth century. The dominant type of mosque comprised a cloistered court leading to a low pillared hall of many aisles, as in the mosques of Kairwan, Damascus, and Cairo. The dome, at first used solely over the tomb in sepulchral mosques, was later used over the prayer-hall also, as in the famous Aksa Mosque and Dome of the Rock at Jerusalem. In the eleventh century the final fixed types had been reached; the minaret had become an essential adjunct; the geometrical style of ornament was complete with its bewildering tracery, and the dome had triumphed over the flat ceiling. In India, especially under the Moguls after 1494, the Persian forms of dome, minaret, and arch were blended with many Hindu features in magnificent mosques, palaces, tombs of sandstone and marble, of which the Taj at Agra (q.v.) is the most perfect example. The latest addition to the artistic heritage was through the Turkish conquest of Constantinople in the fifteenth cen-

tury, which led to a return in even greater force of the primitive influence of Byzantium.

Romanesque. Meanwhile Europe had enjoyed the architectural revival of the Romanesque Period. First Italy, then Germany and France, and finally England and Spain had felt the new artistic currents. There were no national styles, far less was there any unity throughout Europe. Each province had special characteristics. In parts of Italy, such as Tuscany and Rome, the arrangement of the early Christian basilica was preserved almost intact with the added enrichment of marble and mosaic incrustations and new architectural details. It was the same in most of Germany and northern France until the twelfth century. Some sections, as Venice and Sicily, were even strongly affected by Byzantine art. But the most fertile novelty of the age was the development of the vault, which found expression particularly in central and southern France and northern Italy. The dome (Périgord), the tunnel vault (Provence, Burgundy, Spain, etc.), and the groin or cross-vault (Lombardy) were all successfully used to cover churches of the basilical type of plan. The future of architecture lay in this development. Gradually the ribbed groin-vault gained the supremacy and spread to Germany, Normandy, and other provinces of France, preparing the way for the Gothic style. The great crypts, the porches, towers, façades of rich and varied types, a decoration of figured and ornamental sculpture, made possible by the use of stone in place of brick, were among the prominent features. This phase of vaulted Romanesque was rich, heavy, and impressive. It was particularly the style of the monastic orders.

Gothic. Out of it there gradually grew, in the course of the twelfth century, in the north of France, the Gothic architecture (q.v. for illustration), the perfect embodiment of vaulted constructive design (see VAULT) formed of three main elements: ribbed groin-vaults to cover the interior spaces; piers to receive their vertical weight; and flying buttresses, to transmit and resist their thrusts. The last-named feature, the flying buttress, or, more properly, the flying arch and buttress, was the culminating invention of the Gothic designers. It was the outcome of nearly a century's experiments in the effort to devise some means of adequately resisting the powerful outward thrusts of the high central vaults of nave and choir, without increasing the massiveness of the internal piers separating the aisles on which these vaults rested. By the flying arches these thrusts are transmitted to the massive buttresses built outside the side aisles, and the internal piers have to support only the vertical weight of the vaults. It was an anticipation of modern engineering principles. Thus resulted a species of stone skeleton which, when perfected, freed architecture from the thralldom of heavy walls; hence the development of large windows with their tracery and stained glass, the slender piers, the lofty vaults. The new style was hailed everywhere and spread from the region of Paris gradually over Europe, being best understood in Spain and England, less so in Germany, and least of all in Italy. It coincided with the bloom of mediæval sculpture, which remained the handmaid of architecture, contributing to the rich harmony of the style. For the first time since Roman days, a single general style prevailed throughout western Europe, though varied in detail by local schools and na-

tional peculiarities. The typical cathedrals are those of Paris, Amiens (q.v. for illustration), Rheims, and Cologne (the latter completed, however, only in recent times), having great choirs with radiating chapels and aisles, a transept with façades, a nave with two or four side aisles, a western façade with two flanking towers. Single towers in the centre of the front, as at Ulm; square screen façades, as at Peterborough; plain, square-ending apses, as often in England—all such features are variations from the orthodox French type. So are the many cases, especially in Italy, where wooden roofs in place of ribbed vaults are used with Gothic forms, but in violation of Gothic principles. The development of the Gothic styles was progressive. The French churches of the twelfth century retained many Romanesque forms and heavy proportions, as at Sens, Senlis, Noyon, and Laon. Larger windows and lighter tracery, more slender proportions, and greater height of vaulting came with the Golden Age of the thirteenth century, with Notre Dame in Paris (1163-1230), Chartres, Rheims, Amiens, and St. Denis. The attenuated geometric style reigned in France in the fourteenth century; then the flamboyant until the sixteenth century. In England the Early English corresponds to the thirteenth, the Decorated to the fourteenth, and the Perpendicular to the two succeeding centuries. Other countries had corresponding but less clearly marked divisions. The general tendency was increase of decorative richness and variety of form, a loss of scientific as well as artistic values, the invasion of prettiness in place of breadth and strength.

The Renaissance. Although Italy had created some large monuments in a *quasi-Gothic* style, monastic churches, such as Santa Croce and Santa Maria Novella in Florence, and the Frari in Venice; cathedrals, such as Siena and Milan (q.v. for illustration), Italian artists were prepared for the Renaissance style introduced by Brunelleschi and his followers early in the fifteenth century, a style based on the study of Roman monuments adapted to mediæval needs. The new style employed the dome very successfully in its churches, but it was preëminently a decorative and not a constructive style, and, like the Roman architecture which it followed, found its best expression in civil, not in religious monuments. Single artists stamped their works with a special style. Brunelleschi, Alberti, Bramante, Sansovino, Michelangelo, Palladio, are not merely names—they are types. The Roman scheme of using the constructive arch within a decorative framework of pilasters or columns and entablatures became a Renaissance commonplace. The palaces and civic buildings of Florence, Rome, Venice, Lombardy, Genoa (for illustration, see those titles), represent the essential features of the style rather than such churches as those of Santo Spirito at Florence, St. Peter's at Rome, La Salute at Venice. Although early Renaissance decoration is exquisitely delicate, later developments tended first toward magnificence and later toward coarseness and final vulgarity. The imitation of classic art was at first not complete; Alberti aimed at it, but it reached its cold perfection only under Palladio, just before the opposite school of fantastic irregularity, called the Baroque, came to the front before the close of the sixteenth century. The style was at first almost entirely in the hands of Florentine artists, who introduced it everywhere; then the

Lombards took the lead under Bramante, with a branch in Venice; finally the Roman school, with Michelangelo, Raphael, Vignola, and many others, obtained supremacy.

Meanwhile the Renaissance style was spreading over Europe, where it first blended with and then superseded Gothic. This occupied nearly the entire sixteenth century, for although it penetrated to France about 1500, it did not obtain national foothold in Germany until about 1550, nor in England much before 1600. In none of these countries was it used in its original purity, being everywhere affected by national peculiarities. The most artistic changes were those in France, whose chateau architecture, especially in the Loire region and near Paris, produced masterpieces of composition worthy of comparison with the best Italian work. Blois, Chambord, the Louvre, the Tuileries, the Luxembourg, and Versailles form an unsurpassed series. For illustrations of the Louvre, the Luxembourg, and Versailles, see these titles.

Germany was more foreign to the classic spirit; and the percentage here and in England of purely classic design was much smaller than in Italy or France. The classic orders were less frequently used, and architecture retained more mediæval features. The most interesting classes of buildings in Germany during the latter sixteenth and early seventeenth centuries were the princely castles and residences, of which the finest example is the Heidelberg Schloss; and the town halls, like those of Altenburg, Bremen, and Augsburg.

The Renaissance in Italy produced a codification of Roman architectural principles (of Greek types nothing was known) which was embodied in a series of books, the most important being the *Regola delle cinque ordini d'architettura* of Giacomo Barozzi da Vignola (1507-73) (q.v.). On these books was based the practice of Europe in the seventeenth and eighteenth centuries. In Italy the purest classic type prevailed during the latter part of the Renaissance. Bramante employed Roman details with great elegance and purity, as did also his successors, Peruzzi, Antonio da San Gallo the younger, Palladio, and especially Vignola and Giacomo della Porta, who assisted Michelangelo on the dome of St. Peter's and the Capitol in Rome. Toward the end of the sixteenth century there also appeared a tendency toward extreme freedom in decoration, producing the so-called Baroque style (see BAROQUE ART), which ultimately caused the degeneracy of Italian architecture. Until, and to some extent during, the time of Bernini (1589-1680), however, the Baroque is quite in harmony with the revived Roman style and lends piquancy to it; as in Bernini's colonnade before St. Peter's.

The Italian classical movement was continued in France. At first felt in the sixteenth century in the work of Pierre Lescot at the Louvre, Jean Bullant at Ecouen, and Philibert de l'Orme at the Tuileries, its influence increased until the middle of the seventeenth century and culminated in the prodigious undertakings of the reign of Louis XIV (1643-1715), at Versailles, Marly, Trianon, and Paris. The movement affected not only the buildings themselves but their emplacement. The large lines of the plan of Paris may be traced to the reign of Louis XIV.

The principles established in the seventeenth century continued in the eighteenth and developed into the current French architecture of the present day. French decoration is, in large

measure, an adaptation of the Baroque style and has passed through phases which correspond to the reigns and have taken the names of succeeding monarchs—style Louis XIV, Louis XV, Louis XVI. (See Rococo.) French architecture crystallized about the formation of the Académie Royale d'Architecture in 1671, which is now merged with the Institute. Its school is perpetuated in the Ecole des Beaux-Arts (q.v.).

In England the course of revived classicism had not the strength developed in France, but it received a powerful impulse from Inigo Jones (1573-1652) and his follower, Sir Christopher Wren (1632-1723), the great architect of St. Paul's Cathedral, who was contemporaneous with the reign of Louis XIV. It derived also a certain consistency from the use of the book and drawings of Palladio, introduced by Richard Boyle, Earl of Burlington (1695-1753). The term "English Palladian" applies well to work done until after the time of Sir William Chambers (1726-96). The German people during the seventeenth and eighteenth centuries produced much interesting architecture, but developed little which is characteristically national. They yielded easily to Italian and French influences.

Throughout the early part of this period Flanders and Holland adopted the classical and Baroque traditions of Italy, with which country they were in close commercial relations. The architecture of Spain in the sixteenth century developed a peculiar form of Renaissance called Plateresque and in the seventeenth and eighteenth centuries is a picturesque outgrowth of the Italian Baroque. See CHURRIGUERESQUE.

Colonial Architecture. In general this name is applied to the architecture of any colony which reflects the contemporaneous work of the mother country. It is here used of the very important Colonial styles developed in the Americas during the eighteenth century.

The Spanish colonies, especially Mexico, produced interesting architecture directly derived from the late Baroque buildings of Spain, sometimes called Churrigueresque (q.v.) which was, doubtless, occasionally executed by native workmen with Aztec traditions. As in Spain, it shows a tendency to concentrate decoration at points, as about doors or towers, where it is contrasted with large, plain wall surfaces. There is also a brilliant use of colored tiles. Mexican architecture is famous for the development of the low Spanish domes, of which there are many fine examples by the native architect Treguerras. In the neighborhood of southern California the use of sun-dried brick (adobe) gave origin to a unique form of Spanish-Colonial which is called "Mission Architecture."

The term "Colonial" (sometimes also "Georgian"), as applied to the English colonies, includes all the work done under the influence of English examples in the eighteenth and early nineteenth centuries; chiefly, that is, during the reigns of the four Georges. Unlike the Spanish the northern buildings are elegant, precise, and a little dry in style, with a decided leaning toward classicism, not in accuracy of design but in purity of line and proportion. Before 1730 building was confined to dwellings, chiefly of wood. As the country became settled and it was possible to build with more elegance, carpenters and builders instructed themselves by the use of English architectural books by Sir William Chambers and others, or compilations from them, which fixed the practice at least in the northern

colonies. Perhaps the most interesting product of the New England Colonial style is the series of charming meeting-house steeples suggested by the spires of Sir Christopher Wren's and James Gibbs's churches in London.

In New York and the middle part of the country there is the same adaptation of English details, but with broader and richer effects. In the South, where brick was quite generally used, the ample country residences gave fine opportunities.

Colonial architecture was influenced to a slight degree by French practice. From 1784 to 1787 Thomas Jefferson was Minister to France, and not only took much interest in architecture, but also assisted young American architects, like Charles Bulfinch (q.v.), in their studies. In the buildings which he superintended, however, his house at Monticello, Va., and the University of Virginia, he followed English text-books chiefly. A French draughtsman named Mangin was employed on the City Hall in New York, finished 1811, but the actual architect was John McComb. An able Frenchman, Pierre Charles L'Enfant, made the plans according to which the city of Washington was laid out.

The Capitol at Washington, although the dome and wings were built in the nineteenth century, may still be considered the chief Colonial monument, the central part being the work of architects trained in the eighteenth century.

The Nineteenth Century. The regular sequence of developing styles ceases in an abrupt way with the wars of the French Revolution. Before that time no style of architecture had ever existed which was not in the main the result of natural evolution. Since the close of the eighteenth century, however, there has occurred a series of imitative fashions chasing one another rapidly across the background of equally mutable social conditions.

The first of these fashions is the so-called *Style Empire*, the character of decorative design influenced in part by new study of Roman antiquity and partly reproduced from the work of the preceding reign and fitted to the grandiose requirements of Napoleon's brief dominion. The French Republic had shown a marked deference to what were supposed to be the thoughts and ambitions of the Roman Republic, and a fancied attempt to reproduce the Roman forms is evident in all the work of the Napoleonic epoch. This, however, applies only to the larger masses, for in the furniture and metal work of the time there is more of Louis Quinze than of *Æmilius Paulus*—a formalized rococo rather than a modernized Greco-Roman style. The endurance of this fashion was brief, however. The *Arc de l'Etoile* and the great Church of the *Madeleine* in Paris were begun and their character determined during this period. Also the character which we associate with Paris of wide and elegant avenues was fixed by Percier and Fontaine, although such arcades as those of the *Rue de Rivoli* and the *Rue Royale* were not destined to become a favorite addition to important streets. The influence of the Empire style was hardly felt outside of Paris; and for succeeding students it has been rather a fashion in costly furniture and the hanging of walls with silk than an architecture of dignity.

With the return of peace there came to Europe a long period of singular artistic sterility, due in part to the extraordinary changes, political,

social, and above all industrial, of that period. In Great Britain and Germany and later in the United States, the study and imitation of Greek architecture were stimulated by the publication of several remarkable books, which for the first time made known to the world of culture the real form and aspect of the Greek monuments. Certain phases of imperial Roman art were also thus published to the world as models for imitation. Under these influences there were built Greek and Roman porticoes with square box-like churches or commonplace public buildings behind them, such as the British Museum and St. Pancras's Church in London. Smaller churches of this sort are somewhat abundant in Great Britain and in America, where the Greek details were applied with considerable taste and ingenuity to secular buildings as well as to churches. Unfortunately, both in England and the United States, the use of lath-and-plaster and of other cheap substitutes for fine materials became very generally prevalent. Architecture had, indeed, become to the general mind a mere matter of external dress and superficial aspect, not of fundamental structural design. In the absence of any true appreciation of the real problem of architecture, it was thought quite sufficient to dress a building, planned without taste and cheaply constructed, in the garb—so far as colonnades and decorative details were concerned—of the refined and perfect Greek architecture, or of the stately and impressive Roman style. But such a method of design could never produce really fine buildings nor remedy the essential incongruity between the structure and its dress. The Greek Revival of England, Germany, and the United States, and the Roman copyism of France and the rest of Europe, failed to rescue architecture from its banality and lifelessness. No new style and no vital and rational architecture could result, though some of the products of these movements—the British Museum at London, the St. George's Hall at Liverpool, the *Ruhmeshalle* at Munich, for instance—were at least externally dignified and decorative in effect.

During the same period (1825–50) in which one group or school of architects were thus copying Greek and Roman façades, another group in England were preaching the revival of the Gothic style as the only hope of architecture. In their eyes the classic styles represented paganism and an alien civilization; the English Gothic was a national and Christian architecture, and for churches and schools, at least, the only rational and appropriate style to copy. Like the neo-classic movements, this was really an intellectual and sentimental rather than an æsthetic propaganda. Not the thoughtful designing of buildings as to plan, construction, and decoration, on principles of sound reasoning guided by a cultivated taste, but the copying of the forms of some dead style or the imitation of ancient buildings, was still deemed the proper path to follow. Hence this movement, like the other, though promoted with enthusiasm by men of sincere purpose, lofty aims, and high culture, failed to produce either a new style or a really vital revival of an old one. The progress of archæology led, however, to increasing consistency and correctness of design; while in the second phase of the movement, from 1850 to 1870 or 1880, greater intelligence and freedom in the adaptation of details and originality in the invention of new combinations, the following of

Italian Gothic models in much of the secular architecture, and a great and general improvement in the arts and crafts of building, led to the erection of many interesting and highly ornate buildings. As was to be expected, the best results were attained in ecclesiastical and scholastic edifices, but the Houses of Parliament by Sir Charles Barry (see WESTMINSTER PALACE), the Assize Courts at Manchester and several town halls, are also in many respects worthy of admiration. The name "Victorian Gothic" is often applied to the later phases of the movement.

In France there was no parallel to either of these developments. The so-called Neo-Grec movement, led by Duc, Duban, and Labrousse between 1830 and 1850, was a concerted effort by these able architects to introduce more of Greek refinement and of personal originality into the official and public architecture of France, wholly dominated at that time by the rigidly classic Roman teaching of the *École des Beaux-Arts*. Complete freedom in the handling of the orders as well as in the general composition of architectural designs, and a refined but somewhat dry treatment of profiles and other details, characterized the work of these men in the court of the Beaux-Arts, the column of the Bastille, the west wing of the reconstructed Palais de Justice, and the Library of St. Geneviève. These works strongly influenced the successors of Duc, Duban, and Labrousse and introduced into the French architecture of the period 1850-80 a new element of flexibility and elegance not found in the more purely archaeological or the utterly commonplace contemporary architecture of other countries. Meanwhile, however, under the Second Empire of Napoleon III (1852-70), a new and more powerful tendency appeared in the admirable work of Visconti and Lefuel, to whom was intrusted the completion of the Louvre (q.v.). In this they followed, not blindly but with careful regard to the spirit and character rather than the detail, the models left by Lescot in the Court of the Old Louvre: that is, the best work of the style of Henry II. Nearly all public and monumental architecture in France has since been either in a free version of this style, or inspired from that of the preceding reign (Francis I), but modified and adapted to modern uses with a skill and good taste which are characteristic of the French among modern nations. Another important building which has strongly influenced later French architecture is the Opera of Charles Garnier, an over-ornate but admirably composed design. In the adornment of buildings with decorative sculpture externally and with mural paintings within, the French stand far ahead of all their contemporaries. A disturbing element in the evolution of modern styles has been the invention or adoption of new materials and processes of building, to which it was difficult to adapt the forms of the traditional styles, while architects trained in these lacked the courage and resource to evolve rational new forms and combinations suited to the new requirements. After all, styles and details are not made in a day, and the best architecture has always been the product of slow evolution from traditionally accepted forms. The introduction of iron and steel columns and trusses, making possible the light and broad-spanned roofs of modern railway stations and armories, was due to the engineers first of all, and architects have been slow to make these new re-

sources serve highly æsthetic ends. The recently developed vogue of concrete, and adoption of steel-frame construction for very lofty buildings, have introduced new problems with which architects are still struggling with more or less success. In spite of the persistence of historic style forms, the modern buildings that have resulted are wholly unlike any that have preceded them and reveal the evolution of a new style, not in the details used so much as in the use made of the details. An earnest of this modern style is seen in the Library of St. Geneviève, Paris, with its internal iron columns and light trussed arch-ribs, though this dates back to about 1845-50. The great groups of exhibition buildings at Paris in 1889 and 1900, at Chicago in 1893 and at St. Louis in 1904, and the recently completed Pennsylvania Terminal at New York exhibit various phases of this development. (See STYLE.)

In the United States, with the decline of the Greek Revival, a period of architectural sterility supervened, which lasted until about 1880. The Greek movement left behind it a considerable number of buildings which, in spite of the fundamental error underlying the movement, were dignified in mass, refined in detail, and solid in construction, e.g., the Washington Capitol, Treasury and Patent Office, the Marine Exchange and Girard College at Philadelphia, the Custom House at Boston, and many others. The period that followed was destitute of guiding ideas, taste had sunk very low; politics and the conquest of the wilderness of the West occupied all minds; and then came the desolation and exhaustion of the Civil War, followed by wild speculation and the panic of 1873. There were but a handful of trained architects in the country. The official architecture of governmental buildings of that time is exemplified in the State, War and Navy Departments at Washington, the Post Office at New York, the City Hall at Philadelphia, and the State Capitol of New York at Albany—dull and heavy designs, badly planned, mechanically executed; supposedly "inspired" from contemporary French architecture! But new agencies had been set in motion tending to better things: museums of art (the Metropolitan of New York dating from 1871); the influence of several strong men trained in Paris, the increasing tide of European travel; and the new prosperity which, after the completion of the Union Pacific Railroad in 1869 and final recovery from the panic of 1873, furnished new resources with which to meet new and increasing demands for buildings. Students of architecture began to supplement their American training by two or three years of study in Paris and travel in Europe, and an extraordinary activity in building was accompanied by a remarkably rapid awakening and development of the public taste. For 15 years or more the influence of H. H. Richardson (q.v.) was paramount, beginning with his fine Trinity Church in Boston (1876) and was continued by a remarkable series of public, private, and ecclesiastical buildings, designed in a vigorous though highly personal style based on French and Spanish Romanesque precedents. This was succeeded by a growing taste for classic and Renaissance types, greatly stimulated by the enthusiasm awakened by the show palaces of the Columbian Exposition at Chicago in 1893. Rapid progress was made in both the design and construction, as well as the planning of monumental edifices and groups

of buildings, owing both to the improvement of taste in the public and to the increasing numbers of trained architects and draughtsmen, many of them educated in Paris. Building activity became greater in the United States than in any other country, and vast sums were spent yearly on business buildings, palatial residences with superb gardens, libraries, and university groups. The development of the elevator or lift, between 1865 and 1880, made practicable buildings of 8 to 12 stories in place of the old-limit affair of 5; and steel-frame construction, first developed in a practical way in Chicago about 1886-88, and adopted in New York since 1892, made possible the "sky-scraper" of 20 or more stories, represented by the Woolworth building (1912) of 57 stories. Eclecticism has prevailed as to style in late years, the details of Gothic architecture having found great favor for many kinds of buildings, while versions of classic and Renaissance styles, freely handled, rule in the majority of buildings of a monumental character, varied by the occasional employment of Greek forms and details.

Recent Architecture. The profound peace enjoyed by the people of western Europe and America in recent years has encouraged extensive building. In Europe the necessary monuments and public buildings have been built according to customary formulas, but in minor works there has been a tendency toward extreme eccentricity. An abandonment of old conventions and the development of new has created the so-called *Art Nouveau* or *Style Nouveau*, which is represented in all the arts, but has had most effect in architecture. So far as the *Style Nouveau* has contented itself with the abandonment of meaningless excrescences and tended to bring architecture back to its fundamental relations of color, line, and form, its work has been beneficial. But it has seldom stopped at this point. It has usually proceeded to the invention of new forms which have little reason for existence and little beauty.

Like most modern art movements, the *Style Nouveau* crystallized in Paris. In France, however, its eccentricities have in general been mitigated and even avoided by the prevailing good taste of the nation. In the Exposition of 1900 at Paris the new spirit was seen in nearly all the architecture, though only a few of the buildings displayed the bizarre and extreme freakishness of the *Pavillon Bleu*. A large part of the current design of apartment houses and hotels in France is in the new spirit, sometimes very happily handled, but often devoid of true architectural dignity and consistency.

The most extreme development of the *Style Nouveau* may be studied in Germany and Austria. Although the results in the former country are sometimes happy, especially in suburban residences, they frequently violate all laws of structural expression and propriety. In Vienna, an important centre of the movement, there are many examples of modern design controlled by good taste. The application of color to stuccoed exteriors has received much attention in that city. In Bohemia the new art has run to riotous extremes in external design. A good example of a rational style is the City Hall of Copenhagen, by Martin Nyrop. In Holland and the Low Countries generally there has been much interesting work in brick.

In England, where the art of William Morris, one of the forces underlying the *Style Nouveau*,

had its home, the less attractive phases of the movement have not found encouragement. Since the Victorian Gothic revival in the middle of the nineteenth century the sympathy of English architects has been with mediæval motives and ideals. Classic conventions have been used solely for secular buildings and then not with interest and often without correctness. Of the Mediæval manner, Romanesque or Gothic, the churches of John Francis Bentley (d.1902) and especially his Roman Catholic Cathedral of Westminster may perhaps be considered the most characteristic. There is also a new cathedral at Liverpool by Gilbert Scott, and a huge building for the London County Council on the bank of the Thames.

Undoubtedly the most powerful later architectural achievements have been in the United States. The rapid advance in individual fortunes and in the general well-being of the people, the invention of new and facile methods of construction, already mentioned, and the consequent necessity of a prodigious amount of building have already been alluded to. In recent years this phenomenal architectural activity has been accompanied by a remarkable awakening of interest in the problems of city planning and municipal embellishment, an awakening not confined to the United States. Indeed, Germany has been for years a leader in this field, and there have been International Congresses of city planning in London, Düsseldorf, and other European cities.

Among American cities, Washington has presented the most promising field for experiments, inasmuch as it is still possible to carry out, in its main features, the original design of De l'Enfant for the laying out of that city (1791). In 1902 a commission for formulating plans was appointed; its report was adopted in 1904, and some work has been already executed in pursuance of its recommendations. A commission was appointed to plan the rearrangement of considerable portions of the city of New York, but its remarkable report has never been officially adopted nor any part of it carried into execution. Chicago, Pittsburgh, Cleveland, San Francisco, and many other cities have followed these examples. Among important buildings erected by the Federal government or by States and cities within recent years are the Offices of Congress at Washington, the Custom House, Public Library, and Municipal Offices in New York; State capitols for Minnesota at St. Paul and for Wisconsin at Madison; the very monumental Union Railway Station at Washington; and the New York Central and Pennsylvania terminals at New York, both of colossal dimensions and immense cost.

If libraries and museums be included under the category of *educational architecture*, this division probably constitutes the most important and prolific field of American architecture during recent years. All the great universities and many colleges have made substantial additions to their buildings. Among the most prominent examples of extensive plans now being carried out are those of the National Military Academy at West Point, the Naval Academy at Annapolis, the University of California at Berkeley, and Columbia University in New York City. In ecclesiastical architecture the most notable achievements in recent years have been the completed portions of the cathedral of St. John the Divine, the many-storied Broadway Tabernacle, the superb new St. Thomas's Church, all in New

ARCHITECTURE

A MODERN AMERICAN TOWER BUILDING
THE WOOLWORTH BUILDING, NEW YORK CITY

York City, St. Paul's Church in Chicago, and extensive cathedral projects for Baltimore and Washington.

In *commercial architecture* the bank buildings have generally been the most elegant and pleasing, partly because of their moderate height and simple and massive construction. Among the prominent examples of "sky-scrapers" are the tower-like Singer, Metropolitan Life, and Woolworth buildings in New York, the latter 756 feet in height.

In this brief survey there has been no place for the architecture of Farther Asia, of India, and the neighboring provinces; of China and Japan; still less for the architecture of Mexico, Central America, Peru, etc. All these are described under their especial heads, and under ARCHITECTURE, ANCIENT AMERICAN. The details of all the styles here mentioned are also given under the subdivision *Architecture* of such separate titles as ASSYRIAN ART; BABYLONIAN ART; BAROQUE ART; BYZANTINE ART; CHRISTIAN ART; EGYPTIAN ART; GOTHIC ART; GREEK ART; MOHAMMEDAN ART; PERSIAN ART; PHOENICIAN ART; RENAISSANCE ART; ROMAN ART; ROMANESQUE ART. Under the general head ART, HISTORY OF, a review is given of all the various classes of titles under which the architectural material in this encyclopædia is classified, such as biographies of architects, descriptions of various kinds of buildings, definitions of terms, etc. The history of the science and material of construction is given under BUILDING.

Bibliography. An excellent introduction to the principles and appreciation of architecture is by Sturgis, *How to Judge Architecture* (New York, 1903), and of more popular character, Wallis, *How to Know Architecture* (New York, 1910). A systematic handbook of styles is Rosengarten, *A Handbook of Architectural Styles* (Eng. trans., London, 1878). More recent, and with references and a larger enumeration of monuments, is Hamlin, *A Textbook of the History of Architecture* (New York, 1909). Fergusson, *A History of Architecture in All Countries* (London, 1893; American revision, New York, 1905), has value, but is out of date; a recent, reliable, and scholarly work is Simpson, *A History of Architectural Development* (London, 1912). Two volumes have appeared of the three required to complete Sturgis's *History of Architecture* (New York, 1905—). Fletcher and Fletcher, *A History of Architecture* (London, 1905) follows the comparative method. Another compact one-volume history is by Stratham, *History of Architecture* (London, 1912). Lübke, *Geschichte der Architektur* (Leipzig, 1884), is somewhat antiquated, but generally accurate. Ramée, *Histoire de l'architecture* (Paris, 1885), is still useful. A critical history, from the standpoint of pure construction and form, has now been given in Choisy, *Histoire de l'architecture* (Paris, 1899), without an enumeration of monuments, and extremely technical. Two series of separate handbooks, each covering some special style or country, and together forming a complete whole, are being published—one in France, the other in Germany. The general title of the French series is *Bibliothèque de l'enseignement des beaux-arts* (see ART, HISTORY OF); Laloux, *L'architecture grecque* (Paris, 1888); Corroyer, *L'architecture romaine* (Paris, 1887), and *L'architecture gothique* (Paris, 1891); and Palustre, *L'architecture de la Renaissance* (Paris, 1892), are the only volumes on archi-

itecture alone; but the rest of the field is covered in the architectural sections of the following general volumes: Maspero, *Egyptian Archaeology* (London, 1895); Babelon, *Oriental Antiquities*, translated by B. T. Evetts (New York, 1880); Martha, *L'archéologie étrusque et romaine* (Paris, 1884); Peraté, *L'archéologie chrétienne* (Paris, 1892); Bayet, *L'art byzantin* (Paris, 1883); Gayet, *L'art arabe* (Paris, 1893), and *L'art persan* (Paris, 1895).

The German series is more detailed and is solely architectural. It is the *Handbuch der Architektur*, ed. Durm (Darmstadt, 1895; now issued from Stuttgart), and contains special volumes on the theory and practice of architecture as well as its history. Its four sections are entitled: I. *Allgemeine Hochbaukunde* (materials; statics; methods; forms); II. *Baustile* (history, in four sections: Ancient, Mediæval, Renaissance, and Modern); III. *Hochbau-Constructionen* (elements of structure; foundations; external features; internal features; specific details); IV. *Entwerfen, Anlage und Einrichtung der Gebäude* (composition; buildings for dwelling and trade; buildings for agricultural and provisioning purposes; public houses, clubs, halls, etc.; buildings for health, charity, etc.; educational, scientific, and artistic establishments; civic, governmental, administrative, and military buildings; religious and memorial structures; the city). There are a number of octavo volumes in each of these sections and subsections, several of which have been published. In the historical section the most valuable are: Durm, *Die Baukunst der Griechen* (Darmstadt, 1892), and *Die Baukunst der Etrusker und der Römer* (Darmstadt, 1885). Others are: Essenwein, *Die Ausgänge der klassischen Baukunst* (Early Christian), and *Die Fortsetzung der klassischen Baukunst im oströmischen Reiche* (Byzantine); Franz Pascha, *Baukunst des Islam* (Darmstadt, 1896); and Essenwein, a series of works on *Die romanische und die gotische Baukunst* (Darmstadt, 1889-92), including his volumes on *Military Architecture* (*Kriegsbaukunst*), and *Domestic Architecture* (*Wohnbau*); also Halak, *Der Kirchenbau und Einzelheiten des Kirchenbaues*.

There are two principal dictionaries of architecture in English; *The Dictionary of Architecture* of the English Architectural Publication Society, on a large scale, never completed; and Russell Sturgis, *Dictionary of Architecture* (3 vols., New York, 1901-02). Gwilt, *Encyclopædia of Architecture* (London, 1888), is handy to consult. In French there is Planat, *Encyclopédie de l'architecture et de la construction* (Paris, 1890-93). An excellent modern architectural manual is Guadet, *Éléments et théorie de l'architecture* (4 vols., Paris, 1902). The bibliographies for particular phases and periods of architecture will be found under the various articles treating of them.

ARCHITECTURE, APPRECIATION OF. Since architecture is an art which touches life at many points and concerns both the public and the individual in many important relations; since, moreover, good architecture can flourish only where there prevails an enlightened public taste, and the public taste is but the sum of the individual tastes of the community, it is important that every citizen should be capable of a correct appreciation of architectural works, i.e., qualified to pass intelligent judgments upon the

merits and defects of the buildings he sees, based not upon caprice or mere personal likes and dislikes, but upon knowledge and good taste. A person wholly ignorant of architecture may like or dislike particular buildings, but his appreciations are valueless. The general standard of architectural taste is determined by the number and culture of those who, without professional training, know enough of the principles and of the great masterpieces of the art to discriminate between the good and the bad. For the attainment of this knowledge and of the good taste which should control its use, the chief means are reading, travel, and the study of plans, photographs, and other illustrations of architecture. Fortunately the abundance of books, periodicals, and illustrations available in public and private libraries makes possible a fairly broad knowledge of architecture, even for persons of moderate means and those unable to travel and see in person the great masterpieces of the art abroad.

Architecture is not, as too many seem to think, an art merely of the external dress of buildings, still less, as Ruskin's writings apparently imply, a matter wholly or chiefly of ornamental detail. It is, first of all, an art of *building*; it is based on construction and planning, upon which the decorative treatment, both internal and external, is really dependent. A true work of architecture is the material realization of an artistic conception, of which the planning, construction, composition, and decoration are, so to speak, the four corner stones. In the plans the architect seeks to meet utilitarian requirements by the arrangement of rooms and "circulations" (corridors, etc.); structural requirements by the disposition of the walls, supports, piers, etc.; and aesthetic requirements by the proportioning of all the parts. Planning is thus the foundation of architectural design, construction, its means of realization; composition determines the main lines and masses of its visible aspect, and decoration dresses the whole in pleasing details. Good planning, sound and rational construction, pleasing masses and proportions, harmonious, appropriate, and refined detail and ornament, and a general expressive effect suitable to the purpose, function, size, materials, and constructive system of the building, are all found in good architectural works. The historic styles are the methods of design and combinations of form evolved in different ages and lands, and the study of these constitutes the study of the history of architecture; but *style*, as a quality, is character independent of any particular historic expression. All the above considerations are involved in the appreciation of architecture. Consult: Sturgis, *How to Judge Architecture* (New York, 1903); Statham, *Architecture for General Readers* (New York, 1895); Wallis, *How to Judge Architecture* (New York, 1911); Guadet, *Théorie de l'Architecture* (Paris, 1902); Hamlyn, *A History of Architecture* (New York, 1909); Fletcher, *A Comparative History of Architecture* (London, 1905); T. G. Jackson, *Reason in Architecture* (London, 1906); Van Pelt, *A Discussion of Composition, especially as applied to Architecture* (New York and London, 1902). See ARCHITECTURE: DECORATION.

ARCHITECTURE, ANCIENT AMERICAN. No historical sketch of aboriginal American architecture is possible with our lack of reliable data as to the history of the American races and

their relation to each other. The tribes whom we are accustomed to group under such heads as "Mound Builders" and "Cliff Dwellers" (for illustration see these titles), although far from being the earliest inhabitants of our continent, never produced any works that enter the domain of art, though some of the "pueblos" show careful construction and plan, especially in Arizona and New Mexico; for example, Casa Grande (q.v. for illustration), Chihuahua, and Bonito. The peoples of Maya and Nahuatl nationality who founded the confederacies of Mexico, Central America, Peru, and other South American states, developed an architecture that may fairly be compared with that of Farther Asia, especially India. But no sure historic records of the age of these monuments give an earlier date than the twelfth century A.D.; though plausible conjecture goes back to the fifth century B.C. for the earliest Maya examples. The earliest ruins are those of the Mayas, and among them we can distinguish local variations and historic development; for example, those of Chiapas, of which the most important are at Palenque, differ from those in Yucatan, which are much later. The ruins at Copan, in Honduras, form the connecting link between the Palenque style and that found at Uxmal, Chichen-Itza, Izamal, and other ruined cities of Yucatan. Guatemala also has monuments of the Palenque, and later types, at Uxatlan, Caluinal, Tikal, etc. The fortified city of Tenampua, in Honduras, is especially interesting. The Maya ruins of Central America are the more monumental the nearer they approach the frontier of Yucatan. The arrangement of the buildings is according to one general scheme: they rise from a mound, surmounted by a platform on which the building or buildings stand. This mound is entirely or partly natural, cut into terraces about 5 feet high or lines of stone steps. The lines of the mound are made by rubble and retaining walls faced either with colored stucco or large slabs (Palenque) or with dressed stone (Chichen-Itza and Uxmal). The separate buildings rise from a base in the form of a truncated pyramid, and the chambers and passages are covered with vaults formed of the triangular corbel arch of projecting horizontal courses. Among the most impressive structures are the pyramids; one at Izamal is between 700 and 800 feet long and contains several chambers. They usually rose in front of each temple. These pyramids were crowned by shrines and bear some resemblance to Buddhist buildings in India. The greatest variety of monuments is at Chichen-Itza. There was a lavish use of decorative sculpture either as integral part of the architecture, or in the form of accessory steles, pillars, obelisks, statues. The famous "Tablet of the Cross" from Palenque is the most tasteful simple piece. An idea of the way in which the Maya buildings were grouped is given by the ruins of Palenque, Uxmal, and Chichen-Itza. For illustrations, see these titles.

The Mayas suffered from invasions of Nahuatl peoples in the sixth century A.D., but though more recent, the Nahuatl monuments appear not to have survived so well; perhaps because this people preferred the less durable material of adobes, cemented together with mortar, to the stonework of the Mayas. This is exemplified in the Pyramid of Cholula, originally crowned by a magnificent temple destroyed by Cortés. It measures 1440 feet square—an area nearly four

MEXICAN ARCHITECTURE
THE TEMPLE OF PALENQUE—RESTORATION

times that of the Pyramid of Cheops; its height was 177 feet, and it was divided into four terraces. Ruins of debated character occur at Xochicalco, in Mexico, Huatusco, and Centla. Here, as with the Mayas, the truncated pyramid is the main form of substructure. It is curious that even less remains of the Aztec monuments, erected only during the two centuries preceding the Spanish Conquest. Probably it was because, being the centres of civilization at that time, they bore the brunt of Spanish vandalism, while the older cities, long since deserted, remained immune and often unknown. Perhaps slightly earlier than the Aztec domination are the cities of the Zapotecs in Central America, whose capital, Mitla, was captured and ruined by Aztecs c.1500 A.D. The palace at Mitla has called forth the most enthusiastic praise for the beauty of its masonry, the symmetry of its proportions, and the classic restraint of its ornament. This palace consists of an interior quadrangle, 130 × 120 feet, surrounded on three sides by mounds crowned by other buildings. It is built not entirely of dressed stones, as at Palenque, but of faced rubble, as in Yucatan. The main hall was supported by six columns, supporting heavy beams, a most unusual arrangement. It must be remembered that the manual labor of facing the masonry and executing the sculptured decoration in all these buildings of Central America and Yucatan was vastly increased by the lack of metal implements. We finally come to Peru, which is studded with ruins of the greatest interest, bold in construction and massiveness, though lacking in that richness of sculptured ornament so characteristic of the styles thus far mentioned. Pachacamac, Chimu, Tiaguanaco, Titicaca, and Cuzco are the most important sites. The fortresses are of especial interest; also great engineering works, such as aqueducts, reservoirs, and bridges. The temples, called *huacas*, are composed of truncated pyramids, usually of stone. That of Obispo is 150 feet high, with a base 580 feet square, covering eight acres. Some of these pyramids served as sepulchres, like one near Obispo, surrounded by an inclosing wall 14 feet high. Another at Moche was 800 × 470 feet and about 200 feet high. The palaces were built of adobes and were formed of an irregular series of buildings on a terraced mound. That at Chimu is typical. The ruins at Tiaguanaco are, perhaps, the earliest and belong to a civilization prior to that of the Incas. Most remarkable are the numerous erect monoliths comparable to the Celtic monoliths in the Mediterranean (e.g., Malta), and in England (e.g., Stonehenge). For books of reference, consult the bibliography under ARCHÆOLOGY, AMERICAN.

ARCHITRAVE, är'ki-trāv (Gk. ἀρχι-, *archi*-, chief + Lat. *trabs*, beam). The lowest member of the entablature (q.v.), which rests immediately upon the columns, also called the epistyle. The term also designates the lintel over a square-headed window or doorway. It is even sometimes applied to the molded bands carried around the top and sides of a window or door. For illustration, see ENTABLATURE.

ARCHIVES, är'kivz. See RECORDS, PUBLIC.

ARCHIVES, HOTEL DES. The name signifies the equivalent of Hall of Records, but although general in its meaning and applicable to any French building for storing official records, it is applied as a special name, by preëminence, to

an important seventeenth to eighteenth century building in Paris in which is stored a priceless collection of historic records and original manuscripts of treaties and decrees from the time of Dagobert to that of Napoleon. The building, sometimes known as the Hôtel Soubise from the family to whom it formerly belonged, is a stately example of the richest private architecture of the time of Louis XIV, with a magnificent entrance court, of which the simple but dignified house façade forms the rear elevation. It was remodeled in part and decorated in the eighteenth century; particularly rich is the oval chamber with paintings by Boucher, and the "Salle des Bourbons," both in the style of Louis XV. The collections are open to the public on certain days.

ARCHIVOLT, är'ki-völt (It. *archivolt*, from *archi*, chief + *volto*, vault, arch). A molded or otherwise decorated band or series of bands around the opening of an arch. In the classic styles the bands and moldings project from the general plane of the wall, the outer molding most of all. In mediæval architecture the moldings are cut into the voussoirs and recede successively inward from the plane of the wall as they approach the soffit, or intrados. The term "archivolt" is, however, rarely used of these

ARCHIVOLT.

mediæval moldings. In good design the moldings of the archivolt are confined to the voussoirs, and define correctly the intrados and extrados of the arch. Archivolts are sometimes used, with purely decorative intent, even where the extrados of the arch is stepped. In the Baroque style (q.v.), and in some modern work, an interrupted archivolt is used in combination with rusticated voussoirs—a doubtful device, though picturesque. Archivolts may be merely painted, in interior decoration; and they may be flat bands of marble or glazed tile, as in Assyrian buildings. See DRIFMOLDING.

ARCHLUTE, ärch'lüt' (It. *archiliuto*). A large double-necked lute about 4 feet 5 inches long, used in the seventeenth century for the lowest part in instrumental music and accompaniments. The neck contained two sets of tuning pegs, the strings were of catgut or metal, and the compass was two octaves, from C below the bass clef. The sound board, with a circular hole, was of pine, while the back was made of strips of pine and cedar glued together and richly ornamented. See LUTE; THEORBO.

ARCH OF ARCA'DIUS, HONORIUS, AND THEODO'SIUS. See THEODOSIUS, ARCH OF.

ARCH OF AUGUSTUS. See AUGUSTUS, ARCH OF.

ARCH OF CLAUDIUS. See CLAUDIUS, ARCH OF.

ARCH OF CON'STANTINE. See **CONSTANTINE, ARCH OF.**

ARCH OF DRU'SUS. See **DRUSUS, ARCH OF.**

ARCH OF HAD'RIAN. See **HADRIAN, ARCH OF.**

ARCH OF JA'NUS QUAD'RIFRONS. See **JANUS QUADRIFRONS, ARCH OF.**

ARCH OF SEPTIMIUS SEVERUS. See **SEPTIMIUS SEVERUS, ARCH OF.**

ARCH OF TITUS. See **TITUS, ARCH OF.**

ARCH OF TRA'JAN. See **TRAJAN, ARCH OF.**

ARCHON, är'kôn (Gk. ἀρχων, *archôn*, literally leader, chief, from ἀρχεῖν, *archein*, to begin, lead, rule). A generic title for the highest magistrate, the actual ruler, in Athens, and other Greek cities. The Athenian archon is the only one whose history and duties are well known. There were nine archons at Athens, chosen yearly by lot. The first was called "The Archon," or, since he gave his name to the year, Archon Eponymos, the 'Namesake Archon'; the second was the Archon Basileus, the third Archon Polemarchus; the other six were Thesmothetæ. During the Athenian democracy the archons were law officers, the Archon Eponymos having charge of suits relating to the family, the Basileus of religious cases, the Polemarch of those involving foreigners, and the Thesmothetæ of a variety of other cases. According to Athenian tradition the last king, Codrus (q.v.), was succeeded by a life archon; in 752 B.C. the office was limited to 10 years. Up to this time, only members of a certain family could be archons; but in 713 B.C. the office was opened to all nobles (Eupatrides), and in 683 B.C. it was made annual. Finally, in 457 B.C., it was opened by law to citizens of the three upper classes and in practice to all citizens. The historical development seems rather to have been the reduction of the power of the Basileus, by giving first the military command to a new officer, Polemarch ('general'), and then by adding a civil ruler as the civil head of the state, thus restricting the 'king' to religious functions. The military command was still held by the Polemarch at the time of the battle of Marathon (490 B.C.); that battle was fought by Miltiades (q.v.), as Polemarch. The same Greek word is often used to denote rulers who, strictly, bore other official titles.

Among the Jews of the Dispersion the title "archon" was used to denote members of the official body exercising control over their independently organized communities, as at Alexandria, Antioch, and Rome. In the New Testament it is used specifically of members of the Sanhedrin (e.g., Nicodemus, John iii. 1), of the officer presiding over the synagogue (e.g., Jairus, Luke viii. 4); and, generally, for rulers, magistrates, and men of influence. In the sense of ruler it is applied to Christ in Rev. i. 5: "Ruler [archon] of the kings of the earth," and to Satan in John xii. 31: "The prince [archon] of this world." In the mystical jargon of the Gnostics the term "archon" was frequently employed; hence one of their sects, especially opposed to Judaism, received the name "Archontics." See **GNOSTICS**; **HERESY**; **HERETICS**.

ARCH-PRIEST, ärch'prest'. A name dating from the fourth century and equivalent to the Greek *protopresbyter*. It was usually applied to a senior priest attached to a cathedral, whose duties were to assist the bishop, to act as his substitute in the performance of the church

offices, and to have general oversight of the cathedral clergy; also to those placed in large towns to occupy similar positions respecting the local clergy. This title in later times gave way to that of *dean*, as applied to the former, and *rural dean*, to the latter class of arch-priests.

ARCH'WAY (*arch* + *way*). A vaulted passage between walls; or, any passage, vaulted or not, terminating in an arched opening at each end.

ARCHYTAS, är-kî'tas (Gk. Ἀρχύτας). The son of Mnesagoras, or Hestæus, of Tarentum, a distinguished philosopher, mathematician, general, and statesman. He lived in the first half of the fourth century B.C. and was thus a contemporary of Plato, whose life he is said to have saved by his influence with the tyrant Dionysius. He was seven times elected general of his city, though it was customary for the office to be held for one year only; he was never defeated. His connection with Plato belongs to the time of the latter's visit to lower Italy. He was drowned on the Apulian coast and is said to have been buried near Matinum, in Apulia. Archytas was a man marked for his morality, self-control, and gentleness. As a philosopher, he belonged to the Pythagorean school. His services to the science of mathematics were many and important, and he passed as the founder of scientific mechanics. He was the first to distinguish harmonical progression from arithmetical and geometrical progression; he also solved the problem of doubling the cube. (See **CUBE**.) Among his mechanical contrivances was a flying pigeon made of wood. He is said to have invented the pulley. As an astronomer, he taught that the earth is a sphere rotating on its axis once in 24 hours and that the heavenly bodies move about it. He further made original contributions to the knowledge of musical tones. In philosophy he must have influenced Plato not a little, and perhaps, also, Aristotle. The mathematical fragments of Archytas have been carefully collected by Blass in *Mélanges Graux* (Paris, 1884). The other fragments which are attached to the name of Archytas, and which relate to ethics, logic, and physics, are probably for the most part not genuine. They are to be found in Mullach, *Philosophorum Græcorum Fragmenta*, vol. i (Paris, 1860-81). The two letters ascribed to Archytas, one addressed to Dionysius and the other to Plato, and the work *On the Ten Categories*, are also spurious.

ARCHYTAS OF AMPHISSA (c.240 B.C.). A Greek poet, to whom some hexameter lines are attributed by Plutarch, Athenæus, and Stobæus. He is spoken of by Diogenes Laërtius as an epigrammatist upon whom Bion wrote an epigram. Nothing is known of the details of his life and work beyond the scanty information given by the authors named.

ARCIF'ERA (Lat. *arcus*, bow + *ferre*, to bear, carry). A group of anurous amphibians, the toads, having a tongue, with the clavicle and coracoid of each side connected by a longitudinal arched cartilage, allowing contraction and expansion. See **TOAD**.

ARCIS-SUR-AUBE, är'sës' sür ôb' (Fr. Arcis on the Aube). Capital of the arrondissement of the same name in the French department of the Aube, and remarkable on account of the battle fought here, March 20-21, 1814, between Napoleon and the allied forces under Prince Schwartzenberg (Map: France, N., K 4). The battle began with several skirmishes on the first,

and ended in a general engagement on the second day, when the French retreated over the Aube. It was sanguine but indecisive. After the battle Napoleon determined to operate in the rear of the allies, and left the road to Paris open, assuming that they would not venture to proceed without attempting to secure their rear. The allies marched, nevertheless, on the capital, and thus decided the campaign. Arcis-sur-Aube is the birthplace of Danton. Its industries are silk and cotton spinning, stocking weaving, and it has an important trade in grain. Pop., 1901, 2774; 1911, 3033.

AR/CITE. One of the two Theban knights who, in Chaucer's *Knight's Tale*, are at first close friends, but who, having seen the lovely sister-in-law of Theseus from their prison window, both claim her as mistress and later joust fiercely for her hand, in which tourney Arcite is slain.

ARC LAMPS AND ARC LIGHTING.

See ELECTRIC LIGHTING, *Arc Lamps*.

ARCO DEI LEONI, dā'ē lā-ō'nē (It. Arch of the Lions). A gate in Verona, built supposedly in the third century A.D. Originally it had two arches, but at present only one remains. It is a dainty bit of architecture, with Corinthian columns, above which is a story pierced with three openings between pilasters. It is situated in the Via Leoni and is coeval with the Porta de' Borsari.

ARCO DELLA PACE, dēl'lā pā'chā (It. Arch of the Peace). A large arch of white marble, with smaller ones on either side, surmounted by a bronze figure of Peace driving a six-horse chariot. It was erected in Milan, Italy, in 1807, in honor of Napoleon, but not completed until 1838, and was consecrated to Peace in 1815.

ARCOLE, ār'kō-lā. An Italian village in the province of Verona, situated on the left bank of the Alpone and famous for the victory gained by Bonaparte over the Austrians under the chief command of Alvinczy, Nov. 17, 1796. From the 14th to the 16th the French vainly attempted to rush the bridge across the Alpone held by the Austrians under Mitrowsky; on the 17th they forded the stream below the bridge and took the enemy in the rear. In the series of battles around Arcole the Austrians lost 18,000 men, and, as a result of the battle, they were compelled to abandon the relief of Mantua, which was besieged by the French.

ARÇON, ār'sōn', JEAN CLAUDE ELÉONORE LE MICHAUD, LEMICEAUD, d' (1733-1800). A distinguished French engineer. He was born at Pontarlier, and was educated as an engineer in the military school at Mézières. During the Seven Years' War he acquired considerable reputation, especially in the defense of Cassel, his work being distinguished by a remarkable fertility of invention. His most famous scheme was a system of floating batteries designed to reduce Gibraltar (1780), then in the hands of the English and defended by Governor Elliot. The attempt, however, was not successful, mainly because of the fact that his efforts were indifferently supported. When the French under Dumouriez overran Holland, Arçon took several strongly fortified places, among others, Breda. After his retirement from the army he was called to the Senate (1799). His important work is *Considérations militaires et politiques sur les fortifications* (Paris, 1795).

ARCO'NA. See ARKONA.

ARCOS DE LA FRONTERA, ār'kōs dā lā

frōn-tā'rā (Sp. Bow of the Frontier, alluding to its being built in bow shape and to its position on the frontier). A town on the right bank of the Guadalete, in the province of Cadiz, Spain (Map: Spain, C 4). It is situated on a conical height 545 feet above sea level, and is a remarkably picturesque city with steep, crooked streets. Above the city stands the castle of the dukes of Arcos, now in ruins. Beyond are the Ronda Mountains. Seven monasteries, two parish churches, with the main church of Gothic style, are among its interesting buildings. The manufactures include leather, mats, thread, and rope. There is considerable trade in oil, wine, and fruit. Pop., 1900, 14,393; 1910, 13,983.

Arcos is the Arcobriga (Celt. *briga*, town) of the Romans. It was wrested from the Moors by Alfonso the Wise, and strongly fortified as a frontier town, in 1264.

ARCOSO'LIIUM (Lat. *arcus*, arch + *solium*, seat, chair of state). A name given to the niches, surmounted by an arch, that were used, for example, in the early Christian catacombs, for the burial of the more illustrious dead. They usually contained a carved marble sarcophagus and were ornamented with frescoes.

ARCOT, ār-kōt' (Tamil *Arkat*, Six Woods). A city in the presidency of Madras, India, the capital of the district of North Arcot, on the right bank of the Palar River, 65 miles west of Madras (Map: India, C 6). It is a railway junction, has a military cantonment, contains some mosques in a tolerable state of repair, and the ruins of the Nawab's palace. Of great antiquity and mentioned by Ptolemy, it is noteworthy because of its history, the most brilliant incident of which was its capture and defense by Clive (q.v.), in 1751. It was acquired by the East India Company in 1801. The walls of the famous fort now serve as a dyke which protects the city against periodical inundation. Pop., 1901, 10,734; 1911, 11,475.

ARCTIC (Gk. ἀρκτικός, *arktikos*, northern, from Gk. ἄρκτος, *arktos*, bear, north). A term meaning 'lying near the constellation of the Bear.' The Arctic Circle is a circle drawn round the North Pole, at a distance from it equal to the obliquity of the ecliptic, or $23\frac{1}{2}^{\circ}$. The corresponding circle round the South Pole is the Antarctic Circle. Within each of these circles there is a period of the year when the sun does not set, and another when it is never seen, this period increasing as we approach the pole itself. At the pole it is six months in length, if we neglect the effects of refraction (q.v.).

ARCTIC CURRENT, HIGH LANDS. See ARCTIC REGION.

ARCTIC DISCOVERY. See POLAR RESEARCH.

ARCTIC O'CEAN. See ARCTIC REGION.

ARCTIC PLANTS. See ARCTIC REGION.

ARCTIC REGION. Mathematically speaking, that portion of the surface of our globe which surrounds the North Pole within the limits of the Arctic Circle, and thus, extending $23\frac{1}{2}^{\circ}$ in every direction from the pole, covers an area of 8,200,000 square miles.

Geographically, it is preferable to define the Arctic region as that portion of the northern hemisphere which is subjected to Arctic influences. These influences may be considered, on land, to extend southward as far as the northern limit of tree growth. Within this limit the Arctic region includes, in the western hemi-

sphere, the western and northern coasts of Alaska, that part of the mainland of Canada north of a line connecting the mouth of the Mackenzie with Fort Churchill on Hudson's Bay (59° N.), the northern part and the eastern coast of the peninsula of Labrador, the whole of the American Arctic Archipelago, and of Greenland. In the Eastern Hemisphere the Arctic region includes the whole northern fringe of the Eurasian coast from the Kola Peninsula, in 35° E. long. to the Chukchee Peninsula, the easternmost tip of Siberia, together with the outlying islands or island groups to the north of Europe and Asia. In September, 1913, the Russian naval officer, Captain Wilkitzky, discovered the east coast of a new land extending from 30 miles north of Cape Chelyuskin, the most northern part of Asia, for 200 miles northwest to lat. 78° N., long. 86° E. He named it Nicholas II Land. It is probably a large island. The lack of strict dependence of climate on latitude is perhaps nowhere better illustrated, for the Arctic region, as thus defined, extends as far south as 51° 30' N.—the latitude of London—along the Labrador coast, which is inhabited by the Eskimo in his native environment, while in northern Europe it is pushed back to beyond 71° N., where lies the northernmost city of the world, Hammerfest, Norway.

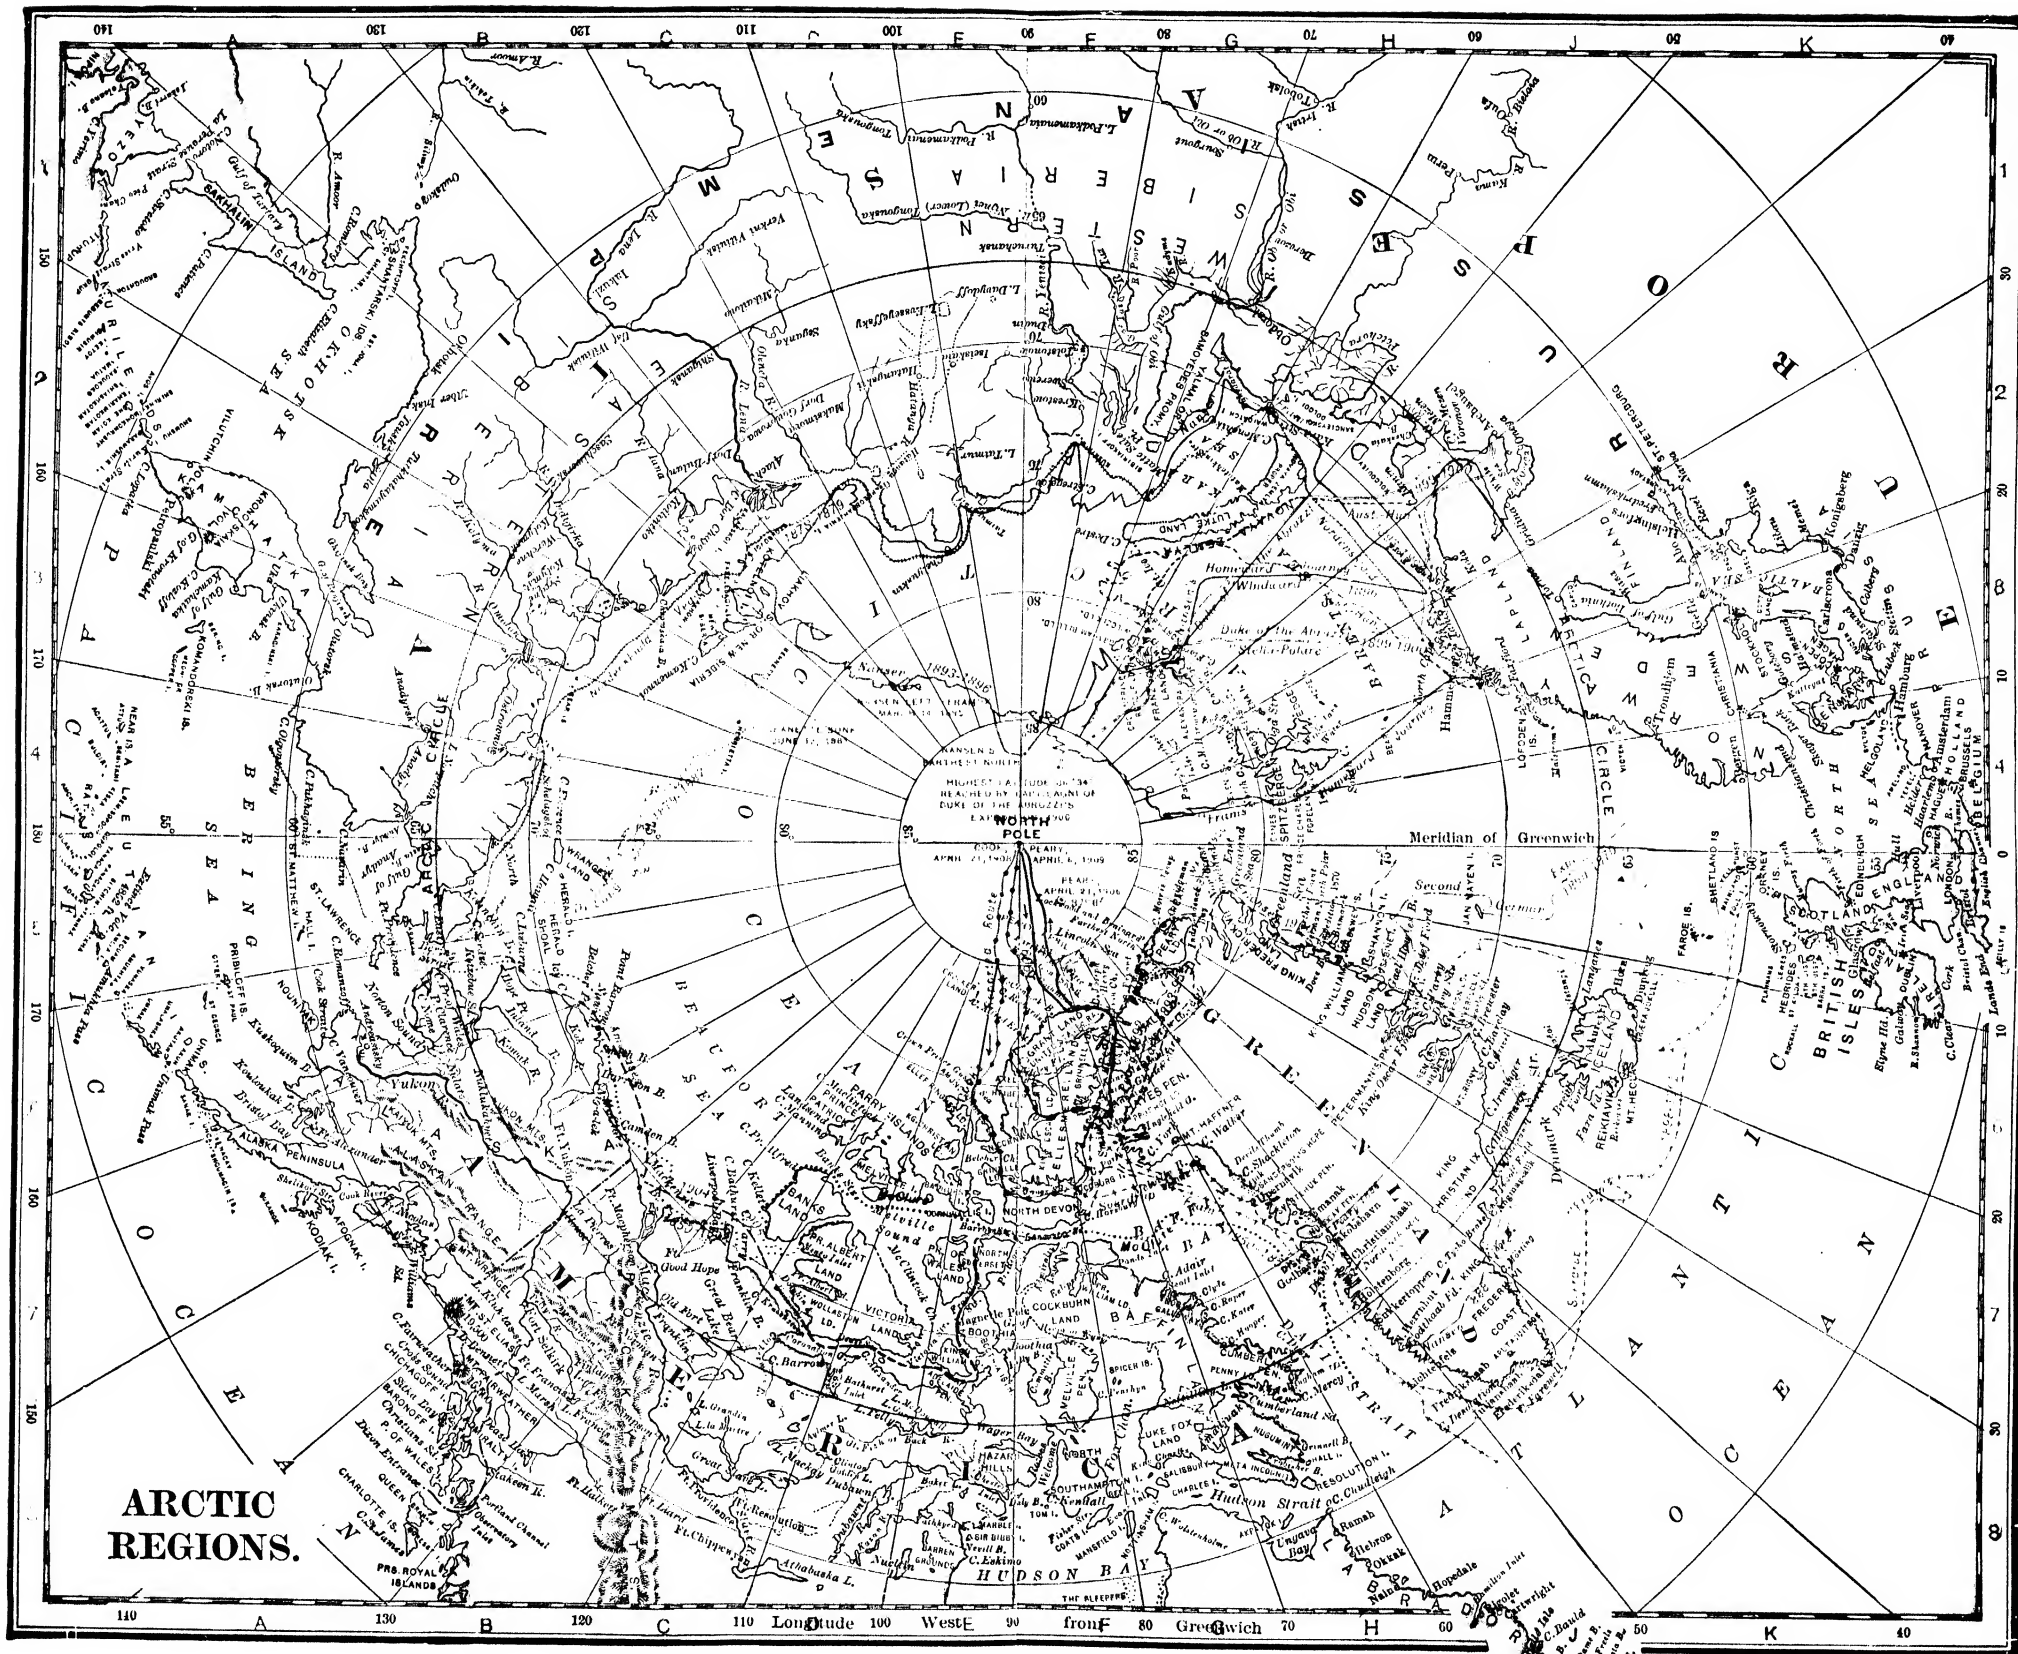

The Arctic is a region of snow and ice: for months in the winter the sun is below the horizon, and though for other months in summer it never sets, its heat is not strong enough in most quarters to reduce the quantity of snow and ice which form in the cold season. The longest day and the longest night at latitude 70° are about two months each; 10° farther north they are about three months each; at the pole they divide the year almost equally.

Topography. The land surface of the Arctic region has been as yet but incompletely explored, although the unremitting interest in Arctic exploration is gradually adding to our knowledge of its extent and details. The loftiest region is Greenland, along the east and west coasts of which there are mountains rising from 3000 to 8000 feet above sea level, culminating possibly in Petermann Peak, with an estimated altitude of 8000 to 11,000 feet. The name "Arctic Highlands" was given to that portion of the American continent which lies between Hudson's Bay and the mouth of the Mackenzie River, reaching far below the Arctic Circle. The district lies partly within and partly without the barren or treeless stretches of northern North America. The southern portion has elevations of 1700 to 2000 feet above sea level. The portion north of Great Slave, Great Bear, and Athabasca lakes has a gentle and regular slope toward the Arctic Ocean. The usage of the term "Arctic Highlands" may, perhaps, be extended so as to include the highlands west of Smith Sound. The name was also applied by Ross in 1818 to the region around Cape York (lat. 76° to 78°, long. 67° W.), in Greenland; and the most northern Eskimos, who live on the seacoast at the foot of these mountains, have until recently borne the name of "Arctic Highlanders," given to them by Ross. The northern part of Seward Peninsula in Alaska is characterized also by a broken topography, with mountains rising 5000 feet or more above sea level. Banks Land and other large islands off the coast of the North American continent, including Baffin, Ellesmere, Grinnell, and Grant Lands, are comparatively low, with

rounded mountains in the interior. In Baffin Land the central plateau is from 600 feet to 800 feet above the sea, and isolated mountains attain a height of 2000 feet. In the eastern part of Siberia the surface is broken by low mountain ranges and by wide river valleys. The portion of Siberia lying west of the Yenisei River, however, is a low, almost unbroken plain, having a dense growth of moss and containing numerous and extensive swamps, features that are comprehended under the general term of *tundra* (q.v.). Portions of Franz-Josef Land, including Rudolf Island (lat. 80° to 83°) are elevated, the mountains and plateaus rising 2000 feet or more above the sea. Upon these plateaus and that of Spitzbergen, and particularly upon that of Greenland, extensive "ice caps" have formed. The outer edges of these masses of ice are forced through the fiords in the form of glaciers, which discharge icebergs. See GLACIER: GEOLOGY.

Geology. The geology of the Arctic lands presents a great variety of features, which, however, are comparable in general to those exhibited in more southern latitudes. Extensive coal beds and numerous fossil remains in sedimentary strata bear evidence that the conditions prevailing in former ages were favorable for the development of a diversified fauna and flora, such as do not at present exist. The Carboniferous strata are the most significant as to the past climatic conditions. They have been found in Banks Land, North Devon, and Spitzbergen. Coal beds and strata of the Tertiary Age have been discovered in Greenland and Grinnell Land, and similar deposits are known to occur as far north as 82°, in which poplar, pine, birch, and hazel flora are represented. In Spitzbergen a Carboniferous flora has been obtained, comprising no less than 26 species, of which some are new, but others common to the coal measures of England and the United States. Greenland (q.v.) consists principally of gneisses, schists, and granite, with later intrusions of basalt, and is noteworthy as the source of the mineral cryolite. Most of the islands off the North American Continent are made up of crystalline rocks and Paleozoic sediments, of probably Cambrian and Silurian Age. The northern part of Seward Peninsula has been found recently to be composed of metamorphosed sediments of undetermined age, and of Cretaceous limestones. The great island groups north of Euro-Asia, including Franz-Josef Land, are formed of early Paleozoic and pre-Cambrian rocks overlaid by basalt. Very little is known as to the geological features of northern Siberia.

The Arctic Ocean is the body of water encircling the North Pole, and included between the northern boundaries of Europe, Asia, North America, Greenland, and the north Atlantic Ocean above the Arctic Circle, with which latter ocean it is in open connection, while it is in communication with the Pacific Ocean only through the narrow Bering Strait. It drains a vast area, including the northern parts of North America and of Asia. The great rivers, Obi, Yenisei, and Lena, in Asia, and the Mackenzie, in Canada, empty into this ocean. Its area is estimated at between 4,000,000 and 5,000,000 square miles. How much of this area is covered by land is uncertain; but the considerable depth of soundings taken by Arctic explorers would seem to indicate an extensive polar sea. It is possible that land exists to the

northwest of the known American Archipelago as a continuation thereof. The water region immediately surrounding the pole is covered with great fields of ice, which are frozen together in winter, but become separated to a greater or less degree (especially at the edges where ice floes are formed) during the summer. This ice area is called the ice pack, and it extends somewhat to the southward of lat. 75° N. above Bering Strait and the adjoining American and Asiatic coasts, between the limits of long. 160° E. and 130° W.; to the westward and eastward of this region the pack limit retreats northward; and in long. 120° W., it is found at about lat. 78° N.; in long. 90° W., at about lat. 78° N.; in long. 85° W., at about lat. 81° N.; in long. 50° W., at about lat. 83° N. On the east coast of Greenland the ice pack descends to lat. 78° N., to retreat again to 82° or 83° N., north of Spitzbergen and Franz-Josef Land, where this latitude is preserved as far east as long. 100° east of Greenwich, when the detour toward the south begins, which reaches its limit at about long. 173° E. This ice is kept in sluggish motion, principally by the winds, in such a manner that a vessel lodged in the ice at a point north of Alaska, or even of Siberia, would gradually drift toward the pole and, passing beyond that, would continue southward until set free from the ice near Spitzbergen or Greenland. Nansen made such a drift in 1893-96. The depth of the Arctic Ocean is variable, being very shoal (only a few hundred feet deep) north of western North America and eastern Asia, where, however, measurements have not been made above lat. 75° north, and very deep (7000 to 13,000 feet) within the Polar Circle to the north of the New Siberia Islands, the Chelyuskin Peninsula (most northern point of Asia), Franz-Josef Land, and Spitzbergen. Northward of the American Arctic Archipelago along the 70th meridian west of Greenwich the depth rapidly increases, a sounding of 9000 feet at the pole on Peary's expedition in 1909 having failed to reach bottom. Northward of the continent of Europe the depth is from 600 to 1200 feet. The Arctic Ocean is apparently affected by tides, in which the monthly variations are more important than are the semi-diurnal, but both these are masked by the influence of the winds and the ice. The assumption that a great portion of the Arctic Ocean has for a long time been covered with a solid pack of ice has suggested for it the name of Palaeocrystic Sea, or the Sea of Ancient Ice.

Arctic Currents. The open connection between the north Atlantic and the Arctic oceans offers an opportunity for a free interchange of waters between the two. On the east side of the north Atlantic the drift of the surface water is northward, and on the west side the current flows southward. This latter, called the Arctic Current, passes from the Arctic Ocean through the Greenland Sea and Denmark Strait, between Iceland and Greenland; thence along the eastern coast of Greenland; rounds Cape Farewell, and flows up Davis Strait to about lat. 64° N. Here it probably turns toward the west and joins the Labrador Current. There is another movement of water southward from the Arctic Ocean through the straits and bays which communicate with Baffin Bay. The Labrador Current flows southward along the west coast of Baffin Bay, past Labrador and Newfoundland, until it dips into the eastward drift of the warmer waters

off the Banks of Newfoundland, where the divers currents prevailing are but feeble. It has been supposed that a part of this current continued southward along the Nova Scotian and New England coasts, but some other explanation must be offered for the cold current which exists on that coast. The Labrador Current, which has a very low water temperature, carries with it icebergs and floes, which eventually disappear by melting in the vicinity of Cape Race. In this latter region heavy fogs prevail whenever winds from the south carry moist, warm air over the cold water. There is another drift of water northward through Bering Strait, but its volume is not great.

Climate. The annual average temperatures of the Arctic region are below 32° F. On the island of Jan Mayen, 29° F.; in Spitzbergen, 22° F.; Sea of Kara, 13° F.; Point Barrow, 8° F.; Lady Franklin Bay, 2° F. In Spitzbergen the average temperatures are, in July, 40° F.; in December, -2° F.; those of Lady Franklin Bay, in July, 37° F.; and February, -39° F. In other localities Nares experienced a minimum temperature of -74° F.; Greely, a minimum of -62° F.; Nansen, -52° F., and De Long, -72° F. The distribution of average temperatures for January shows a great area extending northward of the central and eastern part of the Asiatic and American continents, from about lat. 75° to beyond the pole, over which the average temperature is below -35° F., from which central area the temperatures increase in all directions, save on one side, to the following temperatures along the Arctic Circle: -30° F. on the North American Continent, +30° F. in Iceland and the north Atlantic, +5° F. in north Europe, -10° F. at Bering Strait, -31° F. in eastern north Asia; but there is actually a decrease of temperature from the polar region to -60° F. in the neighborhood of Verkhoyansk, Siberia, which is the cold pole of the northern hemisphere. The distribution of average temperatures for July shows a circumpolar area of +35° F., which lies mostly north of lat. 80°, between North America and Europe, but lies below lat. 80° elsewhere, and descends to lat. 70° in northern Alaska. From this central cold area the temperatures increase in all directions to the following values along the Arctic Circle: Western north Atlantic, +45° F.; eastern north Atlantic, +50° F.; northern Europe, +55° F.; northern Asia, +60° F.; Bering Strait, +45° F., and northern North America, +55° F. The winds in January near the pole are generally from the north in the neighborhood of Baffin Bay and northward of North America, but north of Asia they appear to be from the south, veering toward the east over northern Europe. In July the winds are from the southwest in Baffin Bay, from the northwest in the archipelago northward of North America, from the east north of Alaska, from the northeast north of Asia, from the north or northeast north of Europe, and from the north-northeast or northwest in the north Atlantic. The cloudiness averages probably between 40 and 50 per cent in January, and between 60 and 70 per cent in July. The annual precipitation is in general less than 10 inches in the Arctic regions, and most of it falls as snow.

The temperature of the Arctic waters varies from several degrees above freezing to even slightly below freezing at and near the surface; but from a distance of 500 or 600 feet below the

surface down to great depths the temperature is about 1° F. above freezing.

Inhabitants. Ranging across the North American Continent, above the Arctic Circle, from Alaska to the eastern end of the archipelago, and also settled on both the west and the east coasts of Greenland, are tribes of Eskimos, a race of aborigines, believed by many authorities to be of Mongolian origin. They live by hunting and fishing, speak an agglutinate language, have no written characters and no well-defined form of government. Whether they have a well-defined form of religion has not been definitely determined. Peary, who examined with some care the isolated tribe in the Whale Sound region of Greenland, reports that the nearest approach to religion is "simply a collection of miscellaneous superstitions and beliefs in good and evil spirits." Other observers, however, report that they have some belief in a future life. For further information see ESKIMO; GREENLAND; ALASKA; ETC. The other important Arctic inhabitants are the Lapps and Finns, and a series of tribes, probably of Mongolian origin, living in the northern part of Siberia; the Samoyedes, Tunguses, Yakuts, Yukahires, and Chukchees. These tribes are supported, some by hunting and fishing, but most by keeping herds of reindeer, which find sustenance in the moss of the tundra. But all the tribes are more or less nomadic in their habits, even those that build villages of timber. Those that depend for livelihood upon their herds of reindeer are sometimes forced to wander to fresh tundra; those that depend upon hunting and fishing follow the game from place to place.

Flora and Fauna. The general similarity of modern life-forms throughout the Arctic lands, which has been noted by Heilprin and others, is interesting from a geological standpoint, in that it shows that areas now separated by stretches of water were probably connected in past ages. It seems quite certain that the area now occupied by Bering Sea and Bering Strait was in comparatively recent times a land surface, and that there was a migration of fauna and flora between the American and the Eurasian continents. However, the uniformity of conditions over wide areas is also undoubtedly a factor causing similarities of life-forms, as is shown by the fact that isolated Antarctic islands have closely similar flora.

Arctic Plants. In many respects these plants resemble alpine plants (q.v.), and, like them, form one of the three climatic groups of xerophytes (q.v.). Dwarf growth is one of the chief characteristics of Arctic vegetation, and is remarkably well illustrated in a juniper stem reported by Kihlman: The stem was but 3½ inches thick, and yet showed 544 growth rings. Plants that grow to a height of one or two feet in Sweden are but one or two inches high in the far North. As in the case of alpine plants, reduction is confined to the stems and leaves, the roots and flowers being as large as in warmer climates. Cushion and rosette plants are well developed. The leaf structure is highly xerophytic, leathery and thick-skinned evergreen leaves being particularly abundant.

The Arctic life conditions have been especially well described by Kihlman (*Pflanzenbiologische Studien aus Russisch-Lapland*, 1890, etc.). The cold and darkness of the long winter nights have but little influence on the vegetation. Of greater

importance are the short vegetative period, which excludes many plant species from life in Arctic regions, and the prevalence of dry winds at times when transpiration losses cannot be made good. Kihlman thinks that this latter factor is the chief cause of Arctic phenomena. The absence of trees, then, is due not to the shortness of the period of vegetation, nor to the cold, but to dry winds; this is shown by the fact that trees thrive in the coldest known place in the world (Verkhoyansk, Siberia), and also by the fact that the height of the shrubs is determined by the level of the snow in winter. The continuous though not intense light of Arctic regions checks

DRABA ALPINA.

Showing the densely compacted cushion-form of Arctic-alpine plants.

growth, but favors photosynthesis. One of the peculiarities of Arctic plant life is that there are no gradual seasonal transitions. The buds are largely laid down in the preceding season, and spring into active life at once; growth is checked with equal suddenness in the fall.

The Arctic differs radically from the temperate zone in that plant structures are xerophytic, regardless of water and soil conditions. In fact, one may refer all of the Arctic vegetation to one great plant formation, the tundra. While Arctic plants closely resemble alpine plants ecologically, there are interesting floristic differences. Alpine plants are noted for their endemism, while Arctic plants are similar over wide areas, those of Europe and America being almost identical.

About 1700 species of plants have been found in the Arctic region. In the zone nearest the circle grow a few trees, mainly junipers, dwarf willows, and birches. The tree line in the

Samoyed region ends near the 67th parallel of latitude; at the Yenisei River, near the 65th parallel; at the Lena, near the 71st parallel; at the Mackenzie, near the 68th parallel; at Hudson's Bay it runs down to the 60th parallel; in Labrador, to the 52d parallel. In Greenland it lies near the 62d parallel. Flowering plants, grasses, mosses, and lichens extend to the most northern land seen by man. Examples of those found in all sections of the Arctic world are saxifrages (*Saxifraga oppositifolia* is ubiquitous), several varieties of ranunculus, potentillas, poppies (the Arctic poppy, *Papaver nudicaule*, is found even upon the crests of the cliffs in northern Greenland, where it thrusts its head through the edge of the ice cap to reach the sunlight), drabas, cochlearia, etc. The country richest in variety is Lapland, where are found three-fourths of the species known in the Arctic regions. For the varieties characteristic of each country, see LAPLAND; GREENLAND; SIBERIA; ALASKA; SPITZBERGEN; FRANZ-JOSEF LAND; ELLESMERE LAND; GRINNELL LAND; ETC. See also MUSCI; LICHEN; GRASSES; DISTRIBUTION OF PLANTS; ETC.

Arctic Mammals. The similarity of species of Arctic mammals throughout the circle of the globe is even closer than that of plants. Of land mammals there are but few, and many of these are of the same species wherever found. The polar bear (*Ursus maritimus*) has the highest range. Specimens have been found upon the ice pack north of every known land. The bear, however, is never found far from the coast, either inland or at sea. (See BEAR.) The Arctic fox (*Vulpes lagopus*) has almost as high a range, and is also found throughout the entire Arctic land area. The lemming is found in every Arctic country except Franz-Josef Land. The reindeer (*Rangifer tarandus*) is found around the globe occasionally as far north as about the 79th parallel, but does not inhabit the great islands in the Arctic Ocean. The musk ox (*Oribos moschatus*) has been common within the memory of man as far west as Point Barrow; but at present its range extends from the Mackenzie River east across the continent to Grinnell Land and again across the northern part of Greenland. The Arctic hare (*Lepus glacialis*) is found in the northern part of North America and of Greenland, and in these regions it reaches the highest known land. Among the other Arctic land animals are the wolverine, or glutton (*Gulo arcticus*), which is found in North America and is reported to have existed in Greenland, though such reports lack scientific verification; the Arctic wolf; and the Eskimo dog, which is supposed by most authorities to have been derived from the wolf by taming.

The most important of the sea mammals are the whales and seals. The right whale (*Balanus mysticetus*) is found in the waters east of Greenland, in Baffin Bay, and again north of Bering Strait. The range of individuals is exceedingly wide; a whale bearing a Greenland harpoon has been found in the Bering Strait region. The razor-back, the hump-back, and the bottle-nose, the grampus, the white whale, and the narwhal, are also found in the Arctic Ocean. See WHALE.

Among the pinnipeds, the most remarkable is the walrus (q.v.), which formerly inhabited the seas near the coasts of all Arctic lands, but on account of slaughter by fishermen for ivory, skin, and oil, has been driven from Europe and from the southern part of Baffin Bay. The north

Atlantic species (*Odobenus rosmarus*) is still plentiful in the Smith Sound region and in Spitzbergen and Franz-Josef Land, and the Pacific species (*Odobenus obscurus*) is found on the northern coast of Alaska and Kamchatka. Among species of hair seals which inhabit the Arctic seas, the most important is the *Phoca fatida*, whose range covers the Arctic regions near the shores and ice fields, and extends south to Labrador, the Orkneys, the Hebrides, the gulfs of Bothnia and of Finland, and along the coasts of Siberia and Alaska, into Bering Sea. The harp seal (*Phoca Groenlandica*) and the bearded seal (*Erignathus barbatus*), which is the largest of the north Atlantic pinnipeds next to the walrus, also have a circumpolar distribution. The bladder-nose or hooded seal (*Systophora cristata*) ranges from Greenland to Spitzbergen and along the northern coast of Europe. For other seals, see SEAL.

Arctic Birds. Birds are very plentiful throughout the whole of the Arctic region. The little auk (*Mergulus or Alle alle*) and the guillemot (*Uria lomvia*) are found in thousands in whatever region there are cliffs to serve as nesting spots. Raven (*Corvus corax*), snow buntings (*Plectrophenax nivalis*), and sandpipers have been seen in the remotest northern land regions. The snowy owl (*Nyctea nivea or nyctea*) and the gyrfalcon (*Falco rusticolus*), though in certain regions rare—as, for instance, Greenland and Franz-Josef Land—still inhabit all Arctic lands. Various species of gulls—Ross's gull (*Rhodostethia rosea*), the glaucous gull (*Larus glaucus or hyperboreus*), the ivory gull (*Pagophila eburnea or alba*)—also range very far north; Nansen saw Ross's gulls and ivory gulls upon the ice pack above Franz-Josef Land. Among the other characteristic Arctic birds are the eider duck, kittiwakes, skuas, teal, petrels, puffins, and ptarmigans. Further information concerning the mammals and birds of the Arctic region will be found under the names of the animals. See also DISTRIBUTION OF ANIMALS, and the titles of the countries included in the Arctic region.

Arctic Insects. Insects have been collected wherever exploration has extended and vegetation was known. Bees and parasitic hymenopterans occur as far as the Pedicularis or other flowers bloom—up to 82° or more in Grinnell Land, and in Greenland. Beetles are less hardy, and few are known north of the Arctic Circle, but flies, butterflies, and moths have been taken up to 83° on the American side of the pole. Thus the Nares expedition brought back several species of Lepidoptera, mostly of common genera (*Argynnis*, *Colias*, *Lycena*, etc.) of butterflies, while the few moths represent various families. These insects have only about six weeks in which their larva can hatch and feed, and probably do not mature in a single season; but it must also be remembered that the whole 24 hours of the days of their brief career are sunny, and they fly about continuously.

Marine Life. More than 125 species of fishes have been taken within the Arctic Circle, and valuable fisheries exist on the northern coasts of Russia, in the waters about Spitzbergen and Nova Zembla, and might be organized north of Bering Strait. The most important are cod, halibut, flatfish, and related forms; but many bottom-feeding families are represented as far north as knowledge extends. Several species of salmon or trout ascend Arctic rivers, the most

northerly case being that of *Salmo arcturus*, taken in Grinnell Land (lat. 82°). Food for many of these fishes, and for seals and walruses, is afforded by a large variety of mollusks, including squids, clams, and mussels, and a long list of gastropods, chiefly of the families Pleurotomidae, Buccinidae, Naticidae, and Trochidae. Nearly 100 species have been catalogued, a large proportion of which also exist in temperate latitudes. The great abundance of diatoms and the general prevalence of low algae sustain these and similar low animals. No mollusks are more widespread and numerous, however, than the pteropods, especially of the genera *Clione* and *Lima-cina*, and they furnish an important element in whale diet. There are also chitons and sea slugs. Crustacea abound in the Arctic seas. A few are of the higher forms, allied to crabs and shrimps, but mainly they are entomostracans of small size and pelagic life. Such amphipods as *Anonyx* and *Hippolyte* are well represented in the extreme north at various depths, as also are the copepods, isopods, barnacles, and pycnogonids; and the specimens of such species as are also known southward are very much larger than their southern equivalents. All of these, and especially the copepods, are of great economic importance as food for whales. They are an example of the power of resisting cold possessed by these creatures, for they survive freezing for a long period, and their eggs are still more hardy. The shores and shallows of the Arctic Ocean also abound in annelids, of which 20 or more species have been collected, and which form an important element in the diet of the larger denizens of those seas; and the still humbler ranks of life are represented by jellyfishes and hydroids, especially varied and numerous north of Alaska, and by polyzoans and test-bearing protozoans in great numbers. Seaweeds diminish toward the extreme north to a very few olive-colored kinds, and seem to be more abundant north of Europe than in the American Arctic regions.

Discoveries. For explorers the principal entrance to the Arctic Ocean is the passage between Nova Zembla and Franz-Josef Land; the next most convenient entrance is through Davis Strait. American explorers have generally passed up Davis Strait, Baffin Bay, and Smith Sound, and through the very narrow Kennedy Channel; and Markham in 1875 pushed the ship *Alert* through Robeson Channel into the Arctic Ocean, where it wintered at Floeberg Beach, and Peary's steamer *Roosevelt* later wintered at Cape Sheridan on the same coast.

As to the efforts to reach the North Pole itself, it may be stated that by the use of sledges Parry, in 1827, reached 82° 45', far outstripping all previous records; Markham, of the British expedition under Nares, attained 83° 20'; Lockwood, of Greely's expedition, reached 83° 24'; Peary, in 1900, reached 83° 54'; in 1902, 84° 17'; in 1906, 87° 6'; and in 1909 the pole itself. By the passage eastward toward the New Siberian Islands and the subsequent drift in the ice floe, Nansen's ship, the *Fram*, in 1895, reached 85° 57'; but having previously left the ship, by a sledge journey over the ice-pack, Nansen and Johannsen reached 86° 14'. On April 26, 1900, Cagni, of Abruzzi's expedition, by a rapid march northward from Franz-Josef Land, reached 86° 33'.

For an account of exploration in the Arctic regions, see POLAR RESEARCH. For further in-

formation concerning the magnetic phenomena, see MAGNETISM, TERRESTRIAL.

Bibliography. A very good bibliography of the Arctic region is Chavanne, aided by Karpf and Mommier, *Die Litteratur über die Polar-Regionen der Erde* (Vienna, 1878). In this work may be found the titles, classified, of most of the important books that had been written up to the time of its publication. General Greely's *Handbook of Arctic Discoveries* (5th ed., Boston, 1910) also gives valuable lists of books, classified according to the various spheres of Arctic exploration. A fairly comprehensive work covering *The Natural History, Geology, and Physics of Greenland and Adjacent Regions* (London, 1875) was prepared by T. Jones as a manual for the British Admiralty Expedition of 1875-76. The information presented by the contributors to this work extends somewhat beyond the regions "adjacent" to Greenland, but needs to be supplemented, and in a few passages corrected, by the reports of later explorations. Of such reports, the most important are (1) those of the International Polar Expeditions of 1881-83, published by the various cooperating governments. Those of the United States appeared (a) by Greely under the title, *Report on the Proceedings of the United States Expedition to Lady Franklin Bay* (Washington, 1888); (b) by Ray, under the title, *Report of the Expedition to Point Barrow*; that of Austria, by Wohlgenuth, appeared under the title, *Oesterreichische Polarstation Jan Mayen* (Vienna, 1886); that of Denmark, by Paulsen, under the title, *Expedition Danoise, Godthaab* (Copenhagen, 1889-93); that of Great Britain, by Dawson, under the title, *Fort Rae* (London, 1886); that of Russia, by Andreyeff and Lentz, under the title, *Beobachtungen der russischen Polarstationen auf Nowaja Semla* (St. Petersburg, 1886-95), etc. (2) Wright, *Greenland Ice Fields and Life in the North Atlantic* (New York, 1896), which contains a brief description of the flora and fauna of Greenland and a discussion of Arctic glacial phenomena; (3) Conway, *The First Crossing of Spitzbergen* (London, 1897); (4) Jackson, *A Thousand Days in the Arctic* (New York, 1899), which deals with Franz-Josef Land, and *The Great Frozen Land* (New York, 1895), which deals with the Samoyed Peninsula; (5) Peary, *Northward over the Great Ice* (New York, 1898), which contains a valuable chapter on the most northern Eskimos; (6) Peary, *The North Pole* (New York, 1910); (7) Nansen, *Farthest North*, which sets forth the drift of a vessel frozen in the ice across the Arctic Ocean. Of fundamental importance is *The Norwegian North Polar Expedition 1893-1896: Scientific Results*, edited by Nansen. Books on Arctic currents are: Dittmar, *Das Nord-Polarmeer* (Hanover, 1901), and the report published by the Norwegian government of the investigations of the ship *Ingolf* in the region of east Greenland and Iceland.

Valuable works on the inhabitants are: Boas, "The Eskimo of Baffin Land and Hudson Bay" (*Bulletin, American Museum of Natural History*, vol. xv); Pecher, *The Races of Man and their Geographical Distribution* (London, 1876); Ratzel, *The History of Mankind* (3 vols., trans., New York, 1896). For the distribution of animals consult Heilprin, *The Geographical and Geological Distribution of Animals* (New York, 1887); for the distribution of plants consult Heer, *Flora Fossila Arctica* (7 vols., Zurich, 1868-80).

ARCTIUM, ärk'shî-ûm. See BURDOCK.

ARCTOI/DEA. See CARNIVORA.

ARCTOSTAPHYLOS (Gk. ἀρκτος, *arktos*, bear + σταφυλή, *staphylê*, grape-bunch). A genus of shrubs and small trees closely related to *Arbutus*. Most of the species are American; two, however, are circumpolar. The red bearberry (*Arctostaphylos uva-ursi*) is one of them. It is a trailing evergreen shrub, which bears small flowers and red berries. Its associated species, *Arctostaphylos alpina*, has berries which are black when ripe and leaves which are not evergreen. The leaves of *Arctostaphylos uva-ursi* are used in medicine. The manzanita of California is *Arctostaphylos pungens*. It is a shrub or small tree 30 feet high that sometimes forms almost impassable thickets. Only the trailing forms are entirely hardy.

ARCTOWSKI, ärk-tôf'skê or -tôs'ké, HENRYK (1871—). A Polish scientist and explorer. He was born in Warsaw and studied chemistry and geology at the universities of Paris, Liège, and Zurich from 1888 to 1896. After a year at the British Museum he set out with the Belgian Antarctic expedition in 1897, in charge of the physical observations. During the two years' stay of this expedition in the south polar regions he discovered and studied the geology of the Antarctic Andes and established the first complete record of meteorological observations made in that part of the world. On his return to Europe he became assistant in the Royal Observatory of Belgium and remained there until his removal to the United States in 1909. He was appointed chief of the science division of the New York Public Library in 1911 and became a member of many American and European scientific societies. His published writings include *Die antarktischen Eisverhältnisse* (1903); *L'enchaînement des variations climatiques* (1909), and many reports and articles in scientific journals of this and other countries.

ARCTURUS (Gk. ἀρκτος, *arktos*, bear, the Great Bear + οὔρος, *ouros*, guardian). The principal star in the constellation Boötes (the 'herdsman'). Arcturus is of the first magnitude and is very conspicuous in the northern heavens. According to the *Harvard Photometry*, it is exceeded in brightness by only two stars, Sirius and Canopus. Its parallax, as determined by Elkin, is 0".024. Its distance from us is therefore about 8,500,000 times the mean radius of the earth's orbit, and its light takes about 125 years to reach us. It may be found by continuing the curve of the three stars which form the handle of the Dipper, or Ursa Major (q.v.).

ARCUATION. See LAYERING, ARCUATION.

ARCEIL, ärk'kê'y' (anciently, Lat. *Arcus Iulianus*). A suburb of Paris lying 4 miles south of that city (Map: Paris and vicinity). It is a holiday resort and noted for the ruins of an aqueduct built by order of the Roman Emperor Julian and for several aqueducts of modern times. Pop., 1901, 8425; 1911, 11,319.

AR'CUS SENI'LIS (Lat. bow of old age), or GERONTOXON (Gk. γέρον, *gerôn*, old man + τόξον, *toxôn*, bow). A change occurring in the cornea of the eye, in consequence of fatty degeneration of its margin. The *arcus senilis* usually commences at or even before the age of 40 years, as an opaque whitish crescent, skirting either the upper or lower margin of the cornea; and from this beginning it extends along the edge till it finally becomes a complete circle, which some-

times assumes a chalky whiteness. On close examination it may be seen that a narrow interval of partially clear cornea always intervenes between the arcus and the opaque sclerotic. As far as vision is concerned, the formation of this circle is of little importance. It is usually associated with arteriosclerosis and fatty degeneration of other portions of the body, including the heart.

ARCY, är'sê', GROTTO OF. A cavern of remarkable beauty, 12 miles east of Auxerre, France. It is supposed to have been used in early times as a stone quarry, and possibly the material for the Auxerre cathedral was taken from it. There are three main divisions with an aggregate length of about 2900 feet.

ARD, or **AIRD**. A Celtic root, meaning 'height' (cf. Lat. *arduus*, high), which appears in many geographical names, especially in Ireland and Scotland.

ARDAHAN, är'dâ-hân'. The capital of a district in the territory of Kars, Transcaucasian Russia (Map: Russia, F 6). It is situated 45 miles northwest of Kars on the Kur River. Its strategical importance on the military route from the Black Sea to the Turkish frontier and as the point of juncture of the roads to Batum, Akhaltsikh, Kars, and Erzerum was recognized by the Turks, who, by constantly improving its fortifications, finally made it a powerful stronghold. In 1877, 20,000 Russians under Devel and Heiman successfully stormed it. By the Treaty of San Stefano and the Berlin Congress (1878), Ardahan and the surrounding country were ceded to Russia. Pop., 800.

AR'DAN. A small South American linguistic stock in the region lying between the rivers Napo and Nanay, in extreme northeast Peru-Ecuador.

ARDASHIR, är'dâ-shêr' (Pahlavi *Artaxsatar*, later Pers. *Ardasir*). The name of three monarchs of the Sassanian dynasty of Persia (see SASSANIDÆ), and a later form of the old name Artakshathra, or Artaxerxes (q.v.). The most important of the three was Ardashir I, or Artakshatar Papakan, who founded the Sassanian dynasty by overthrowing Artabanus, the last of the Parthian kings, and strengthened his power by further conquests, and ruled over Persia 226-240 A.D. His records are contained in the *Kārnāmê i Artakshshir i Pāpakān*, which have been translated into English and Gujarati by Darab Sanjana (Bombay, 1896). The other two of the name were Ardashir II, 379-383; Ardashir III, 628-629. See PERSIA.

AR'DEA. A town in ancient Italy, capital of the Rutuli and their King Turnus (q.v.).

ARDEBIL, är'de-bêl', or **ARDABIL**, är'dâ-bêl'. A celebrated town of Azerbaijan, Persia, situated in lat. 38° 15' N., long. 48° 19' E., on a plain over 4000 feet above sea level, and 40 miles from the Caspian Sea (Map: Persia, C 2). It has a moderate climate, and its picturesque environs and the mineral springs in its vicinity make it the favorite abode of the Persian rulers, whose tombs it contains. Before the Russo-Persian War (1826-28) the city was strongly fortified under the French. During the war it was captured by the Russians and was subsequently nearly ruined by earthquakes. Since the Middle Ages it has derived some importance from its proximity to the Lenkoran-Tabriz caravan route. Its population is estimated to be above 10,000.

ARDECHE, är'dêsh'. A department in the

south of France. It takes its name from the river Ardèche, a tributary of the Rhône, and includes the northernmost part of the old province of Languedoc. Area, 2145 square miles. Pop., 1896, 360,599; 1906, 347,140; 1911, 331,801. Ardèche is almost wholly mountainous. The upland, which has winter for about six months, is devoted to pasturage, while the terraces and valleys near the Rhône have a warm climate and produce good white and red wine, olives, dates, almonds, chestnuts, vegetables, etc. Lead, iron, copper, and manganese are mined, and lime is quarried. Leather, silk, paper, and flour are manufactured, and these with lumber form the principal articles of commerce. Capital, Privas.

AR'DEN, EDWIN HUNTER PENDLETON (1864—). An American actor and manager. He was born, Feb. 13, 1864, in St. Louis, Mo. He left home at the age of 17, and after a variety of experiences in the West went upon the stage in 1882, with J. W. Keene's company, in Chicago. Besides his engagements with other managers, he traveled for a number of years with his own company and appeared in plays of his own authorship. He has written, either alone or in collaboration, *Eagle's Nest*, *Barred Out*, *Raglan's Way*, and *Zorah*.

ARDEN, FOREST OF. A wood in Warwickshire, in old times very extensive. It is supposed to have been a huntingground of Robin Hood. Certain authorities believe that Shakespeare used it as a background in *As You Like It*; others assert that his scenery was taken from the forest of Ardennes.

ARDENNES, är'dèn' (Celt. high wooded valley, from *ard*; Lat. *arduus*, high: the ancient Lat. *Arduenna Silva*, Ardenne Forest). A wild, hilly region, extending over portions of Belgium and France and gradually sloping toward the plains of Flanders. In early times the name was given to a vast forest lying between the Rhine and the Sambre, a distance of about 160 miles. The average height of the hills is less than 1600 feet; but in the east, Mont Saint-Hubert attains an elevation of 2100 feet. Large tracts of this region consist of gently undulating plateaus densely covered with oak and beech forests, while other portions are marshy, heathy, and barren. The districts through which the Meuse and other rivers flow present some extraordinary appearances. The channel of the river is sometimes bound in by rugged and precipitous cliffs more than 600 feet high. The principal rocks of the Ardennes are clay slate, graywacke, quartz, etc., interspersed with extensive strata of Paleozoic limestone. There are coal and iron mines in the northwest; lead, antimony, and manganese are also found. There is little cultivation of grain, but cattle and sheep are extensively raised. Consult A. Meyrac, *Villes et villages des Ardennes* (Charleville, 1898).

ARDENNES. A frontier department in the northeast of France, formerly a part of the old province of Champagne. Area, 2028 square miles; pop., 1896, 318,865; 1906, 317,505; 1911, 318,896. The northeastern part of Ardennes belongs to the basin of the Meuse; the southwest is watered by the Aisne; and both of these rivers, united by the canal of Ardennes, receive several affluents. Agriculture is carried on extensively in the fertile valleys, cereals, grain, and potatoes being the principal crops. In the mountainous districts there are extensive forests and tracts of grazing lands. The vine is cultivated at Mézières, in the southwest. In the

north, near Givet, marble is obtained; but the prevailing rock is limestone, veined with lead and iron. Slate, marble, and iron, porcelain clay, and sand for making glass are obtained. Other leading industries are saw milling and the manufacture of iron, leather, flour, and sugar. Most of these commodities are exported. Capital, Mézières. Consult A. Joanne, *Le département des Ardennes* (Paris, 1898).

ARDENNES, THE WILD BOAR OF. An appellation of William de la Marck, a lawless baron of the reign of Louis XI, whom Scott has introduced in several chapters of *Quentin Durward*.

AR'DEN OF FEVERSHAM. The first English "bourgeois tragedy." It deals with a murder by a wife and her paramour. The plot was drawn from an actual occurrence contemporary with it. It was first printed in 1592; its authorship is unknown. The play has been attributed both to Shakespeare and to Kyd. In 1736 Lillo, author of *George Barnwell*, began an adaptation of it, which was completed after his death by Dr. Hoadley and produced in 1790. For further information, consult Saintsbury, *History of Elizabethan Literature* (London, 1887).

ARDITI, är-dé'tè, LUIGI (1822-1903). An Italian composer and musical conductor. He was born at Crescentino, Piedmont, July 16, 1822. After graduating from the Milan Conservatory in 1842, he began his career as a violin virtuoso, traveling with Bottesini, the famous double-bass player. With the Havana Opera Company, of which he became conductor, he visited New York in 1847 and during subsequent seasons, conducting in 1854 the first performance at the Academy of Music, where he brought out his opera, *La Spia* (based on Cooper's novel, *The Spy*). In 1857 he was conductor at Her Majesty's Theatre in London. In 1869 he conducted *The Flying Dutchman*, the first performance of a Wagner opera in England. In 1878 and many subsequent seasons he again conducted opera in New York. His waltz songs *Il Bacio* (to which Piccolomini gave great vogue) and *Fior di Margharita* (sung by Patti and other great prima donnas), are famous. He was Patti's favorite conductor. His other operas are *I Briganti* (1841) and *Il Corsaro* (1856). He published *My Reminiscences* (New York, 1896), containing a good deal of valuable information besides interesting chitchat. He died, May 1, 1903, at Hove, near Brighton.

ARDMORE. A city and the county-seat of Carter Co., Okla., about 100 miles south of Oklahoma City; on the Gulf, Colorado, and Santa Fe, the Rock Island, San Francisco, and Oklahoma, and New Mexico and Pacific railroads (Map: Indian Territory, F 4). It is the seat of Hargrove College and St. Agnes's Academy. It controls large commercial interests in cotton and asphalt; has deposits of natural gas and many large oil wells; and is an important stock-raising centre. It has municipal water works. Ardmore was settled in 1886 and incorporated in 1898, but has adopted the commission form of government. Pop., 1900, 5681; 1910, 8618.

ARDOCH, är'dôg. A small village in Perthshire, Scotland, 8 miles south-southwest of Crieff (Map: Scotland, E 3), with the best-preserved Roman camp in Britain. The camp is 2½ miles north of Greenloaning station on the Caledonian Railway, in the grounds of Ardoch House. The intrenched works form a rectangle 500 by 430

feet, the four sides facing the cardinal points. The north and east sides are protected by five ditches and six ramparts, these works being 270 feet broad on the north side and 180 feet on the east. A deep morass exists on the southeast, and the perpendicular banks of Knaig Water, rising 50 feet high, protect the camp on the west. The prætorium, or general's quarter, now called Chapel Hill, rises above the level of the camp, but is not exactly in the centre, and is nearly a square of 60 feet each side. Three of the four gates usual in Roman camps are still seen. A subterranean passage is said to have formerly extended from the prætorium under the bed of the Knaig. Not far north of this station, on the way to Crieff, may be traced three temporary Roman camps of different sizes. Portions of the ramparts of these camps still exist. Pop., 1901, 916; 1911, 863.

ARDROS'SAN (Gael. *ard*, high + *rossan*, point). A small seaport town and summer resort in Ayrshire, Scotland, on the Firth of Clyde, 32 miles by rail southwest of Glasgow (Map: Scotland, D 4). Its harbor, sheltered by an island off the coast, is one of the safest and most accessible on the west coast of Scotland and has been greatly improved by the earls of Eglinton, to whose efforts the prosperity of the town is largely due. There is a large export of coal and pig iron from this place, and ship-building and fishing furnish occupation for many of the inhabitants. On a hill above the town stand the ruins of Ardrossan Castle, said to have been surprised by Wallace when held by the forces of Edward I. Population of the police burgh in 1901, 5933; in 1911, 5760.

ARE, *âr* (Lat. *area*, piece of level ground). The unit of the French land measure, a square, the side of which is 10 meters (or 32.809 feet) long, and which, therefore, contains 100 square meters = 1076 English square feet. The next denomination in the ascending scale is the *decare*, containing 10 ares; but the denomination commonly used in describing a quantity of land is the *hectare* of 100 ares = 2.47 English statute or imperial acres. See METRIC SYSTEM.

A'REA (Lat. piece of level ground, vacant place). The superficies of any bounded surface or space. The calculation of areas, or mensuration of surfaces, is one of the ultimate objects of geometry. Area is commonly measured by a square unit, as the square inch, square yard, square meter, square degree. (See MENSURATION; QUADRATURE.) In antiquity this word meant any space free of buildings, such as a square, inclosure, court, arena of a circus, space around a temple, or any other public building. In this last connection, the area was consecrated ground. So, in connection with early Christian churches there were areas protected by law, in which the faithful were buried. In modern use the word is applied also to the open space of a narrow front yard or back court, or in connection with a basement.

ARE'CA (Sp. Portug. from Canarese *adiki*). A genus of palms containing about 15 species. The fruit is a fibrous one-seeded drupe, a nut with an outer fibrous husk. *Areca catechu*, the Pinang palm, or betel-nut palm, is a native of the East Indies, whose nut yields a sort of catechu. (See CATECHU.) This areca nut or betel nut, is very much used in all parts of the East. the chewing of it with quicklime and the leaf of the betel pepper being one of the most prevalent habits of the people. (See BETEL.) The

fruit is about the size of a hen's egg, smooth, orange or scarlet, the fibrous husk about half an inch thick. When chewed, it reduces the saliva and stains the lips and teeth. It is said to stimulate the digestive organs and to prevent dysentery. Areca nuts form a considerable article of trade in the East. The timber of the palm which produces them, and its leafstalks and spathes, are also used for domestic purposes. The tree is often 40 to 100 feet high, and in general less than a foot in diameter. The leaves are few, but very large, their leaflets one to two feet long. In Malabar an inebriating lozenge is prepared from the sap. *Areca oleracea*, or *Oreodoxa oleracea*, the "cabbage palm" of the West Indies, is a very tall tree, 100 to 200 feet, whose huge terminal leaf bud is sweet and nutritious and is sometimes used for the table as cabbage; but when it is cut off the tree is destroyed. The stem of this tree, notwithstanding its great height, is remarkably slender. The nuts are produced in great numbers; they are about the size of a filbert and have a sweet kernel. *Areca sapida*, now called *Rhopalostylis sapida*, the New Zealand palm, is remarkable as extending southward beyond the geographical limits of any other of its family, as far, indeed, as lat. 38° 22' S. It is a small palm, only from 6 to 10 feet high, with leaves 4 to 6 feet long. The young inflorescence is eaten. *Areca vestiaria*, a native of the East, is so called because clothing is made from its fibres. For illustrations, see PALMS.

ARECIBO, *â'râ-sâ'bô*. The chief city of the department of the same name, rather picturesquely situated on the northern coast of Porto Rico (Map: Porto Rico, C 2). It is about 40 miles west of San Juan, with which it is connected by rail, and has a rather shallow harbor and some sugar mills, the product of which is the principal export. The city is surrounded by coffee plantations and fine grazing land. Pop., 1899, 8008; 1910, 9612.

AR'EIOP'AGUS. See AREOPAGUS.

AR'EMORICA. See ARMORICA.

ARE'NA (Lat. sand, sandy place, beach, coast). The central part of an amphitheatre, inclosed by the seats. In it the gladiatorial contests and other games were held, and the name "arena" was given to it because of the sand which was spread to soak up the blood. The term is extended to mean any flat inclosure for the exhibitions of shows, games, sports, and contests, and even figuratively to the region or field of political and other intellectual contests. See AMPHITHEATRE.

AR'ENA'CEOUS ROCKS (from Lat. *arena*, sand), or Psammites, Gravel and Sand Rocks, composed mainly of quartz particles deposited through water or air. They are mechanical sediments produced by the disintegration and removal of siliceous rocks by the action of atmosphere, rain, rivers, frost, lake and ocean waves, and other superficial agencies. The arenaceous rocks, or psammites, include plain sand, river sand, sea sand, sandstone, graywackes, quartzite, gravel, shingle, and conglomerate (q.v.). Seldom are they composed entirely of quartz; the quartz being commonly associated with fragments of other minerals such as feldspar, mica, iron ore, hornblende, etc., all of which may be cemented by carbonate of lime or magnesia, quartz, or iron. Arenaceous rocks grade by intermediate stages into argillaceous rocks through increasing admixtures of clay, and into

calcareous rocks by admixture of lime. See **ARGILLACEOUS ROCKS**; **CALCAREOUS ROCKS**; **ROCKS**.

ARENALES, i'ra-nā'lēs, JUAN ANTONIO ALVAREZ DE (1755-1825). An officer in the patriot army in the Peruvian revolution against Spain. In 1820, with a body of 1000 men, he was sent from Pisco with orders to strike into the country across the Andes and proceed by a circuitous route to Lima, there to meet the main army—a feat not unlike Sherman's famous march—which he accomplished most successfully, completely defeating the Spanish army at Cerro de Pasco.

ARENA'RIA (Lat. *arenarius*, pertaining to sand, from *arena*, sand), or **SANDWORT**. A genus of plants of about 150 species, belonging to the family Caryophyllaceae. The species are annual and perennial tufted herbs, rarely somewhat shrubby, and natives of the temperate and colder parts of the world. Some of them are arctic and alpine plants. Many of them are chiefly found in sandy soils. The flowers are generally small and inconspicuous.

ARENBERG, i'ren-bērk, or **AREMBERG**, i'rem-bērk. A duchy of the Holy Roman Empire, with territory mainly in Germany. The lords of Aremberg became important in the twelfth century, but the male line died out in 1280. The heiress married the Count de La Marck and had two sons, of whom the elder became Count de La Marck, and the younger, Lord of Aremberg. The male line died out again, and in 1547 the heiress married a member of the family of Ligne who was made a Count of the Empire by Charles V. He distinguished himself in the Dutch wars. His services and the fortunate marriage of descendants added to the prestige and property of Aremberg, and the title was raised to Duke. See the following articles.

ARENBERG, or **AREMBERG**, AUGUST MARIA RAIMUND, PRINCE (1753-1833). A Belgian soldier and author—also known as Count La Marck—a brother of the Duke of Arenberg. He served in India in 1780, and participated in the Belgian revolt of 1789, but afterwards swore allegiance to the Emperor Leopold II. He was an intimate friend of Mirabeau during the French Revolution, and his *Correspondance entre le Comte de Mirabeau et le Comte de La Marck* (edited by Vacourt, 2 vols., Brussels, 1851) must be considered a valuable contribution to the history of the French Revolution.

ARENBERG, or **AREMBERG**, LEOPOLD PHILIPP KARL JOSEPH, DUKE OF (1690-1754). An Austrian field marshal. He was born at Mons, of one of the most illustrious families of Belgium. At 16 he was colonel of a regiment, and counselor of state to Archduke Charles, the Austrian claimant to the Spanish throne, who subsequently became Emperor as Charles VI. He fought at Malplaquet in 1709 and in the same year became grand bailiff of Hainault. In 1716 he served in Hungary under Prince Eugene, and fought at Belgrade in the following year; on returning to the Netherlands in 1718 he was made military governor of Hainault, and subsequently commander-in-chief of all the Austrian forces in the Netherlands, with the rank of field marshal. In 1743 he led his troops with great gallantry at Dettingen. Afterward he served in Silesia under Charles of Lorraine, and in 1747 was president of the commission in control of the Netherlands. He was a lover of the sciences and

of letters and was a patron of J. J. Rousseau. He also corresponded with Voltaire and with Frederick the Great. The fullest account of Leopold of Arenberg is that given by Gachard, in the *Biographie Nationale*, published by the Royal Academy of Belgium and founded on documents in the Belgian royal archives.

ARENDAL, i'ren-dāl. A town on the south-east coast of Norway, situated near the mouth of the Nid Elf in the Bay of Christiania, 36 miles northeast of the city of Christiansand (Map: Norway, D 7). It is built partly on piles, partly on rock, with numerous canals intersecting it, and this circumstance, as well as its situation, gives it a very romantic aspect and has caused it to be called "The Little Venice." The bay, which is protected by the island of Tromsø, forms an excellent harbor and favors the commerce of the town. The exports are iron from the neighboring mines, timber, and wood pulp. Shipbuilding is also carried on, and, on a smaller scale, distilleries and tobacco factories. Pop., 1900, 4370; 1910, 10,315.

ARENDT, i'rent, OTTO (1854—). A German economist and politician, born in Berlin. He studied law and political science at Leipzig and Freiburg, and with the appearance in 1880 of his work, *Die vertragsmassige Doppelrechnung*, became an active advocate of bimetalism. He was one of the founders of the society for the introduction of international bimetalism (1882), and became the real head of the party in Germany. In 1885 he was elected to the Prussian House of Representatives as a member of the Liberal Conservative party. From 1888 to 1898, he was editor of the *Deutsches Wochenblatt*, in which he advocated colonial expansion and the coalition of national parties. His published works include *Leitfaden der Währungsfrage* (17th ed., 1895); *Die Ursache der Silberentwertung* (1899); *Die parlamentarischen Studienreisen nach West- und Ost-Afrika* (1906); *Geld, Bank, Borse* (1907).

ARENDT, i'rent, RUDOLF (1828-1902). A German chemist, born at Frankfurt-on-the-Oder. He studied at the University of Leipzig and after 1861 taught at the commercial high school there. The best known among his works is his *Technik der Experimental Chemie* (2 vols., 1881; 3d ed., 1900). Arendt was for many years editor of the *Chemisches Centralblatt*. He also wrote *Anschauungsunterricht in der Naturlehre* (4th ed., 1886); *Leitfaden für den Unterricht in der Chemie* (7th ed., 1899); *Grundzüge der Chemie* (8th ed., 1903).

ARÈNE, a'rēn', PAUL AUGUSTE (1843-96). A French writer and Provençal poet born at Sisteron. He was director of the Lyceum at Marseilles and afterward of that at Vanves, and gained his first success as an author with his *Pierrot héritier* (presented in 1865), a one-act comedy in verse. His further publications include the dramatic works *Jean des figures* (1870), *Les comédiens errants* (1873), and *Le duel aux lanternes* (1875), some prose fiction, such as *Au bon soleil* (1879), and *Le canot des six capitaines* (1888), and a volume of descriptions of travel, *Vingt jours en Tunisie* (1884). His work was marked by delicate humor. He was a regular contributor to *La République Française*, *L'Érénement*, and *Gil Blas*. Consult Armand Silvestre, preface to *Poésies* (Paris, 1900); Lorenz Petry, dissertation (Halle, 1910).

ARENG' PALM. See GOMUTI.

ARENS, i'rens, FRANZ XAVER (1856—). An

American musician. He was born at Neef, Germany, but came to America at the age of 10. Later he went again to Germany to study music. He took the regular course at the Conservatory in Dresden, where he graduated in 1885. From 1885 to 1888 he conducted the Philharmonic Orchestra of Cleveland, Ohio, and also appeared in other cities as conductor of music festivals. From 1890 to 1892 Arens was abroad in charge of "American Composers" concerts. In 1900 he founded the People's Symphony Concerts in New York for the purpose of bringing the best music to the poorer classes. The admission fee is merely nominal. From the beginning these concerts were successful, and their scope was gradually extended, so that from a few orchestral concerts, conducted personally by Mr. Arens, chamber-music concerts by regular organizations became a feature. This movement has spread to other cities.

ARENSKI, á-rén'ské, ANTON STEPANOWITICH (1861-1906). A distinguished Russian composer. He was born at Novgorod, July 30, 1861, and died at Tarioki (Finland), Feb. 25, 1906. From 1879 to 1882 he was a pupil of the Conservatory at St. Petersburg, where he studied under Rimski-Korsakoff (q.v.). In 1883 he became professor of composition at the Imperial Conservatory in Moscow, where in a short time he gained a national reputation as a successful teacher. He returned to St. Petersburg in 1895, succeeding Balakireff (q.v.) as conductor of the Imperial Court Chorus. Although a contemporary of the Neo-Russian composers, he has little in common with them; he rather inclines to the ideals of Glinka (q.v.) and Tchaikowski (q.v.). His works comprise the operas: *The Dream on the Volga* (1892); *Raphael* (1894); *Nala and Damayanti* (1899); for orchestra: two *Symphonies* (Bm. and A); *Concerto for piano*; *Concerto for violin*; *Fantasia for piano and orchestra*. Chamber music. *String quartets*, *trios*, *piano quintet*. Many compositions for piano, songs, and choruses. Theoretical works: *Treatise on Harmony* and *Handbook of Musical Form*.

ARENTS, á'rents, ALBERT (1840—). A German-American metallurgist. He was born at Klausthal, Germany, and studied mining engineering there and at Berlin. In 1865 he came to the United States and undertook to treat the lead ores in Hampton Co., Mass. He was metallurgist and mining engineer of a number of enterprises in the Western States, and patented many valuable industrial improvements, including a "siphon-tap" for lead blast furnaces.

ARENTZEN, á'rents-en, KRISTIAN AUGUST EMIL (1823-1900). A Danish poet. He was born at Copenhagen, and after extensive travels he was appointed to the chair of aesthetics in the University of Copenhagen. He published two dramas, *Gnalog Ormctunge* (1852), and *Knud den Hellige* (1853), and a volume of *Digte* (1854, republished as *Ny Digtsamling*, 1867). He is chiefly known for his important critical work, *Buggesen og Oehlenschläger* (8 vols., 1870-78).

AREOIS, á'rā-ō'ez. The society of the Areois was a famous institution among the natives of the Society Islands (Tahiti), organized for literary, dramatic, and especially religious purposes. The members traveled from place to place, singing, dancing, and representing historical events and scenes in the lives of gods and heroes. They also devoted themselves to erotic pleasures (love adventures and sexual

congress of an absolute reality were acted), which has made the *Areois* stand for a sort of artistic sexualism. Upon the women belonging to the society, infanticide was imposed by oath. It represents one of the most remarkable sides of Polynesian life, for which a parallel has to be sought in the European Middle Ages.

A'REOM'ETER. See HYDROMETER.

AR'EOPAGIT'ICA. A pamphlet advocating unlicensed printing; the greatest prose work of Milton (1644), a plea for freedom of thought.

AR'EOP'AGUS (Gk. 'Αρείος πάγος, *Areios pagos*, hill of Ares). A bare, rocky hill to the west of the Acropolis of Athens, about 350 feet high. The ancients explained the name by saying that here Ares had been tried for the murder of Halirrhothius, or that the Amazons (q.v.), the worshipers of Ares, had attacked the Acropolis from this point. Some modern writers prefer to connect it with the Eumenides (q.v.; see also the account of the *Oresteia*, under ÆSCHYLUS; and ORESTES; and the close of the present article) and the bloodguiltiness, which was tried here, and derive the name from 'Αρά, so that the meaning would be 'hill of the curse.' (Consult Frazer, *Pausanias*, ii, 363.) At the south end steps hewn in the rock lead to a series of rock cuttings which cannot now be satisfactorily explained. On the north side, which overlooks the city and is near the deep cleft where the Eumenides were worshiped, seems to have been the place where the court of Areopagus tried cases of willful murder. The Areopagus gave its name to the most venerable court of Athens (Gk. ἡ ἐν 'Αρείῳ πάγῳ βουλή, 'the Council on the Areopagus'). It met in the open air, and accuser and accused stood on platforms hewn from the rock. The Areopagus seems originally to have been the council of nobles, such as surrounds the king in the Homeric poems, and naturally, therefore, the "king" archon (see ARCHON) remained its presiding officer. This council appears to have gradually taken into its hands the entire governing power, since we are told that it appointed all officials, including the archons, who entered the Areopagus at the end of their term of office. The Areopagus exercised the supreme judicial power and could bring to an account any official, so that its indirect influence must have sufficed to control the State. In the code of Draco the Areopagus kept its place as the court for all cases of willful murder, and even under the Solonian Constitution it seems to have preserved its place as a guardian of the laws, with the power of procedure against any official, or even private citizen, whose conduct was an offense against good morals or the well-being of the community. Under Solon, however, it seems to have lost its deliberative functions, so that it could no longer take part directly in administration and legislation. Clisthenes seems to have made no formal change in the rights of the Areopagus; but his creation of the Senate of Five Hundred and the power given the popular assembly certainly must have lessened its real influence. It is certain that in 462 B.C. the leaders of the democracy, Ephialtes and Pericles, succeeded in carrying a law which deprived the Areopagus of all those powers by which it exercised a general control over officials and public morals, leaving it only the right of judgment in murder cases, and the oversight of the sacred olive trees of Athena and some sacred lands. In spite of this reduction of its powers, it remained the most venerated body in Athens,

and we find it appointed at times to act for the State, or to conduct investigations of treasonable conduct, as a sort of commission of the popular assembly. In the reforms of Demetrius of Phalerum (317 B.C.), the Areopagus seems to have been given once more an oversight over public morals, and especially over offenses against the new sumptuary laws. In Roman times it was, according to Cicero, one of the governing bodies of Athens, and its name appears on decrees with that of the senate and people. Its judicial jurisdiction was also widely extended, and its decisions still commanded great respect. It is doubtful whether the apostle Paul was actually brought before the court of the Areopagus. It seems more probable that his speech was delivered before a body of curious philosophers on the hill of Areopagus, a convenient spot somewhat retired from the confusion of the neighboring market place. In Athenian legend the court was famed as the body which, under the presidency of Athena, acquitted Orestes of the charge, brought against him by the Furies, of bloodguiltiness in murdering his mother, Clytemnestra. The story forms the subject of the *Eumenides* of Æschylus (q.v.). Consult: Philippi, *Areopag und Epheten* (Berlin, 1874); Busolt, *Handbuch* (Nördlingen, 1887); Schömann, *Griechische Alterthümer*, ed. Lipsius (Berlin, 1897); Meier and Schömann, *Der attische Prozess*, ed. Lipsius (Berlin, 1883-87); and Botsford, *The Athenian Constitution* (New York, 1893).

AREQUIPA, ä'râ-kâ'pâ. A maritime department of Peru (Map: Peru, C 7). Area, 21,951 square miles. It is mountainous in the east and has a fertile soil, but is sparsely settled. The district is subject to severe volcanic disturbances. Copper, mica, borax, and sulphur are mined in the department. The population was officially estimated in 1896 at 229,007. Capital, Arequipa (q.v.).

AREQUIPA. An episcopal city, capital of the department of Arequipa, Peru; situated on the Chile River, 100 miles by rail northeast of the port of Mollendo. Another railroad, which reaches a summit level of 14,460 feet, runs to Puno, on Lake Titicaca, 225 miles to the east. Its situation, on the plateau of Quilca, 7000 feet above sea level, at the foot of the half-extinct volcano Misti, gives Arequipa a very temperate climate. The air is exceedingly dry and the water is impregnated with salts. It is the second city in Peru, is regularly laid out, and has a cathedral, a university, and two national schools. The inhabitants are engaged in the manufacture of jewelry, the cutting of precious stones, and in commerce, the city being the centre of trade for the interior of Peru. Near by is the Arequipa Observatory, a branch of the Harvard College Observatory, at an altitude of 8060 feet. It contains the Bruce Photographic Telescope, the largest instrument of the kind yet constructed, the gift of Miss Catherine W. Bruce of New York. Arequipa was founded in 1540 by Francisco Pizarro, and has ever since been important in the history of Peru, occupying a prominent place in the war for independence. In 1600 the city was almost ruined by an earthquake. In 1868 the city was again subjected to shocks which overthrew nearly all its buildings and killed more than 600 people. Pop., 1889, 30,000; 1896, 35,000; 1908, 35,000 to 40,000.

AREQUIPA, or MISTI. A volcanic mountain

of the Andes, Peru, about 20,000 feet high. The volcano has been inactive since 1831.

ARES, ä'rêz. See MARS.

AR/ETÆUS (Gk. 'Aperaios, Aretaios). A famous Greek physician and writer of Capadocia, who flourished in the latter half of the first and the beginning of the second century after Christ. He is considered to rank next to Hippocrates in the skill with which he treated diseases. He was noted for his total want of professional bigotry, and in his accuracy in the detail of symptoms and the diagnosis of disease was superior to most of the ancient physicians. His great work, written in singularly elegant and concise Ionic Greek, is divided into two parts. The first four books treat of the causes and symptoms of acute and chronic diseases; the last four, the cure of the same. They have been translated into various European languages, besides having been frequently edited in the original. The finest edition is the Oxford one of 1723, by J. Wigan. A German translation appeared at Vienna (1790-1802); an English one, by T. F. Reynolds, London, 1837; and there is a Greek and English edition by Dr. F. Adams (London, 1856).

ARETE. A unique instance among the Greeks of a woman carrying on a philosophic tradition. See ARISTIPPUS.

AR'ETHUSA. See ALPHEUS.

ARETHUSA BULBO'SA. A beautiful terrestrial orchid growing in wet bogs of the northern United States. The plant is small, and consists of a slender scape, 6 to 10 inches in height, which arises from a bulb. The lower portion of the scape bears a few green bracts, and the summit is crowned by a brilliant rose-pink flower one to two inches in length. The plant blooms in late spring. For illustration, see Plate of ANEMONE.

AR'ETIN'IAN SYLLABLES. The syllables *ut, re, mi, fa, sol, la*, used by Guido d'Arezzo.

ARETINO, ä'râ-tê'nô, CARLO (properly CARLO MARSUPPINI) (c.1399-1453). An Italian humanist. He was born at Arezzo (whence his surname), studied the Latin language and literature at Florence under Giovanni da Ravenna and Greek under Manuel Chrysoloras; and, with the patronage of the Medici, lectured learnedly and successfully on the classics. His first lecture, indeed, seems at once to have established his fame; for on that occasion, we are told, he amazed all by quotations from every known author, Greek or Roman. But it also seems to have begun the quarrel between him and the renowned Filelfo, who eventually, through Medicean hostility, was compelled to withdraw to Siena. He was appointed first apostolic secretary, and became in 1444 chancellor of the Republic of Florence. His writings include translations into Latin of the *Batrachomyomachia* and book i of the *Iliad*. His finely sculptured tomb, one of the finest monuments of the Renaissance, is still to be seen at Florence, in the southern aisle of the church of Santa Croce. Consult Nisard, *Les gladiateurs de la république des lettres aux XV^e, XVI^e, et XVII^e siècles* (Paris, 1860).

ARETINO, GUIDO. See GUIDO D'AREZZO.

ARETINO, LEONARDO. See BRUNI.

ARETINO, PIETRO (1492-1557). A notorious and profligate Italian author of the sixteenth century, who, apart from his comedies, is interesting chiefly for his colossal and successful

impudence. He was born at Arezzo, the son of a shoemaker, Luca, whose surname is unknown; for Pietro, being ashamed of his origin, assumed that of Aretino. While still young he came to Rome and found favor with Pope Leo X and Cardinal Giulio de Medici, but lost it through writing some licentious sonnets. For a while he frequented the Medicean court, where he attached himself closely to Giovanni de Medici, but after the death of the latter withdrew to Venice, where he soon acquired powerful friends and where he remained almost continually till his death. Aretino has best been summed up as a systematic blackmailer. His letters are an astonishing record of audacity; they show him to have been equally adept in the art of threats and of successful flattery and extorted from many of the greatest figures of the time—even from Francis I and Charles V—rich gifts of jewelry, large sums of money, and in some cases even annuities, which enabled him to lead at Venice a life of lavish opulence. Letters written to him by kings and princes abound in terms of adulation and flattery. He was a remarkably prolific writer in various fields of literature, and he has left dialogues, biographies, sonnets and other poems, comedies, one tragedy, and six volumes of letters. Aside from the tragedy *Orazia*, which was good, judged by contemporary standards, the comedies, of which the principal ones are the *Cortigiana* and *Talanta*, are alone of any merit, and their interest is due mainly to their vivid portrayal of life; but, in the words of Symonds, it is life seen "from the standpoint of the servants' hall." Aretino's greatest strength lay in his satire. There is an edition of *Le commedie e L'Orazia tragedia di Pietro Aretino* (Milan, 1876). Consult: Graf, *Attraverso il Cinquecento* (Turin, 1888); Van Dyke, *Renaissance Portraits* (New York, 1905); De Sanctis, *Storia della Letteratura italiana*, ed. by Benedetto Croce (Bari, 1912); Landoni, *Lettere scritte a Pietro Aretino* (Bologna, 1873-74).

ARETINO, SPINELLO. See SPINELLO ARETINO.

AREZZO, à-rèt'sò (ancient Lat. *Arretium*). An episcopal city of Italy, the capital of the province of Arezzo, Tuscany (Map: Italy, F 4). It is beautifully situated on the slope of a hill, 54 miles southeast of Florence and 6 miles from the confluence of the Chiana and the Arno. It has broad streets, impressive buildings, a famous academy of science, a museum and picture gallery, a library, many convents, and excellent mineral springs. Externally, the cathedral, which was begun in the thirteenth century, is unattractive; but the proportions of the interior are pleasing, and the decorations are elaborate and by master hands of several centuries. The church of San Francisco contains some fine fifteenth-century frescoes. The Pieve, begun in the eleventh century on the site of a heathen temple, also contains art treasures. The ancient Arretium was one of the 12 richest and most populous cities in Etruria and excelled in pottery and in copper work. It was a vigorous opponent of Rome in the fourth and third centuries B.C., but later sought aid from Rome against the Gauls. In the Hannibalic War it supported Rome. In the Social War, Sulla sacked it, banished its citizens, and replaced them with his own followers. The fame of the pottery works of Arretium (Arretine Ware: see ARCHAEOLOGY) endured throughout Roman times; much ancient pottery has been found there,

bearing often reliefs of high artistic value. It was also sacked by the Goths under Totila and restored under Justinian. During the contest of the Guelphs and the Ghibellines in a later age, it became subject to Florence, being defeated in the battle of Campaldino, in which Dante took part. Among celebrated men born here were Mæcnas, the famous patron of letters in the time of the Emperor Augustus; Petrarch; Carlo Aretino (see ARETINO, CARLO); Pietro Aretino (see ARETINO, PIETRO); Guido Aretino (see GUIDO D'AREZZO); Leonardo Aretino, the historian (see BRUNI); Cesalpino, the botanist; Redi, the physician; Pope Julius II; the notorious Marshal d'Ancre (see ANCRE); and Vascari, author of *Lives of the Painters*. (See also SPINELLO ARETINO.) The principal manufactures are cloth, silk fabrics, and leather. The country is unusually fertile, and produces grain, wine, oil, and fruit. Pop., 1881, 39,000; 1901 (commune), 44,027; 1911, 48,170.

ARGÆUS, är-jæ'us, MOUNT. See ARJISH.

AR'GALI (Mongolian name). A mountain sheep, specifically *Ovis ammon*, formerly common to all the mountain ranges of northeastern Asia, but lately killed off in Siberia and restricted to the heights of Mongolia, where it is found near timber line. Its size is that of a large donkey, and it is covered by short, coarse, gray-brown hair, with the short mane and a stripe down the fore legs dark and the rump and under surface of the body white. The massive horns of the ram coil like those of the bighorn (sometimes called American argali) and measure 40 to 48 inches along the curve and 16 or more around the base; the horns of the ewes reach about half of these dimensions. A closely allied species is the nyan, or Tibetan argali (*Ovis hodgsoni*), which is distinguished by a white ruff upon the throat. It frequents the barren and desolate regions of high Tibet. Sportsmen regard these sheep as among the most difficult game to stalk, and good specimens are rare in collections. See BIGHORN; and Plate accompanying SHEEP.

AR'GALL, SIR SAMUEL (c.1580-1626). An English navigator, and Deputy Governor of the Virginia Colony. In 1609 he was sent to Virginia in charge of a vessel with orders to find a more direct route than that previously followed, and he succeeded in considerably shortening the time ordinarily occupied by the passage. After his arrival, in 1609, he was employed in surveying Chesapeake Bay and a large part of the coast northward to Cape Cod. Returning to Virginia, he took part in the fighting with the Indians, and in 1612 he conducted the negotiations with the chief of a Potomac tribe to whose care the women of the Powhatan tribe had been intrusted during hostilities, by which the English secured possession of Pocahontas, a favorite daughter of the chief. Powhatan, in exchange for a copper kettle. Her marriage to John Rolfe followed soon after, and the troubles with the natives were settled, leaving Argall free to go to sea again. In 1613 he was given command of a powerful war vessel and instructed to keep all intruders out of the territory claimed for England. He sailed to Mount Desert Island, where he found a French Jesuit settlement, which he destroyed, carrying off the settlers to Jamestown as prisoners. French establishments at Port Royal and St. Croix received the same treatment. In 1617 Argall was promoted to be Deputy Governor and Admiral of Virginia. He

conducted affairs in a high-handed fashion, and was accused of engaging in illegal trade, especially with the Spanish settlements in the West Indies. He ignored several peremptory orders to return to England to answer the charges against him, but eventually went back to stand trial. No serious action, however, was taken, probably because of the protection afforded him by the Earl of Warwick, who is supposed to have participated in the profits of Argall's ventures. In 1620 Argall was captain in a fleet which attacked the Algerine pirates in the Mediterranean. A year later he was knighted. In 1625 he was appointed admiral of an Anglo-Dutch fleet of 28 vessels, which took Spanish prizes valued at over £100,000, and later in the same year he commanded the flagship in Cecil's expedition against the Spaniards.

ARGAN (Ar. *arjan*), *Argania sideroxylo*, a species of the family Sapotaceæ. It is a low, spiny evergreen tree, native of the southern parts of Morocco, and bears an ovate drupe the size of a plum, dotted with white, and full of a white milky juice. The Moors extract from the fruit an oil known as "argan oil," which they use with their food.

ARGAN, är'gän'. The hypochondriac in Molière's *Le malade imaginaire*, who allows himself to be cozened by apothecaries even to the extent of forcing his daughter to receive the addresses of one of them. He is finally effectively disillusioned and cured by his brother-in-law.

ARGAND, är'gand, Fr. pron. är'gän', AIMÉ (1755-1803). A Swiss mathematician, the inventor of the well-known Argand burner. The chief difficulty that attended the use of lamps as a source of light before Argand introduced his invention consisted in procuring complete combustion of the oil, so as to keep the flame from smoking. Argand's improvement consisted in making the wick ring-shaped. The flame procured by means of a circular wick has naturally the form of a hollow cylinder, with a current of air ascending through the inside, so that the burning surface is doubled. Argand's younger brother accidentally discovered the effect of the glass chimney, by which the flame is steadied, a draught created, and thus the greatest possible amount of light produced. The Argand burner has been extensively used in gas lighting.

ARGAND, JEAN ROBERT (1768-1822). One of the inventors of the geometric representation of complex numbers. His *Essai sur une manière de représenter les quantités imaginaires dans les constructions géométriques* was published at Paris in 1806, but lay forgotten for 60 years. Meanwhile Gauss (1831) had made the complex numbers and their geometric representation familiar to mathematicians. It is now known that Argand was anticipated by Wessel (1797) and Kühn (1750). See COMPLEX NUMBERS.

ARGANTE, är'gänt'. 1. A witty portrait in Molière's gallery of dupes—the father who, in *Les fourberies de Scapin*, is trickily persuaded by Scapin to give up his own plans in favor of those of his son and daughter. 2. A giantess typifying Licentiousness in the *Fæerie Queene*, by Spenser.

ARGANTES, är-gän'téz. A fierce Circassian, the bravest of the infidel warriors, in Tasso's *Jerusalem Delivered*.

ARGAO, är-gä'ô. A seaport on the southeast coast of the island of Cebu, Philippines, situ-

ated about 33 miles southwest of the city of Cebu. Pop., 1903, 35,448.

ARGEL. See ROMAN FESTIVALS.

ARGEL, är'gèl, or **ARGHEL** (Syrian), *Solenostemma argel*. A plant of the family Asclepiadaceæ, a native of Arabia and of the north of Africa, deserving of notice because of the frequent use of its leaves for the adulteration of senna. They are lanceolate and leathery and may be readily distinguished from genuine senna leaves by their texture, their being downy, their greater heaviness, the comparative absence of veins, and the symmetry of their sides, the sides of the true senna leaves being unequal. They are acrid and cause sickness and griping, but a difference of opinion prevails as to their possessing purgative properties.

ARGELANDER, är'ge-län'dër, FRIEDRICH WILHELM AUGUST (1799-1875). One of the most eminent German astronomers of the nineteenth century. He was born at Memel, Prussia. He studied at Königsberg, where the political sciences first attracted him; but he was subsequently drawn away to astronomy by the lectures of Bessel, by whom he was employed to make calculations and observations. In 1820 he was appointed assistant to Bessel in the Königsberg Observatory, and in 1823 succeeded Walbeck as astronomer at the observatory of Åbo, in Finland. Here he began a series of observations on the fixed stars which have a perceptible "proper motion." His studies were unfortunately interrupted by a fire which destroyed the observatory; but after a time he resumed them in a new observatory at Helsingfors and published a catalogue of not less than 560 stars having "proper motions." This contained the results of his observations at Åbo and received from the Academy of St. Petersburg the Demidoff Prize. In 1837 he was invited to fill the chair of astronomy at the University of Bonn. Argelander was long engaged in a series of observations on the changes of light in variable stars, and he also added to our knowledge of the progressive motion of the solar system in space. Argelander's works include: *Observationes Astro-nomicae in Specula Universitatis Fennico Factæ* (3 vols., Helsingfors, 1830-32); *Neue Uranometrie* (Berlin, 1843), containing 18 celestial charts of fixed stars seen with the naked eye, *Mittlere Oerter von 33,811 Sternen* (Bonn, 1867); and a few others of considerable importance. His greatest work, however, is the *Atlas des nordlichen gestirnten Himmels* (Bonn, 1857), with a *Sternverzeichnis* (Bonn, 1859-62, vols. iii-v of the *Astronomische Beobachtungen auf der Sternwarte zu Bonn*). This work contains an enormous number of observations carried out by Argelander and his assistants during the nine years from 1852 to 1861.

ARGEMONE (Lat. an herb, Gk. ἀργεμώνη, *argemônê*, a-kind of poppy). A genus of plants of about 10 species belonging to the family Papaveraceæ distinguished by four to six petals, three to seven radiating concave stigmas, and an oblong capsule, opening by valves at the apex. *Argemone mexicana*, sometimes called Mexican poppy and prickly poppy, is an annual herbaceous plant one to two feet high, with large yellow flowers, and sessile, wavy and sinuated, spiny leaves, variegated with white. It is a native of Mexico and of the southern parts of the United States and is now also common in many tropical and sub-tropical coun-

tries, in which it has been naturalized. In parts of Australia it has become a troublesome weed. Its seeds are narcotic, purgative, and diuretic, exhibiting in a strong degree those qualities of the family of which the seeds of the poppy are devoid. They are used in the West Indies as a substitute for ipecacuanha, also instead of opium; and the juice of the plant is employed as a remedy for ophthalmia. This plant is not infrequently to be seen in flower borders in Great Britain and elsewhere; but in the northern parts, at least, the seed is generally sown in a hotbed. *Argemone intermedia*, a similar species with white petals and a capsule armed with stout spines, is common from Kansas and Nebraska southward and westward. *Argemone grandiflora*, a Mexican species, has large white flowers, and the plant is almost devoid of prickles. All these plants are occasionally met with in gardens.

ARGENIS. An allegorical romance in Latin by John Barclay published in 1621. It purports to narrate the history of a war waged by Lycogenes, a Sicilian rebel, and Poliarchus, a prince of Gaul, for the hand of the daughter of Meliander, King of Sicily. But under this thin, figurative veneer one can easily trace a history of contemporary happenings. Poliarchus represents Henry IV, Ilyanisebe, Queen Elizabeth, and Radiobanes, Philip II. The book has exerted not a little literary influence. Fénelon's *Télémaque* is modeled after it. It was also the favorite work of Cardinal Richelieu, suggesting to him some of his political moves. Cowper said of it that it was "the most amusing romance that ever was written."

ARGENS, ä'r'zhän', JEAN BAPTISTE DE BOYER, MARQUIS D' (1704-71). A French philosophical writer, born at Aix, in Provence. His *Lettres chinoises* (1739-42), *Lettres cabalistiques* (1741), and widely read *Lettres juives* (1738-42) attracted the notice of Frederick II, and their author was invited to Potsdam. In 1744 he was made director of fine arts in the Academy of Berlin with a large salary. Soon he was the friend and daily companion of the King, who liked exceedingly his frank and vivacious character. Frederick's poems were edited by Argens in 1760. When almost 60, he married an actress, without Frederick's permission. Deprived of his pension, he returned to Provence and died at Toulon. Among his other numerous writings should be mentioned *Mémoires secrets de la république de lettres* (1744), *Histoire de l'esprit humain* (14 vols., 1765-68), and *Réflexions critiques sur les écoles de peinture* (1752). In 1763 his principal works were published together in 24 volumes. *Philosophical Dissertations on the Uncertainty of Human Knowledge*, a London edition, appeared in 1753.

ARGENSOLA, ä'r'hën-sô'là, LUPERCIO LEONARDO DE (1559-1613) and BARTOLOMÉ LEONARDO DE (1562-1631). Two Spanish poets, sometimes called, and not entirely without reason, the "Spanish Horaces." They were born at Barbastro, in Aragon, the elder brother Dec. 14, 1559, the younger Aug. 26, 1562. Both studied at the University of Huesca, and both later enjoyed the patronage of Maria of Austria, widow of the Emperor Maximilian II, who made Lupercio her secretary and Bartolomé her chaplain. The former was subsequently appointed, by Philip III, historiographer of Aragon. Bartolomé was commissioned by the Conde de

Lemos, then president of the Indian Council, to write the *Conquista de las Islas Molucas* (1609); and when that nobleman became Viceroy of Naples, both brothers, who had meanwhile acquired fame as poets, were included in his suite, thereby arousing the anger of Cervantes, who had hoped to obtain a like honor. Lupercio died in Naples, in 1613, while filling the office of Secretary of State. Bartolomé succeeded his brother as historiographer of Aragon. He returned to Spain and busied himself till his death in 1631 with Lupercio's unfinished work, a continuation of Zurita's *Annals of Aragon*. Only the first part, which deals with the years 1516-20, was completed, every detail being treated with wearisome minuteness. The collected poems of the two brothers were first published posthumously by Lupercio's son, under the title of *Rimas* (Saragossa, 1634), and received from no less a personage than Lope de Vega the indorsement that the authors "had come from Aragon to reform among our poets the Castilian language." Although an overstatement, due to Lope's aversion to Gongorism in all its forms, this verdict indicates the real merit of their verse. They are both models of correct form and pure idiom, with the Horatian model and the classic standard ever before them, yet their influence on the literature of their country was, on the whole, small. Lupercio is also remembered as a dramatist whom Cervantes pronounced almost equal to himself; but of his three known plays, one, the *Filís*, is lost, while his *Isabela* and *Alejandra* show little to justify Cervantes's praise. The best edition of the *Obras sueltas* of both brothers is that edited by the Conde de la Viñaza (2 vols., Madrid, 1889, in the *Colección de escritores castellanos*), which includes the plays and shorter prose writings. Consult also J. P. W. Crawford, "Notes on the Tragedies of Lupercio Leonardo de Argensola," in the *Romance Review*, vol. iv (1913).

ARGENSON, ä'r'zhän'sôn', MARC ANTOINE RENÉ DE VOYER, MARQUIS DE PAULMY (1722-87). A French diplomat and author, son of Louis XV's Minister of Foreign Affairs. He was Envoy to Poland, Switzerland, and Venice; a member of the Royal Academy, and gathered a library of about 100,000 volumes, which was purchased by the Comte d'Artois in 1785 and became the nucleus of the Bibliothèque de l'Arsenal. He was editor of 40 volumes of the *Universal Bibliography of Romance*, in which are some novels of his own.

ARGENSON, MARC PIERRE DE VOYER, COUNT D' (1696-1764). A celebrated French statesman, brother of René Louis de Voyer d'Argenson (q.v.). After holding a number of inferior offices, he succeeded M. de Breteuil in the War Office in 1742. On the death of Cardinal Fleury in the following year, the whole care of the war then raging devolved upon him. He found matters in the most deplorable condition. The French troops, decimated by sword and disease, were in full retreat across the Rhine; the Austrians already swarmed in Alsace and Lorraine, and the very political existence of France was imperiled; but Argenson, by his vigor and lucky choice of generals, changed the fortunes of war in the course of one year. After the victories of Fontenoy and Loufeld, and the capture of Bergen-op-Zoom, peace was secured by the famous Treaty of Aix-la-Chapelle, signed in 1748. Argenson, however, did not remain inactive; he introduced reforms in the army, established the

Ecole Militaire in 1751, and by various measures kept alive the military spirit of the nation. He was an illustrious patron of literature. Diderot and D'Alembert dedicated to him their great *Encyclopédie*; and to Voltaire, whose fellow-student he had been, he furnished materials for his *Siècle de Louis XIV.* In 1757 he was exiled to his estate, it is supposed by the machinations of Madame Pompadour. On her death he returned to Paris.

ARGENSON, MARC RENÉ, MARQUIS D' (1652-1721). A member of an ancient French family possessed of a domain in what is now the department of Indre-et-Loire. Passing through many minor offices, he was made Keeper of the Seal in 1718, and Minister of State in 1720. He resigned the same year owing to the friction caused by John Law's financial schemes. He was a member of the French Academy and honorary member of the Academy of Sciences.

ARGENSON, MARC RENÉ DE VOYER D' (1771-1842). A grandson of Marc Pierre d'Argenson. A French soldier and statesman. Though he was an aristocrat by birth and possessed immense wealth, he embraced the cause of the Revolution and served as Lafayette's adjutant till the excesses of 1792 drove him from public life. In 1809, while prefect of Antwerp (then Deux-Nèthes), he took part in the expulsion of the English from Walcheren. In 1813 he resigned rather than unjustly confiscate the property of the mayor at the order of the French ministry. He was elected deputy for Belfort in the Hundred Days and reelected after the second Restoration. In 1830 he appeared in the Chamber to represent Strassburg, joined the "Society of the Rights of Man," subsidized heavily the newspapers of the Opposition, and by voice and pen fought vigorously the July monarchy. He was brought to trial for publishing a radical tract; and, though acquitted, became discouraged, retired to his estates, and spent the remainder of his life in an endeavor to better rural conditions.

ARGENSON, RENÉ LOUIS DE VOYER, MARQUIS D' (1694-1757). Minister of Foreign Affairs for Louis XV from 1744 to 1747, when he was forced to resign on account of the intrigues of Spain, whose policy he had frustrated in his negotiations with Italy. He was more of a student and idealist than a diplomat, and his ministry was not very successful. After his retirement he devoted himself to literature. He was a profound student of political science, and wrote, among other works, *Considérations sur le gouvernement ancien et présent de la France* (Amsterdam, 1764). His journal and memoirs, in nine volumes, were published at Paris, 1861-67, and at the same place in 1898, *La France au milieu du XVIII^e siècle*. Consult Ogle, *The Marquis d'Argenson* (Oxford, 1893).

AR'GENT (Fr. silver). An archaic or poetic term for silver or anything as white as silver; especially used in heraldry to designate the silver of a coat of arms or merely the white color of any part of one's armor.

ARGEN'TA. A city in Pulaski Co., Ark., opposite Little Rock, on the Arkansas River, and on the St. Louis Southwestern, the St. Louis, Iron Mountain, and Southern, and the Chicago, Rock Island, and Pacific railroads (Map: Arkansas, C 3). The city has a railroad hospital, St. Joseph's Orphanage, Fort Logan H. Roots, and two parks. Its industries include extensive railroad shops, four cotton oil mills, four compresses, a stove factory, an excelsior plant, a

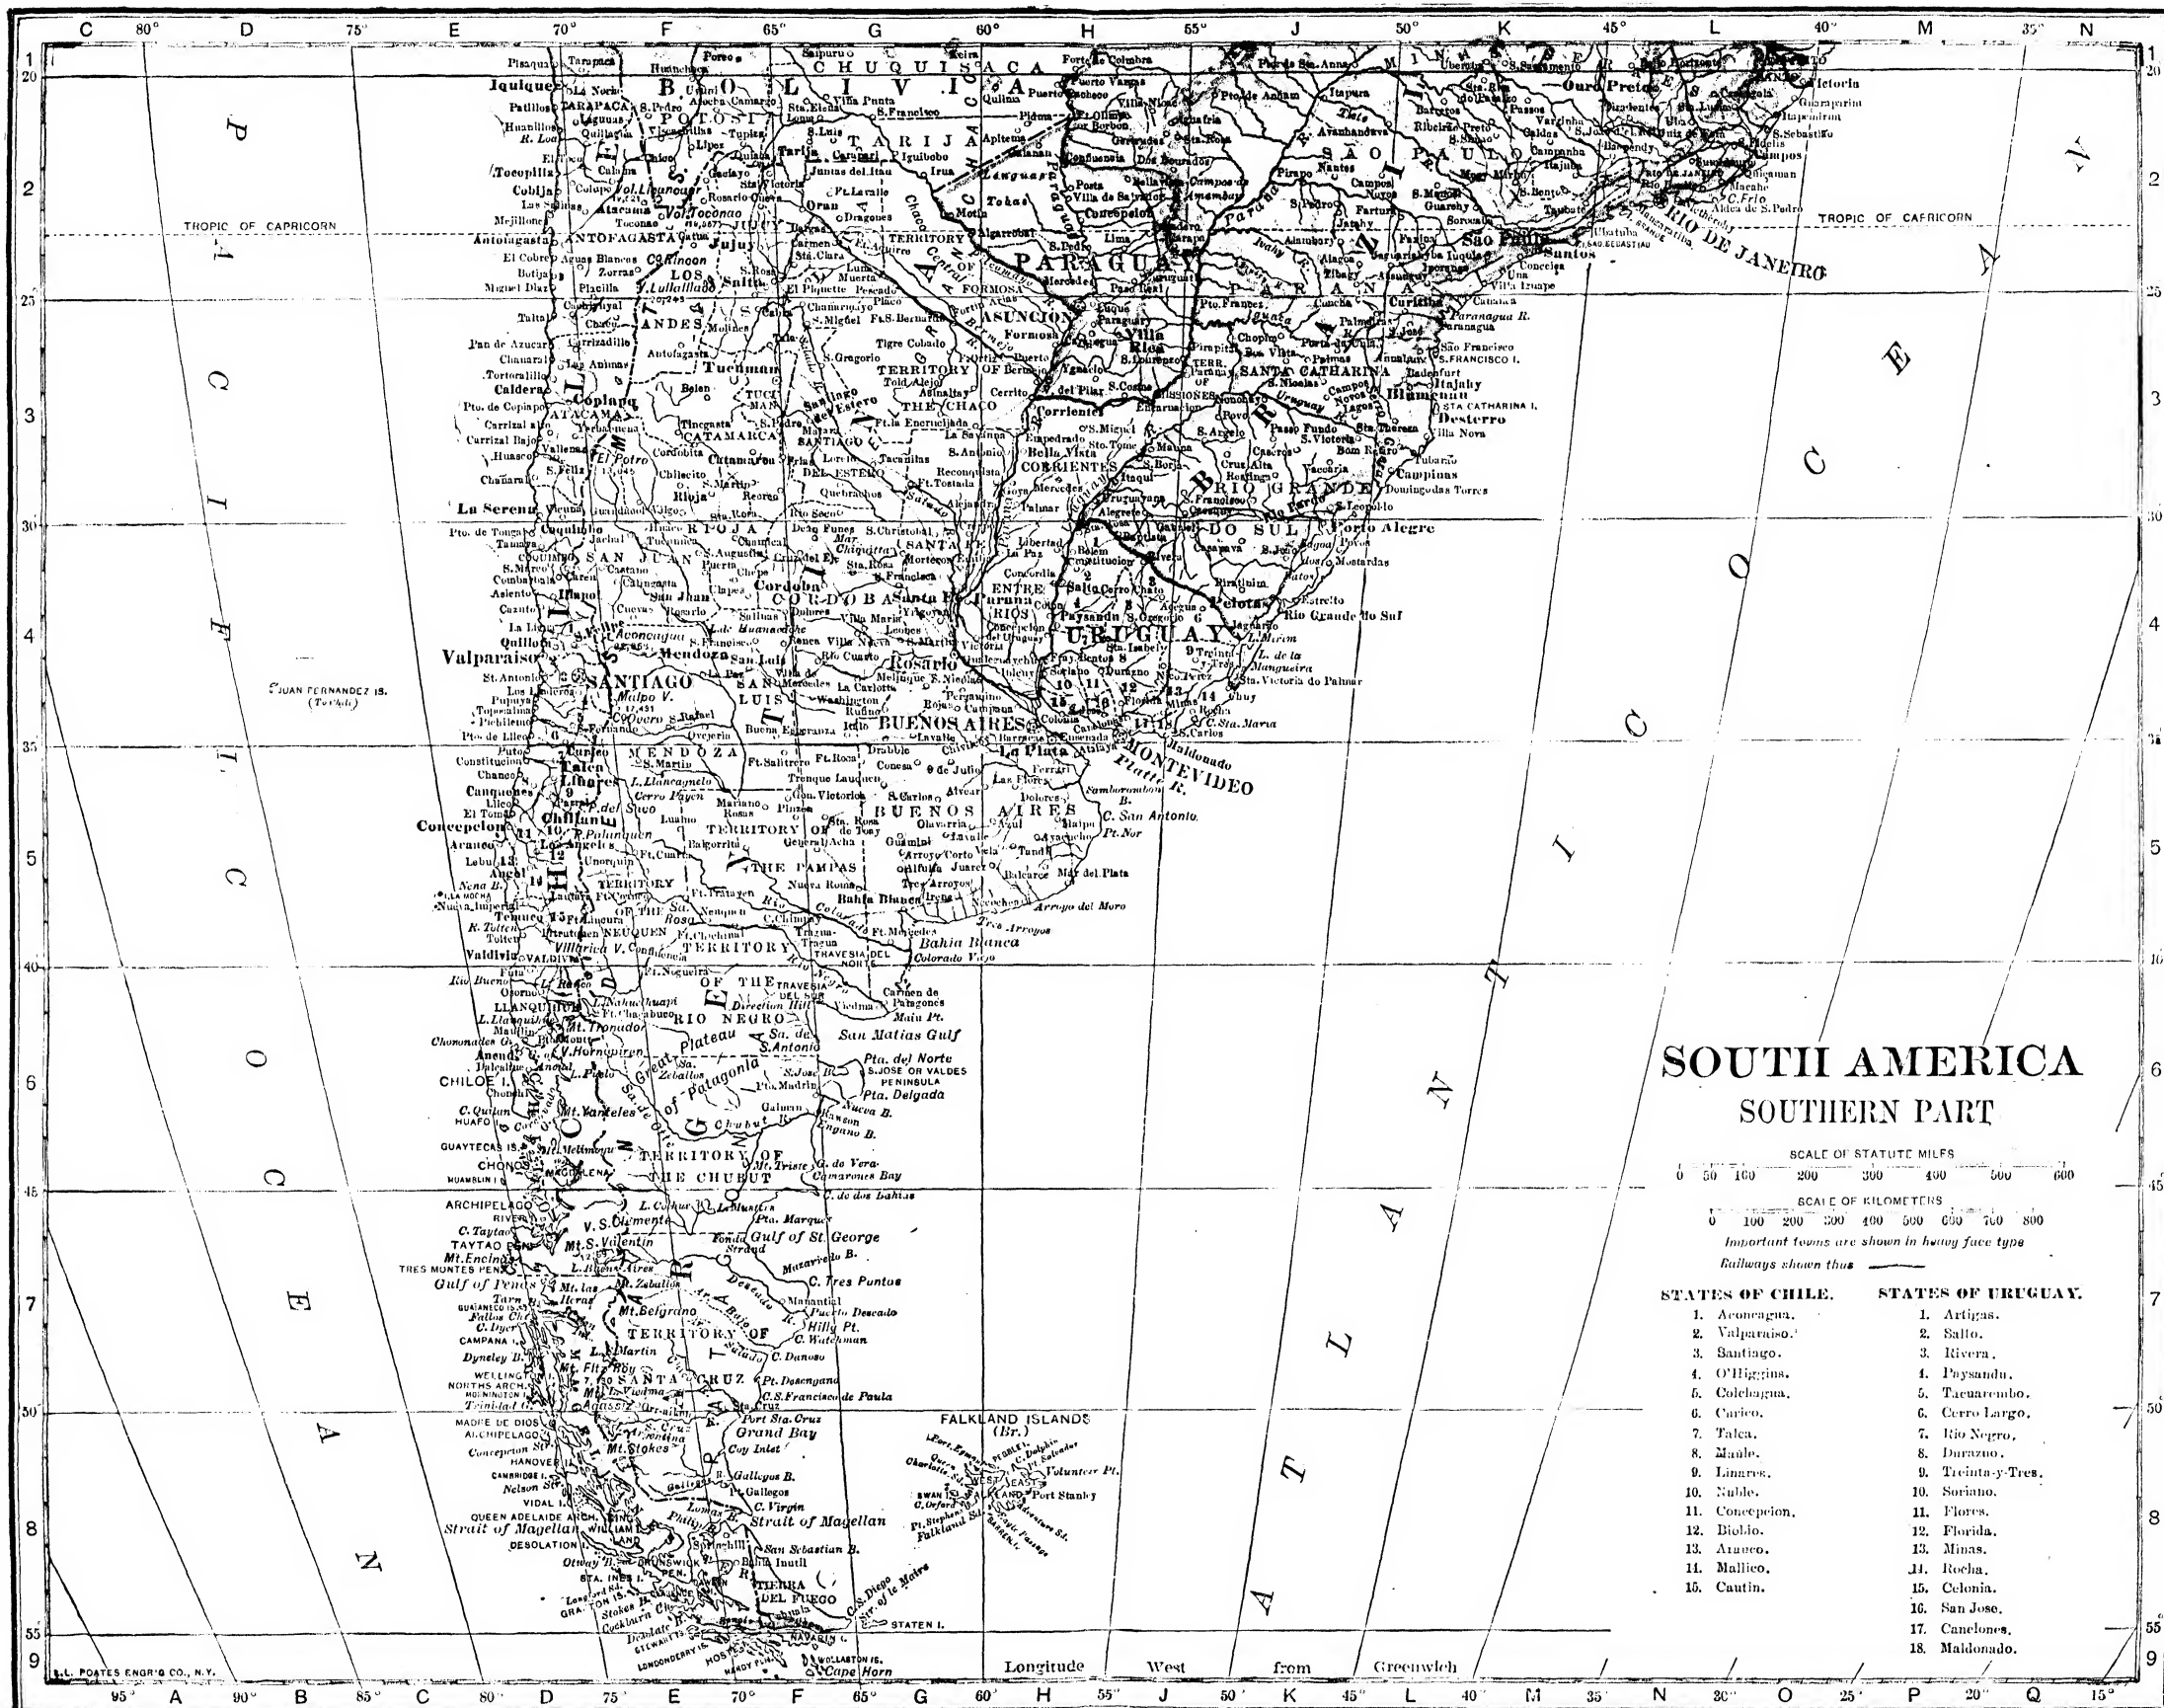

cooperage, and boiler and iron works. Natural gas provides a low-priced fuel for manufacturing and domestic purposes. The surrounding region is agricultural and yields corn, rice, and all small grain. The electric light plant is owned by the municipality. Pop., 1900, about 4500; 1910, 11,138.

ARGENTEUIL, är'zhan'tè'y'. A town in the department of Seine-et-Oise, France, 7 miles northwest of Paris (Map: Paris and vicinity). The surrounding region is noted for producing excellent asparagus. The town has manufactures of files, pasteboards, watches, and alcohol. It was built up about a nunnery, now in ruins, which was founded by Charlemagne in the seventh century. His daughter, Theodada, and Héloïse, beloved of Abélard, were abbesses. Pop., 1901, 17,375; 1911, 24,282.

ARGENTEUS CO'DEX. See ULFILAS.

ARGENTINA, är'jën-tè'nà; *Sp. pron.* är'-tjën-tè'nà, or ARGENTINE REPUBLIC (officially, REPÚBLICA ARGENTINA) (from Lat. *argentum*, silver; cf. the name Río de la Plata, Sp., River of Silver). A federal republic, next to Brazil the largest state in South America (Map: South America, C 6). In the beginning it was styled "the United Provinces of the Río de la Plata." It is included between lat. 21° 55' and 55° 2' 30" south, long. 53° 40' and 73° 17' 30" west, and is bounded on the north by Bolivia and Paraguay; on the east by Paraguay, Brazil, Uruguay, and the Atlantic Ocean; on the south by the Atlantic and Chile; and on the west by Chile, the watershed indicated by the highest summits of the Andes separating the two countries. It forms a blunted wedge-shaped area about 2200 miles long, with a width of nearly 1000 miles at the north and less than 200 miles near the Strait of Magellan. A number of islands are included: the Falkland Islands, off the Atlantic Coast, which were at one time claimed by the republic, are held by Great Britain. The total area is 1,083,596 square miles, divided between 14 organized provinces, 10 territories, and the Federal Capital district of 72 square miles. Pop., 1913 (est.), about 10,000,000.

Topography. The surface is diversified by the Andean Cordilleras on the western border and by the interior highlands; but the greater part of the area is a flat plain sloping gently toward the Atlantic Ocean. The Andes system in the northwest is a broad plateau, broken into parallel or slightly diverging ridges which reach well to the east of the Chilean frontier, and occupy large areas in the provinces of Jujuy, Salta, Tucumán, Catamarca, Rioja, and San Juan. Above the plateau rise numerous crests to a height of over 17,000 feet, attaining extreme elevations in Aconcagua (23,393), Mercedario (21,982), Famatina (20,340), and Tupungato (22,329). In the western province of Mendoza the Andes contract laterally, and gradually fall off in height toward the south, where they end in the highlands of Tierra del Fuego. East of the Cordilleras, the most notable elevations are the north and south ridge of the Sierra de Córdoba, on the western boundary of the province of Córdoba; the Tandil and Ventana Highlands, in the province of Buenos Aires; and the continuation of the mountain range of Lower Brazil, in the territory of Misiones. These independent mountain ranges, however, are of no great areal or topographic importance; the entire region eastward from the base of the Andean plateau is generally flat or slightly undulating, and falls gradually from an elevation of about

2000 feet to, or nearly to, the level of the sea. That part of the plain north of the Río Salado (affluent of the Paraná) is called the "Gran Chaco" (great hunting ground), and the northern part contains extensive forests. North of the Río Negro, in Central Argentina, are the extensive characteristic pampas, monotonous treeless stretches of apparently level ground covered with grass during the wet season. Northward the pampas graduate into more forested country, and are also marked by a large interior drainage system and by saline swamps, while to the south they merge into the desolate, dry steppes of Patagonia, which are disposed at an elevation ranging from 200 feet at the base of the Andes to 500 feet or less on the coast. Between the Río Paraná and the Río Uruguay are the provinces of Corrientes and Entre Ríos, which are generally low, the latter province, however, containing a small area of hills in the west.

Hydrography. Aside from a few inclosed basins in the interior, the entire area is drained by easterly flowing rivers into the Atlantic. The great system of the Río de la Plata, formed by the confluence of the Uruguay and the Paraná, belongs only partly to Argentina, as both its branches rise in the interior of Brazil and for a large part of their course flow along the frontiers of Brazil, Paraguay, and Uruguay. The Paraná is of great importance to Argentina as a commercial highway. With the Paraguay it drains the Gran Chaco, through the channels of the Pilcomayo, Bermejo, and Salado, and also the northern pampas, where in past times there were several important tributaries that are now represented by smaller streams with intermittent flow. The Paraná is navigable by steamers for a distance of about 1200 miles and by light-draught boats for nearly its whole length. From the confluence of the Paraguay to the sea the fall amounts only to about 225 feet, so that a slight depression would separate the system of the Río de la Plata into three independent branches—the Paraná, the Paraguay, and the Uruguay. In the central provinces of Argentina, between the Río Salado on the north and the Río Colorado on the south, there is an area of inclosed drainage, with extensive saline marshes, which deposit alkaline salts during the dry season. South Argentina is drained by the Colorado and Negro, both rising on the slopes of the Andes. The drainage basin of the Colorado formerly covered a much larger territory, as the provinces of San Juan, San Luis, and Mendoza were drained by a northern tributary that now ends in a swampy reservoir. Patagonia has several large streams, including the Chubut, Deseado, Salado, and Chico, which receive their water supplies from the slopes of the Andes, where there are numerous glacial lakes. See PLATA, RÍO DE LA; PARANÁ; PARAGUAY RIVER; COLORADO, RÍO; SALADO, RÍO.

Climate. The northern part of Argentina projects well within the equatorial hot belt, while the central and southern parts extend through the south temperate zone. The peculiar location of Argentina, with oceanic conditions on the east and high mountains on the west, makes its climatic details very dependent on the direction of the winds. The northern section lies within the region of prevailing east winds, which convey inland the warm, moist air from the Atlantic Ocean, and cause a very uniform temperature, with heavy precipitation on the coast, but decreasing in amount with prog-

ress inland. South of the Río de la Plata the west and northwest winds of middle latitudes prevail, and these convey across the narrow territory the air from the Pacific Ocean, which has been deprived of most of its moisture on the windward slopes of the Chilean Andes. Thus the air becomes drier, and the precipitation decreases with approach toward the Atlantic coast. The monsoon effects considerably modify these general conditions, so that for the northern and more important half of Argentina, in winter, northerly winds are very common.

The temperature decreases with increase of latitude, and varies in the annual average from 70° F. at the north to less than 45° F. at the south. In the north the temperatures range from a maximum of 105° F. to a minimum of 30° F.; the hottest month averages about 80° F., and the coldest month about 55° F. Toward the middle of Argentina the hottest month averages only 75° F. and the coldest a little less than 50° F., and at the extreme south, in Tierra del Fuego, the temperatures are continuously low, snow falling at all times. There is in general a great difference between the day and night temperatures; but the intense cold waves of the middle latitudes of the continents of the northern hemisphere are entirely lacking. In general, the rainy season is in summer, with a winter season that is dry, even to the utter lack of rain in the interior. Three rain belts lying nearly parallel to the Andes are noticeable; in the extreme northeast the rainfall is moderately heavy, from 50 to 70 inches. To the west of this there is a zone of moderately light rainfall, extending as far south as the mouth of the Río de la Plata, where the annual average is about 30 inches. Still farther west there is a rapid decrease to the Andean slopes, some areas having no more than two inches. On the pampas the weather is variable, changes from the cool, dry south winds to the moist, hot north winds frequently occurring with great suddenness. The former winds, which sometimes blow with stormy violence, are called "pamperos." They come with little warning and are sometimes of day-long continuance. The moist, hot wind from the north, called "zonda" (somewhat similar to the sirocco), causes intense discomfort to the inhabitants. The dry zonda of the east side of the Andes region is of Föhn character.

Flora. There is great variation in the abundance and character of the vegetation, corresponding to the great variation in latitude, altitude and topographic conditions. In the north and northeast are found tropical woodlands, to the south and west of which are scattered forests containing most of the species usual in warm temperate zones. The slopes of the Andes are well wooded, especially with thorny and shrubby plants, as are the banks of the Paraná and the rivers flowing from the west into the Paraguay, although the trees do not attain great size. Palms are a distinctive feature of the base of the Sierra de Córdoba and of the northwestern foothills. The pampas, in the wet season, are covered with clover and thistles, or with tall grass and flowers, gay verbenas, geraniums, etc.; but here, as well as on the Gran Chaco, there is little to form thickets, except mimosas and cacti. The algarroba, a shrub resembling a honey locust, is widely distributed; it is used for fence posts; from the pulp of the pod are made a kind of flour, and, by fermentation, an intoxicating liquor called chicha. Patagonia has herbs,

shrubs, cacti, some tufty grass, brambles, and copse; but it is almost treeless, except in the south, and even there but four species of trees are found, two of them being beeches. Among the indigenous trees and plants are the quince, aloe, coca, cinchona, maté (or Paraguay tea), manioc; the prickly pear, with edible fruit; the *Cactus foliosus*, on which the cochineal insect feeds, and a shrub harboring an insect yielding a handsome green dye. The apple tree, introduced from Chile by the Indians, flourishes in the southwestern provinces; the grape is extensively grown in the western province of Rioja, San Juan, and Mendoza; the province of Salta is famed for its bananas and coffee; and the peach, fig, orange, and walnut are grown in many parts. The scarcity of wood in some provinces compels the use of dry thistles and peach-tree cuttings for fuel.

Fauna. The larger wild animals, found mainly in the northern forests, are the jaguar, puma, ocelot, ant-eater, tapir, sloth, monkey, and peccary. The pampas and plains are inhabited by deer, wildcats, wild dogs, pumas, skunks, armadillos, the red wolves, foxes, and several burrowing quadrupeds, notably the viscacha. The guanaco, vicuña, and llama range from the mountains to the plains; the capybara and coypu frequent the rivers; the condor, vulture, the *Rhea americana* (ostrich) range north of the Río Negro, and the *Rhea Darwini*, south of it. Several species of game birds, and birds of prey, flamingos, and water fowl of many kinds, parrots, humming birds, and other birds of gay plumage are seen in the forested regions or on the open plains, where bird life greatly flourishes. There are several varieties of reptiles in Argentina; boas and rattlesnakes occur in the north, together with iguanas, alligators, and turtles. Spiders also and mosquitos of great size, destructive locusts and ants, and chigoes abound. Fish are very numerous in the coast and inland waters. Seals, sea lions, and sea elephants are captured along the coast, and the rivers supply many edible fish. Most interesting fossil remains are found in different parts of the republic, a large number of species having been obtained, among them the megatherium, toxodon, glyptodon, and gigantic ratite birds.

Geology and Mineral Resources. The interior highlands have usually a granitic core, overlaid by Paleozoic formations, while the Andean system is largely composed of Mesozoic strata, broken through by igneous rocks and covered by extensive volcanic sheets. The pampas are made up of Tertiary sandstone and limestone with sandy or clayey material on the surface. In Patagonia the northwest and southeast ridges are denuded remnants of former mountain ranges and rise out of layers of coarse gravel that cover the region to a depth of 50 feet or more. The gravel consists of granite, gneiss, and schist, and has been derived by disintegration and glacial action from the underlying formations. Large areas are also occupied by sand dunes that shift their position with the winds. The region of the Andes was once the scene of enormous volcanic development, when streams of lava flowed down the slopes and spread out over the adjacent plains in the form of thick and extensive sheets. The lower stretches of the rivers in Argentina are bordered by recent deposits of alluvium. The mineral resources of the country have received but little attention as yet, although they

are extensive and include a large variety of ores and minerals. Gold is found in the Andes and in the mountains of San Luis, coal in Mendoza and Tierra del Fuego, marble in the Sierra de Córdoba, while copper, lead, silver, iron ores, and sodium salts occur at numerous localities. The output of silver annually exceeds \$200,000 in value. The annual gold product amounts to about \$10,000. Mica is mined in the mountainous part of Córdoba, and the product is shipped to European countries. Some petroleum is obtained in Neuquén territory.

Agriculture. This is naturally the most important industry in a country so rich in land and so sparsely settled as Argentina. The estimated area under cultivation in 1910 was 20,367,082 hectares (1 hectare=2.47 acres), or about 6.8 per cent of the total area of the country. In 1895 the cultivated area was 4,892,004 hectares; in 1888, 2,459,120; and in 1872, 580,008, the latter figure representing about one thirty-fifth of the agricultural area of 1910; and the 1910 area shows an increase of 316 per cent over that of 1895. During the first decade of the twentieth century Argentina took her place among the world's greatest grain-producing countries.

In 1895, at the time of the last census, there were more than 180,000 farms in Argentina, of which 60 per cent were cultivated by their owners, 30 per cent by tenants paying rent, and 8 per cent by persons working for a share of the crop. Although there are no statistics to show the growth of each of these groups, it is a matter of common observation that the number of farmers owning their land is increasing, as free land is abundant and its acquisition extremely easy. Renting for a share of the crop is the first step on the part of the agricultural laborer toward becoming a landowner. Land being abundant and population sparse, labor is naturally well rewarded; so that a laborer often receives from one-fourth to one-half of the crop, the proprietor furnishing land, implements, and seeds, as well as a house and food for the laborer and his family. Under these conditions it takes the laborer only a few years to acquire land of his own. In 15 out of the 23 provinces and territories for which there are figures in the two censuses of the country, the number of farms increased from 43,746 in 1888 to 107,274 in 1895. The average size of farms is about 125 acres, the number of larger plantations and of farms of smaller area being inconsiderable.

The rapid increase in the cultivated area is to a great extent due to European immigration, the newcomers settling in colonies, living in accordance with their own customs, and using their own methods of cultivation. The first colony thus founded consisted of Swiss peasants, who came to Argentina in 1856; in 1874 there were 32 colonies, tilling 12,900 acres; in 1884 the number of colonies increased to 85, the area under cultivation to 86,000 acres; in 1895 the total area under cultivation was 12,083,000 acres. Various nationalities are represented in these colonies, including Italians, Russian and Rumanian Jews, and Boers. The wonderfully rapid growth of colonies is explained by the very liberal immigration laws of the republic, alluring inducements being held out to immigrants, who receive in some provinces large tracts of land and provisions and implements.

The most important crop in Argentina, from a commercial point of view, is wheat, maize and

flax ranking next. Barley, oats, potatoes, tobacco, and other European crops are also extensively raised. Sugar cane is cultivated in the northeast with considerable success, and the cultivation of cotton has been introduced with fairly satisfactory results; the Louisiana variety seems to thrive best, the average return being one ton per acre. The fruits raised are oranges, olives, figs, grapes, and dates, as well as apples, pears, and plums. Silk-worm culture, for which the climate seems to be splendidly adapted, also receives considerable attention. The following figures illustrate the growth of the agricultural industry in Argentina: In 1888 the area devoted to the cultivation of wheat was 815,438 hectares; in 1895 it was 2,049,683; in 1910, 6,253,180. The area devoted to the cultivation of corn in the corresponding years was 801,588, 1,244,184, and 3,215,350 hectares, respectively. The area under linseed increased from 387,324 hectares in 1895 to 1,503,820 in 1910. In the two latter years oats increased from 38,624 hectares to 801,370 and alfalfa from 713,091 to 5,400,580. Notable as these increases are, they indicate only the early stages of the expansive movement of Argentine agriculture. The harvest of 1910 (planted in 1909) showed 3,565,556 metric tons of wheat from 5,354,067 hectares, 716,615 tons of linseed from 1,276,355 hectares, and 529,306 tons of oats from 503,306 hectares. The following is the estimated yield in 1912: Wheat, 4,523,000 metric tons, linseed, 572,000; oats, 1,004,000; corn, 7,515,000; alfalfa, 4,038,000.

The following are the chief wheat-raising provinces, with their production in metric tons in 1910 and 1912 and the estimated value in pesos gold of the crop in the latter year:

	1910	1912	1912
	Tons	Tons	Pesos
Buenos Aires	1,340,299	1,803,000	66,711,000
Córdoba	1,240,528	1,200,000	44,400,000
Santa Fé	470,007	600,000	24,420,000
Pampa Territory	300,214	560,000	20,720,000
Entre Ríos	154,508	215,000	7,955,000

The estimated value of the total agricultural (and forest) production in 1912 was 672,912,190 pesos gold, of which 230,320,367 pesos was credited to the province of Buenos Aires, 138,187,150 to Santa Fé, 100,324,570 to Córdoba, 33,438,940 to Entre Ríos, and 28,841,620 to Pampa territory. There is a continually increasing area planted to sugar cane, tobacco, and the vine.

Stock raising is only less important than agriculture. The following table shows the number of various kinds of animals reported at the first and second censuses and the live-stock census of 1908:

	1888	1895	1908
Cattle	21,961,657	21,701,526	29,116,625
Horses	4,234,032	4,446,859	7,531,376
Asses and Mules	417,494	483,369	750,125
Sheep	66,706,097	74,379,562	67,211,754
Swine	393,758	652,766	1,403,591
Goats	1,894,386	2,748,860	3,945,086

As compared with the United States, Argentina has about half as many cattle and about 15,000,000 more sheep; in the United States the 1910 census showed 61,803,866 cattle and 52,447,861 sheep. The estimated value of the total stock-raising products in 1912 was 394,917,922 pesos gold; of this sum the share of

Buenos Aires province was 183,319,391 pesos, Entre Ríos 46,961,095, Córdoba 35,875,753, Santa Fé 35,034,437, Corrientes 19,371,037, and Pampa territory 8,104,931. The wool clip may be fairly judged from the export, which amounted in 1885 to 128,393 metric tons; in 1895, 201,353 tons; in 1905, 191,007 tons, and in 1910, 150,599 tons. Meat exports are shown in the section *Commerce*. The production of butter fell from 8,835,039 kilos in 1903 to 7,151,647 kilos in 1909, while the cheese output advanced from 1,187,998 kilos to 3,084,261 kilos. The greater part of the butter is produced in the province and city, and most of the cheese in the province, of Buenos Aires.

Manufactures. The manufacturing industries of Argentina are largely in foreign hands. This is especially true of the larger industries, requiring investments of considerable capital and management on a large scale, such as electric light and power plants, flour mills, mines, smelting works, etc. The census of 1895 reported in the country 22,204 manufacturing establishments, 18,706 of which belonged to foreigners and 3498 to natives. The proportion of native workmen in these establishments was more than one-third of the total number of 145,650, 52,356 being Argentinians and 93,294 foreigners. The number of women workers engaged in the manufacturing industries was 22,911. The total number of people engaged in manufactures, including employers and employees, was 167,854, and the capital invested was 284,101,367 pesos gold. An enumeration made in 1909 and 1910 showed 32,007 industrial establishments, with a capital of 321,559,979 pesos gold, annual output 540,724,534 pesos, and 330,701 employees.

The manufacture of food products is foremost among the industries. The flour mills and the meat-packing establishments employ a capital of about 20,000,000 and 22,000,000 pesos gold, respectively. The 37 sugar manufactories have a reported capital of about 32,500,000 pesos, with an annual output valued at over 20,000,000 pesos. The 3409 wineries have a capital of about 28,750,000 pesos; their output in 1910 was valued at 26,597,000 pesos. The annual output of the breweries is about 1,000,000 hectoliters.

The development of Argentine industry has been in those branches of manufacture in which the natural products of the country can be converted into more valuable finished or half-finished products. As a consequence, the country is being gradually relieved of the necessity of paying a tribute to foreign nations for articles of prime necessity, and employment is provided in the country for a large and steadily increasing number of people. The growth of the sugar-refining industry is a case in point. Previous to 1870 the country imported annually some 22,000 tons of sugar and hardly produced 1000 tons at home; in 1905 the home product rose to 137,095 tons and over 14,000 tons were exported. After falling to 127,322 tons in 1908, the output rose to about 160,000 tons in 1911. Among industries carried on on a large scale, the manufacture of gas should be mentioned. It is almost exclusively in foreign hands (largely English), and in 1895 there was invested in it a capital of nearly \$40,000,000. Electric-lighting plants have made much less progress, the capital invested in such plants in 1895 being only \$1,000,000. The more distinctive native manufactures are those of baskets from the willows

of the Paraná Islands; the homespun cotton and woolen cloths, blankets, rugs, laces, and embroideries of the northwestern highland provinces; the tanned leather, wooden ware, laces, blankets, etc., of Córdoba; and the harness, belts, ponchos, horse blankets, ropes, etc., of the Indians. The growth and diversification of Argentine industries are best brought out by the following table, showing the absolute and relative values of the products of the various branches of industry exported from the country at three different periods:

growth of Argentine trade is shown by the following figures (values in millions of gold pesos of 96.5 cents):

	Imports	Exports		Imports	Exports
1870	38 50	29.6	1885	92 25	83.9
1880	43 10	54.9	1890	142 25	100.8

Early in 1890 a severe commercial and financial crisis struck the country, from the effects of which it took her several years to recover. The

Value in gold pesos (96 5 cents)

Products	1895 Pesos	per ct.	1905 Pesos	per ct.	1911 Pesos	per ct.
1 The animal industry	74,630,000	62 1	141,043,000	43 7	162,697,537	48.9
2 Agriculture	41,450,000	34 5	170,235,000	52 6	154,285,547	46 5
3 All other industries	3,990,000	3 4	11,566,000	3 7	15,051,483	4 6
Total	120,070,000	100 0	322,844,000	100 0	332,034,567	100.0

The small export of manufactured products does not indicate lack of industrial progress, since the manufactures go mainly to satisfy the home market. It should also be borne in mind that quite a considerable part of animal and agricultural products are exported in a finished state, e.g., flour and packed meats. The industrial establishments in 1910, aside from those of sugar and wine, numbered 28,661; of these 10,349 were in the city of Buenos Aires, 8647 in the province of Buenos Aires, 2951 in Santa Fé, 1319 in Entre Ríos, and 902 in Córdoba.

Commerce. Being an agricultural country, with the manufacturing industry still in its infancy, Argentina must, on the one hand, import most of the manufactured products needed by its people, and, on the other hand, seek to dispose of its enormous agricultural surplus to the nations of Europe. Of the total imports brought into the country, manufactured articles of all kinds constitute more than 86 per cent, while vegetable and animal substances constitute less than 13 per cent; and even these include many manufactured products, such as refined sugar, cigars and cigarettes, dried fruit, and manufactures of rubber. Making allowance for such articles, the value of really crude products of the farm barely exceeds 1 per cent of the total imports; on the other hand, the only manufactured articles exported from Argentina consist of products of the farm and mine, such as refrigerated meat, washed wool, hides and furs, lard, animal oil, linseed oil, flour, copper bars, etc. The imports into Argentina, in the order of importance, are textiles and apparel, iron and iron manufactures, food substances, building material, railway material, and all vehicles, coal and coke, oils, drink, chemicals, lumber and timber, paper and paper manufactures, etc. The trade with Europe has been facilitated by the establishment of branches of foreign mercantile houses in Argentina.

Since British capital has contributed more to the development of the material resources and the industries of Argentina than the investments of any other nation, Great Britain naturally gets the lion's share of Argentina's trade. The principal countries sharing in the import trade of Argentina are: Great Britain, Italy, Germany, the United States, France, Belgium, and Brazil. Of those taking Argentine products, the most important are: Great Britain, Germany, France, Belgium, the United States, and Brazil. The

following figures in pesos gold show the downward movement of the trade within the few years following 1890, marked especially by a sudden shrinkage of imports, and the gradual recovery:

	Imports	Exports		Imports	Exports
1891	67,207,000	96,703,000	1904	187,305,969	264,157,525
1892	97,899,000	114,667,000	1905	205,154,420	322,843,841
1893	100,913,000	94,906,000	1909	302,756,095	397,350,528
1894	92,789,000	101,250,000	1910	351,770,656	372,626,055
1896	112,164,000	116,802,000	1911	375,127,176	332,034,567
1900	113,485,000	154,600,000	1912	384,853,469	480,391,256

In the decade from 1903 to 1912 Argentina's total foreign trade increased 145 per cent. For 1912 the exports were classified as follows: Agricultural products, 278,186,572 pesos gold (of which 264,495,250 raw material); live-stock products, 188,215,956; forest products, 8,938,112; products of the chase, 2,008,212; mineral products, 285,272; other, 2,712,132; total, 480,391,256. The 1912 exports included corn valued at 108,908,193 pesos gold; wheat, 97,835,174; wool, 58,148,664; frozen beef, 34,285,076; and linseed, 34,213,565.

The growth of the trade with the United States during the last half-century is shown by the following figures taken from reports of the U. S. Bureau of Commerce and Navigation:

	Exports to Argentina	Imports from Argentina
1850	\$1,064,000	\$2,653,000
1860	999,000	4,020,000
1870	2,281,000	6,414,000
1880	1,779,000	6,214,000
1890	8,320,000	5,400,000

The crisis of 1890 had a similar effect on the trade with the United States as it had on the general trade of Argentina, the decline continuing for several years. Since 1896, however, the trade has again been increasing as follows:

	Exports to Argentina	Imports from Argentina
1896	\$6,000,000	\$9,300,000
1900	11,600,000	8,100,000
1904	16,900,000	9,800,000
1905	28,920,000	15,717,000
1912	53,158,179	29,847,016

The trade with the United States increased, not only absolutely, but also relatively. In 1896 the imports from the United States constituted 9.9 per cent of the total import; in 1900, 11.9 per cent; in 1904, 12.8 per cent; and in 1905, 14.1

per cent. The exports from Argentina to the United States were 8.0 per cent in 1896, 5.2 per cent in 1900, and 4.8 per cent in 1905. The chief articles of import from the United States are machinery and all kinds of tools and implements. The American export of agricultural implements to Argentina in 1912 amounted to nearly \$7,500,000. The chief articles of export to the United States are wool and hides and skins. Argentine returns show that imports from and exports to the United Kingdom in 1912 were valued at 118,669,226 and 121,373,358 pesos gold, respectively; Germany, 63,941,503 and 53,995,175; United States, 59,126,951 and 32,391,148; France, 37,618,578 and 36,052,069. These figures are exclusive of exports "for orders," which at the point of shipment are not assigned to any country; such exports in 1912 aggregated 114,903,510 pesos.

Transportation and Communication. Shipping.—The foreign trade of Argentina is carried on chiefly in foreign vessels, mostly British and German. In 1912, 4333 vessels (exclusive of the coasting trade) with a total tonnage of 10,541,697 entered at the ports of the republic, and 4290 of 10,598,838 tons cleared. Of entrances and clearances combined 4450 vessels of 11,770,699 tons were credited to the port of Buenos Aires. The merchant shipping bearing the Argentine flag consisted in 1911 of 161 steamers with a net tonnage of 80,447, and 185 sail of 57,350 tons net; vessels with a tonnage less than 50 are not included in this enumeration.

In September, 1905, the Chamber of Deputies passed a bill looking to the establishment of a direct line of fast steamers between Argentina and European ports.

Railways.—Perhaps in no other field has the economic progress of Argentina been so well exemplified as in its railway development. Argentina has a larger railway mileage than any country in America south of the United States, although it has only half the area and about one-fourth the population of Brazil and less than half the population of Mexico.

In 1912 there were 32,853 km. (20,414 miles) of railway. From Buenos Aires the extension in the north is as far as the Bolivian and Paraguayan frontiers; in the west, via Mendoza, to the Chilean frontier, whence the line continues to Santiago and Valparaiso; in the south, via Bahía Blanca to Neuquén. The first railway in Argentina was inaugurated Aug. 30, 1857, and extended 10 km., or a little more than 6 miles, west from Buenos Aires. In 1865 there were 249 km. (155 miles); in 1870, 732 km. (455 miles), including the Central Argentine Railway, extending from Rosario on the Paraná River to Córdoba. The trunk line leading north from Córdoba to Tucumán was built between 1870 and 1880, when the total extension reached 2516 km. (1563 miles). In the following decade the railways increased in length nearly fourfold, reaching 9432 km. (5861 miles) in 1890. By that year the country was covered with a network of railways branching out from the three great industrial centres on the Paraná River—Buenos Aires, Santa Fé, and Rosario. On the south the railway reached the sea at Bahía Blanca; on the west it extended to Mendoza at the foot of the Andes and not far from the Chilean boundary; on the north to Salta, also close to Chile. In 1900 the railways aggregated 16,563 km. (10,292 miles), and in 1910, 27,989 km. (17,392 miles). In April, 1910,

was opened the tunnel through the Andes, effecting rail communication between Buenos Aires and the Pacific.

On the economic side Argentina did not escape the experience which has been the lot of all countries where railway building has been allowed to go unchecked under private management. Excessive issue of capital stock, over-speculation, and kindred abuses accompanying the great railway "boom" of the eighties had their day of reckoning, and contributed in no small share to the great commercial panic of 1890, when the government found it impossible to pay interest on railway securities guaranteed by it. It was that experience that led to the gradual withdrawal of guarantees to railways, and the radical reform in railway management which culminated in the creation of a special Ministry of Railways, a sharp supervision of railway management, and a strong tendency toward government ownership and management. The 32,853 km. in operation in 1912 represented a capital of 1,120,210,000 pesos gold: passengers, 73,212,084; freight, 38,869,804; receipts, 129,700,178, and expenditures, 813,488,088 pesos gold. At the beginning of 1912 the railway extension was 31,574 km. (19,619 miles), of which 9831 were narrow gauge (1 meter), 2490 mean gauge (1.435 meters), and 19,253 broad gauge (1.676 meters). State lines, owned partly by the federal government and partly by the provinces, especially Buenos Aires, Santa Fé, and Entre Ríos, aggregated 5360 km. (3331 miles), and private lines 26,214 km. (16,289 miles). The cost of the state lines is reported to have been about 28,650 pesos per kilometer and that of the private lines 35,320 pesos per kilometer.

Telegraphs.—In 1910 the telegraph lines aggregated 59,950 km. (37,251 miles), of which 25,602 km. (15,908 miles) were government lines, 27,713 km. (17,220 miles) private lines, 5558 km. (3454 miles) Buenos Aires provincial lines, and 1077 km. (669 miles) Entre Ríos provincial lines. The length of wire was about 161,000 km. (100,040 miles), of which about 62,000 km. (38,525 miles) belonged to the federal government. There is telegraph communication with Valparaiso, whence a submarine cable connects with San Francisco, Cal. Buenos Aires is connected with Montevideo by submarine cable, and also with Europe by way of Rio de Janeiro and the Cape Verde Islands; and in this indirect way with the United States also. There is, besides, a cable between Buenos Aires and Lisbon.

Banking. The first bank established in Argentina was the Banco de la Provincia Buenos Aires, opened in 1822. It was followed by a number of other banks, but none of them managed to exist long, as the insignificant commerce of the country was not sufficient to maintain such institutions. The real banking history of the country dates from 1872, when the Banco Nacional, with a capital of 50,000,000 pesos, was founded. In 1882 the first foreign bank, the Banco Italiano del Río de la Plata, was established, and the growing commerce of the country soon led to the establishment of French, German, and Spanish banks, which the respective nations established in the interests of their own commerce. By a law of Nov. 3, 1887, national banks, resembling those of the United States, were established. The creation of these banks without proper safeguards thrown around them, followed by great abuse of the inadequate law by government officials, soon resulted in flooding the

country with worthless paper money. Speculation on a scale that left far behind the worst features of the German *Grunder* fever in the early seventies, and resembling much the excesses of the days of John Law (q.v.) in France, gave the country for a time the appearance of genuine prosperity; the "boom" was skillfully utilized through the medium of the Paris Exposition of 1889 to attract still more foreign capital, and the scramble for wealth went on until it culminated in financial panic. The panic swept away the numerous national banks, most of which had nothing but paper and a political "pull" with the directors of the National Bank at Buenos Aires as their chief assets. The National Bank itself, robbed of its capital by its directors and by politicians, was declared insolvent, and was reorganized in 1891, under the name of the Banco de la Nación Argentina, with a capital of 50,000,000 pesos paper; its capital in October, 1912, amounted to 120,999,950 pesos paper. In addition, there are 14 provincial banks and many commercial and agricultural banks. In 1899 the paper peso was fixed by the Congress of Argentina at .44 of the gold peso, thus contributing to the stability of the currency. At the end of 1812 the gold held by the Banco de la Nación Argentina and the Conversion Office amounted to 239,259,062 pesos.

Government. The constitution of Argentina, adopted in 1853 and modified in 1860 and in 1898, is modeled closely upon that of the United States; and the entire system of government, both federal and provincial, is almost identical in its chief features with our own. The legislative power is vested in a Congress consisting of a Senate and a House of Representatives. The Senate is composed of 30 members, elected 2 each by the legislatures of the 14 provinces, and 2 by the Federal District. They serve for nine years, but the terms of one-third of them expire every three years. The lower house consisted in 1912 of 120 members, elected directly by the people for a term of four years, one-half of the House being renewed every two years. To the House of Representatives is reserved the right of initiating bills dealing with taxation and military conscription and of impeaching the national executive and judiciary. The executive power is vested in a president, elected for a period of six years by the same method as that pursued in the United States, except that the number of electors chosen by each province is twice the number of its representatives in Congress. The president acts through his ministers, eight in number, who preside over the departments of the Interior, Foreign Affairs and Worship, Finance (Hacienda), Justice and Public Instruction, War, Navy, Agriculture, and Public Works. The ministers may appear and speak in Congress, though they have no vote, and are responsible for the acts of the chief executive, whose decrees they must countersign separately or jointly. Through the ministers the president may initiate legislation in either house. The Supreme Court of the republic consists of five judges and an attorney-general, appointed by the president, with the approval of the Senate. It exercises similar jurisdiction to that of the United States Supreme Court.

The provinces, 14 in number, have each their own constitution and exercise complete control over their own affairs. They possess even greater power than the States of our Union, in that they may conclude treaties (with the con-

sent of Congress) for the fostering of industry, immigration, colonization, railways, and canals. The governor is elected directly by the people for a period of three or four years. The national domain is divided into 10 territories, controlled by Congress and ruled by governors appointed by the president. When a territory acquires a population of 30,000, it is granted the power of choosing a legislature, and when its inhabitants number 60,000, it must of right be admitted as a province with boundaries determined by Congress. For purposes of administration and police, the republic is divided into 425 departments and 1750 districts. The national capital is Buenos Aires.

Local Government.—Every community of more than 1000 inhabitants may be erected into a municipal corporation. In the provinces of Buenos Aires, Santa Fé, Entre Ríos, San Juan, and Corrientes, the municipalities are supreme in the sphere of local government. The municipal presidents and councils are elected by the people, except the *intendente* ('governor') of Buenos Aires, which comprises the Federal District, who is appointed by the president of the republic. In the other provinces the municipalities are subject to inspection and regulation by the government officials and judicial authorities. Foreigners are eligible to any municipal office.

Immigration and Emigration. From 1857, when immigration statistics were first recorded, to 1911, the immigrants by sea numbered 3,924,952; in the same period emigrants numbered 1,156,871. Of the immigrants, 2,053,242 were Italian, 1,132,230 Spanish, 201,732 French, 115,827 Russian, 89,442 Syrian, 68,525 Austro-Hungarian, 50,731 German, 48,526 British, 30,619 Swiss, 21,781 Belgian, and 16,419 Portuguese. Immigration from 1857 to 1860 was 20,000; thereafter by decades it has been as follows: 1861-70, 159,570; 1871-80, 260,613; 1881-90, 846,568; 1891-1900, 648,326; 1901-10, 1,764,103. The financial panic of 1890 caused a great decrease, the immigration in 1889 being 261,000 and in 1901 only 52,000. Immigration and emigration have been as follows: 1906, 302,249 and 103,853; 1907, 257,924 and 138,063; 1908, 303,112 and 127,032; 1909, 278,148 and 137,508; 1910, 289,640 and 97,854. Immigrants in 1910 included 131,466 Spaniards, 102,019 Italians, 15,478 Syrians, and 12,765 Russians.

The Argentinians have long understood the value of immigration to a naturally rich and fertile, but sparsely settled country like their own, and have accordingly made great efforts to attract foreign labor, as well as foreign capital, to their country. In addition to liberal immigration laws, and generous distribution of land to colonists, large sums of public and private money have been spent in bringing over and aiding immigrants. While encouraging white immigration to the agricultural and grazing lands, the government does not favor any further increase of unskilled laborers in Buenos Aires and other cities.

Education. The public-school system of Argentina was admirably organized by President Sarmiento (1868-74), but on the whole it has not been kept up to the standard he set for it. Primary education is free and obligatory for all children between the ages of 6 and 14. The elementary schools are supported by the individual provinces, although subsidized by the federal government. They are under the general control of provincial boards of education, while the

details of administration are left to district school boards. The schools in the territories and the Federal District are managed by a National Board of Education under the supervision of the Minister of Justice and Public Instruction. Besides the regular elementary schools, there are kindergartens, schools for adults, and, in sparsely settled districts, ambulatory schools. In some of the provinces, and in the federal schools, religious instruction of any kind may be imparted outside of school hours; in others only the Catholic faith may be taught; in one, Entre Ríos, no religious instruction is permitted. The population of school age in 1911 was reported at 1,025,570, of whom about 45 per cent attended school, and of the latter only about 13 per cent could read and write. Slightly more than half of the total population was reported illiterate. Primary schools, public and private, numbered, in 1911, 7183, with 746,725 pupils and 22,456 teachers. Secondary education is controlled by the federal government, which maintains 27 national colleges (10,227 students and 1533 teachers) and 62 normal schools. Higher education is provided by the national universities at Buenos Aires, Córdoba, and La Plata, and by the provincial universities at Paraná and Santa Fé; the university teachers number about 450 and the students over 7300, of whom more than half are credited to the University of Buenos Aires. The federal expenditure on education in 1911 was over 19,200,000 pesos paper.

Religion. The constitution guarantees freedom of religion to all, but makes the Roman Catholic faith that of the State. The country is divided into five dioceses and one archbishopric. The government builds churches and supports the Catholic priesthood, but it controls all ecclesiastical appointments, and sanctions or rejects the decrees of the papal see. Marriage was made the subject of a civil contract in 1884. The native Argentinians are nearly all Roman Catholics. Of the 3,954,911 people returned by the census of 1895, 3,921,136 were Catholics, 26,750 Protestants, 6085 Jews, and 940 belonged to other denominations.

Finance. The economic progress of Argentina has been accompanied throughout its course by extremely unfavorable financial conditions. The chief cause of the unsatisfactory state of public finance has been the large increase of expenditure incurred without reference to the financial strength of the people. Students of Argentine affairs unite in the opinion that the politicians of the country embarked with too light hearts on all kinds of undertakings—some productive, others wasteful and useless; moreover, the administration of the budget was until recently extremely loose. In 1870 the total budget of the government was 12,635,000 pesos; in 1880 it was 16,815,000 pesos, or an increase of 33 per cent in one decade; in 1890 it was 71,508,000 pesos, or a further increase of 325 per cent; and in 1900 it was 95,000,000 pesos paper and 33,000,000 pesos gold, or, reducing it all to a paper basis, 194,000,000 pesos, or a further increase of 171 per cent. Dr. Alberto B. Martínez, formerly Assistant Minister of Finance, ascribes the great increase in public expenditure to the following principal causes: (a) Increase of administrative functions, due to rapid growth of population; (b) increase of public debt; (c) depreciation of paper money; (d) wars, foreign and civil; (e) guarantee by the State of the

payment of interest on costly public works; (f) imperfect administrative machinery; (g) defective control of public expenses, etc. In 1890, on the eve of the great financial crisis, the revenues of the republic amounted to 73,408,000 pesos paper, as against an expenditure of 92,854,000 pesos. The enormous deficit, together with the general unsettled financial condition of the country, forced the government to suspend payment on the national debt, and during the following years the revenue continued to decline. Although since 1895 the revenue has been steadily increasing, the expenditure has often been in excess, as is shown by the following figures (in pesos):

Year	Revenue		Expenditure	
	Gold	Paper	Gold	Paper
1895	29,800,000*	29,000,000*	24,200,000*	83,900,800*
1900	46,000,000*	67,100,000*	32,900,000*	95,400,000*
1901	38,185,343	62,318,816	29,216,218	94,658,119
1902	40,238,779	59,531,150	41,629,990	104,035,062
1903	46,615,856	65,466,010	37,149,031	98,441,878
1904	52,254,429	69,961,835	32,087,241	122,031,533
1905	53,076,067	84,778,282	82,345,819	134,906,626
1906	61,616,089	88,835,790	51,413,656	153,403,724
1907	64,527,983	97,153,871	29,521,411	186,107,108
1908	68,197,676	99,237,264	25,756,809	193,845,362
1909	74,165,574	106,607,826	68,768,368	235,969,955
1910	84,809,876	112,407,150	41,598,523	260,273,231

* Estimated.

The budget of 1912 showed revenues of 89,281,681 pesos gold, and 128,751,718 pesos paper, and expenditures of 29,909,343 gold, and 248,764,942, paper.

Of the total revenue, import duties furnish about three-sevenths, the remainder being derived from excise taxes on spirits, wines, and tobacco (one-fifth), land and stamp taxes (about 7 per cent of total revenue), proceeds from railways, telegraphs, and posts (about 6 per cent of revenue), and a number of other taxes. The increase of internal taxation took place in the early nineties to put a stop to the growing deficits and to put the country in a position to resume payments on the debt. The growth of the Argentine debt during the last three decades of the century was in round figures as follows: 1870, \$47,000,000; 1880, \$85,000,000; 1890, \$353,000,000; 1900, \$440,000,000. At the end of 1911 the external debt amounted to 303,719,786 pesos gold, and the internal debt to 161,367,000 pesos gold and 139,656,940 pesos paper; the floating debt was 34,064,123 pesos paper, and there was outstanding paper money amounting to 685,150,000 pesos. The annual interest of the debt requires about 28,000,000 pesos gold.

National Defense. Military service is compulsory upon male citizens between 20 and 45 years of age—nominally for a period of 25 years, of which from 3 months to one year are spent in continuous service. The country is divided into five military districts, each providing a complete division of the first line. The active strength of the army is 21,680 officers and men, and a total peace footing of about 170,000. The infantry is equipped with the Mauser magazine rifle, and the cavalry with a carbine of the same type, while the artillery use the Krupp 7.5 cc. gun.

Weights, Measures, and Money. The metric system was officially adopted in 1887. Gold is

the standard of value. A gold peso (\$) equals 96.5 cents in United States money. A peso has 100 centavos. The paper peso is equal to 44 centavos gold money.

Population. The table below shows by provinces the area of Argentina and the population according to the census of 1895 and the official estimate of Dec. 31, 1910. The figure given for total area should be regarded only as an approximation. Different areas are stated even in the Argentine reports, one being 2,987,353 square kilometers (1,153,417 square miles) and another 2,952,551 square kilometers (1,139,980 square miles); while a recent planimetric calculation gives 2,806,400 square kilometers (1,083,551 square miles).

Provinces	Popula- tion 1895	Est. pop. Dec. 31, 1910	Area in square miles
1. Eastern Littoral			
Federal District	663,854	1,314,163	72

Indians	30,000		
Grand Total	4,044,911	7,171,910	1,138,996

The calculated or enumerated population of Argentina in 1869 is stated at 1,821,211; in 1872, 2,231,049; in 1888, 3,158,434; in 1895, 3,951,911; at the end of 1910, 7,171,910. The increase from 1869 to 1895 was about 120 per cent. The urban population constituted 34.6 per cent of the total population of the country in 1869, and 42.8 per cent in 1895, thus keeping pace with the industrial development of the country. In the United States the urban population constituted 36.1 per cent of the total in 1890, 40.5 per cent in 1900, and 46.3 in 1910.

Of the 3,954,911 persons reported by the 1895 census, 2,088,919 were males and 1,865,992 females, the great excess of males being a common phenomenon in young countries attracting large numbers of immigrants. There were 2,950,384 natives, as against 1,004,527 foreigners, or, in other words, more than one-third of the population consisted of immigrants, among whom the proportion of males to females was about 7 to 4. The best represented nationalities among the foreign population were: Italians, 492,636; Spaniards, 198,685; Frenchmen, 94,098; and South Americans (Brazilians, Chileans, etc.), 117,000. The Indians seem to be fast dying out, their number having decreased from more than 93,000 in 1869 to 30,000 in 1895. The density of population increased from 1.6 per square mile in 1869 to 3.7 per square mile in 1895, ranging in the latter year from 0.16 per square mile in the territory of Neuquén to 11.1 in the province of Buenos Aires.

History. The Río de la Plata was entered in 1515 by Juan Díaz de Solís, who was searching for a southwest passage to the East Indies, and in 1527-28 Sebastian Cabot ascended the Paraná to its confluence with the Paraguay, giving the name La Plata (silver) to the latter stream, from the stories of hoards of silver which he heard from the Indians, who told him that the metal came from the head waters of the river in the west, i.e., Bolivia. At the junction of the Carcarañá and the Paraná, above the present site of Rosario, he built a fort. In 1535 Don Pedro de Mendoza visited the new country and founded Buenos Aires, which was abandoned by the colonists in 1536 and was not permanently established until 1580. Meanwhile Asunción (1536), Santa Fé (1573), and other places had been settled, and horses and cattle had been introduced. Spanish colonists from Peru had founded cities in the northwest, Tucumán (1565) and Córdoba (1573), and down to 1776 the basin of the Río de la Plata was a dependency of the viceroyalty of Peru. In that year the viceroyalty of Buenos Aires was formed, including Bolivia, Paraguay, and Uruguay, and the country was governed by viceroys until 1806, when, during the war of France and Spain against England, Buenos Aires and Montevideo were occupied by the English. Buenos Aires, however, was recaptured by the inhabitants, who, forced to defend themselves, saw the need and advisability of independence of the mother country. Accordingly, they refused in 1808 to acknowledge Joseph Bonaparte as King of Spain, and on May 25, 1810, the people deposed the Spanish viceroy, and the struggle for independence began. A provisional government was instituted under a *junta gubernativa*, which was replaced early in 1814 by a "Supreme Board of the United Provinces," under the virtual control of one man, Antonio de Posados. Civil strife followed, and on July 9, 1816, a general congress at Tucumán declared the independence of the "United Provinces of the Río de la Plata," though this was not substantially attained without war (1817-24) and was not recognized by Spain until 1842. During 1826-28 there was war with Brazil for the possession of the Banda Oriental (Uruguay), which in 1828 was finally recognized by both as an independent state, and from 1827 to 1831 the Plata provinces were practically isolated from each other. In 1831 Buenos Aires, Entre Ríos, Corrientes, and Santa Fé formed a federal compact, and invited the

others to join them; but anarchy resulted till 1835, when Gen. Manuel de Rozas was installed as dictator. His tyrannical efforts to make Buenos Aires supreme led to his downfall in 1852. In 1853 a constitution, still in force, was adopted for the "Argentine Republic," but Buenos Aires refused to accept the document, and in 1854 declared itself independent, but was defeated in 1859 and obliged to reënter the Confederation. Hostilities were soon renewed (1861), however, and though the province did not again become independent, it increased greatly in relative importance, and the city of Buenos Aires supplanted Paraná as the capital of the Confederation. During 1865-70, under the presidency of Gen. Bartolomé Mitre and of Gen. Domingo Faustino Sarmiento, a war was waged against Paraguay by the Argentine Republic, Brazil, and Uruguay, with little benefit to the republic. In 1881 a treaty was made with Chile by which Argentina acquired all the country east of the Andes, comprising Patagonia and the eastern part of Tierra del Fuego. In July, 1890, a revolution broke out, aided by the army and navy—the result of the political and financial corruption of the cabinet officers and the stagnation in business produced by debasement of the currency. President Miguel Juárez Celmán was forced to resign, and was succeeded by Dr. Carlos Pellegrini, who held office until October, 1892, when Dr. Luis Sáenz-Peña was inaugurated. Sáenz-Peña made a vigorous effort to put the country on a proper financial basis, conditions having continued very bad since the failure of the Barings, which was largely brought about by their extensive dealings in unproductive Argentine securities. Repeated political disturbances at the various provincial capitals, however, prevented any successful financial reorganization or sufficient commercial improvement, and in January, 1895, Sáenz-Peña resigned, and the vice-president, Dr. José Evaristo Uriburrú, took the executive chair. He held office until 1898, when Lieut.-Gen. Julio A. Roca, who had occupied the place between 1880 and 1886, was again elected president. The dispute with Chile over the boundary in the Atacama region was submitted for arbitration to the United States minister at Buenos Aires, whose decision, rendered in March, 1899, gave to Argentina about 25,000 square miles of territory. The question of the Patagonian boundary was settled in November, 1902, after years of controversy, by the decision of a commission appointed by the King of Great Britain, to whom the two countries submitted their claims. Of the disputed area Argentina received about 15,600 square miles and Chile a little over 21,000 square miles. The delimitation of the boundary was concluded in March, 1903. In May, 1902, the two governments entered into an agreement providing for a cessation in the increase of naval armaments and the ultimate establishment of an equilibrium between the two fleets. Dr. Manuel Quintana, who assumed the presidency Oct. 12, 1904, was active in advocating measures looking to the improvement of the finances and the industrial life of the nation. In July, 1905, Congress passed a law providing for the conversion of the internal debt and a measure providing for the conversion of the foreign debt was adopted by the Chamber in August. A military insurrection in the provinces of Buenos Aires, Santa Fé, and Córdoba, early in February, was suppressed in the course of a few days. An abortive up-

rising occurred in Santiago del Estero in June. In August an anarchist attempt was made on the life of the president. Strikes among the harbor and railroad employees led to the proclamation of a state of siege in October. President Quintana died in March, 1906, and was succeeded by the vice-president, Dr. Figueroa Alcorta. The latter finished his term and in 1910 was succeeded by Dr. Roque Sáenz-Peña. For Coat of Arms, see HERALDRY.

ARGENTINE, är'jen-tén. Formerly a city in Wyandotte Co., Kans., but annexed to Kansas City in 1910; on the Atchison, Topeka, and Santa Fe Railroad (Map: Kansas, H 2). It has a structural steel company, zinc and chemical works, an ice plant, grain elevators, and extensive railroad repair shops. Pop., when annexed, about 6300. See KANSAS CITY.

ARGENTINE (Fr. *argentín*, silvery, from Lat. *argentum*, silver). A small deep-sea smelt, most abundant on the southern coasts of Europe, where it is seined in schools, with anchovies and sardines. These fishes are chiefly remarkable and valuable for the resplendent silvery lustre of their sides and the abundance of nacre, the substance used in making artificial pearls, with which their air bladder is externally loaded. It consists of a coat of silvery fibres. Representatives of the genus (*Argentina*) are found on both shores of America. See Plate of WHITE-FISH, SMELT, ETC.

ARGENTINE REPUBLIC. See ARGENTINA.

ARGENTITE, or SILVER GLANCE. A gray sulphide of silver occurring massive or in isometric crystals. It is a rich ore of silver.

ARGENTON, är'zhän'tón'. A town in the department of Indre, France, 72 miles from Poitiers (Map: France, N., G 6). It is on the Creuse River, and many old houses and remains of castles give it a quaint appearance. The principal industry is the manufacture of boots and shoes, and there are several tanneries. Argen-

ton lies just south of the Roman Argentomagus. Pop., 1911, 6122.

AR'GENTORA'TUM. The Latin name for Strassburg, derived from an old Celtic term signifying 'the Stone of Argantos.'

ARGHOOL, ar-gool'. A wood wind instrument of the Arabs, invented in post-Mohammedan times. It consists of two tubes, made of common cane, with a reed mouthpiece. One tube is always, the other usually, perforated.

ARGILE PLASTIQUE, ar-zhâ' plâ'stâk' (Fr. plastic clay). A series of beds at the base of the Tertiary system in France, which consist of extensive deposits of sand, with occasional beds of plastic clays, used for pottery. See TERTIARY SYSTEM.

AR'GILLA'CEOUS ROCKS (Lat. *argillaceus*, clayey, from *argilla*, Gk. ἀργίλλος, *argillos*, white clay, potter's earth; cf. ἀργός, *argos*, shining, white). Rocks consisting of or containing more or less clay. Pure clay, or kaolinite, a hydrated silicate of aluminum, is always an alteration product of other minerals, particularly of feldspars. However, the term "clay" is applied to practically all plastic or sticky masses of earth or shale, which may include, besides kaolinite, a variety of minerals, such as quartz, feldspar, limonite, hematite, magnetite, etc. Clay deposits may be either residual or transported—i.e., formed in place, or carried to the point of deposition by water, wind, or glaciers. They are derived from the alteration of igneous rocks, limestone, sandstone, or shale. When consolidated without deformation, so that they have partings or capacity to part along planes of deposition, clay deposits form shale. When consolidated and so metamorphosed that new planes of cleavage are developed at angles to the deposition planes, the clay is known as a slate or clay slate. When still more metamorphosed, the clay may be known as a phyllite. Argillaceous rocks may be readily identified by the peculiar odor which they emit when breathed upon. These rocks grade by admixture of lime into calcareous rocks or limestones. See ARENACEOUS ROCKS; ROCK; GEOLOGY; CLAY.

AR'GILLITE. See SHALE.

AR'GINU'SÆ. Three islets off the south coast of the island of Mytilene (Lesbos), Asiatic Turkey. Near their shores the Spartan fleet under Callieratides was defeated by the Athenian fleet under Conon, September, 406 B.C.

ARGIVES, ar-jivz, or ARGIVI (Lat. *Argivi*, Gk. Ἀργεῖοι, *Argeioi*). (See ARGOLIS.) The inhabitants of Argos. In Homer, the name is applied to all the Greeks.

AR'GO. See ARGONAUTS.

ARGO. A large southern constellation in which is commemorated the mythical ship of the expedition of the Argonauts (q.v.). On account of its great extent, modern astronomers have subdivided Argo into three smaller constellations, *Puppis* (the Poop), *Vela* (the Sails), and *Carina* (the Keel). Canopus, a star of the first magnitude, is its chief ornament. Its declination (52° 38' S.) renders it invisible in the northern and central United States. The star η Argus, or η Carina, as it is now generally called, has undergone greater changes in brightness than any other variable star of its class. Apparently unknown to Ptolemy, who catalogued other bright stars culminating at the same altitude at Alexandria, it was first observed by Halley at St. Helena in 1677 when it showed as a star of the fourth magnitude. During the greater part of

the eighteenth century it was classed as a second magnitude star, but in 1811 it was again of the fourth magnitude. With several minor variations, it reached its maximum splendor in 1843, when it was only slightly inferior to Sirius in brightness. Sinking slowly in brilliancy, it brightened again for a short time in 1856, and then faded, rapidly at first and later more slowly, until 1886, when it assumed its present condition. It has been invisible to the naked eye since 1868, and now shows as a telescopic star of the seventh magnitude. It is situated in a remarkable nebula, named by Sir John Herschel the "keyhole" nebula, on account of its shape. Photographic observations made at the Cape of Good Hope Observatory in 1899 leave little room to doubt the existence of some connection between η Carinae and the nebula.

AR'GOB. A district in Bashan, which, according to Deut. iii. 4, contained threescore walled cities, "the kingdom of Og." Its exact location is uncertain. The Targums translate Argob by Trakona—i.e., Trachonitis, the modern El Leja—which, indeed, abounds in deserted towns and villages. Some of these are cave dwellings or subterranean chambers; others are built above ground, of massive blocks of black basalt, with heavy doors moving on pivots, staircases and roofs of the same material. The latter belong to the period from the first to the seventh century A.D., according to De Vogüé, Barton and Drake, Wetzstein and Waddington; though it is possible that the Greek cities may have been built on the sites of earlier towns, as Driver suggests. In Deut. iii. 14, Jair, son of Manasseh, is said to have conquered the region of Argob as far as Geshur and Maacha. But the Hawoth Jair were tent villages in Gilead, not walled cities in Bashan. Argob may have been situated on the western slopes of Jebel Hauran, north of Salehil, but this is far from certain. A most careful description of the region is given by J. G. Wetzstein, *Reisebericht über Hauran und die Trachonen* (Berlin, 1860); cf. also the excellent plates in De Vogüé's *Syrie Centrale* (Paris, 1869). Porter, *Five Years in Damascus* (London, 1870), and *Giant Cities of Bashan* (London, 1869), are interesting but somewhat unreliable.

AR'GOL (of uncertain origin, perhaps from Gk. ἀργός, *argos*, white). The crude potassium bi-tartrate which is found as a crust in wine vats. It exists originally in the juice of the grape, but is deposited during fermentation, as it is sparingly soluble in an alcoholic liquid. Accordingly as it is deposited from the red or white grape, it is called *red argol* or *white argol*. In addition to the potassium bi-tartrate it usually contains small quantities of calcium tartrate with coloring and extractive matters. Crude argol is purified by dissolving in water and heating for several days; on cooling, the clear liquor is run off, the deposited crystals constituting the commercial cream of tartar. In the crude state argol is used in metallurgy as a reducing agent in fire assaying; the organic matter combines with the oxygen of the lead oxide, and the potash-lime elements combine with the silica of the ore forming a slag.

AR'GOLIS (Gk. Ἀργολίς). A division of ancient Greece. In its wider sense it is the northeast portion of the Peloponnesus, bounded on the west by Achæa, Arcadia, and Laconia; on the north bordering on the Corinthian and Saronic gulfs; and penetrated on the south by

the Argolic Gulf, which separates the portion bordering on Laconia, the Kynuria, from the eastern peninsula. This district, containing about 1700 square miles, is filled with mountains, and never in historical times formed one kingdom; the northern states—Sicyon, Corinth, and Phlius—were often considered outside of Argolis proper. The chief towns of the eastern peninsula were Epidaurus, Troezen, and Hermione. The plain of Argos, in the middle portion, was famed for its fertility, and contained the cities of Mycenæ, Tiryns, and Argos, and was called Argæia. The edge of this plain is now swampy; the southeast portion contained, even in ancient times, the swamp of Lerna, home of the Hydra (q.v.), slain by Hercules. In the legends Argolis plays an important part. Mycenæ was the home of Agamemnon and the capital of Argolis, though other chiefs ruled at Argos, Midea, and Tiryns. Here, also, was placed the birth of Hercules (q.v.), and his contests with the Nemean lion and the Lernean hydra. Still earlier the plain was the scene of the story of Inachus and his daughter, Io; of Danaus and his daughters; and of the rule of Perseus and Pelops.

In historic times the chief city was Argos, which held possession of the Argive plain and was at the head of a somewhat loosely organized league of several of the Argolic states, which under King Pheidon (c.670 B.C.) became a great power in the Peloponnesus. Later the growing power of Sparta greatly lessened the influence of Argos, which, however, always remained a jealous rival, and during the fifth and fourth centuries B.C. usually appears in alliance with Athens.

The principal divinity of Argos was Hera, who had a very ancient sanctuary to the east of the city, the Heræum, where was a celebrated gold and ivory statue of the goddess, the work of Polycletus. This sanctuary was excavated by the American School of Classical Studies at Athens, from 1892 to 1895; the excavators discovered a large number of buildings, including earlier and later temples, much interesting sculpture, and a great mass of pottery, showing that this had been a place of worship from the earliest times. Argos was the seat of a celebrated school of artists in bronze and was also famed for its musicians. The modern town is a flourishing place on the site of the ancient city, of which few traces remain in sight. Argolis is one of the nomes of the kingdom of Greece. The capital is Nauplia. Consult Waldstein, *Excavations at the Heraion of Argos* (1892). See EPIDAUROS; HERÆUM; MYCENÆ; TIRYNS; TROEZEN.

ARGON (Gk. ἀργόν, neut. of ἀργός, *argos*, inactive, inert, alluding to its incapacity for entering into chemical combination). A gaseous element discovered in 1895 by Lord Rayleigh and Sir William Ramsay, although Cavendish had undoubtedly obtained a minute quantity of it from atmospheric air in 1785. Argon is contained in the atmosphere to the extent of nearly 1 per cent. It was obtained by its discoverers by passing air through a combustion tube packed with metallic copper, which absorbed the oxygen, after which the gas was passed through an iron tube packed with magnesium turnings and heated in a combustion furnace. The magnesium absorbed the nitrogen, and the argon, in its gaseous form, was then collected in a holder. It was also obtained by adding oxygen to air, subjecting the mixture to

the action of an electric current in the presence of an alkali, and removing all oxygen by means of pyrogallie acid. The density of the argon made by means of magnesium was 19.94° (the density of oxygen being taken as 16). The elementary nature of argon has been demonstrated by a comparison of its specific heats at constant pressure and at constant volume, which showed that a molecule of argon is made up by a single atom and hence is not compound. But if this is true, then the molecular weight (i.e., twice the density) of argon is identical with its atomic weight, and hence the latter is concluded to be about 40. Sir William Crookes found in the spectrum of argon two characteristic lines near the red end that could not be mistaken for the lines of nitrogen or of any other element. However, the spectrum of argon has been found to change greatly with the means employed in producing it. Argon cannot be liquefied unless its temperature is reduced to at least 121° below zero C. At that point a pressure of 50.6 atmospheres (759 pounds per square inch) is sufficient to produce liquefaction. Under ordinary atmospheric pressure liquid argon boils at -187° C. At the temperature of -189.6° C. it freezes. No well-defined chemical compound of argon with other substances is as yet known. Its discoverers received the first Hodgkins Medal and the grand prize of the Smithsonian Institution at Washington. Consult Lord Rayleigh and Sir W. Ramsay, "Argon, a New Constituent of the Atmosphere," *Smithsonian Contributions to Knowledge* (Washington, 1896).

ARGONAUT. A small pelagic octopod cuttlefish of the genus *Argonauta*, specifically, the paper sailor or paper nautilus (*Argonauta argo*). The female is many times longer than the male and secretes a thin, iridescent, crenelated, and somewhat boat-shaped shell, which serves as a brood pouch. In calm weather the animal rises to the surface and seems to voyage about, whence the fanciful name and sundry fables. For fuller description, see OCTOPUS.

ARGONAUTICA. The name of various epic poems narrating the deeds of the Argonauts, especially one written by Apollonius of Rhodes and one by Valerius Flaccus, a Roman of the first century A.D. Flaccus's work is a free imitation of that of Apollonius.

ARGONAUTS (Gk. Ἀργοναῦται, *Argonautai*, i.e., the sailors on the ship *Argo*). A name given to those who, under command of Jason, undertook a voyage famous in Greek legend. The *Argo* is mentioned in the *Odyssey*, and incidents of the story appear in the Hesiodic poems. Allusions to the story, often contradictory and influenced by local legends, are scattered through the fragments of lyric poetry, and single episodes of it were used by the tragedians, though only the *Medea* of Euripides (q.v.) has survived. These fragments, and the somewhat more satisfactory scraps from the prose writers, are the chief sources for the earlier versions; but our most complete and valuable account is contained in the poem, in four books, by the Alexandrian poet and scholar, Apollonius of Rhodes, who tried to combine the mass of material with which his studies had made him familiar into a connected and consistent narrative. A brief narrative is also found in the mythological handbook which goes under the name of *Apollodorus*. (For Roman versions of the story see APOLLONIUS RHODIUS.) In its

main outlines the story is as follows: Pelias, King of Iolcus, in Thessaly, having reason to fear his nephew, Jason, commanded him to fetch from *King Æetes, in Colchis, the golden fleece of the ram which had borne away Phrixus and Helle (q.v.). With the help of Hera and Athena, Jason and Argos, son of Phrixus, built a wonderful ship, strong and swift, but light, and, since it bore a piece of the oracular oak from Dodona in its keel, capable of delivering prophecies. About him Jason gathered a band of heroes, whose names and number vary greatly, though the party is usually estimated to have comprised about 50. The earlier versions seem to have placed the land of Æetes in the far east, but the later writers placed it in Colchis, on the Black Sea. On the voyage the most notable adventures were: 1. The landing on Lemnos, where the Argonauts found a state of women only, under Queen Hypsipyle, all the men having been murdered shortly before. Here they remained some time, and two sons were born to Jason and Hypsipyle. 2. Near the Bosphorus Pollux conquered Amycus, King of the Bebryces, in a boxing match, and so secured for his companions access to a spring. 3. In these same Thracian regions they found the blind prophet Phineus, tormented by the Harpies (q.v.), whom the sons of Boreas, Calais, and Zetes, put to flight; in return Phineus showed the Argonauts how to pass the ever-clashing rocks of the Symplegades. 4. This adventure they accomplished by hard rowing, after they had been encouraged by the sight of a dove, which flew through the passage with only the loss of her tail feathers. When they arrived at Colchis, Æetes demanded that Jason should yoke fire-breathing bulls with brazen hoofs, plow with them a field, sow the dragon's teeth given him by Cadmus, and then destroy the crop of giants which would spring from such seed. All this Jason accomplished, with the help of Æetes's daughter, Medea, who had fallen in love with the hero. With her help, also, he foiled further plots of the King, and, securing the fleece by stealth, fled with Medea and her young brother, Absyrtus. Pursued by Æetes, Medea saved the Argonauts from capture by killing her brother and strewing the fragments of his body into the sea, thus delaying her father, who piously collected his son's remains for burial. The return of the Argonauts was very diversely narrated. Some brought them by way of the Tanais into the Northern Sea, while others led them eastward to the ocean and back across Africa, carrying their ship through the Libyan desert on their shoulders. After many adventures they at length reached Iolcus and delivered the fleece to Pelias. (For the further legends see articles MEDEA; PELIAS.) There are indications that both Jason and Medea were originally worshipped as gods at Corinth and elsewhere, but later sank to the rank of heroes and became connected with the common folk tale of the lover who must perform impossible tasks to win his mistress, but who overcomes all obstacles by magic help. Whatever the origin of the story, there can be no doubt that it was developed under the influence of the voyages that marked the great period of Greek colonization in the eighth and seventh centuries B.C. The wonders and adventures encountered by the first explorers of the Black Sea and the west were thrown back into the mythical past, and told of gods and heroes—Hercules, Jason, and Odysseus.

ARGONAUTS OF '49. A name applied to the fortune seekers who emigrated to California in the years immediately following the discovery of gold there in 1848, the largest number of whom went out in 1849. See FORTY-NINERS.

ARGONNE, är'gün'. A rocky plateau in northeast France, extending along the border of Lorraine and Champagne and forming parts of the departments of Ardennes and Meuse. The Argonne forest proper, or west Argonne, has a length of over 30 miles and a width of from one to eight miles. The forest of east Argonne includes the forest of Apremont. Argonne has been the scene of several stirring historical events, notably in connection with Dumouriez's "Argonne campaign" of 1792 and with the Franco-Prussian War.

AR'GOS. See ARGOLIS.

ARGOSTOLI, är'gös-tö'lä. An episcopal city, capital of the island of Cephalonia, on the east shore of the Gulf of Argostoli, an inlet of Livada Bay (Map: Greece, B 3). The town is famous for its mills, which are driven by a current of sea water, flowing through an artificial channel about 150 feet long, then disappearing through fissures in the rocks. It has an excellent harbor, and it finds considerable trade in exporting wine, oil, melons, and currants. A long bridge connects the north shore of the bay with the Koutavós Lagoon, which lies to the south. There is a naval school here. Pop., about 14,000.

ARGOT, är'gö'. The French term for what in English is called "slang," especially the dialect of thieves and vagabonds. Like all such dialects, argot is often sparkling with wit and remarkable for aptness and comprehensiveness of expression. Many specimens of it are to be found in Victor Hugo's *Les Misérables*, in Zola's *Assommoir*, and in the lower grade of Parisian journals. Consult: Barrère, *Argot and Slang* (London, 1887); Knoblauch, *Dictionary of Argot* (French-English) (New York, 1912); Sainéan, *Les Sources de l'argot ancien* (Paris, 1912); La Grasserie, *Etude scientifique sur l'argot et le parler populaire* (Paris, 1907); Villatte, *Parisismen* (Berlin, 1906); Yve-Plessis, *Bibliographie raisonnée de l'argot et de la langue verte* (Paris, 1901); Delvaux, *Dictionnaire de la langue verte* (Paris, no date). See SLANG.

ARGOUT, är'gö', ANTOINE MAURICE APOLLINAIRE, COUNT D' (1782-1858). A French financier. He was born in Isère, and after acting as auditor to the Council of State (1810), became prefect of Gard (1817) and a peer of France (1819). As mediator between Charles X and the popular leaders, during July, 1830, he obtained concessions from Charles, but not until it was too late. He was appointed Minister of the Marine in 1830, and acted as Minister of Commerce (1831) and Minister of the Interior (1833). He was governor of the Bank of France from 1834 until his death, except for a short while in 1836 when he was Minister of Finance. In 1852 he entered the Senate.

ARGÜELLES, är-gwä'lyäs, AGUSTÍN (1776-1844). A Spanish politician of the Liberal school. He was born at Rivadisella, in Asturias. On the breaking out of the War of Independence in 1808, he went to Cadiz, where he agitated for the organization of a regency with a free constitution. In 1812 he was sent as representative of his native province to the Cortes, where he was appointed one of the members of a committee to draft a constitution. His splendid talents as a public speaker soon won him the admiration

of the Liberal party, who used to call him the Spanish Cicero. But on the return of Ferdinand VII Argüelles fell a victim to the reactionary spirit which ensued. On May 10, 1814, he was arrested, and after a trial that was a mockery of justice, condemned by the King to 10 years' imprisonment in the galleys at Ceuta. The revolution of 1820 restored him to freedom. Argüelles became Minister of the Interior, but soon resigned, provoked beyond measure by the narrow bigotry of the court. He continued a constitutional Liberal always. In the Cortes held at Seville, in 1823, he voted for the suspension of the royal power; but after the violation of the constitution he fled to England, where he remained till the amnesty of 1832. On his return to Spain he was repeatedly made President and Vice-President of the Chamber of Deputies, and always showed himself a moderate but unwavering reformer. In July, 1841, in the discussion of the law regarding the sale of Church property, he spoke strongly against all concordats with the Pope. During the regency of Espartero he was guardian to the young Queen Isabella. In his old age he still exhibited the fiery eloquence that marked his youth. Consult Evaristo San Miguel, *Vida de D. A. Argüelles* (Madrid, 1851).

ARGUMENT. In law, the address by counsel to the court or jury, in which he argues upon the merits of his client's case in order to affect the decision or verdict to be rendered. Arguments to the jury are based upon the facts established or disputed in evidence at the trial of a cause, and upon matter of common knowledge of which the court or jury may take judicial cognizance. It is not strictly limited to the facts, however, counsel having the right to instruct the jury as to the law applicable to the facts presented by him. Arguments addressed to the court may be based either upon the facts before it or upon the law. The time to be devoted to the argument, its scope, and order are subject to the discretionary control of the court. It is the usual practice to permit the attorney for a plaintiff or appellant both to open and close the argument. If in the argument the attorney goes beyond proper comment upon the evidence, or indulges in abuse of a party or attorney in the case, or comments upon failure of a privileged witness to testify, or otherwise so conducts himself as unwarrantably to inflame or prejudice the minds of the jury, it may be ground for setting aside the verdict. See JURY and the authorities referred to under PRACTICE.

ARGUMENT (Lat. *argumentum*). In logic, either the ground or premise on which a conclusion is rested, and, more specifically, the minor premise (see LOGIC), or a whole syllogism. Popularly, it is applied to a series of arguments, or to a controversy. *Argumentum ad hominem* is an appeal to the known prepossessions or admissions of the persons addressed. For instance, an attempt may be made to silence an opponent, who has recently changed his mind, by saying: "Your well-known speech last winter leaves you the single course open of admitting that so-and-so is the case." *Argumentum ad rem* is an argument pertinent to the issue. *Argumentum e consensu gentium*, or *ad iudicium*, is an appeal to the common belief of mankind. *Argumentum a tuto* rests upon the supposed safety or prudence of adopting a certain conclusion. *Argumentum ad populum* is an appeal to popu-

lar passions or prejudices. *Argumentum ad ignorantiam* is an artful attempt to establish a statement by showing that we do not know the truth of its opposite. *Argumentum ad verecundiam* is an appeal to a reverend authority. Lastly, the *argumentum a baculo* is the use of the cudgel or of a browbeating manner to settle a dispute. This form of argument is concise in its style and has quickly adjusted many controversies.

ARGUN, ärgöön'. A river of Asia, which unites with the Shilka at Ust-Strielka, on the borders of Siberia and Manchuria, to form the Amur. It rises on the northern borders of Mongolia and has a generally easterly course of about 1100 miles, in the lower half of which it forms the boundary between Trans-Baikalia and Manchuria. Not far from the middle point of its course it flows through a considerable lake called Dalai-Nor. In its upper course it bears the name of Kerulen.

ARGUN KHAN, ärgöön' kân. See MONGOL DYNASTIES.

ARGUS (Lat. for Gk. Ἄργος, *Argos*). 1. The son of Zeus and Niobe. He was the mythical ancestor of the Argives, and founder of Argos, and was worshiped at his grave, near that city. He was said to have introduced agriculture from Libya. 2. Argus, surnamed Panoptes ('all-seeing'), had 100 eyes, some of which were always awake. For his watchfulness Hera chose him to guard Io (q.v.), who had been transformed into a cow. Hermes, sent by Zeus to steal the cow, killed Argus by stoning him, or, in the later version, charmed all his eyes to sleep and struck off his head. Hera used the eyes of Argus to decorate the peacock's tail. 3. Argus, the builder of the ship *Argo*. (See ARGONAUTS.) 4. Argus (Argos) is also the name of several Greek cities, of which the most celebrated was the historic capital of the Argolic plain. (See ARGOLIS.) In Homer, Argos denoted the kingdom of Agamemnon, the entire Peloponnesus, and even the whole of Greece. 5. Argus, the dog of Odysseus, who after 20 years recognized his master on his return, in spite of his disguise, and died of joy.

ARGUS, THE. See ALLEN, WILLIAM HENRY.

ARGUS PHEASANT, fêz'ant. See PHEASANT.

ARGYLL, ärg-il', ARCHIBALD CAMPBELL, MARQUIS OF (1598-1661). A prominent Scottish nobleman. In his sixteenth year he saw service under his father, whom he succeeded, as eighth Earl, in 1638. Already he had given proofs of that strength of religious principle which marked his whole life, and of a perilous union of attachment to Charles I, and of faith in the principles against which the King made war. In the General Assembly at Glasgow, in November, 1638, he openly took the side of the Covenanters and thenceforth became recognized as their political head. In 1640 he commanded a military expedition through Badenoch, Athole, Mar, and Angus, for the purpose of enforcing subjection to the Scottish Parliament. The King, on his visit to Scotland in 1641, found it convenient to show peculiar favor to Argyll and created him a Marquis. On the breaking out of hostilities Argyll was still desirous for negotiation, but was finally compelled to take the field. In April, 1644, he dispersed the Royalist forces under the Marquis of Huntly in Aberdeenshire. He was less successful in withstanding the genius of Montrose, who, on Feb. 2, 1645, almost annihilated his army at Inverlochy. His estates had

suffered so much in the preceding year from the ravages of the brilliant Cavalier that a sum of public money was voted for his support. In August, 1646, he went to London, with Loudon and Dunfermline, to treat with the Parliament for a mitigation of the articles presented to the King. He was at the same time the bearer of a secret commission from the King to treat with the Duke of Richmond and the Marquis of Hertford on the propriety of a Scottish demonstration in favor of Charles. On the defeat of the "engagement" plan, to which he had been decidedly opposed, the government of Scotland devolved on Argyll and the other Presbyterian leaders. In the Parliament of February, 1649, Charles II was proclaimed King, and at Scone, on Jan. 1, 1651, Argyll put the crown on his head. At this time it was even said that the complaisant monarch intended to marry one of his daughters. As head of the committee of estates Argyll took vigorous measures to oppose Cromwell's invasion of Scotland, and still adhered to the King after the subjugation of the country. After the battle of Worcester he retired to Inverary, where he held out for a year against Cromwell's troops. Falling ill, he was taken prisoner by General Dean. He refused submission to the Protector, but made an engagement to live peaceably, which he strictly kept. On the Restoration he repaired to Whitehall, encouraged by a flattering letter from the King to his son. By order of Charles II he was committed to the Tower, and on Feb. 13, 1661, was brought before the Scottish Parliament on the charge of treason. He defended himself with spirit, but in vain; on the 27th of May he was executed at Edinburgh. Conflicting estimates of Argyll's character have been written; cowardice in the field has been proved against him, and Scott places him in an unfavorable light in his *Legend of Montrose*.

ARGYLL, ARCHIBALD CAMPBELL, ninth EARL OF (?)—1685. Eldest son of the preceding. He was early distinguished by personal accomplishments and exhibited great bravery on the disastrous day of Dunbar, where he commanded a regiment on the Royalist side. After Worcester, he continued, like his father, in arms, and made himself so obnoxious to the Parliamentary leaders that he was specially excepted by Cromwell from the Act of Grace in 1654. After much harassing persecution he submitted to the Parliament but continued to be closely watched. On the restoration of Charles II he was received into high favor (as a balance to the execution of his father), and, unfortunately for his own fame, participated in some of the iniquitous acts of the Scottish Legislature. He had, however, numerous and active enemies; and, on the ground of an intercepted letter, in which he had complained of neglect, he was tried and condemned to death by the Scottish Parliament for the imaginary crime of *lesa majestas*. The influence of Clarendon restored him to liberty and favor; even the King himself was prejudiced in his favor, but in taking the test oath framed by the Scottish Parliament in 1681, his added reservation, "So far as consistent with the Protestant faith," was declared treasonable, and he was again condemned to death. The devotion of his wife enabled him to escape from Edinburgh Castle in the disguise of a page, and, after remaining concealed some time, he fled to Holland. On the accession of James II he landed in the north of Scotland, in May, 1685, with an armed force,

to coöperate in the revolt of Monmouth, but after a series of misfortunes, was taken prisoner, hastily condemned, and beheaded, June 30, 1685. His son Archibald, one of the deputation sent by the Scottish Convention to present the crown to the Prince of Orange, was in 1701 created Duke of Argyll. Consult John Willcock, *A Scots Earl in Covenanting Times; Being the Life and Times of Archibald Campbell, Ninth Earl of Argyll* (Edinburgh, 1908).

ARGYLL, GEORGE JOHN DOUGLAS CAMPBELL, eighth DUKE OF (1823–1900). He succeeded his father in 1847. At the age of 19, while Marquis of Lorne, he wrote a pamphlet entitled *A Letter to the Peers from a Peer's Son*, on the struggle which ended in the disruption of the Scottish Church. In 1848 he published an essay on presbytery, which contains an historical vindication of the Presbyterian system. On the formation of the coalition ministry by Lord Aberdeen he was invested with the office of Lord Privy Seal, which he continued to hold in Lord Palmerston's administration. In 1855 he relinquished his office and became Postmaster-General. In 1859, on Palmerston's return, he again accepted office. He was Secretary of State for India under Mr. Gladstone in 1868–74, and Lord Privy Seal in 1880–81; he resigned office in 1881, disapproving of the Irish Land Bill. In 1874 he had supported the abolition of patronage in the Church of Scotland. In 1854 he was chosen Lord Rector of the University of Glasgow; in 1855 presided at a meeting of the British Association in that city, and in 1861 was elected president of the Royal Society of Edinburgh. He was hereditary master of the Queen's household in Scotland, Chancellor of the University of St. Andrews, a trustee of the British Museum, also hereditary sheriff and Lord Lieutenant of Argyllshire. Besides numerous papers on zoölogy, geology, etc., he wrote *The Reign of Law* (1866); *Primeval Man* (1869); *A History of the Antiquities of Iona* (1871); *The Unity of Nature* (1884); a volume of poems, *The Burdens of Belief* (1894), and *Organic Evolution* (1898). Though Argyll is best known by *The Reign of Law*, which has become a classic in the defense of theism, all his work shows very great ability. He was also one of the most finished orators of his time. His autobiography has been edited by his widow (2 vols., London and New York, 1906).

ARGYLL, JOHN CAMPBELL, second DUKE OF (1678–1743). A Scottish general and statesman. He was the son of the first duke, and took an important part in the political and military affairs of his time. As royal commissioner in 1705, he had a principal share in bringing about the union of England and Scotland. As a soldier he distinguished himself under Marlborough at Ramillies, Oudenarde, Lille, Ghent, and Malplaquet. Previous to the change of ministry in 1710, Argyll had been a strong Whig. He now joined the Tories in opposing the Duke of Marlborough. As a reward he was appointed by the Tories generalissimo of the British army in Spain; but, considering himself to have been slighted by the ministry, he soon after returned, and finding his influence greatly diminished, he again became a Whig. His career up to the rebellion of 1715 was tortuous, and seriously detracts from his meritorious services during that critical period. He was, however, placed in command of the King's forces in Scotland and was completely successful in quelling the Jaco-

bite rising. His services were rewarded in 1718 with an English peerage and the title of Duke of Greenwich. In 1721 he again played into the hands of the Tories, for the purpose of securing the entire patronage of Scotland. He was made a field marshal in 1735. In 1737 he rose into immense popularity in his own country by his spirited defense before Parliament of the city of Edinburgh in regard to the Porteous mob. Pride and passion rather than ambition were the motives which chiefly controlled him. He was endowed with remarkable oratorical gifts, but the shiftiness of his policy prevented him from ever attaining a place commensurate with his seeming abilities. He was noted for his kindness and courtesy in private life. The benevolence of his disposition procured him the title of "the Good Duke of Argyll." Compare the flattering description of him in Scott's *Heart of Midlothian*. Consult also his *Life*, by Robert Campbell (1745).

ARGYLL, JOHN DOUGLAS SUTHERLAND CAMPBELL, ninth DUKE OF (1845—). An English statesman and author. He was born in London, and was educated at Eton, St. Andrews University, and Trinity College, Cambridge. He was returned to Parliament as a Liberal from Argyllshire, which he represented from 1868 to 1878. In 1871 he married Louise, fourth daughter of Queen Victoria. From 1878 to 1883, as Marquis of Lorne, he was Governor-General of Canada, his administration being markedly popular and successful. In 1895 he was returned to Parliament from South Manchester. He succeeded to the dukedom of Argyll in 1900. He published *A Trip to the Tropics* (1867); *Guido and Lita* (1875); *The Psalms Literally Rendered in Verse* (1877); *Imperial Federation* (1885); *Canadian Pictures* (1885); *Queen Victoria, Her Life and Empire* (2d ed., 1909); *Passages from the Past* (1908); *Yesterday and Today in Canada* (1910).

ARGYLL AND THE ISLES, JAMES ROBERT ALEXANDER CHINNERY-HALDANE, LORD BISHOP OF (1842-1906). A Scottish prelate. He was educated at Trinity College, Cambridge, took orders in 1866, and was curate of All Saints, Edinburgh, from 1869 to 1876. From 1876 to 1895 he was rector of Nether Lochaber, and in 1881-83 was Dean of Argyll and the Isles. In 1883 he became bishop. Among his publications may be mentioned *The Scottish Communicant*; *The Communicant's Guide*; *Charges on the Holy Eucharist and Kindred Subjects* (1883-87).

ARGYLLSHIRE (*Argyle*, Gael. *Airer-Gadhel*, district of the Gaels). A county in the west midland division of Scotland, bounded on the north by Inverness-shire; on the east by Perthshire, Dumbartonshire, and the Firth of Clyde; on the south by the Irish Sea; and on the west by the Atlantic Ocean (Map: Scotland, C 3). Its greatest length is about 115 miles; greatest breadth, about 55 miles; its extent of coast line is very great, amounting to 2289 miles, owing to the indentation of the coast by the numerous lochs. It is second only to Inverness in size, with an area of 3232 square miles, of which 616 are occupied by numerous islands. The chief of these are Jura, Mull,Islay, Tyree, Gigha, Coll, and Colonsay. The general aspect is wild and picturesque, marked by rugged and lofty mountains and deep inland bays. Some fertile valleys exist. Sheep raising is one of the chief industries. More sheep are pastured in Argyll than in any other county in Scotland, and nearly 1,000,000 acres are available for this

purpose. Forests once partly covered the shire and abounded in game, and some of the lakes are famous for excellent fish. Quarrying and mining are also carried on. The chief towns and villages are Inverary, the capital, Campbeltown, Oban, Dunoon, Lochgilphead, and Tarbert. Pop., 1801, 81,300; 1851, 89,300; 1891, 75,000; 1901, 73,642; 1911, 70,902, the decrease being due chiefly to emigration. Consult Campbell, *Records of Argyll* (Edinburgh, 1885).

ARGYRO-CASTRON, är'yé-rô'käs-trôn. A town of European Turkey, in the vilayet of Janina, on an affluent of the Viosa River, 90 miles southwest of Monastir. It has several mosques. Its population in the eighteenth century was above 20,000. A plague in 1814 was disastrous, and the inhabitants now number about 10,000.

ARGYROPULOS, är'gérô-pôw'lôs, JOHANNES (c.1416-86). A Greek humanist, who contributed largely to the revival of Greek learning in the West. He was born at Constantinople, but went to Italy at an early age, by 1441, and in 1456 was called by Cosmo de' Medici to the chair of Greek and the Aristotelian philosophy at Florence. There his pupils included Lorenzo and Pietro de' Medici, Politianus, Reuchlin, and Acciaiuoli. In 1471 he removed to Rome, where he died. His chief works were Latin translations of the *Ethics*, *Politics*, *Economics*, *De Anima*, and *De Carlo* of Aristotle, and a commentary on the *Ethics* of that philosopher.

ARIA, är'râ or är'ri-a, or **AIR** (It. from Lat. *acr.* Eng. *air*, in the meaning style, manner, for similar development of meaning, cf. *modus*, mode, musical mode). An elaborate lyrical composition for a solo voice with accompaniment of the orchestra. Usually it is a number from an opera or an oratorio, but there exist also independent arias written for concert performance. Such are called *concert arias*. The difference between an aria and a ballad (q.v.) is that the former is always lyric, the singer expressing his emotions in the first person, whereas the latter is epic, the singer narrating in the third person. Broadly speaking, the aria differs from the song (lied) by the fact that it has orchestral accompaniment, while the song is written with accompaniment for a single instrument, usually the piano. In view of the enormous development of the modern song it can no longer be maintained that the aria is conceived along grander lines. Richard Strauss's *Cäcilie* is a "song" because it has piano accompaniment, but in grandeur of conception and intensity of utterance it surpasses many arias. In fact, the composer subsequently orchestrated it, and in this form it is one of the finest arias in the range of musical literature.

The form of the aria originated in Italy, and its development goes hand in hand with the evolution of the monodic style (see MONODY) of the Italian opera. The earliest example of the so-called *aria grande* or *aria da capo* is found in the opera *Gerusalemme liberata* (1686) by Pallavicini (q.v.). The form is binary; a first theme is followed by a second theme, after which the first theme is repeated; whence the term *aria da capo*. The whole is preceded by an orchestral introduction, called *ritornello*, which consists of the first theme. Alessandro Scarlatti (q.v.), to whom for a long time has been erroneously ascribed the invention of this form, uses it for the first time in his *Teodora* (1693). For the sake of contrast and better effect, how-

ever, he wrote the first theme as an allegro and the second as a slow movement, in which form the aria has become typical. In the course of the eighteenth century the last portions, especially the repetition, became more and more overloaded with meaningless ornamentation, the object of which was only to gratify the vanity of the singers in the exhibition of vocal feats. Before long the sole interest in opera was centered upon the aria, and both composers and audience lost all sense of dramatic truth. Thus the aria was the prime factor that caused the decadence and final disappearance of the operatic school known as that of the *bel canto*. From the middle of the eighteenth century on this form of the aria was designated as *aria di bravura*, or *aria di coloratura*. The true instinct of such masters as Gluck, Mozart, and Weber led them to reject all useless cadenzas, and especially the literal repetition of the first theme, as undramatic. Wagner rejected the entire form.

Aria da chiesa is an aria on a sacred text. It bears the same relation to the sacred song as the concert aria to the secular song. In the *aria parlante* the flowing melody is mingled with a more declamatory style approaching the recitative. An *arietta* is an aria on a smaller scale, often without a contrasting second theme, even with only piano accompaniment. An *arioso* is a recitative occasionally interrupted by real melodic outbursts. It is frequently synonymous with *aria parlante*.

A'RIAD'NE (Gk. 'Αριάδνη). A daughter of Minos, King of Crete, by Pasiphaë. In the earliest form of the story Ariadne, while on her way to Athens with Theseus, was killed by Artemis (*Odyssey*, xi, 321 ff.). The more common version told how, when Theseus landed in Crete with the offerings for the Minotaur, Ariadne loved the youthful stranger and enabled him to slay the monster and escape from the labyrinth. Theseus secretly carried her with him from Crete, but abandoned her on the island of Naxos. The earlier writers seem to have attributed this desertion to the will of Dionysus, while later the faithlessness of Theseus was made prominent. Dionysus found the deserted Ariadne and made her his bride, placing her crown among the stars. Ariadne, as left forsaken by Theseus, and as found and married by Dionysus, has been a favorite subject with artists.

A'RIAL'DUS. A deacon of the Church of Milan, who flourished during the eleventh century and was called the Patarcene, an opprobrious epithet, meaning 'the ragpicker,' because his followers assembled in the slum quarter of Milan, where the ragpickers lived. He led them in vigorous protest, even insurrections, against the marriages and incontinence of the clergy and in support of the strict enforcement of clerical celibacy. Although successively sanctioned by Popes Stephen IX (1057-58), Nicholas II (1059-61), and Alexander II (1061-73), he found little sympathy among his brethren, and used to complain that he could get only laymen to assist him in his agitation. Having at length succeeded in obtaining a papal bull of excommunication against the Archbishop of Milan (1065), a fierce tumult ensued in the city, whose inhabitants declared against Arialus and his coadjutors, not because they opposed clerical marriages, but because they seemed to be bent on subjugating the Church of Milan to Rome. Arialus now fled to the country, but, his hiding place being

betrayed, he was conveyed captive to a desert isle in Lake Maggiore, where he was murdered by the emissaries of the Archbishop, and his remains thrown into the lake, June 28, 1065. He was afterward canonized by Pope Alexander II.

ARIANE, a'rè-an'. One of Corneille's less excellent tragedies, composed in his period of decline, in 1672, and founded on Ariane's (Ariadne's) adventures after her unhappy marriage with Theseus.

A'RIANISM. See ARIUS.

ARIANO, a'rè-ā'nò (anciently, Lat. *Arianum*). An episcopal city in the province of Avellino, south Italy, built on a rocky height of the Apennines, 17 miles east of Benevento (Map: Italy, K 6). In the limestone of the surrounding mountains caves have been hollowed out, in which many of the poorer people dwell. The region is fertile, and the chief manufacture is earthenware. Pop., 1881, 14,398; 1901, 17,650; 1911, 17,625.

A'RIANS. See ARIUS; HERESY; HERETICS.

ARIAS, a'ri-as, BENEDICTUS, surnamed MONTANUS (1527-98). A Roman Catholic divine noted for his great linguistic attainments. He was born at Fregenal de la Sierra, Spain. He studied first at Seville and afterward at Alcalá de Henares, where he distinguished himself by the ardor he manifested in the acquisition of the Semitic Oriental languages. He next proceeded on a tour through Italy, France, Germany, England, and the Netherlands, in the course of which he obtained a knowledge of various modern tongues. He joined the knightly Order of St. James as a priest, and as theologian of Bishop Martin Perez Azala, of Segovia, attended the Council of Trent; but on his return home he resolved to retire into seclusion at Aracena and dedicate his whole time to literature. In 1568, however, Philip II persuaded him to repair to Antwerp and superintend the publication of the famous edition of the Polyglot Bible, executed in that city at the suggestion of the printer, Christopher Plantin. After four years' labor the work was issued under the title *Biblia Sacra, Hebraice, Chaldaice, Græce et Latine, Philippi II Regis Catholici Pietate et Studio ad Sacrisancta Ecclesiæ Usum*. Chph. Plantinus excudebat (8 vols., folio, Antwerp, 1569-73). Only 500 sets were printed, and the greater part of them were lost at sea, on their way to Spain. It was received with universal applause. The Jesuits, to whom Arias was sincerely and strenuously opposed, alone attempted to fasten the charge of heresy on the author because he had included so much rabbinical matter, and he made several journeys to Rome to clear himself of the accusation. Philip II rewarded him with a pension of 2000 ducats, besides bestowing on him various other emoluments—as court chaplain and librarian at the Escorial. He died at Seville in 1598. His literary works are very numerous. They relate principally to the Bible and to Jewish antiquities; but he also wrote numerous Latin poems and a history of nature. For his biography and portrait, consult *Memorias de la real Academia de la Historia*, vol. vii (Madrid, 1832), and Gorris, *Vie d'Arias Montano*, (Brussels, 1842).

ARICA, a-rè-kà. A seaport town of north Chile, situated in the province of Tacna, about 40 miles by rail from Tacna, the capital of the province, and near the mouth of the Lluta (Map: Peru, C 7). It has a safe roadstead and is 2100 miles from Panama. This port is connected by

road and rail with the interior and is an outlet for Bolivian trade. It exports gold, copper, silver, tin, alpaca, wool, sulphur, saltpetre, and guano. The population, estimated at the time of the Spanish régime at 30,000, was, at the census of 1903, only 2877. An enumeration in 1909 returned 4300. Arica was discovered in 1579 by Sir Francis Drake. It has suffered considerably from earthquakes, that of 1868 being most destructive. During the war between Chile and Peru the town was bombarded by the Chilean forces and was transferred to Chile in 1883 along with the province of Tacna (q.v.). Consult Paz Soldan, *Historia de la guerra entre Perú y Chile*.

ARICHAT, á'rè-shát'. A seaport on Madame Island, Nova Scotia, the capital of Richmond County, on the Cape Breton Railroad. The town is the see of a Roman Catholic episcopate and, with West Arichat, numbers about 2500 inhabitants, engaged in fishing and canning and in commerce in agricultural products. The harbor accommodates the largest vessels. The United States is represented by a consular agent.

ARICI, á-rè'chè, CÉSARE (1782-1836). An Italian poet born at Brescia. He studied at Milan and was secretary of the departmental court at Brescia under Bonaparte. He was appointed professor of eloquence in the lyceum at Brescia in 1810, subsequently professor of history and literature and in 1824 professor of the Latin language. His principal work is the didactic poem *La coltivazione degli olivi* (1808), which won for him an important place in Italian literature. He also wrote another didactic poem, *La pastorizia* (1814), and some shorter poems, such as *Il campo santo di Brescia*, and made a translation of the *Bucolics* and *Æneid* of Vergil.

ARICIA. One of the oldest towns of Latium in Italy on the Appia Via (q.v.), at the foot of the Alban Mount, 16 miles from Rome, known now as Ariccia. As early as the time of the kings the city was of importance. In 338 B.C. it was conquered by C. Mænius and became a *civitas sine suffragio*; later, it became a *municipium* (q.v.). Near the town was a steep hill, often mentioned in Latin writers as the gathering place of beggars, who bothered the occupants of the carriages as they crawled up the hill. Near the town lay Lake Nemi.

ARICINI. The people of Aricia.

ARID RE'GIONS. See DESERTS.

ARIEGE, á-ré-azh'. A border department of France lying along the northern slopes of the Pyrenees (Map: France, S, F 5). In the south several peaks rise to a height of nearly two miles, and their summits are perpetually snow-clad, but the northern part of the department is a low fertile plain. The chief industries are grazing, agriculture, iron, copper, and lead mining, and the manufacture of woollens, linens, and pottery. Capital, Foix. Area, 1893 square miles. Pop., 1896, 219,641; 1911, 198,725. Consult H. L. Ducloux, *Histoire des Ariégeois* (7 vols., Paris, 1881-87).

ARIEGE (anciently, Lat. *Aurigera*, gold-bearing). A tributary of the Garonne (q.v.) which rises in the Pyrenees, in southern France, and flows northward to join the Garonne above Toulouse. It is 95 miles long and of little commercial importance.

ARIEL. 1. An Arabian antelope. (See GAZELLE.) 2. A toucan. See TOUCAN.

ARIEL. 1. The name given in the Revised

Version of the Bible to the father of two Moabitish youths slain by Benaiah, one of David's "mighty men" (2 Sam. xxiii. 20). 2. One of a delegation sent by Ezra (Ezra viii. 16). 3. Jerusalem (Isa. xxix. 1, 2, 7). 4. In later Jewish angelology, the name of a water spirit. 5. A guardian of the waters in mediæval black art, several times introduced into English poetry. The character first appears in Shakespeare's *Tempest*, where he is described as an "ayrie sprite," Prospero's servant. In Milton's *Paradise Lost* he assumes the more grandiose proportions of a fallen angel. In Pope's *Rape of the Lock* he is a minute and invisible guardian of Belinda's head-dress.

ARIES, á'rî-èz. See BATTERING RAM.

ARIES (Lat. the Ram). One of the signs of the zodiac, including the first 30° of the ecliptic measured from the vernal equinox, or that point where the vernal passage of the sun across the equator takes place; its conventional symbol is ♈, representing the head of a ram. The vernal equinox, or, as it is also called, the first point of Aries, is constantly changing its position among the fixed stars, in consequence of the precession of the equinoxes, moving westward at the rate of 50".2 annually. It is from this circumstance that the sign Aries no longer corresponds with the constellation Aries, or the Ram, which was the case about 2000 years ago, when the ecliptic was divided into 12 equal parts called signs, each named after the group of stars through which it passed. The present sign Aries is in the constellation Pisces, about 30° west of the original sign; and although the sun when passing the vernal equinox will always be at the first point of the sign Aries, yet nearly 24,000 years will elapse before that point will again coincide with the beginning of the constellation Aries. See ECLIPTIC; PRECESSION; ZODIAC.

ARIET'TA. See ARIA.

ARIKARA, á-rè'ká-rá. A tribe of Caddoan stock now confederated with the Mandans and Hidatsa on the Fort Berthold Reservation in North Dakota and numbering about 400. They are a northern offshoot from the Pawnee (q.v.), of whose language their own is practically a dialect. About the year 1780 they occupied several villages some 500 miles lower down the Missouri River, but were driven out by the Sioux, since which time they have rapidly declined. Their tribal name, often abbreviated to Ree, seems to be from the same root as *Pawnee*. Consult Dorsey, *Traditions of the Arikara* (Washington, 1904).

ARIL (LL. nom. pl. *arilli*, dry grapes; from Lat. *aridus*, dry). An extra investment of the seed, outside the ordinary testa. It may be a more or less complete investment and is often fleshy. For example, the aril of the yew (*Taxus*) is a beautiful, scarlet, fleshy cup, which gives the seed the appearance of a berry. See SEED.

ARIMATHÆA (Gk. Ἀριμαθία, *Arimathia*). The home of Joseph, the Jewish counselor who favored Jesus (Matt. xxvii. 57; Mark xv. 43; Luke xxiii. 51; John xix. 38). Its situation is not certainly known, but was probably the same as that of Ramathaim-zophim, or Ramah, the home of the prophet Samuel in the hill country of Ephraim (1 Sam. i. 1, with 19), the modern *er Râm*, about 19 miles northwest of Jerusalem.

ARI'MINUM. See RIMINI.

ARINO'RI MORI. See MORI, ARINORI.

AR'IOBARZA'NES (Gk. 'Αριοβαρζάνης). The name of satraps or kings of ancient Pontus. 1. Father of Mithradates I, who betrayed him to the Persian King about 400 B.C. 2. Son of Mithradates I, who reigned 363-337 B.C. In 362 he rebelled against Artaxerxes and became the founder of the kingdom of Pontus. 3. Son of Mithradates III, King of Pontus 266-240 B.C. He helped to call the Gauls into Asia. See GALATIA.

The name "Ariobarzanes" was borne also by rulers or kings of Cappadocia. 1. King from 93 to 63 B.C., though he was thrice expelled during that period by Mithradates the Great. He was finally restored by Pompey in 63. He was known as *Philoromæus*. 2. Son of the preceding, who abdicated in his favor shortly after his final restoration by Pompey. 3. Son and successor of the preceding, from 51 B.C. He assisted Pompey against Caesar, but Caesar pardoned him and enlarged his domain. He was put to death by Cassius in 41 B.C. He too was known as *Philoromæus* and as *Eusebes*.

ARIOCH, ā'ri-ōk. King of Ellasar, according to Gen. xiv. He may be identical with Rim Sin, King of Larsa, a son of Kudur Mabuk, King of Elam at the time of Hammurabi (c.2124-2081 B.C.). As in the case of Chedor Laomer (q.v.), the name is compounded with that of an Elamitish divinity. According to an inscription (British Museum, 11,680) (ilu) Aku is identical with (Ilu) Sin, the moon-god. *Rim* may have been pronounced *riu*, and an *a* is often prefixed. Rim Sin was a younger brother of Arad Sin. The latter reigned as vassal king in Larsa under his father, Kudur Mabuk. It has been conjectured that Kudur Mabuk was succeeded by a king named Kudur Lagamar. But this king has not yet been found in any inscription. In Dan. ii. 14 Nebuchadnezzar's captain of the guard is named Arioch, which shows that in 165 B.C. the story in Gen. xiv. was already known. Arioch is an Elamitish king in league with Nebuchadnezzar in the story of Judith (i. 6). See Dhorme in *Revue Biblique*, 205 ff. (1908).

AR'ION (Gk. 'Αρίων, *Arion*). A celebrated lute player of Methymna, in Lesbos, who lived at the time of Periander, tyrant of Corinth. According to Herodotus (i, 23 ff.; see also Aulus Gellius, *Noctes Atticæ* xvi, 9), Arion, while dwelling at the court of Periander, paid a visit to Sicily and lower Italy. When on his way back by sea, the sailors of the vessel on which he had taken passage plotted to slay him and seize his possessions. Arion begged permission to try once more his skill in music and, having been allowed to do so, threw himself at the close of his strain into the sea. Several dolphins, charmed with the music, had assembled around the vessel, and on the back of one of these he was carried in safety to Greece. The sailors, on their return, were confronted with Arion and paid the penalty of their intended crime. Another account makes the rescue take place while Arion was on his way from Corinth to Methymna. In the days of Herodotus and Pausanias there existed at Tænarum, where Arion was said to have landed, a bronze monument, representing Arion riding on a dolphin, which was supposed to be a thank offering made by Arion to Poseidon. The lute and the dolphin were put among the constellations. Arion was regarded as the inventor of the dithyramb (q.v.). He may have given it its artistic form, but even so much is doubtful.

ARION (Gk. 'Αρίων, *Arion*). A marvelous horse, the offspring of Poseidon by either Demeter, Gaia, or a harpy, the mother having futilely changed herself into a mare to escape the sea god's addresses. Driven, at different times, by Copreus, Oncus, Hercules, and Adrastus, it yet possessed astounding evidences of its divine origin. It had full power of speech, and its right feet were those of a man.

ARIO'SO. See **ARIA**.

ARIOSTO, ā-r-yōs'tō, LODOVICO (1474-1533). One of the most celebrated of Italian poets, the author of the *Orlando Furioso*, and, with Boiardo and Tasso, one of the trio who showed Italy how the material of the old chivalric romances might be remodeled and endowed with classic form and epic dignity. He was born Sept. 8, 1474, at Reggio, where his father was then military governor. Like Petrarch and Boccaccio before him, he was destined by his father for the law, but abandoned it after five years of half-hearted study. His father's early death (1500) transferred to Ariosto's shoulders the burden of a large family, with but a scanty inheritance; and in 1503 he was glad of the chance offered him to enter the service of Ippolito, the Cardinal d'Este, brother of the Duke of Ferrara. By this time he had already acquired a reputation for his verses, in both Latin and Italian; but his new position was far from favorable to poetic inspiration. The Cardinal, a rough, coarse-natured man, quite destitute of poetic feeling, kept Ariosto actively employed upon diplomatic errands to Rome or upon distant embassies, and on one occasion at least, sent him into active service against the Venetians. It was, however, during the 10 years that Ariosto spent in his service that the *Orlando Furioso* was written, and it was finished in the latter part of 1515 and published at Ferrara, 1516, in 40 cantos. Ostensibly it was a continuation of Boiardo's *Orlando Innamorato*; practically, it was a glorification of the House of Este, having for its real hero Ruggiero, the mythical founder of that house. In payment for this rather obvious flattery, the Cardinal is said to have rewarded him with a golden chain and the query, "Where had he got that rubbish?" and the following year, having incurred his patron's displeasure by a refusal to accompany him to Hungary, Ariosto passed into the service of his brother, the Duke of Ferrara. The Duke, scarcely more munificent than the Cardinal, bestowed upon him the governorship of the wild mountain district of Garfagnana (1522), overrun with bandits, which, with all his endeavors, he could not succeed in reducing to order. He was finally recalled by the Duke in 1525 and spent his remaining years in Ferrara, nominally in his patron's service, but in reality enjoying what he prized most highly—abundant leisure for prosecuting his studies, in the modest home which the Latin inscription over the door proudly states was bought from his own savings. This house is still carefully preserved by the authorities of Ferrara. He died in that city, June 6, 1533, and was buried there in the church of San Benedetto.

The manner in which the *Orlando Furioso* is engrafted upon Boiardo's earlier poem has been aptly compared to the connection between the *Iliad* of Homer and the *Aeneid* of Vergil. Boiardo's poem was based upon the chivalric cycle which dealt with the wars between Charlemagne and the Saracens, confounded with those of

Charles Martel, in which Orlando, or Roland, stood forward as champion of Christendom. Orlando is Boiardo's hero, and falls in love with Angelica, a clever and beautiful Oriental princess sent by the Paynim to sow discord among the Christian knights. The story, left unfinished by Boiardo, is taken up by Ariosto, who makes Angelica fall in love with an obscure young squire, whereupon Orlando becomes insane. It is difficult, however, to disentangle the central argument of this poem from the mass of irrelevant episodes in which it is involved. The *Orlando Furioso* has long been numbered among the world's greatest epics, but it is utterly lacking in epic unity, and probably its nearest parallel is that pointed out by Richard Garnett—Ovid's *Metamorphoses*. In so far as it has a central theme at all, it is not the adventures of the knight who has given it his name, but Ruggiero's conversion from paganism, his union with Bradamant, and the incidental exaltation of the House of Este. Ariosto also left comedies, satires, sonnets, and a number of Latin poems. There are also extensive fragments of another epic, *Rinaldo Ardito*, which are attributed to him; but it is a question whether they are not rather the work of his son Virginio.

The first edition of the *Orlando Furioso*, in its present dimensions of 46 cantos, was published at Ferrara in 1532. Recent editions are those edited by Casella (Florence, 1877), and Papini (Florence, 1903), and an *édition de luxe*, with introduction by Carducci and illustrations by Doré (Milan, 1880). The latest edition of his lesser works, *Opere minori in verso e in prosa*, is that of Polidori (2 vols., Florence, 1894). The latest and most complete biographies are by A. Cappelli, in his collection of Ariosto's *Letters* (Milan, 1887); Giosuè Carducci, *Studi su Ludovico Ariosto e Torquato Tasso* (Bologna, 1905); and Gardner, *The King of Court Poets: Ludovico Ariosto* (New York, 1906). Of translations the following into English may be mentioned: by Sir John Harrington (London, 1591); John Hoole (London, 1783); and the much more spirited version of W. Stewart Rose (London, 1823). Consult De Sanctis, *Storia della Letteratura Italiana*, ed. by Benedetto Croce, vol. ii (Bari, 1912).

ARIOSTO OF THE NORTH. A title given to Sir Walter Scott, suggested by the legendary subject-matter and the romantic manner of treatment which the English and the Italian poet are alike in employing.

A'RIOVIS'TUS (OHG. *heri, hari*, Ger. *Heer*, army, and *furst*, Ger. *Furst*, chief). A German chief. He was the leader of the Suevi and other German tribes, and was requested by the Sequani, a Gallic people, to assist them in a contest against the Ædui. Having gained a victory for the Sequani, Ariovistus was so well pleased with their country (now Burgundy) that he determined to abide there with his followers. Many other Germans followed him into Gaul, where he soon collected an army of 120,000 men. The Gallic people now turned for help to the Romans, and Cæsar demanded an interview with Ariovistus, who proudly replied that "he did not see what Cæsar had to do with Gaul." After another message from Cæsar had been treated in the same scornful manner, the Roman forces under Cæsar advanced and occupied Vesontio (now Besançon), the chief city of the Sequani. A furious engagement took place 58 B.C., in which Roman discipline pre-

vailed over the German forces, which were utterly routed. Ariovistus, with only a few followers, escaped over the Rhine into his own country. His subsequent history is unknown. Consult Cæsar, *De Bello Gallico*, book i; T. Rice Holmes, *Cæsar's Conquest of Gaul* (2d ed., Oxford, 1911).

ARIPA, ñ-ré'pa. A division of the Kalinga tribe which formerly lived near Tubang, Cagayan Province, Luzon. They have now lost their identity. See PHILIPPINES.

ARISTA. See GRAMINEÆ.

ARISTA, á-rës'tà, MARIANO (1802-55). A Mexican general. He was in command of the Mexican Army of the North in 1846 and was badly defeated by General Taylor at Palo Alto (May 8) and Resaca de la Palma (May 9). He was Minister of War in 1848 and was elected President of Mexico in 1851, but resigned in 1853 to avert an impending revolution and was banished soon afterward. He died in Europe.

AR'ISTÆNETUS (Gk. Ἀριστάνετος, *Aristainetos*) (?-c.484 A.D.). A Greek epistolary writer. He is thought to be the author of two books of love stories in the form of letters (Ἐπιστολαὶ Ἐρωτικαὶ, *epistolai erōtikai*), imitations of Alcephron, and taken almost entirely from Plato, Lucian, Philostratus, and Plutarch. They have been edited by Boissonade (1822), and the text and a Latin version are contained in the Didot collection of the *Epistolographi Graeci* (1873). Among English translations is that of Thomas Brown (1715). Aristænetus should not be confused with Aristænetus of Nicæa.

AR'ISTÆUS (Gk. Ἀρίσταιος, *Aristaios*). An ancient divinity whose worship in the earliest times seems to have been widely diffused throughout Greece, but who is known only in scattered and fragmentary traditions. According to the common tradition, he was the son of Apollo and Cyrene, the latter the granddaughter of Peneus, a river god of Thessaly. She is said to have given birth to Aristæus on the coast of Libya, in Africa, whence the region is alleged to have derived its name of Cyrenaica. Hermes placed the child in the care of the Horæ and Gæa (earth). Another version placed his birth in Thessaly and made him a pupil of Chiron the centaur. He appears at Thebes in Boeotia as son-in-law of Cadmus and father of Actæon (q.v.). Still another story brings him from Arcadia to the island of Ceos, where he was honored as having freed the island from the heat of the dog star by erecting an altar to Zeus Icmæus, the rain-maker, who rewarded this piety by sending the Etesian winds. Aristæus also appears in Corcyra, Eubœa, Sicily, and even Thrace, where he is one of a band of Dionysus. These stories are obviously not fragments of a connected narrative, but rather a number of local traditions connected with a divinity known as "the Good," whose very transparent name prevented his attaining the rank of a great god, though many of his activities are those attributed to Zeus and Apollo. He is connected with the life and interests of hunters and herdsmen, taught bee keeping, the care of the olive tree, and the spinning of wool, and introduced to Cyrene its valuable plant, silphium (*asafœtida*). In the fourth book of the *Georgics* Vergil describes how, when Aristæus lost all his bees, at the bidding of his mother he consulted Proteus (q.v.), to learn how he might replenish his stock. Proteus told him that Orpheus was angry with him, because

Eurydice had been slain by a snake while she was fleeing from Aristæus; he must therefore appease the nymphs by a sacrifice of cattle. He did so, and from the carcasses came forth bees. The telling of the Aristæus tale involves the recital by Vergil of the story of Orpheus and Eurydice. Ancient authorities say that, originally, his part of the *Georgics* contained the praises of Cornelius Gallus; but that when the latter lost the favor of Augustus, Vergil substituted the Aristæus story.

ARISTAGORAS (Gk. Ἀρισταγόρας) (?-497 B.C.). A tyrant of Miletus and brother-in-law of Histæus. During the stay of Histæus at the Persian court Aristagoras was made governor of Miletus, and in 500 B.C. made an unsuccessful attack on Naxos, which he had promised to subdue for the Persians. Fearful of the consequences of his failure, he induced the Ionian cities to revolt from Persia, and, after vainly applying to Sparta for aid, obtained troops and 20 ships from the Athenians. The allies captured and burned Sardis (499 B.C.), but were finally driven to the coast by the Persians, and Aristagoras, in despair, fled to Thrace, where he was slain by the Edonians. Consult G. B. Grundy, *Great Persian War* (London, 1901).

ARISTARCHUS (Gk. Ἀριστάρχος, *Aristarchos*) OF SAMOS. A celebrated ancient astronomer of the Alexandrian school, who made his observations about 280-264 B.C. All his writings have perished, excepting a short essay on the sizes and distances of the sun and the moon. In this he shows the method of estimating the relative distances of the sun and moon from the earth, from the angle formed by the two bodies at the observer's eye when the

moon's phase reaches exactly the first or third quarter, i.e., when we see a half moon. Remembering that the moon's light is simply reflected solar light, it is easy to see from the annexed figure that the three bodies must then form a right-angled triangle, with the moon at the right angle. The angle *MES* being then observed, we can readily calculate the ratio *EM* to *ES*. This is quite correct in theory; but the impossibility of determining when the moon is exactly half illuminated renders the method inaccurate in practice. Besides, in the

days of Aristarchus there were no instruments for measuring angles with anything like accuracy. Aristarchus estimated the angle at *E* at 83° and determined *EM* to be one-twentieth of *ES*, the truth being that the angle at *E* differs only by a fraction of a minute from a right angle, and that *EM*, the distance of the moon from the earth, is about 1/400 of *ES*, the distance of the sun. According to some accounts, Aristarchus held, with the Pythagorean school, that the earth moves around the sun. Vitruvius speaks of Aristarchus as the inventor of a kind of concave sundial. His essay was first published in Latin by Valla (Venice, 1498), then in Greek and Latin by Wallis (Oxford, 1688), and it has since been republished. Consult Heath, *Aristarchus of Samos, the ancient Copernicus* (Oxford, 1913).

ARISTARCHUS OF SAMOTHRACE (c.220-145 B.C.). A Greek scholar. He was the pupil of Aristophanes of Byzantium, became tutor to

the son of Ptolemy Philometor, and succeeded his master as head of the Alexandrian Library. He died in Cyprus. Aristarchus represents the highest attainments of philological criticism in antiquity, and his influence dominated all later workers. He put the study of grammar on a sound basis; he was one of the first to recognize definitely eight parts of speech. In grammar he was an analogist. (See *ANOMALISTS AND ANALOGISTS*.) He gave his attention chiefly to exegesis of the poets, particularly of the Homeric poems; his recension is the basis of our common text of Homer to-day. He wrote an enormous number of exegetical works—according to Suidas over 800—and many special treatises besides. Fragments of his comments are preserved, e.g., in the Venetian scholia to the *Iliad*. He founded a school of *Aristarcheans* at Alexandria, which continued to work on classical texts until after the beginning of the Empire. For an account of Aristarchus's Homeric studies, consult Lehrs, *De Aristarchi Studii Homericis* (Königsberg, 1882). Consult also Sandys, *A History of Classical Scholarship*, i, 131-136 (Cambridge, 1906); Susemihl, *Geschichte der griechischen Literatur in der Alexandrinerzeit* (Leipzig, 1891-92).

ARISTE, *à'rest'*. A male character in Molière's *Les femmes savantes*, the common-sense brother of Chrysale. He befriends the lovers and, through his pardonable falsehood concerning Chrysale's financial loss, exposes the knavery of Trissotin.

ARISTEAS (Gk. Ἀριστεάς). An officer at the court of Ptolemy Philadelphus. He is said to have been sent by the latter to Jerusalem in 273 B.C., where he obtained from the high priest Eleazar a genuine copy of the Pentateuch and a body of 72 elders who translated it into Greek in 72 days. All this is narrated in a letter by an Aristeas to his brother Philadelphus, but the writer probably belongs to a later time (200 B.C.). Consult: Hody, *De Bibliorum Textu Originali* (Oxford, 1705); Dale, *Dissertatio super Aristeia* (Amsterdam, 1705); Schürer, *Geschichte des jüdischen Volkes*, ii, 819-824 (1886). See *BIBLE*, IV (A).

ARISTEAS (Gk. Ἀριστεάς). A magician of antiquity who rose after his death, and whose soul left and reentered his body according to its pleasure. (Consult especially Herodotus, iv, 13-15.) His earliest appearance is as the teacher of Homer. We also hear of him as having been born, at a period later than Homer, at Proconnesus, an island in the Propontis. He is said to have traveled through the countries north and east of the Euxine and to have visited the Arimaspi, the Cimmerii, the Hyperborei, and other mythical nations, and after his return and subsequent disappearance to have written an epic poem in three books, called *Arimaspiæ*, a composition belonging probably to the sixth century B.C. Aristeas is fabled to have entered a fuller's shop at Proconnesus and to have died there. Later a traveler appeared who said that he had met him on the road between Cyzicus and Artace. When the fuller's shop was entered, no body was found. It was seven years after this strange disappearance that he reappeared at Proconnesus and wrote the *Arimaspiæ*. He then vanished once more, to reappear for the second time 240 years later at Metapontum, in Italy. He advised the people of Metapontum to build an altar to Apollo, and by its side a statue of himself, saying that he

had been present, in the form of a raven, when the god founded the city. Herodotus declares that in his day there was in the Forum of Metapontum a statue of Aristeas beside an altar of Apollo. Later accounts tell other wonderful stories of Aristeas. Consult E. Rohde, *Der griechische Roman* (Leipzig, 1900).

ARISTIDES, ār'is-tī'dēz (Gk. Ἀριστείδης, *Aristeidēs*), called THE JUST (c.550-467 B.C.). An Athenian statesman. He was the son of Lysimachus and was descended from one of the best families in Athens. At the battle of Marathon (490 B.C.) he was one of the 10 Athenian generals who held command successively, each for a single day. In the following year he was chief archon. His policy in state politics was opposed to that of the other great statesman of his time, Themistocles, and the rivalry between these two became so pronounced that the Athenians, in order to obtain quiet, finally resorted to ostracism (q.v.). Aristides was banished, and retired to Ægina, Athens's bitter enemy, apparently in 484. The story is told that on the day of voting an ignorant citizen, personally unknown to the statesman, requested Aristides himself to write the name "Aristides" on the ostrakon. When Aristides asked him why he was voting so, he answered: "Because I am tired of hearing him always called *The Just*." Four years later, when Xerxes invaded Greece, a general amnesty for all exiles was declared by Athens, and in consequence Aristides joined the Athenian fleet at Salamis and took a prominent part in the battle that followed. Being thus restored to favor, he was appointed commander of the Athenian troops that fought at Plataea in 479. In 477 he was joint commander with Cimon of the Athenian contingent in the combined Greek fleet which was engaged in driving the Persians from the Greek cities on the coast of the Ægean Sea. After the fall of Pausanias, he took the chief part in organizing the Delian League (see DELOS). It is said that after the battle of Plataea he carried through a law opening the archonship to the whole body of Athenian citizens. He died poor, in 467, leaving a son and two daughters. His body was carried from Pontus to Athens and buried at Phalerum, at the cost of the state. His life, by Plutarch, was well translated by B. Perrin, *Plutarch's Themistocles and Aristides* (New York, 1901).

ARISTIDES, ÆLIUS (129-189). A Greek rhetorician, surnamed Theodorus, son of Eudemon, a priest of Zeus, born at Hadrianoi in Mysia. He enjoyed the teaching of the most famous rhetoricians of his day, Aristocles in Pergamus and Herodes Atticus in Athens; in grammar and literature he was trained by Alexander of Cotyæum, whom he honored with a eulogy still extant. He traveled extensively in Egypt, Asia, Greece, and Italy, exhibiting his art as a speaker. While in Rome in 156 he was attacked by a severe illness, which troubled him 17 years with slight interruptions; yet he seems to have continued his vocation in spite of it. He stood in such favor with the Emperor Marcus Aurelius that he secured the rebuilding of Smyrna at the imperial expense after its destruction by an earthquake in 178. Ascribed to him we have two rhetorical treatises and 55 speeches, but it is not entirely certain that the treatises are from his hand. Of these some are eulogies on deities and cities (e.g., Rome and Smyrna), others declamations like his *Panathenaicus*,

modeled on Isocrates's oration with the same title. Interesting also are the six *Sacred Speeches* (Ἱεροὶ Λόγοι) which report the suggestions made by Æsculapius through his priests for the rhetorician's recovery. All these writings were edited by Dindorf (3 vols., Leipzig, 1829). In style he was a strict Atticist, imitating successfully the best Attic writers. Consult Sandys, *A History of Classical Scholarship*, vol. i (Cambridge, 1906).

ARISTIDES OF THEBES. A Greek painter of the time of Apelles, about the middle of the fourth century B.C. He was a son and pupil of Nicomachus. He was noted for power of expression in his work, one of his finest pictures being that of a babe approaching the breast of its mother, who had been mortally wounded at the capture of a city, and whose face showed her fear lest the child should find blood instead of milk. His works were bought at enormous prices, and one of them was the first foreign painting ever exhibited to the public in Rome. He left two sons, Nicærus and Ariston, to whom he taught his art. See GREEK ART.

ARISTIDES, SAINT. A Greek Christian apologist, of the second century, who also taught rhetoric and philosophy. He dedicated to Antoninus Pius (138-61) an Apology for the Christian faith, which was highly esteemed by the early Church. This work was long lost, with the exception of a fragment discovered and published at Venice in 1878. Dr. J. R. Harris, however, found the complete Apology in 1889 in a Syriac version on Mount Sinai. It was inscribed to the Emperor Titus Hadrianus Antoninus Augustus Pius. For both Syriac text and translation, consult J. R. Harris, "The Apology of Aristides," in his *Text and Studies* (1891); R. Seeberg, "Die Apologie des Aristides untersucht und wiederhergestellt," in Zahn's *Forschungen zur Geschichte des neutestamentlichen Kanons*, v. 161-437 (1893).

ARISTIDES QUINTILIANUS (Gk. Ἀριστείδης Κωνσταντῖνος, *Aristeidēs Kōntilhanos*). A Greek grammarian of about the third century A.D., and author of a treatise on music which is one of the most valuable of all ancient discussions of that subject. In the first part it treats of the principles of harmonics and rhythm, as laid down by Aristoxenus (q.v.), but later introduces the Neo-Platonic ideas of the moral effects of music and the connection between musical intervals and the harmony of the universe. It was originally edited by Meibomius (Amsterdam, 1652), and in 1882 by Jahn. Consult Cäsar, *Die Grundzüge der griechischen Rhythmik im Anschluss an Aristides* (Marburg, 1861), and T. D. Goodell, *Chapters on Greek Metric* (New York, 1902).

ARISTIPPUS (Gk. Ἀριστίππος, *Aristippos*). The founder of the Cyrenaic or Hedonistic school of philosophy. He was the son of Aristades of Cyrene, in Africa, and was born probably not long before 435 B.C. He was drawn to Athens by the fame of Socrates, whose pupil he remained until his master's condemnation and death, without, however, adopting fully his philosophy. After Socrates's death he lived in various cities, avoiding all hindering connections by becoming a citizen of no state, but having guest friends in many. We know that he sojourned some time in Ægina, in Corinth, where he was intimate with the famous courtesan Laïs, and especially at the Syracusan court. He must have spent considerable time also in his native Cyrene,

where he possessed property, for his philosophic school was there established. His master, Socrates, had taught that virtue and felicity together formed the highest aim of man; the latter Aristippus emphasized as a principle in itself, and declared that pleasure (*ἡδονή, hēdonē*) was the supreme good. To know how to select one's pleasures and to subordinate them to reason is to master the art of life. According to him, our sensations alone are the real bases of knowledge, and all that gives pleasant sensations must be good; virtue and all so-called moral obligations and limitations have no validity so far as they limit pleasure. In holding that our sensations are the only real bases of knowledge he agreed with Protagoras, who, perhaps, was one of his teachers. Yet Aristippus shows the influence of Socratic doctrine when he teaches that the wise man will wish to preserve the enjoyment he may secure by practicing self-control, judgment, and moderation, and for the same end will resist the mastery of the passions. Further, the greatest pleasure is to be found in the cultivation of the mind. For this teaching he has been not inaptly named a pseudo-Socratic.

Many anecdotes about Aristippus have come down from antiquity. They show him to have been a skillful man of the world, capable of adapting himself to the changes of fortune. Plato is reported to have said that Aristippus was the only man he knew who could wear with equal grace both fine clothes and rags. Diogenes Laertius has preserved to us many of his *bonmots* and repartees. He apparently did not formulate a philosophy himself; the Cyrenaic system was probably worked out by Arete, his daughter, and by her son, Aristippus the younger. (See HEDONISM.) Aristippus's works have been lost; the five letters to which his name is attached are unquestionably spurious. Consult Zeller, *Geschichte der griechischen Philosophie* (Leipzig, 1893), and Ueberweg, *History of Philosophy*, Eng. trans. (New York, 1877).

ARISTIPPUS THE YOUNGER. A Greek philosopher, son of Arete, daughter of Aristippus. He was inducted by Arete into his grandfather's philosophy, and hence was known as *Μητροδιδάκτος*, 'Mother-Taught.'

ARISTO, a-rēs'tō. Sganarelle's brother in Molière's *École des maris*.

ARISTOBULUS (Gk. Ἀριστόβουλος, *Aristoboulos*). An Alexandrian Jew who lived under Ptolemy VII, Philometor (181–145 B.C.). He was the author of a work on the Pentateuch, of which only fragments are preserved in Clement of Alexandria and in Eusebius. It was intended to show that Greek philosophers and poets had borrowed their views from the Pentateuch; and to support this theory numerous quotations were taken from works ascribed to Linus, Hesiod, Homer, and Orpheus, of which also Christian apologists made abundant use. Many scholars have questioned the genuineness of the work of Aristobulus. Among them are such men as Richard Simon, Humphrey Hody, Eichhorn, Grätz, Renan, Kuenen, Elter, Wendland, and Bousset. Their arguments have been based on the assumed familiarity with the Letter of Aristeas, the peculiar form of the quotations from Orpheus and others, and the supposed claim of Aristobulus to be the teacher of Ptolemy. The genuineness has been defended by Valckenauer, Gfrörer, Freudenthal, Clemen, Friedländer,

Schlatter, and Schürer. It has been pointed out that Demetrius of Phalerum may have made suggestions to Ptolemy II during his coregency with his father, before the plot to place Eurydice's son on the throne led to the removal of Demetrius; that Aristobulus may have adopted in good faith the Orphic poems from some older work of a Jewish writer; that his address to Philometor resembles that of many a Christian apologist and does not imply a claim to be the King's teacher; and that there is no motive for a forgery, the author never concealing his Jewish character. The question is discussed at length and a full bibliography is given by Schürer, *Geschichte des jüdischen Volkes*, iii, pp. 512 ff. (4th ed., 1909).

ARISTOBULUS OF CASSANDRIA. A Greek historian, born in a city of Chalcidice, but afterward—later than 316 B.C.—a citizen of Cassandria. When 84, after 285 B.C., he wrote an historical work of unknown title on Alexander the Great, whom he accompanied on his Asiatic campaigns. This work was freely used by later authors, especially Arrian, Strabo, and Plutarch.

ARISTOBULUS I. A prince of Judæa, who succeeded his father, John Hyrcanus, as high priest in 104 B.C. His mother (or step-mother) had been given the royal office by the will of Hyrcanus, but the son deposed her and put her in prison, where she died of hunger, while he took the title of king, according to Josephus, in addition to the title of high priest which appears on his coins. Aristobulus had a decided leaning toward Hellenism, though, despite this fact, he remained Jewish in his feelings. He was disliked by the people for imprisoning his mother, and all his brothers, except Antigonus, whom he also, at a later period, is said to have murdered at the instigation of Queen Salome. Josephus declares that he conquered a large part of the Iturean country and compelled the inhabitants to accept Judaism. This would seem to imply that he also held possession of Galilee. He died in 103 B.C. of a malignant disease. Consult Wellhausen, *Israelitische und jüdische Geschichte*, pp. 274 f. (6th ed., 1907), and Schürer, *Geschichte des jüdischen Volkes*, pp. 256 ff. (3d ed., 1901). See MACCABEES.

ARISTOBULUS II (?–49 B.C.). A Jewish ruler and ecclesiastic, son of Alexander Jannæus (brother of Aristobulus I) and Salome Alexandra (widow of Aristobulus I), who succeeded in grasping the high-priestship and the royal authority from his elder brother, Hyrcanus II, to whom both belonged. Aristobulus maintained himself from 69 to 63 B.C., when Hyrcanus appealed to Pompey. After many intrigues and changes of front, Pompey finally took sides against Aristobulus, and, after reducing the extent of the Jewish possessions, placed Hyrcanus in charge as high priest, without the title of king. Aristobulus was taken as a prisoner of war to Rome. In 56 he escaped to Judæa and fought the Romans again. He was, however, defeated and again taken to Rome. He was released by Cæsar in 49, and sent by him with troops to Judæa, to agitate against Pompey, but in the same year he was poisoned by adherents of Pompey.

ARISTOCRACY (Gk. ἀριστοκρατία, *aristokratia*, from *ἀριστος*, *aristos*, best + *κράτος*, *kratos*, power). A form of government in which the sovereign power is vested in a small number of citizens, as opposed to monarchy, in which

the supreme authority rests with one man, and to democracy, where the ultimate authority is exercised by the entire body of freemen. Etymologically, the term denotes the rule of the "best," used, however, in the sense of the Greek *aristos*, which connoted high birth and the possession of wealth, as well as personal excellence. In an aristocracy, however, though the power of government was wielded by a few, theoretically the administration of government was carried on for the welfare of the many. Whenever the interests of the commonwealth were made subservient to the interests of the rulers, aristocracy degenerated into *oligarchy*. To the Greek mind aristocracy appealed as the most acceptable form of government, in that it was free alike from the dangers of despotism and mob rule. Athens, before the period of the Persian wars, and Sparta, practically during the entire course of its history, were aristocracies in fact, since in both places the chief power was exercised by senates which represented only the noblest and wealthiest families of the state. The same was true of Rome for at least 250 years before the establishment of the Empire. As preeminence in rank became less closely associated with the ownership of land, there arose aristocracies of wealth as well as of birth, typified by ancient Carthage and modern Venice. In the Middle Ages there was no aristocracy, strictly speaking, for though political power reposed in the hands of a very small portion of the people, each feudal lord in his own domain was sole master. It was only with the rise of the modern state that an aristocracy again became possible. It appeared, however, in quite a different form from the ancient aristocracy and partook rather of the nature of a privileged social class. Where the sovereign power was vested in the king, as was the theory of monarchical government in early modern times, aristocracy referred rather to a monopoly of titles and offices than of actual political power. Still, the rule of powerful families was not rare in the history of Europe, especially at times when weak kings occupied the throne, as was the case with the Guises of France and the rulers of the house of Valois. In England the government, from the accession of the house of Hanover down through the eighteenth century, though parliamentary in form, was in fact an aristocracy, since king and Parliament alike were under the control of a few great Whig families. At present, however, though the aristocratic element is still strong in Great Britain and Germany so far as the enjoyment of public office is concerned, the term "aristocracy" has become almost entirely social in meaning, and is used loosely and in a great variety of combinations to denote a select few—as aristocracy of birth, of wealth, or of brains. See GOVERNMENT.

AR/ISTOGI/TON. See HARMODIUS AND ARISTOGITON.

AR/ISTOL. A light-brown, amorphous powder formed by the union of iodine and thymol. It contains 45.8 per cent of iodine. Chemically it is dithymol-diiodide. Insoluble in water and glycerin, it is freely soluble in ether and fatty oils, and slightly so in alcohol. Its action is similar to that of iodoform (q.v.), but it possesses the advantage of being odorless. Being an unstable compound, it cannot be mixed with substances which have a tendency to combine with iodine and so is best used alone. It is used as a substitute for iodoform, as a mild anti-

septic, dusting powder or ointment in dressing wounds, and in various skin diseases.

ARISTOLOCHIA, à-ris'tô-lô-kî'â (Lat. from Gk. ἀριστολόχεια, *aristolochēia*, an herb promoting childbirth, like birth-wort, from ἀριστος, *aristos*, best + λοχεία, *lochēia*, childbirth, child-bed). A genus of plants of the family Aristolochiaceæ. This family consists of herbaceous plants or shrubs, often climbing shrubs, and includes more than 200 known species, chiefly natives of warm climates, and particularly abundant in the tropical regions of South America. Our wild gingers (*Asarum*) are herbs, but most of the representatives of the family are shrubby, some of them climbing to the summits of the loftiest trees. Several are found in the south of Europe, one only, the common birth-wort (*Aristolochia clematitis*), occurs upon the Continent as far north as about lat. 50°, and is a doubtful native of England. It is a perennial plant, with erect, naked, striated stem, heart-shaped dark-green leaves on long stalks, the flowers stalked, and growing to the number of sometimes seven together, the tube of the perianth about one inch long, and of a greenish color. It grows chiefly in vineyards, hedges, about the borders of fields, among rubbish, and in waste places. It has a long branching root, with an unpleasant taste and smell, which, with the roots of *Aristolochia rotunda* and *Aristolochia longa*, two herbaceous species, natives of the south of Europe, was formerly much used in medicine, being regarded as of great service in cases of difficult parturition, whence the English name. These roots possess powerful stimulating properties, and those of the southern species are still used as emmenagogues. The root of *Aristolochia indica* is used in the same way by the Hindus. *Aristolochia serpentaria*, Virginia snakeroot, is a native of most parts of the United States, growing in woods. It has a flexuous stem, 8 to 15 inches high, bearing heart-shaped, very acute leaves. The flowers are on stalks, which rise from near the root; the orifice of the perianth is triangular. The root has a penetrating, resinous smell and a pungent, bitter taste. It has long been a fancied remedy for the bite of a rattlesnake. It possesses stimulant, tonic, and diaphoretic properties. It forms an article of export from the United States to Europe, being highly esteemed as a medicine in certain kinds of fever. Its reputation as a cure for serpent bites is shared by other species, natives of the warmer parts of America. Several South American species seem also to possess medicinal properties analogous to those of the Virginia snakeroot. *Aristolochia sipho* or *Aristolochia macrophylla*, a climbing shrub of 15 to 20 feet in height, a native of the southern parts of the Alleghany Mountains, is frequently planted in the United States, in Great Britain, and on the Continent of Europe, to form shady bowers. It has very large round or somewhat heart-shaped leaves (a foot in breadth), of a beautiful green. The flowers hang singly, or in pairs, on long stalks; the tube of the perianth is crooked in its upper part, inflated at the base, and lined with reddish-brown veins, having a sort of resemblance to the bowl of a tobacco pipe, for which reason the shrub is sometimes called pipe-shrub, pipe-vine, or Dutchman's pipe. *Aristolochia tomentosa* resembles *Aristolochia sipho*, except in being smaller, very hairy, and in having yellow flowers. The tropical species are distinguished for their beauty and the peculiar

forms of their flowers. Some of them are much-prized ornaments of our hothouses, *Aristolochia grandiflora* (*Aristolochia ggas* of Lindley), the goose flower or pelican flower of the West Indies, being one of the most important. Its name is derived from the fancied resemblance to the bird.

ARISTOMENES, ār'is-tóm'ē-nēz (Gk. 'Ἀριστομένης). A Messenian general who commanded the army of his country against Sparta in the Second Messenian War, in the seventh century B.C. He upheld with success the Messenian cause for about 17 years, but was finally defeated and went, according to one story, to Rhodes, where his son-in-law was one of the reigning princes. Many heroic deeds are related of Aristomenes.

ARIST'ON. A Greek painter. See ARISTIDES OF THEBES.

ARISTON (Gk. 'Ἀρίστων), or **ARIS'TO** or **CHIOS** (?-c.250 B.C.). A disciple of Zeno and afterward, according to Diogenes Laertius, of the Platonist Polemo. He taught philosophy at Athens with great influence and distinction. Though a professed Stoic, he differed from Zeno in that he rejected all branches of philosophy except ethics and held that the moral improvement of men was the sole purpose of philosophy. He maintained that the supreme good consisted in ἀδιαφορία, *adiaphoria*, or entire indifference to everything except virtue and vice, and recognized only one virtue, which he called *ὑγεία*, *hygieia*, or health of soul, and doubted the existence of God. Ariston was called Siren, from his eloquence, and Phalanthus, from his baldness. See Zeller, *The Stoics, Epicureans, and Sceptics* (Eng. trans., London, 1892).

ARISTOPHANES, ār'is-tōf'a-nēz (Gk. 'Ἀριστοφάνης) (c.445-c.385 B.C.). The only writer of the old Greek comedy of whose plays any survives entire. He was the son of one Philip-pus and was born possibly in the deme of Cydathene. Tradition says he also had property in the island of Ægina, and was therefore sometimes called an Æginetan. That his education was of the best is shown by his intimate knowledge of Æschylus, Stesichorus, and Pindar. His genius was of the highest order, so that he maintained himself for over a generation as more than peer among the brilliant writers of comedy of his day. In politics he favored, with all the force of his impetuous nature, the aristocratic peace party; and in his hands, comedy, which had been given a political turn by his older contemporary, Cratinus, became in the first period of the Peloponnesian War a most effective weapon against the demagogues and their faction. In all his plays Aristophanes is a conservative, opposing all things that are new. His sharp wit and biting humor on at least two occasions stirred Cleon to bring suits against him.

Aristophanes' literary activity covered 40 years (427-388 B.C.), and his plays mirror the political and the social changes of the state. We can distinguish three periods: the first ends with 421, the second with 405, and the third with 388. In all we have 44 titles of plays ascribed to Aristophanes, of which four are considered spurious; from the 40 genuine plays 11 are preserved, of which five belong to the first period. Aristophanes' earliest play was *The Banqueters*, produced in 427, a satire on the new-fangled teachings of the Sophists as compared with the simple education of the fathers.

The Babylonians (426) contained a sharp attack on the demagogue Cleon. Both these plays are lost. *The Acharnians* (425) won the first prize. It is a satire on the headstrong jingoes at Athens who are typified in the play by Lamachus, an Athenian general, one of the war party. The blessings of peace are exhibited by the good fortune of an old countryman, Dicaeopolis, 'Righteous City' or 'Honest Policy,' who makes a private treaty with the Lacedæmonians for 30 years and thereby enjoys all blessings, in contrast with Lamachus, who comes to grief with his campaigning. *The Knights* (424) also won the first prize. This is the first play which Aristophanes brought out in his own name; of the three previous plays, *The Babylonians* and *The Acharnians* were produced under the name of Callistratus, *The Banqueters* under that of an actor, Philonides. In *The Knights* Aristophanes fulfills the promise which he made, in *The Acharnians* the year before, to cut Cleon into pieces. The demagogue is here represented as a vulgar, insolent charlatan; the people are represented in the person of a credulous and fickle old Demos, and the poet is thus able to show the weaknesses of the credulous and fickle mob that governed Athens. At the end Cleon is discomfited and old Demos has his youth renewed so that he clearly sees how he has been tricked. It is said that Aristophanes himself was obliged to take the part of Cleon, as no actor was willing to incur the enmity of the influential demagogue. *The Clouds* (423) was not so successful as the two previous plays. Its present form is a revision of the original. This comedy is a satire on the pretensions of the new Sophistical school and an attempt to point out its dangerous tendencies. Hence in this play Aristophanes returned to the theme he had handled in his first play, *The Banqueters*. Socrates is taken as the representative of the Sophistical school, whether because Aristophanes did not understand his teachings, or because he was a convenient butt, is uncertain. It represents a young Athenian, Phidippides, who is ruining his father by his spendthrift habits. So the old man sends him to the "thinking-shop" of Socrates, where he can learn to make the worse appear the better cause and so save his father by enabling him to escape the payment of his debts. The son, after some hesitation, reluctantly enters the school and learns his lesson all too well. A famous scene of *The Clouds* represents a dialogue between the Just and the Unjust Argument, in which the latter wins and obtains the mastery over the pupil. The youth returns to his home thoroughly trained in the new sophistic and, at a festival made by his father for his return, sings an immoral passage from Euripides, thrashes his father, and then justifies what he has done by the art he has just learned. His old father's eyes are now opened, and he takes vengeance on Socrates by setting his "thinking-shop" on fire. It is said that the reckless young Phidippides was intended to represent Alcibiades. *The Wasps* (q.v.) (422) is a ridicule of the regular courts of justice. *The Peace* (421) is a play in the interests of the truce between the Athenians and the Spartans consummated in this year. Peace is brought down from heaven and restored to earth. This play renews the discussion begun in *The Acharnians*.

Seven years passed before Aristophanes produced another play. In the meantime public measures had been taken to check political

satire, and *The Birds* (414) ridicules the Athenians' fondness for litigation and their flighty character. Two old men leave Athens in disgust and with the aid of the birds establish the city Cloud-cuckoo-town, in mid-air, shut off the gods from enjoying sacrifice, and win back the sceptre from Zeus. The whole play is very brilliant and clever; it contains some exceptionally beautiful lyrical passages. Some have wished to see in it a caricature of the Athenians' hopes of founding a great western empire in Sicily, and a satire on Alcibiades, an ardent imperialist. The *Lysistrata* (411) represents a woman's conspiracy to bring about peace; the play thus belongs with *The Acharnians* and *The Peace*. War between Athens and Sparta had been renewed three years after the Peace of Nicias. Lysistrata, 'Disbander of Armies,' persuades the matrons of Athens to desert their husbands and to refuse to return home till peace is again established. The *Thesmophoriazusa*, produced three months after the preceding comedy, contains an attack on Euripides, whom the women, who are celebrating the Thesmophoria (see GREEK FESTIVALS), propose to punish for his hatred of them. *The Frogs* (405) is devoted to literary criticism. In the opening scenes Dionysus is on his way to Hades in search of a good poet, for Sophocles and Euripides have just died. The remainder of the play is given to the adventures of Dionysus in Hades, and the contest between Æschylus and Euripides for the seat of honor there, which Æschylus wins. The real subject is the decay of tragic art, for which Euripides is blamed. The *Ecclesiazusa* (392 or 389 B.C.), or *The Women in Parliament*, is a satire on communistic ideas current at this time. The women disguised as men occupy the Pnyx (see ATHENS), and adopt a new thoroughgoing communistic constitution, in which the government of Athens is handed over to the women. In the *Plutus* (which failed in 408, but was revived in 388) the god of wealth has his sight restored to him, and thereafter confers his blessings only on the deserving. The play "is an allegory, a picture of society turned upside down by the redistribution of wealth."

It will be seen that in the extant plays there is a gradual change from political and personal satire to caricature of social conditions. Furthermore, the local character of the earlier plays gives way in the later to a certain cosmopolitanism. These, therefore, form the transition to the middle and new comedy. Aristophanes, in the opinion of the ancients, held a middle place between his older contemporaries, Cratinus and Eupolis, combining the severe character of the one with the grace of the other. In wit, rollicking humor, invention, skill in the use of language and rhythm, he has never been surpassed. The text is best edited by Meineke (Leipzig, 1860), Blaydes (Halle, 1886), and Hall and Geldart (Oxford). The Scholia were published by G. Dindorf (Oxford, 1835), and by Dübner (Paris, 1842); those from the Ravenna MS. were edited by Rutherford (London, 1896). There are numerous commentated editions of single plays; J. Van Leeuwen has published an annotated edition of all the plays (Leyden, 1893-1905). English translations have been made by Mitchell, Frere, Rogers, Kennedy, Tyrrell, Murray, and Starkie. Consult J. Van Leeuwen, *Prolegomena ad Aristophanem* (Leyden, 1908), for a discussion of the life and writ-

ings of Aristophanes; M. Croiset, *Aristophanes and the Political Parties at Athens*, trans. by James Loeb (London, 1909); W. Süss, *Aristophanes und die Nachwelt* (Leipzig, 1911).

ARISTOPHANES OF BYZANTIUM (c.260-180 B.C.). A learned Greek grammarian, one of the foremost scholars of the ancient world. He was a pupil of Zenodotus at Alexandria, where he was subsequently instructor of the famous critic Aristarchus of Samothrace and director of the great library. He was the first to attempt a critical edition of the Homeric poems and made extensive study of Hesiod, Plato, Aristotle, Alcæus, Anacreon, Pindar, and the comic and the tragic poets. In his edition of Homer he differed much from Zenodotus, and showed scientific spirit by faithfully recording manuscript evidence, even where he rejected it. He introduced into the Greek language the use of accents, reduced punctuation to a system, and invented several new symbols for use in textual criticism. He wrote also an important lexicographical work, which showed a wide knowledge of dialects. Consult Sandys, *A History of Classical Scholarship*, i, 126-131 (Cambridge, 1906).

ARISTOPHANES' APOL'OGY. The sequel to Browning's *Balaustion's Adventure*, published in 1875. It is a long poem in blank verse, supposed to commemorate the defense made by Aristophanes for his comic art, on learning from the venerable Sophocles of the death of the tragedian Euripides.

ARISTOTELIA. See MAQUI.

ARISTOTLE (Gk. Ἀριστοτέλης, *Aristotelēs*) (384-322 B.C.). A Greek philosopher, born at Stagira, a Greek town of the Chalcidice, on the Strymonic Gulf, the present Stavro. He came of a family in which the practice of medicine was hereditary, and his father, Nicomachus, was physician-in-ordinary to the Macedonian King, Amyntas II. From his father Aristotle undoubtedly inherited his love for natural science and through him came into relation with the royal house of Macedonia. Nicomachus died while Aristotle was still young; the son was brought up in Stagira by a family friend, Proxenus, of Atarneus in Mysia, whose memory he held so dear that in after life he erected a statue to him at Delphi and after his death educated and adopted his son Nicanor. Aristotle doubtless received the usual education enjoyed by the son of a well-to-do family and probably was trained also for his ancestral profession. When 17 years old, he went to Athens and associated himself with the Academy. But its head, Plato, was then absent on his second journey to Syracuse, where he acted as adviser to two despots in succession, Dionysius the elder and Dionysius the younger. Aristotle for a time devoted himself to rhetoric, under Isocrates, but, on Plato's return from Sicily, he forsook rhetoric and devoted himself to philosophy. For nearly 20 years he enjoyed the teaching of Plato and association with him; in spite of the different natures of master and pupil, the relation between the two was close. Plato is said to have called him the leader and the intellect of his school, and, because of his zeal, to have likened him to a colt that needs the bit more than the spur. During this period of discipleship Aristotle seems to have begun to lecture to small circles of listeners, chiefly on the subject of rhetoric; at the same time he trained himself to a high degree of perfection in the practice of

oratory. His superior genius was so well recognized by his contemporaries that his elders, like Heraclides Ponticus, who was Plato's representative in 361 B.C., were ready to yield to him, and younger men like Theophrastus were glad to be his followers. At Plato's death in 348-347 B.C., Speusippus became head of the Academy, and Aristotle had no longer any bonds to bind him to the school. He was now in his thirty-eighth year, had enjoyed long intimacy with the best thinkers in Greece, and had undoubtedly already developed to a considerable degree an independent philosophical position. With Xenocrates of Chalcedon, who likewise withdrew from his old associates, Aristotle went to Mysia, and presently accepted an invitation from a former fellow-pupil in the Academy, Hermias, headman of Atarneus, to take up his residence with him. Here he remained three years, until Hermias was, through treachery, captured by the Persians, and put to death by Artaxerxes III. Aristotle sought refuge in Mytilene, taking with him the niece and sister of Hermias; he afterward married the latter, who died somewhat more than ten years later in Macedonia. On the basis of certain allusions in the opening of Isocrates' *Panathenæus* it has been conjectured that the following two years Aristotle spent again in Athens, teaching in company with others in the Lyceum; this conjecture, however, has a very uncertain basis.

During the many years spent at Athens and in Asia Minor Aristotle's hereditary relation with the Macedonian court seems to have been unbroken; for in 343-342 B.C., in response to a call from Philip to educate his son Alexander, then 14 years old, he removed with his family and Theophrastus to Pella, the Macedonian capital. He acted as tutor to Alexander for three years. The plan of the education attempted by him is unknown to us, but it is most probable that the philosopher added to the ordinary education of the day in rhetoric and philosophy some instruction in at least history, geography, and politics suited to a future ruler. How far his pupil absorbed teaching is also uncertain, although we know that his later plans for conquest were in opposition to Aristotle's views. Yet Aristotle was held in high esteem by both Philip and Alexander; during his residence at court he was able to obtain the restoration, at the public expense, of his native city, which had suffered severely in 348 B.C. when Philip conquered the district about the Strymon; later he was able to secure from Alexander protection for Eresus, in Lesbos, the home of his friend Theophrastus. The greatest favors he received, however, were in the way of support and material for his scientific investigations; and his years of residence at the Macedonian court, where he could observe at close range the rule of an aggressive monarch, must have been of the greatest importance in developing his political ideas.

After Alexander mounted the throne and undertook his Eastern conquests, Aristotle returned to Athens in his fiftieth year, to carry out a plan, no doubt long cherished, of opening a school of his own. This he established in the Lyceum, in a building called "The Walk" (*περίπατος*), where he lectured. We have a tradition, doubted by some, that he gave two kinds of instruction: in the morning to a narrow circle of advanced pupils (his esoteric doctrine), and, in the evening, more popular lectures

(exoteric teaching) to a larger body of listeners. The name "Peripatetic," applied to the school and its philosophy, cannot be traced back of 200 B.C. Of the equipment of the school, in books and material, we know nothing. Aristotle continued to teach for 12 years, until Alexander's death, in 323 B.C., which led to a reaction at Athens against Macedonia, made his position in Athens dangerous. He was charged with impiety, but fled to Chalcis, as he said, to save the Athenians from a second sin against philosophy. Here he died. Theophrastus and Eudemus were his immediate successors in the leadership of the school.

Aristotle left behind him an enormous number of writings. Diogenes Laertius, of uncertain date, gives us a list of 46 works. This probably represents the works bearing Aristotle's name in the Alexandrian Library. A list dating from the time of Cicero makes the total much larger. An ancient tradition, given by Strabo (xiii, 1), says that Theophrastus, at his death, bequeathed his library, including of course the works of Aristotle, to a certain Ncleus of Scepsis. His descendants buried the books to save them from the rapacity of the Attalids, who were eager to enrich the Pergamene Library by every possible means. About 100 B.C. the buried collection, naturally much injured by damp and worms, was discovered by Apellicon of Teos, a learned bibliophile, who brought it to Athens. When Sulla captured the city, 86 B.C., he took the books to Rome, where their value was recognized by the grammarian Tyrannion, who had a catalogue prepared by the Peripatetic Andronicus—the longer list mentioned above—and about 50 B.C. published the works thus recovered. Our present recension undoubtedly goes back to this edition, although it is more immediately related to a recension prepared toward the end of antiquity which embraced a number of spurious writings. The later Peripatetics divided the complete works of their master into two classes; exoteric dialogues intended for the public, and acroamatic pieces meant for the small circle of pupils. To these may be added as a third class certain writings not intended for publication, the hypomnematic works consisting of memoranda and collections on various topics. The exoteric dialogues were well known and much admired in antiquity, but only bare fragments have come down to us. These dialogues did not possess the dramatic character of Plato's works; in place of question and answer they had long discourses, such as we find in the philosophical writings of Cicero, who chose Aristotle as his model. Among the titles of the exoteric dialogues known to us are *On the Immortality of the Soul*, *On Philosophy*, *On the Good*, *On Justice*, *On Friendship*. Certain titles, e.g., *Menexenus*, *Gryllus*, *Nerinxus*, *The Sophist*, remind us of Plato's dialogues. Aristotle carefully prepared these for publication and must have exhibited in them that perfection of style which caused Cicero to speak of the philosopher's language as a golden stream. The extant works show but little of this quality. These were never completely prepared and in many cases probably were never intended for publication by Aristotle, but were edited by Theophrastus, Eudemus, and the philosopher's son, Nicomachus. Many have the character of lecture notes, possibly those taken by pupils, and most have suffered from interpolations. A considerable number of the works to which his name is now attached are

spurious. The extant writings may be classed, according to their contents, under Logic, Metaphysics, Natural Science, Ethics and Politics, Rhetoric and Poetics.

The works on Logic were called by the later Peripatetics the *Organon*, 'The Instrument,' as they deal with the instrument and the method of investigation and discussion. They include the *Categories*, on the ten classes of predicates—substance, quantity, quality, etc.; *On Interpretation*, dealing with the proposition and its parts; *Analytica Priora*, in two books, on the syllogism; *Analytica Posteriora*, in two books, on the theory of knowledge and the scientific method; *Topica*, in eight books, on dialectics and reasoning from probabilities; and *Sophisms*, on the fallacies of the Sophists and their correction. Aristotle's claim that he was the first to work out a method of reasoning is sound, and formal logic has made little advance since his day; it has only added to his categorical syllogism (discussed in the *Analytica Priora*) the hypothetical and disjunctive forms, and has supplemented his three figures by a fourth.

The *Metaphysics*, in 13 books, was so called by later students, because in the ancient editions of Aristotle it followed the works on physics. The philosopher himself called it "First Philosophy" (*πρώτη φιλοσοφία*). It is in an unsatisfactory condition, consisting of one finished treatise and a number of shorter sketches hardly connected or fully worked out. It begins with a criticism of previous philosophical systems—the earliest history of philosophy—and then, after stating the philosophical questions preliminary to the examination, discusses the doctrine and the ultimate grounds of Being.

The works on Natural Science comprise the *Physics*, in eight books, treating of the general principles and relations of nature; four books *On the Heavens*, and two *On Beginning and Perishing*. The last treatise is important for a knowledge of Aristotelian philosophy. The *Meteorology* discusses the phenomena of the heavens. Natural History is handled in 10 books; with it are associated the following treatises: *Parts of Animals*, in four books; *Generation*, in five, and *Mode of Progression*, in one. To these must be added certain works of doubtful authenticity: *On Plants*, in two books, a retranslation from the Latin and probably the work of Nicolaus of Damascus, who composed, under Augustus, a compendium of Aristotle's philosophy; *On the Cosmos*, certainly belonging to the Roman period; *On the Motion of Animals*, *On Breathing*, *On Colors of Plants and Animals*, all later than Aristotle. The treatise on *Physiognomy*, which was composed certainly as late as Hadrian's time, is based apparently on two lost works named in the ancient catalogues of the Aristotelian writings. The *Problems*, discussions chiefly of physical questions, is also drawn in part from the philosopher's work. The *Mechanics*, *Mirables Auscultationes*, and some other minor monographs falling within the same field are certainly spurious.

According to Aristotle's own view, psychology was inseparably connected with natural science. Under this head we possess his work *On the Soul*, in three books, and a large number of smaller treatises which are known as the *Parva Naturalia*.

Next must be named the works on Ethics and Politics, which Aristotle regarded as parts of the same subject. Under the former division

there are extant three works: The *Nicomachean Ethics*, in 10 books, which takes its name from the philosopher's son, Nicomachus, to whom the work is dedicated and by whom it probably was edited. This is Aristotle's work. The *Eudemean Ethics*, in seven books, was prepared by Aristotle's pupil Eudemus on the basis of his master's lectures and the *Nicomachean Ethics*, with which it coincides in parts (in books iv-vi). The *Magna Moralia*, in two books, is a late work of the Peripatetic school, and nothing more than an abstract of the other works. In the *Nicomachean Ethics* Aristotle held that every action, every art and science, has some good as its aim; the chief aim of human action is happiness. The happy man is he whose activity is in harmony with virtue and who is adequately provided with external goods through all his life. Virtue is in all cases a mean between extremes. An essay *On Virtues and Vices* is also spurious. The *Politics*, in eight books, is closely connected with the *Ethics*. The work is incomplete but masterly, discussing the elements and the aims of the state, the forms of government, and the ideal state. The loss of the *Constitutions*, which treated of 158 states, is greatly to be regretted; but fortunately the greater part of the *Constitution of Athens*, which belonged to the larger work, was recovered, almost in its entirety, in 1885 from four papyrus rolls of the first century A.D., first published by Kenyon in 1891. This document is one of the most valuable for the history of Athens, and has at many points corrected and enlarged our previous knowledge. Aristotle's ideal was the small, autonomous, aristocratic city-state. The *Economics*, in three books, is the work of the later school.

In the field of Rhetoric and Poetics, Aristotle also made contributions of the highest value and permanence. His *Rhetoric*, in three books, treats of the relations of rhetoric to dialectic, the nature of the proof the orator may employ, the use of examples, and language and style. In this work also appear beginnings of formal grammar and its technical terms. The *Rhetoric* addressed to Alexander, which is catalogued with Aristotle's works, was written by Anaximenes. Of the *Poetics*, only the first book on tragedy and epic poetry is preserved, but this is of inestimable value for its analyses of the various kinds of poetry and its full treatment of tragedy.

From this enumeration of the most important extant writings of Aristotle, the universality of his studies is evident; and in every field enumerated his influence has been enormous. By him Logic, Grammar, Rhetoric, Literary Criticism, Politics, Psychology, Ethics, Natural History, Physiology, were raised to independent disciplines; he was the first to attempt a history of Philosophy and Government. This many-sided literary activity was the natural result of his method of working, proceeding from the individual to the general; and this method, which collects facts, compares, sifts, and groups them according to their relations, and thus obtains systematic knowledge of the subject in hand, has been most fruitful in the history of investigation of every sort, especially in the nineteenth century.

Aristotle's service lies in his analysis and clear distinction of ideas and in his studies in particular fields, rather than in the full development of a philosophy. Yet here he made important advances that have been influential down to the present day. According to him,

Being has four universal elements: Matter, form or essence, the efficient cause, and the final cause. These principles enter into the constitution of everything. Matter is mere potentiality, which through the supervention of Form becomes the Actual. By Form, Aristotle wished to replace the Platonic idea, which, he pointed out, cannot exist apart from the individual. Every change from potentiality to actuality is accomplished by an efficient cause which is working toward an end, the Final Cause. In the field of Ethics this final cause is man's *summum bonum*, happiness, which is defined to be the activity of the soul in accordance with virtue, but under favorable conditions. The problem of free-will Aristotle met by the statement that man has a potentiality in two opposite directions—for good or evil—which can be freely chosen; by consistently choosing one a man forms the habit of virtue or vice, and thus becomes either virtuous or vicious, as his choice determines. Virtue itself lies between the extremes of self-indulgence and asceticism.

The influence of Aristotle on human thought has continued unbroken to the present day. In the early centuries of our era his writings stimulated scientific inquiry; during the Middle Ages Latin translations from the Arabic versions guided the philosophy of the Western church, although the real nature of Aristotelianism was little understood. Arabian philosophy in the West during the eleventh and twelfth centuries was a combination of Aristotelianism with certain Neo-Platonic elements. With the revival of learning the originals of Aristotle's works became gradually known, and from them were drawn the means to combat the errors of scholasticism.

Learned comment on Aristotle began with the first century B.C., and during antiquity and the early mediæval period the amount of comment grew to be enormous. The standard edition of the works is still that by Bekker (5 vols., 1831-40). Vols. i and ii contain the Greek text; iii, the Latin translations; iv, scholia, edited by Brandis; v, the fragments, edited by Rose, and Bonitz's index. A new and complete edition of the ancient commentaries is being published by the Prussian Academy. Twenty-five volumes have already appeared. Of editions of single works, the following are valuable: Trendelenburg's *Psychology* (1877); Schwegler-Bonitz's *Metaphysics* (1848); Ramsauer's *Nicomachean Ethics* (1878); Stewart's *Notes on the Nicomachean Ethics* (Oxford, 1892); Susemihl's *Politics* (1879); Spengel's *Rhetoric* (1867); Vahlen's *Poetics* (1884); Butcher's *Poetics* (3d ed., London, 1902); Bywater's *Poetics* (Oxford, 1909); Cope and Sandys's *Rhetoric* (Cambridge, 1877); Sandys's *Constitution of Athens* (London, 1893); Wilamowitz's *Constitution of Athens* (Berlin, 1891). Useful English works of general import are Grote's *Aristotle* (1872); Grant's *Ethics of Aristotle* (London and Edinburgh, 1877); Bywater, *Ethics* (1890); Jowett, *Politics* (1885); Newman, *Politics* (1887); Wallace, *Psychology* (1884); Hammond, *Psychology* (1902); Zeller's *Aristotle and the Earlier Peripatetics* (London, 1897); Wallace, *Outlines of the Philosophy of Aristotle* (Oxford, 1883); Navarre, *Essai sur la rhétorique grecque avant Aristote* (Paris, 1900). General bibliography by Schwab (Paris, 1896). For influence of Aristotle upon Arabic philosophy, see ARABIC LANGUAGE; AVERROËS.

ARISTOXENUS (Gk. Ἀριστοξένος, *Aristoxenos*) (fourth century B.C.). The greatest student in Greek antiquity of the science of rhythm and music. He was a son of Spintharus and a native of Tarentum. He received his first instruction from his father, who had himself been a pupil of Socrates and was well versed in musical matters. He later studied music under Lamprus of Erythræ, and music and philosophy under the Pythagorean, Xenophilus of Chalcidice. He finally went to Athens and became the pupil of Aristotle. It is said that he expected, upon the death of Aristotle, to be appointed his successor, and was deeply chagrined when Theophrastus was made head of the school instead. He remained at Athens, however, and is said in the course of his life to have written 453 treatises on various subjects—musical, philosophical, and moral. His method was that of Aristotle: he based his conclusions on close observation of facts. One of his tenets was that the notes of the scale were to be judged entirely by the ear, and not, as the Pythagoreans held, by mathematical properties. He carried his musical theories into his inquiries into the nature of the soul, for he held that the soul was a sort of tuning of the body, and that from the nature and configuration of the body as a whole varied movements, i.e., life, resulted, much as harmony results in music. Only one of his works is extant—and this incomplete—*Elements of Harmony* (Ἀρμονικὰ Στοιχεῖα, *Harmonika Stoicheia*) (Eng. trans. by Macran, Oxford, 1902). The best edition is by Marquard (Berlin, 1868). Consult: Westphal, *Melk und Rhythmik* (Leipzig, 1883, 1893); Laloy, *Aristoxène de Tarente et la musique l'antiquité* (Paris, 1904); T. D. Goodell, *Chapters on Greek Metric* (New York, 1902); Williams, *The Aristoxenian Theory of Musical Rhythm* (Cambridge, 1911).

ARISUGAWA, ʼrè-sû-gâ-wâ. The name of a noble family in Japan whose members, besides showing marked ability, have been prominent in the rejuvenation of that ancient Empire. The house was founded by the seventh son of the Mikado Go-Yozai, who reigned from 1587 to 1611 and died in 1638. When in January, 1868, the Shogunate was abolished and the Emperor Mutsuhito was restored to undivided power, ARISUGAWA TARUHITO (1835-95), uncle of the Mikado by adoption and heir presumptive to the throne, became administrator and commander-in-chief of the army. He led the imperial troops against the rebels, saved Yeddo from destruction, and then directed the military operations in the north which brought the civil war to a happy conclusion (1869). In 1875 he was made President of the Senate, and in 1877 received supreme command of the forces, which suppressed the Satsuma rebellion led by Saigō Takamori, for which Arisugawa was decorated with the Order of the Chrysanthemum and made field marshal and junior Prime Minister. He devoted himself to the development of the military and naval forces of the Empire and was chief of the army staff in the war with China, in the course of which he died.—ARISUGAWA TAKEHITO (1862—), brother of the above, was adopted by him as his heir and was heir presumptive to the throne till the birth of a son to the Emperor in 1879. From that year to 1882 he was in the British navy. He commanded a cruiser in the war with China and became subsequently admiral superintendent of the naval base at Yokosuka. Before the outbreak of the

Scheller, *Theorie und Praxis des Volksschulunterrichts nach Herbartischen Grundsätzen* (Leipzig, 1898); J. A. McLellan and J. Dewey, *Psychology of Number* (New York, 1895); D. E. Smith, *Teaching of Elementary Mathematics* (New York, 1900). Notable among higher arithmetics are: Tannery, *Leçons d'arithmétique théorique et pratique* (Paris, 1894), and W. W. Beman and D. E. Smith's *Higher Arithmetic* (Boston, 1897).

ARITHMETICAL PROGRESSION. See SERIES.

ARITHMETIC AND GEOMETRIC SIGNS. Arbitrary symbols used to indicate: (1) the nature of a magnitude, as $+a$, a positive quantity, and $-a$, a negative quantity; (2) operations to be performed upon magnitudes, as $a \cdot b$, i.e., b multiplied by a ; (3) relations between magnitudes, as $a > b$, i.e., a is greater than b . The following are a few signs in common use:

0, 1, 2, 3, 4, 5, 6, 7, 8, 9, are the Hindu numerals

I, II, III, IV, V, VI, etc., are Roman numerals.

$+$ (plus); $-$ (minus); \pm (plus or minus); \times or (times or multiplied by); \div , $/$ or the fraction bar (divided by); $=$ (equal to); $a \equiv b$ (a is identical with b); $a \equiv b \pmod{m}$ (a is congruent to b , modulo m); $a > b$ (a is greater than b); $a < b$ (a is less than b); $a \propto b$ (a is similar to b); $a \propto b$ (a varies as b); ∞ (infinity); $a \rightarrow b$ (a approaches b as a limit); \therefore (therefore); \because (since); $|-a|$ (absolute value of $-a$); $\angle A$ (angle A); \perp (perpendicular to); \cong (congruent to, i.e., similar and equal); $\sqrt{}$ (root of); π (ratio of the circumference of a circle to its diameter); e (base of the hyperbolic logarithms).

ARITHMETIC COMPLEMENT. The difference between a number and the next larger number representing a power of 10. Thus, the arithmetic complement of 7 is $10 - 7$, or 3; the arithmetic complement of 85 is $100 - 85$, or 15; that of 125 is $1000 - 125$, or 875. The arithmetic complement is much used in numerical calculations where differences are to be found. Since $a - b = a + (10^n - b) - 10^n$, it follows that instead of subtracting a number its arithmetic complement may be added, the corresponding power of 10 being then deducted. Thus, $456 - 273 = 456 + 727 - 1000 = 183$. The advantage consists in this, that since the arithmetic complement of a number is easily found by subtracting each digit from 9, except the unit's (which is taken from 10), it is often easier to add the arithmetic complement than to subtract the number. In working with logarithms arithmetic complements are often used instead of their numbers, under the name of co-logarithms. See LOGARITHM.

ARITHMOMETER. See CALCULATING MACHINES.

ARI THORGILSSON, á'ræ tór'gæl-sôn (1067-1148). The father of Icelandic literature. Little is known of his life. His *Íslendingabók*, the first literary work of the island, was finished between 1134 and 1138, has now perished

as a whole, but was apparently an account of the history of Iceland from its settlement, about 870, till 1120. See ICELANDIC LITERATURE.

ARIUS (c.256-336). The founder of Arianism, the doctrine that Christ was not of the same essence as God the Father, but was a creature, though the first and highest of creation. He was born in Libya, in north Africa, about 256. He went to Alexandria and there was made deacon and presbyter and was the highly esteemed pastor of a church called, from its shape, the Baucalis (the Greek name of a kind of vase). In 318 he denied the statement which Alexander of Alexandria made upon the Trinity: viz., that there was only a single essence. This he declared was Sabellianism. Defining his own position, he affirmed that if the Son were truly a son, there must have been a time when he was not. For this statement he was applauded by many, but Alexander called a council of 100 Egyptian and Libyan bishops, which condemned Arius and his allies and deposed them (321). The fight had now begun. Arius had numerous supporters, chief of whom was Eusebius, Bishop of Nicomedia. Alexander also rallied a large contingent and wrote numerous letters (two of which are still extant) exhorting the bishops not to receive the heretic. Notwithstanding this active canvass by Alexander, Eusebius of Nicomedia absolved Arius, who had retired to Palestine and then to Nicomedia, from the Alexandrian condemnation, and had Arius's position approved by a synod held in 323, probably in Nicomedia. Arius wrote *The Banquet*, a work in prose and verse, of which fragments remain. It set forth his view of the person of Christ and put it in a form so that it could be sung to popular tunes. This is said to have aided his cause greatly. The strife attracted the attention of the Emperor Constantine, as it was troubling the peace of the Church. Constantine did not appreciate the importance of the doctrine involved and thought the controversy could be healed by mutual concessions. He empowered Hosius, Bishop of Cordova, who was his ecclesiastical adviser, to represent him in an effort at Alexandria to smooth matters over; but when Hosius reported failure, he took more active measures, and called a general Church council at Nicea, in Bithynia (325), the first Œcumenical Council, at which the point raised by Arius was settled against him. This result was effected by the champion of Christ's divinity who then appeared—Athanasius, a young deacon of Alexandria, and spokesman for his bishop, Alexander. Three hundred and eighteen bishops, besides numerous other clergy of all grades, were present. Four parties were formed—the strict Arians, led by Arius himself (who was present), who contended that Christ was of different essence (*heteroousios*) from the Father; the strict Athanasians, who contended that he was of the same essence (*homoousios*); the party of Eusebius of Nicomedia; and that of Eusebius of Cæsarea. The creed of the Nicomedian Eusebians was essentially Arian and was rejected by the Council without debate; in fact, the document containing it was torn to shreds. The creed of the Cæsarean Eusebians, which was designed to be a compromise, was respectfully received, as it was an old Church one; but the steady persistence of the Athanasian party forced the Council to reject it and make a new deliverance, in which Arianism was unequivocally condemned. The upshot was that

Arius and his episcopal supporters were banished to Illyria, and his writings publicly burned and interdicted. This action did not, however, end Arianism; and as for Arius, the great influence of Eusebius of Nicomedia and of Constantia, the sister of Constantine, secured his recall in 331, and in a personal interview with the Emperor, Arius convinced him that his views were in substantial agreement with those of Athanasius.

In the confession of faith which he presented, he declared his belief that the Son was born of the Father before all ages, and that, as the "Word," he had made all things both in heaven and earth. The Emperor was satisfied, and sent orders to Athanasius, now Bishop of Alexandria, to receive Arius into the communion of the Church. This Athanasius refused to do, and a series of tumults was the consequence. Eusebius of Nicomedia was greatly incensed. He called a synod of bishops at Tyre, in 335, which proceeded to depose Athanasius. The Emperor was even prevailed on to remove the latter to Gaul, though he alleged as his reason that he wished to deliver him from the machinations of his enemies. In the same year another synod met at Jerusalem, which revoked the sentence of excommunication uttered against Arius and his friends. Still, the majority of the Christians of Alexandria clung to the doctrines of Athanasius, and resolutely resisted every effort to establish the new opinions among them. Disappointed in his expectations, Arius, in 336, proceeded to Constantinople, where he presented the Emperor with another apparently orthodox confession of faith; whereupon orders were issued to Alexander, Bishop of Constantinople, to administer to Arius the holy communion on the Sunday following. This was naturally considered a grand triumph by Eusebius and his friends; but on the Saturday preceding the day appointed for his restoration, Arius suddenly died of hemorrhage of the bowels.

Arius was exceedingly handsome; but the harassing cares of a life spent in a continual struggle with his adversaries are said to have given him a worn and haggard look. His manners were graceful and modest; he was noted for even an ascetic abstinence, and the purity of his moral character was never challenged by a single enemy.

After the death of Arius his followers rallied round Eusebius of Nicomedia, now Bishop of Constantinople (339), from whom they were styled Eusebians. The reconciliatory middle party of Eusebius of Cæsarea (d.340 A.D.), who wished to end the great controversy by abstaining from all strict dogmatic assertions on the matter, soon dwindled into insignificance between the two contending parties. Constans, who ruled the West after the death of Constantine (337), and Constantius, who ruled the East, made an essay toward reconciliation, but it failed at the Synod of Sardis (347), where the Occidental bishops gathered themselves round Athanasius in support of the *homoousian* doctrine (*identity* or *sameness of substance*), while in a separate council at Philippopolis, the Oriental bishops asserted the *homousian* doctrine (implying merely *similarity of substance*). Slight as might appear the verbal difference between the two parties, the bitterness of the controversy was intense and pervaded almost all departments of public and private life. Constantius having, by the death of Constans (350) and his victory over Magnentius (353), gained

dominion over the West, the Arian cause, which he favored, triumphed at the Synod of Arelate or Arles (353) and at that of Milan (355). These victories, however, were more apparent than real. The Nicene doctrine had still strong support on its side and was strictly maintained by the banished Athanasius and his friends, while the Antineans, soon after their triumph, were divided into at least three parties. The old Arians, also styled Anomœoi, or Heterousians, asserted, in the boldest style, their doctrine of "distinct substances." The semi-Arians (a large majority in the Eastern church) maintained the *homoiousian* doctrine of similar substances. A third party held the same doctrine with some qualification. Morally, the victory was leaning to the side of the Nicæans. Julian the Apostate (361-363), in his hatred of the Christian religion, left all parties at liberty to contend as they pleased with one another, provided they did not interfere with his plans. Jovian and his successors in the West, Valentinian I and Gratian, extended full toleration to both parties. Arianism, at last, was virtually abolished in the Roman Empire, under Theodosius in the East (379-395), and Valentinian II in the West. Among the German nations, however, it continued to spread through missionary efforts. Bishop Ulfilas, the translator of the Bible into the Mæso-Gothic language, had been the means of converting the West Goths to Arian Christianity as early as 348, and they adhered to it until the Synod of Toledo in 589. The East Goths, Vandals, Burgundians, the Suevi in Spain, and the Longobards also adopted Arianism; but in all these instances the Nicene doctrine ultimately prevailed, most slowly among the Longobards, who retained the Arian creed until 662. The Arian controversy has never excited any great interest in modern times; yet among Englishmen John Milton was at least a semi-Arian, and it was revived for a time by the writings of the learned Dr. Samuel Clarke (1675-1729) and also by William Whiston (1667-1752). More recently, a part of the Arian doctrine, the denial of "the eternal sonship," was broached in the Wesleyan Methodist church by Dr. Adam Clarke (1762-1832) and a few followers; but it was soon suppressed by the conference. Pure Arianism has gradually lapsed into Unitarianism. Consult: H. Kölling, *Geschichte der arianischen Hærese von Nikäa [325] bis Konstantinopel [381]* [Gutersloh, 1875-83]; J. Gummerus, *Die homousianische Partei bis zum Tode des Konstantius* (Leipzig, 1900); Gwatkin, *Studies in Arianism* (Cambridge, 2d ed., 1900); Harnack, *History of Dogma* (Boston, 1895-97). See ATHANASIUS; CHRISTOLOGY.

ARIZONA (probably from the Spanish words *arida zona*, arid zone, or, according to Mowry, from *arizuma*, meaning silver bearing). A State of the southwestern United States, bounded on the north by Utah, on the south by Mexico, on the east by New Mexico, and on the west by California and Nevada (Map: United States, west half, C 4). It lies between lat. 31° 20' and 37° N. and long. 109° 3' and 114° 54' W. It is nearly 350 miles square and contains 113,956 square miles, only 116 of which are under water. Not considering the Territory of Alaska, it ranks fifth in area and forty-fifth in population, forty-sixth if the District of Columbia be taken into account.

Topography. The extension northwestward of the Mexican Cordilleras, which rises beyond

the Colorado River in the Sierra Nevada, divides Arizona diagonally into two regions—a southwestern part of low elevation and a northeastern part consisting of an elevated plateau. The whole State, however, is mountainous in the form of short, isolated ranges having a general northwest-southeast trend, which are abrupt sterile, and gashed by deep canyons and dry watercourses. In the south these mountains rarely reach 3000 feet in height, but in the central and northwestern elevations they are more continuous and lofty, many summits approaching 10,000 feet (Thomas Peak, 11,496; Ord Peak, 10,266; Bill Williams Mountain, 9264; Mount Logan, 7700; Mount Tipton, 7364; Mount Delenbaugh, 6756, etc.). The highest mountains in the State are in the isolated San Francisco Range, of volcanic origin, in the northern central part, the apex of which reaches 12,794 feet. From these central elevations the State slopes rapidly away nearly to sea level in the Gila valley. The northern part of the State consists of a broken, canyon-cut, hill-studded, arid tableland, the average altitude of which is over 5000 feet above the sea, with many large areas from 6500 to 8000 feet. The few, and often intermittent rivers, which drain this arid region, serving more as the conduits of sudden rain storms than as living watercourses, run in narrow canyons, in some cases a mile or more deep. Evidences of volcanic activity are abundant. The Rio Colorado (see COLORADO RIVER) traverses the northwest corner of the State in such a canyon, and then, turning to the south, becomes the western boundary of Arizona to near its mouth. Its few tributaries, of which the Little Colorado in the north alone is important, reach the river through similar canyons. The whole scenery of this northwestern part of the State is that of a rough, rocky, dry region, interrupted by steep-sided gorges and scarp-fronted mesas and barren mountains, more or less covered with bunchgrass and scattered, stunted trees, and extensive lava flows near the Colorado Canyon. The southern part of the State is, on the whole, even more desert-like in appearance, and all the watercourses (most of which are dry except for a short time after rains) lead downward to the Gila, a broad, shallow river flowing into the Colorado near its mouth. The mountains here are mainly of volcanic origin. The only other rivers in Arizona worth mentioning are the Rio Santa Maria and Sandy, which unite in the central western region to form Bill Williams Fork, which enters the Rio Colorado near lat. 34° N., and the Virgin, in the extreme northwestern corner of the State.

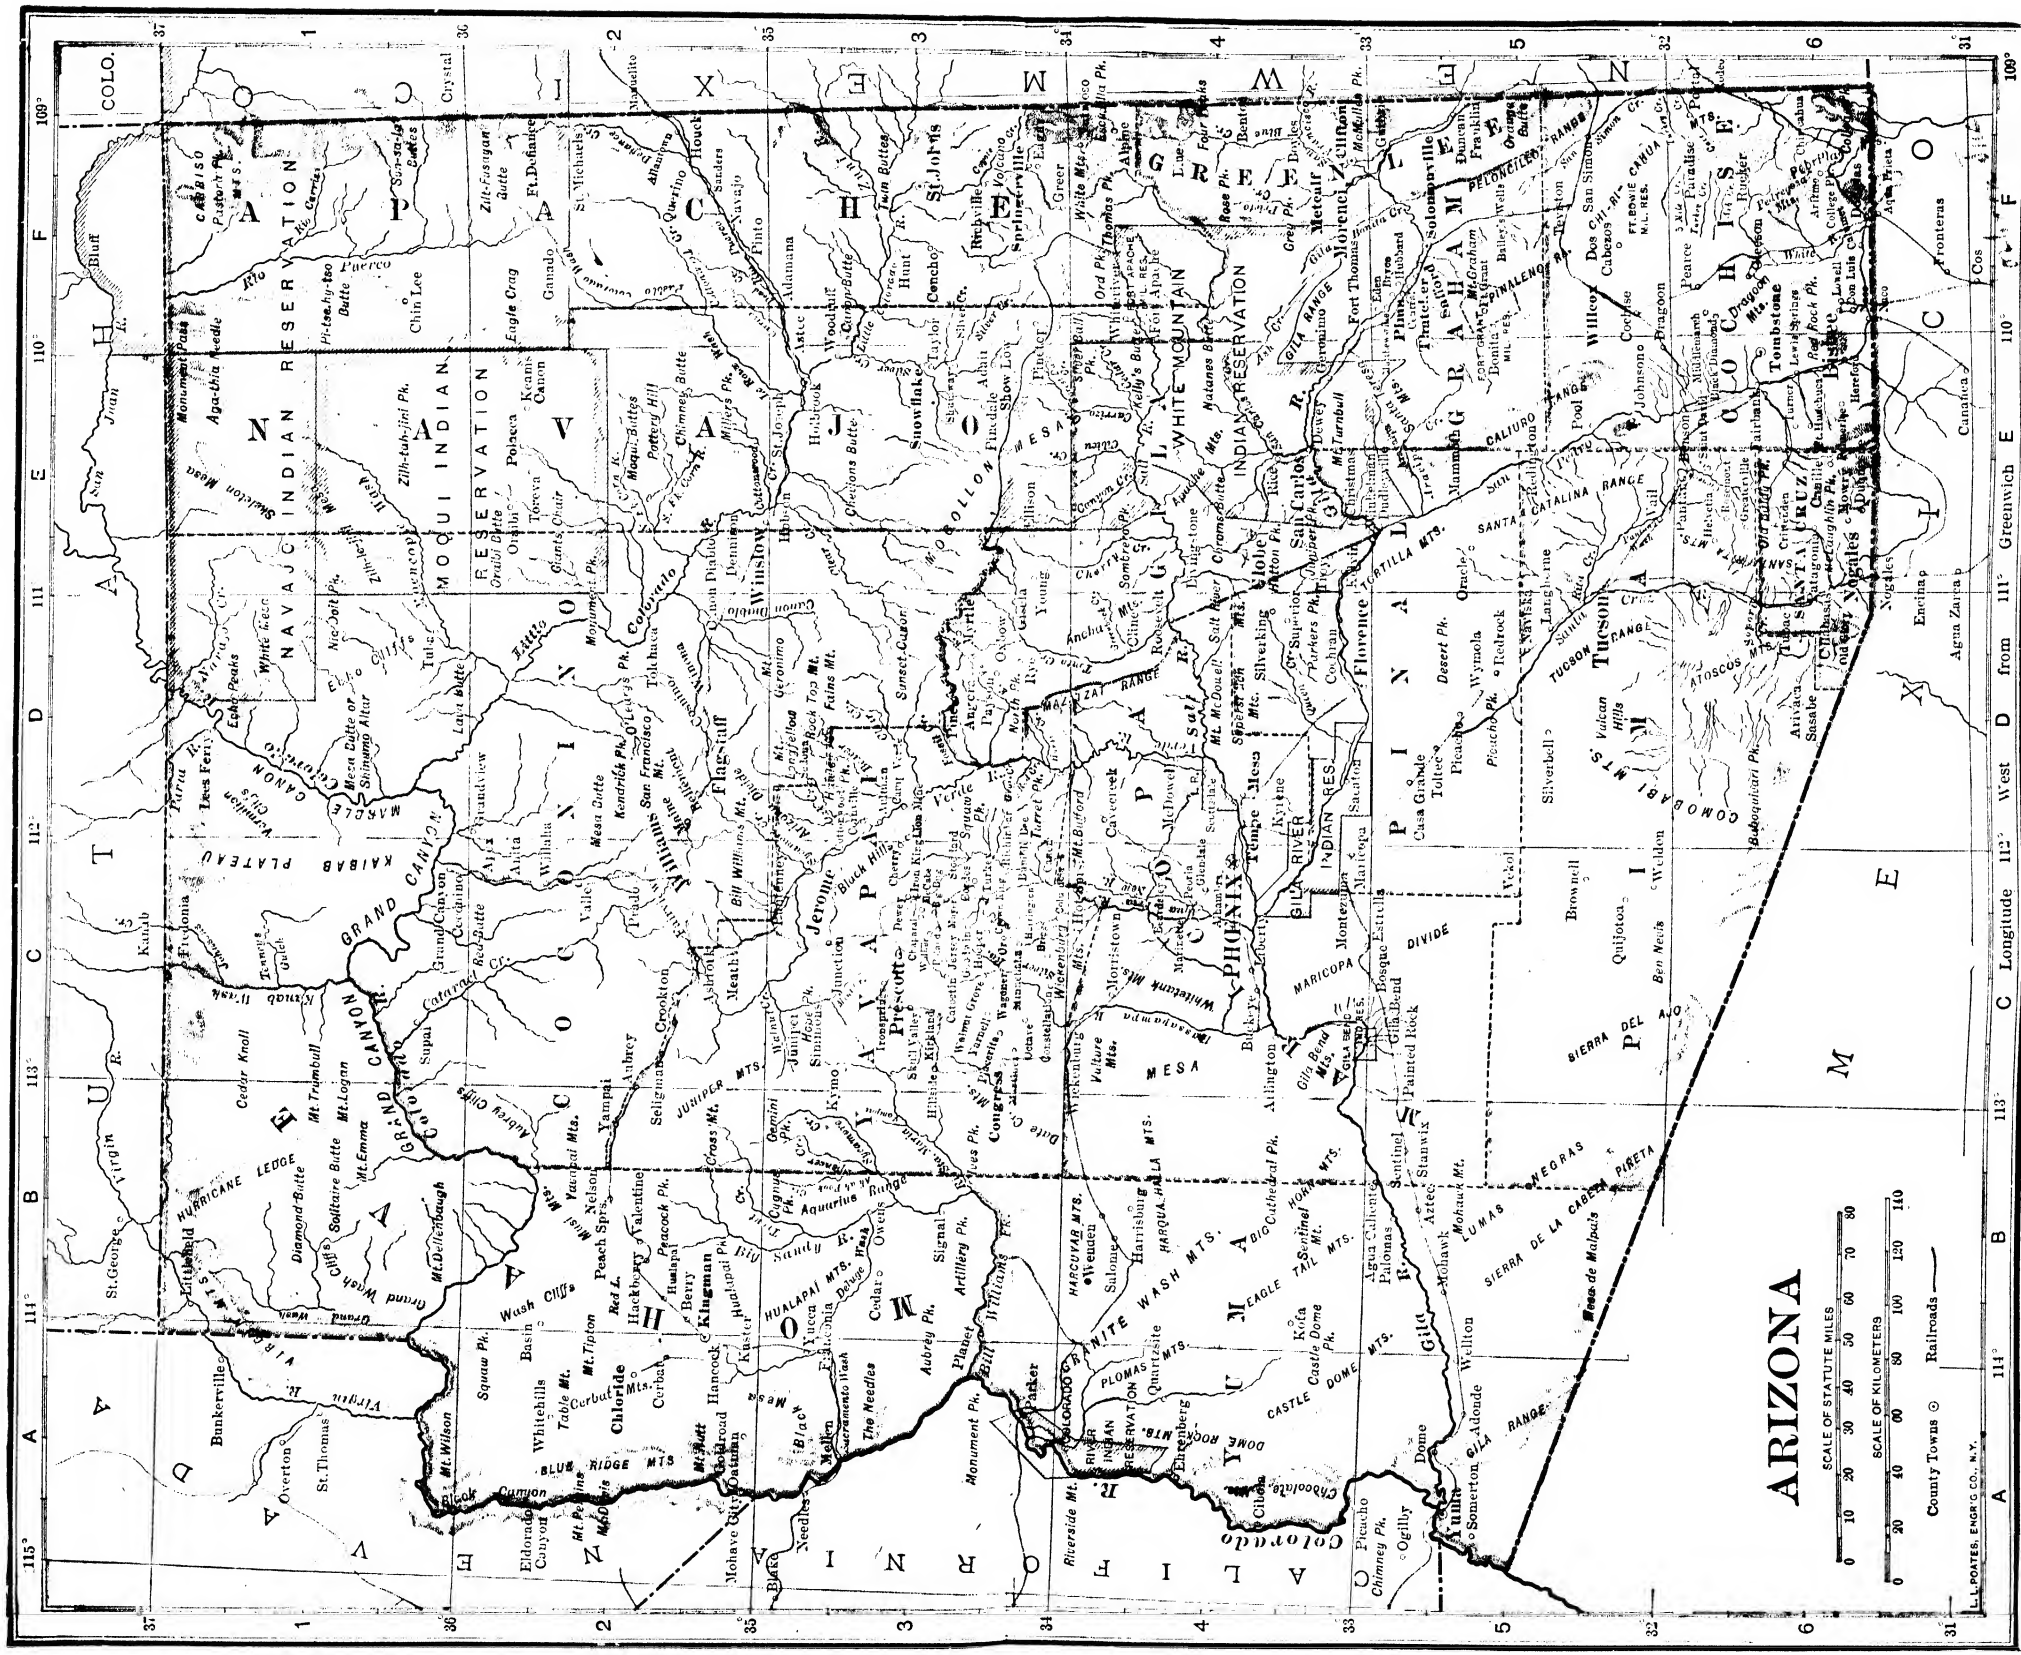

Climate and Soil. The climate of Arizona is, on the whole, dry and healthful, and it has the largest number of clear days of any part of the Union. The northern plateau region has a mean annual temperature of about 45° F., which is almost the same as that of many of the northern States, but without their extremes; the rainfall here is approximately 20 inches per annum among the mountains but much less on the plateau surface. In the lower lands of the southern half of the State the mean temperature is about that of New Orleans (69° F.) and the hottest weather occurs in the lower Gila valley where the mean temperature in July is 98° F. The rainfall, however, is much less than that in the northern section, scarcely exceeding an average of five inches per annum—the heaviest fall (about 13 inches)

being in the district of Tucson. The soil varies from light loam to heavy, dense adobe. In many places along the rivers it is very productive when supplied with water. Elsewhere it is alkaline and lacking in nitrogen and humus matter. The flora and fauna are those of the region extending from southern California around to southwestern Texas. See UNITED STATES, *Flora*; ROCKY MOUNTAINS.

Geology. Northern Arizona consists of a vast series of Carboniferous and Mesozoic marine strata covered by a series of Tertiary lacustrine and terrestrial formations; in all, originally some 15,000 feet thick. A great uplift occurred during Eocene time, and subsequent erosion has carved the land surface into mesas and valleys. A second uplift with much volcanic action occurred about the close of Miocene time. In southern Arizona the changes were not so marked. The State has abundant deposits of valuable minerals, which are described in the paragraph on *Mining*. In Apache County, south of Adamana on the Santa Fe Railroad, are four fossil forests. Trunks of trees to the thickness of four feet are found completely silicified and cracked into blocks of beautiful coloring which are of great value for ornamental purposes. See FOSSIL FOREST.

Mining. The natural mineral resources of Arizona are probably surpassed by those of no other State of the Union. Until within a comparatively recent period, however, the difficulty of access and the lack of proper transportation facilities, combined with local causes, have hindered the development of this wealth. The rapid growth of the mining industry in the State indicates that these difficulties are being overcome.

As far back as the time of the Spanish explorers, it was known that copper existed in the region now included within the boundaries of Arizona, but the mining of this metal on a large scale dates only from the early eighties. Production has steadily increased, and in 1910 Arizona took from Montana the first place as a producer of copper ore. The growth of copper production is shown by the following figures: 1883, 23,874,963 pounds; 1899, 133,054,860 pounds; 1904, 191,602,958 pounds; 1910, 297,250,538 pounds; 1911, 303,202,532 pounds; and 1913, 414,593,000 pounds. The value of the product in the last-named year was about \$64,000,000. Remarkable increase since 1909 is shown by the fact that the figures of the thirteenth census, which are for that year, show a value of the product of \$34,614,116, or hardly more than half the value of the product of 1913. The larger part of the copper is mined in Cochise, Greenlee, Yavapai, Gila, and Pinal counties. The mines in Pinal, Gila, and Greenlee counties produced nearly 49 per cent of the total output in 1912, the output of Pinal County alone increasing 21,449,418 pounds in that year. In Cochise County is the Warren or Bisbee district. Greenlee County embraces the Copper Mountain and Greenlee districts of the Clifton-Morenci region. Yavapai County includes the Verde district with the famous United Verde mines, and Gila County includes the Globe district. In Gila and Pinal counties the low-grade, so called "porphyry" ores, which include deposits in schists, produced 76,748,299 pounds in 1912, compared with 30,636,515 pounds in 1911. There are about 10 copper-smelting plants in regular operation in the State. In 1909 there were 11,394 wage-earners in the copper mines.

Gold mining has not been greatly developed. The production in 1913 was 191,000 ounces, valued at \$3,948,000, an increase in value of \$175,792 over the product of 1912. Of the output, about 42 per cent came from dry or silicious ore, and most of the remainder from copper ores. The largest production of gold is made in Mohave County, whose mines in 1912 yielded 91,870 ounces. The silver production in 1913 was about 3,773,000 ounces, valued at \$2,263,000, an increase of about 8 per cent over the production of 1912. The increase was due largely to increased shipments of lead ore. The greater part of the silver is found in Cochise and Yavapai counties. Over two-thirds of the total output came from copper ore, the remainder from silicious ore and lead ore. Lead is mined in the State in considerable quantities, and the production in 1913 showed a large increase over that of 1912. In the latter year nearly 14,000,000 pounds, valued at \$612,000, were produced, compared with 6,806,443 pounds, valued at \$306,390, in 1912. About 55 per cent of the lead output comes from Cochise County. The production of zinc (spelter) amounted in 1913 to 9,100,000 pounds, valued at \$510,000, which was an increase of 341,758 pounds in quantity, and an advance of about \$170 in value over the production in 1912. Nearly 95 per cent of the production came from Mohave County. The total value of the gold, silver, copper, lead, and zinc in 1913 was over \$71,000,000, compared with the value of \$67,050,785 in 1912. The difference was caused chiefly by the increased copper production. In 1912 there were 445 producing mines, and, in 1911, 397. Other minerals, including mercury, tungsten, vanadium, clays, salt, and precious stones, are also found in the State, but not in sufficient quantities to make them of great importance. In 1913 a deposit of alunite was found in the Nogales region in southern Arizona. The mineral is seldom found pure in nature, but its deposits are important as a possible source of both potash and aluminium.

Agriculture. Although Arizona ranks fifth among the States in land area, climatic and soil conditions prevent its being among the important agricultural States. The northern and north-eastern portions of the State form a high plateau, rising from 4000 to 8000 feet above sea level with an average elevation of 4100 feet. The southern and southwestern parts of the State, lying within the extremely arid southwestern portion of the United States, consist of broad desert plains, interspersed with parallel ranges of mountains. In the eastern half of the State precipitation ranges from 1 to 10 inches annually, and in the eastern half from 10 to 25 inches.

Of the entire land area, only 1.7 per cent was in farms in 1910. In the same year the farms numbered 9227, compared with 5809 in 1900. In these tabulations ranges and ranches belonging to the public domain and used for grazing purposes are counted as farms. The land in farms in 1910 was 1,246,613 acres and in 1900 1,935,327 acres, a decline of 35.6 per cent in the decade. The improved farm land, however, increased from 250,521 acres in 1900 to 350,173 in 1910. That farming in the State tends to become more intensive is shown by the fact that the average acres per farm in 1900 was 333.2, while in 1910 it was 135.1.

The value of all farm property in 1910 was \$75,123,970. In 1900 it was \$29,993,847. This

includes land, buildings, and live stock. The average value of property per farm in the two census years was \$8142 and \$5163, while the average value of land per acre was \$33.97 and \$5.90.

Of the 9227 farms in the State in 1910, 8366 were operated by owners or managers and 861 by tenants. Of the owned farms, 7038 were free from mortgage. More than one-half averaged from 100 to 174 acres. Native white farmers numbered 5218, and the foreign-born white, 806. The non-whites numbered 3203, of whom 3159 were Indians.

The acreage, value, and production of the principal crops in 1912 and 1909 are shown in the table below. The figures for 1912 were compiled by the United States Department of Agriculture, while those for 1909 are those of the thirteenth census.

		Acreage	Production bushels	Value
Wheat,	1912	16,000	528,000	\$528,000
	1909	15,605	298,664	293,847
Corn,	1912	23,000	707,000	778,000
	1909	20,028	362,875	410,214
Oats,	1912	6,000	268,000	188,000
	1909	5,867	189,312	130,384
Potatoes,	1912	1,000	125,000	156,000
	1909	1,151	97,141	98,567
Hay,	1912	113,000	384,000*	4,608,000
	1909	102,490	259,750	2,553,228

* Tons

Hay, including forage of all kinds, constitutes by far the most valuable crop of the State. The chief forage crop is alfalfa, which yields from three to five crops a season.

In 1910, according to the thirteenth census, the cattle in the State numbered 824,929. By far the greater number of these were cattle on grazing ranges, which were being grown for the market. The value of all cattle in 1910 was \$4,209,726. Figures of the United States Department of Agriculture for Jan. 1, 1913, show 812,000 cattle on that date. The following figures for other live stock are from these respective sources. Horses, 1910, 99,578; value, \$4,209,726; 1913, 108,000; mules, 1910, 3962; value, \$399,449; 1913, 5200; sheep, 1910, 1,226,733; value, \$4,400,514, 1913, 1,570,000; swine, 1910, 17,208; value, \$113,714; 1913, 23,000; poultry of all kinds, 1910, 268,762; value \$1,545,966.

The total value of all crops in 1910 was \$5,497,000. This was an increase of 122.3 per cent over the value of the preceding year, but this is partly accounted for by higher market prices which prevailed in 1909. In addition to the crops mentioned in the table above, there are other agricultural and horticultural products of considerable value. Orchard fruits are grown in limited areas. The value of these in 1909 was \$241,110. Apples, peaches, and pears are the most important. Small fruits are grown in limited areas. The value of these in 1909 was \$12,987. Strawberries made up the most of this total. The growing of sugar beets is becoming an industry of importance. In 1900 there was no reported production, but in 1910 the product was valued at \$237,000.

Irrigation. The successful cultivation of practically all farm land in the State is possible only by irrigation. In 1909, 4,841 farms containing 320,051 acres, or 91.4 per cent, of all the improved farm land were irrigated. In the

following year, existing irrigating enterprises were ready to supply water to 387,655 acres. There were in the latter year 1267 independent irrigating enterprises, with 2597 miles of ditches; 402 reservoirs, with a capacity of 1,349,938 acre feet of water, and the cost of the enterprises to July 1, 1910, was \$17,677,966. On March 18, 1911, the Roosevelt storage dam was opened. This dam, which is 283 feet high, creates a great artificial lake, whose waters will reclaim more than 200,000 acres of arid land. The immense Yuma irrigation project, which is partly in California, was approaching completion in 1913. See IRRIGATION; RECLAMATION; DAMS.

Stock Raising. The raising of cattle for market on the grazing lands of the State has always been its most important agricultural industry. Although stock raising will probably maintain its relative importance for many years, similar conditions to those which have affected the industry in other Far Western States promise to bring about radical changes. The government has taken over for national forests large areas which were heretofore free for grazing. Other portions have been taken for cultivation, and, as the irrigation projects continue to be completed and put in operation, still larger tracts of land which have hitherto been adapted only for grazing purposes will be available for cultivation. The pasture lands of the State are confined chiefly to the northern plateau. Rain-fall in the southern portion is insufficient for the growth of grasses, except under a few mountain slopes.

Of the total number (824,929) of cattle in the State in 1909, only 28,862 were classified as dairy cows which were kept for milk. Practically all other cattle were being raised for market. All classes of cattle except calves increased during the decade 1900-10. The total

numbered 590,000, as compared to 384,091 in 1910.

As in the other Far Western States where cattle raising has been a leading industry, changing conditions have made the raising of sheep more profitable. In 1906 the sheep on the ranges numbered 734,000, while in 1910 they numbered 1,226,733, and in 1913, according to United States Department of Agriculture, 1,570,000.

Manufactures. Manufacturing industries are, as is to be expected, little developed. They are chiefly connected with the smelting and refining of copper. That there has been a healthy growth in manufacturing, however, is shown by the relative figures for 1904 and 1909. In the former year there were 169 manufacturing establishments in the State, while in the latter year these had increased to 311. The industries, as a whole, showed a much greater development during the five-year period, 1904-09, than during the period 1899-1904. While the number of establishments increased 84 per cent and the value of the products 79 per cent, from 1904 to 1909, the average number of wage-earners increased only 34.4 per cent, and the value added by manufacture 23.5 per cent. The comparatively low percentage of increase in value on all manufactures is due largely to figures reported for the copper-smelting and refining industry. Manufacturing operations in this industry frequently are so closely related to those of mining that it is not always possible to separate mining and manufacturing expenses. Increased volume of manufactures during the period 1904-09 can be attributed to some extent to the increase in the price of commodities that took place during that period. The essential facts in regard to manufactures in the State in 1909 and 1904 are shown in the following table:

COMPARATIVE SUMMARY FOR 1909 AND 1904

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY				Capital	Salaries	Wages	Value of products
			Total	Proprietors and firm members	Salaried employees	Wage-earners (average number)				
							Expressed in thousands			
All industries	1909	311	7,202	261	500	6,441	\$32,873	\$798	\$5,505	\$50,257
	1904	169	5,217	133	291	4,793	14,396	472	3,969	28,083
Bread and other bakery products	1909	40	164	45	7	112	133	6	96	478
	1904	16	91	24	1	66	85		53	245
Butter, cheese, and condensed milk	1909	11	75	1	16	58	240	22	51	538
	1904	5	39	2	7	30	180	7	22	267
Cars and general shop construction and repairs by steam railroad companies	1909	10	1,141		52	1,089	677	77	976	2,394
	1904	7	1,198		39	1,159	523	54	901	1,329
Flour-mill and gristmill products	1909	10	75	4	17	54	674	26	42	1,317
	1904	9	50		14	36	404	18	24	743
Ice, manufactured	1909	23	152	9	26	117	1,080	28	112	501
	1904	13	97	12	13	72	420	12	55	256
Lumber and timber products	1909	23	911	30	42	839	2,342	106	639	1,419
	1904	9	576	8	26	542	1,469	56	413	1,037
Printing and publishing	1909	64	408	51	89	268	680	104	232	784
	1904	50	269	37	43	189	397	51	161	470
Smelting and refining, copper	1909	8	3,268		139	3,129	21,487	310	2,776	41,059
	1904	7	2,456		107	2,349	9,341	218	2,050	22,762
All other industries	1909	122	1,008	121	112	775	5,560	119	581	1,767
	1904	53	441	50	41	350	1,577	56	230	971

value of cattle was in 1909 \$14,624,708. Of this amount \$1,273,076 was the value of dairy cows. In 1906 the beef cattle on the ranges

It will be seen from this table that the average number of wage-earners in Arizona in 1909 was 6441, and of these 3129 were engaged in indus-

tries connected with the smelting and refining of copper. Of the wage-earners in 1909 only 38 were females. There were but 37 persons under 16 years of age employed in the manufacturing industries. In addition to the industries mentioned in the table above are the Portland cement mines at Roosevelt, which are operated in connection with the Salt River irrigation project. This is one of the largest industries in the State, and the value of this product in 1909 was \$214,132. Unlike conditions in most other States, manufacturing industries in Arizona are not centered chiefly in the largest towns. Phoenix and Tucson are the only incorporated places having a population of 10,000 or over. In these two cities are included only 92 manufacturing establishments, while in the outside districts there are 219. The value of the products of the industries in the two cities in 1909 was \$3,503,762, while for the outside districts it was \$46,752,932.

Transportation. The lower course of the Colorado constitutes the only navigable waters of the State. The Southern Pacific, running across the southern end of the State, the Santa Fe Pacific across the northern end, and the Santa Fe, Prescott, and Phoenix connecting the two, are the principal railroads. The mileage has increased from 349 miles in 1880 to 1094 miles in 1890, to 1465 miles in 1899, and to 2135 in 1913. There were 54.19 miles of electric railroads in 1913.

Banks. In 1912 there were 51 banks, whose deposits totaled \$22,014,683. In the number were included 13 national banks with deposits of \$7,156,021, 25 State banks with deposits of \$8,919,935, and 1 savings bank with deposits of \$429,709.

Finance. The State constitution provided for a State board of equalization, to consist of the chairman of the Board of Supervisors of the various counties, and the State Auditor. A board of equalization was provided for each county, consisting of the board of supervisors in these counties. An amendment to the constitution, ratified in November, 1912, allowed the Legislature to prescribe a method of assessment, equalization, and levy of taxes. The State Tax Commission was created by the same Legislature, and a graduated collateral inheritance tax law was passed. The constitution exempts from taxation all Federal, county, State, and municipal property. The property of educational, charitable, and religious associations or institutions not used or held for profit may also be exempted from taxation. The receipts for the fiscal year ending June 30, 1913, were \$3,825,367, and the disbursements \$3,193,352. At the beginning of the year there was a balance on hand of \$411,441, leaving, at the end of the fiscal year 1913, a balance of \$1,073,456. The chief revenue was from taxes, and the total amount collected by county taxation in 1913 was \$1,252,573. The chief expenditures were for the support of State institutions for education and for the administration of the State government. The bonded indebtedness of the State at the end of the fiscal year 1913 was \$2,098,302.

Education. The State constitution provided for passage by the Legislature of laws for the establishment and maintenance of a general and uniform school system, including kindergarten, common, high, normal, and industrial schools, a University which should include an agricultural college, a school of mines, and other technical schools. In accordance with this

provision, the Legislature of 1912 passed an educational code. The general conduct and supervision of the public school system of the State is vested in a State Board of Education, a State Superintendent of Public Instruction, and County School Superintendents. The Board of Education is composed of the Governor, the Superintendent of Public Instruction, the president of the university, and principals of State normal schools. A permanent school fund for the use of the common schools is derived from the sale of public school lands or other public lands and from other sources. The income derived from this fund is apportioned annually to the various counties of the State, in proportion to the various number of pupils of school age residing therein. The revenue for the maintenance of the State educational institutions is derived from the investment of the proceeds of the sale and from the rental of certain lands set aside for the use of the respective institutions. In addition to this income the Legislature is authorized to make appropriations to be met by taxation, to insure the proper maintenance of all State educational institutions, and is empowered to make such special appropriations. Laws passed by the Legislature of 1912 provide for free text-books in public schools, for county scholarships in the State university, and for the retirement on a pension of \$600 a year of any teacher who has served in the public schools for 25 years or more. In the school year 1912-13 the school population of the State was 46,681. Of these 35,160 were enrolled, and the average attendance in the schools was 25,003. The average length of the school year was eight months. Total revenue for educational purposes for the year was \$1,876,647, and expenditures \$1,321,595. The proportion of illiterates is comparatively large. Of the total population of 10 years and over in 1910, 20.9 per cent were illiterate, as compared with 29 per cent in 1900. The large proportion of illiterates is accounted for chiefly by the large number of Mexicans. The census taken in 1910 showed a school population from 6 to 20 years inclusive of 56,897. Of this number 29,496 were males and 27,401 females. Total school attendance in that year was 30,355: 15,472 males and 14,883 females. The attendance of the urban schools was 7512; rural schools, 16,179.

Charitable and Correctional Institutions. These include the State prison at Florence, the State Industrial School, the State Insane Asylum at Phoenix, the Home for Aged and Infirm Arizona Pioneers at Prescott, and the Florence Crittenden Home at Phoenix; and The Arizona Children's Home at Phoenix. A new building for the State prison was erected in 1912-13. The United States government donated to the State the site of Fort Grant near Willcox, and to this place the State Industrial School, formerly at Benson, was removed. The Legislature of 1912 passed a child-labor law and a parole law. The latter provided for an indeterminate sentence for prisoners and for a Board of Commissioners of paroled prisoners. An act was passed, making it a felony for a parent to fail to provide his or her minor child with necessities and making it a felony for a husband to abandon his wife or fail to provide for her. Another measure provided for the commitment of destitute, homeless, and depraved women, and neglected, abandoned, and homeless children, to the Florence Crittenden Home at Phoenix. An-

other act provided for the care, maintenance, and instruction of blind children under school age.

Religion. The Catholics were first in the field. As early as 1687 the Jesuits had established missions and schools in the State and have been always active in the propagation of their faith. This sect still constitutes a large percentage of the church membership of the State. In recent years the State has been colonized by Mormons, who now rank next to the Catholics in numbers.

Population. The population of Arizona by decades is as follows: 1870, 9658; 1880, 40,440; 1890, 88,243; 1900, 122,931; 1910, 204,354. Of the total population in 1910, 171,468 were white, 29,201 were Indians, 2009 were negroes, 1305 were Chinese, and 371 were Japanese. Native whites numbered 124,744; those of native parentage, 82,478; foreign parentage, 26,170; mixed parentage, 16,260; and rural, 141,094. Of foreign-born whites, by far the larger number were Mexicans; these numbered 51,102, or over half the total foreign-born population. The population was divided by sexes as follows: Males, 118,574; females, 85,780, or 138.2 males to every 100 females. The males of voting age numbered 74,051. There were seven incorporated cities in the State. These with their population in 1910 are: Bisbee, 9019; Clifton, 4874; Douglas, 4437; Globe, 7083; Nogales, 3514; Prescott, 5092; Yuma, 2914. Phenix is the capital.

Indians. The Indians in the State in 1910 numbered 29,201, compared with 26,480 in 1900. Of the total in 1910, only 773 were in incorporated towns, the remainder living on reservations. By far the greater number belonged to the Navajo tribe. They are nearly all engaged in agricultural pursuits, and their condition has greatly improved in recent years.

Militia. The total number available for military duty in 1910 was, according to the thirteenth census, 58,962. The organized militia is comprised in a regiment of infantry called the First Infantry, and a troop of cavalry, Troop A. The combined strength of these in 1912 was 663. The official designation of the militia is the National Guard of Arizona.

Government. The constitutional convention which was in session at Phenix from Oct. 15 to Dec. 9, 1910, adopted a constitution which was ratified by the people at a special election held Feb. 9, 1911. Certain features, chiefly the provision for the "recall" of judges, led to President Taft's refusal to give his approval until the objectionable features were eliminated. (See *History* below.) Congress thereupon passed a resolution which required the people to adopt an amendment omitting judicial officers from the clause providing for recall. This amendment was adopted at a general election held on Dec. 12, 1911. The action of President Taft was rendered null and void by the adoption of an amendment on Nov. 5, 1912, which restored the original clause by which the recall is applicable to all elective officers.

Legislative.—Legislative authority is vested in a Senate and House of Representatives. To the people is reserved the power of proposing laws and amendments to the constitution, and to enact or reject laws or amendments at the polls, independent of the Legislature; and to them is also reserved, for use at their own option, the power to approve or reject at the polls any act or item, section, or part of any act, of the Legislature. These reserved powers constitute the

initiative and referendum. Under the initiative 10 per cent of the qualified electors have the right to propose any measure, and 15 per cent have the right to propose any amendment to the constitution. Under the referendum the Legislature, or 5 per cent of the qualified electors, may order the submission to the people at the polls of any measure or item, section, or part of any measure, enacted by the Legislature, except laws immediately necessary for the preservation of the public peace, health, or safety, or for the support and maintenance of the departments of the State government and State institutions. Any measure or amendment to the constitution proposed under the initiative, and any measure to which the referendum is applicable, is referred to a vote of the qualified electors, and becomes a law when approved by a majority of the votes cast thereon and upon proclamation of the Governor and not otherwise. The veto power of the Governor does not extend to initiative or referendum measures approved by a majority of the qualified electors.

The Senate consists of 19 members, and the House of Representatives of 35 members. Members of the Legislature must be citizens of the United States at the time of election, and be at least 25 years of age, and residents of Arizona at least three years, and of the county of which they are elected at least one year before election. Regular sessions of the Legislature are held biennially, the Governor having power to call special sessions whenever advisable.

Executive.—The executive department consists of the Governor, Secretary of State, State Auditor, State Treasurer, Attorney-General, and Superintendent of Public Instruction, and all hold office for two years. No person is eligible to succeed himself in the office of State Treasurer for two years after the expiration of the term for which he shall have been elected. The salaries of the executive officers are as follows: Governor, \$4000; Secretary of State, \$3500; State Auditor, \$3000; State Treasurer, \$3000; Attorney-General, \$2500; Superintendent of Public Instruction, \$2500.

Judiciary.—Judicial power is vested in supreme courts, superior courts, justices of the peace, and such courts inferior to the superior court as may be provided by law. The supreme court consists of three judges, a majority of whom constitutes a quorum, which is necessary for decision. Judges of the supreme court are elected at a general election, and their term of office is coterminous with that of the Governor of the State elected at the same time; and the one receiving the highest number of votes is chief justice.

Suffrage and Elections.—The constitution, as originally adopted, provided that no person should be entitled to vote at a general election upon any question submitted to a vote of the people (except school elections), unless such person was a male citizen of the United States of the age of 21 years or over. An amendment to the constitution adopted Nov. 5, 1912, extended full suffrage to women. Nominations for candidates for all elective, State, county, and city offices, including representatives for Congress, are made under a direct primary election law. Up to the time of the adoption by the States of the constitutional amendment providing for the direct election of Senators, the nomination of United States Senators was also controlled by the direct primary election law. There are

stringent measures to provide for purity of elections and to guard against abuses of the elective franchise. There is a law providing for general publicity before and after election of all campaign contributions to, and expenditures of, campaign committees and candidates for public office.

Every public officer in the State holding an office, either by election or appointment, is subject to recall from such office by the qualified electors of the district from which candidates are chosen. Twenty-five per cent of those who voted at the last preceding general election for all of the candidates for the office held by such officer may by petition, which shall be known as a recall petition, demand his recall. Every recall petition must contain a general statement of not more than 200 words of the grounds of such demand. No petition shall be circulated against any officer until he shall have held his office for a period of six months, except that it may be filed against a member of the Legislature at any time after five days from the beginning of the first session after his election.

Local and Municipal Government.—Any city with a population of over 3500 has the power to frame a charter for its own government. Municipal governments are forbidden to grant, extend, or renew a franchise without the approval of a majority of the qualified electors residing within their corporate limits, who shall vote thereon at a general or special election; and no franchise must be granted, extended, or renewed for a longer time than 25 years. By an amendment to the constitution adopted Nov. 25, 1912, no county, city, town, school district, or other municipal corporation may for any purpose become indebted in any manner to an amount exceeding 4 per cent of the taxable property without the consent of a majority of the property taxpayers, who must also be qualified electors. Exceptions to this law are made in the matter of indebtedness for water, artificial light, or sewer need, and controlled by the municipality.

Miscellaneous. The constitution prohibits plural or polygamous marriages, and the sale or gift of intoxicating liquors to Indians. Public service corporations are supervised by a State Corporation Commission. The Legislature of 1912 passed an elaborate public-service corporation act. The lawful day's work in all employment by the State is eight hours. The employment of children under 14 during school hours, and of children under 16 in mines, is forbidden. It also passed an employers' liability act applying to dangerous occupations. Columbus Day was made a legal holiday, and a State laboratory for the analysis of food and drugs was established. A pure food law was enacted in 1913.

History. Long before its discovery by white men, Arizona was inhabited by a powerful race, whose ruined cities, aqueducts, and fortifications dot the valleys and canyons of the State. In 1539 Fray Marcos de Niza, with a companion, left the City of Mexico to explore the country now included in Arizona and New Mexico, being stimulated by rumors of its mineral wealth, and of its populous Seven Cities of Cibola. The report brought back was so favorable that in 1540 Vasquez de Coronado led an expedition thither, visiting the Moqui villages and New Mexican pueblos. What is now Arizona was very sparsely settled before the beginning of

the nineteenth century. In 1772 there were only two missions, with three *visitas*, and two incipient towns, Tucson and Tubac. The hostility of the Apaches and other tribes prevented all advance, and outbreaks in 1802 and 1827, added to the disorder attending the Mexican Revolution, led to the abandonment of the mines and ranches and of all settlements, excepting Tucson and Tubac. By the Treaty of Guadalupe-Hidalgo, Feb. 2, 1848, Arizona, then included in New Mexico, became the property of the United States, except the tract south of the Gila, which was a part of the Mexican State of Sonora and was not acquired till Dec. 30, 1853. (See GADSDEN PURCHASE.) On Feb. 24, 1863, Arizona was separated from New Mexico and made a Territory. Indian troubles broke out as late as 1896, and tended in some degree to hinder the development of the country, but the population of the State has steadily increased as larger tracts of desert land have been reclaimed by irrigation and the mineral resources of the region have been utilized. On Dec. 1, 1891, a constitution was adopted by the people in anticipation of admission to the Union as a State, but Congress refused to grant the application.

In 1904-05, and again in 1905-06, Congress passed bills providing for the admission of Arizona and New Mexico as one State. This proposal met with strong objections in Arizona, and in 1906 the voters of the State rejected it. President Roosevelt thereupon declared that he would make no further effort to have the two Territories admitted as a single State. In 1908 a bill providing for the admission of Arizona separately was passed in the House of Representatives, but on account of charges of corruption and bribery on the part of leading officials in the Territories, it met such strong opposition in the Senate that it was dropped. Agitation for the admission of the Territories continued, both within Congress and outside, until on Jan. 20, 1910, an Enabling Act was passed and signed by President Taft. This act authorized the Governor of Arizona to call for the election of delegates for a constitutional convention, to prepare a constitution for the new State. This election was held on Sept. 12, 1910, and resulted in the election of 44 Democrats and 8 Republicans as delegates. The constitutional convention was in session from Oct. 15 to Dec. 9, 1910. The constitution prepared by this body was probably the most radical instrument ever formulated for the administration of a State. Among other provisions was included one for the recall of judges. The constitution was ratified on Feb. 7, 1911, by vote of 12,000 in its favor to 7500 against it. At the first session of the Sixty-second Congress, a joint resolution was passed which provided for the admission of the State and tacitly admitted the right of the people to pass as radical a constitution as they wished. This resolution was vetoed by President Taft in a message in which he severely criticised the provision for the recall of judges, and declared that he would never give his assent to a constitution which contained this provision. Congress thereupon passed another joint resolution, providing for the admission of Arizona as a State on condition that the provision for the recall of judges should be eliminated. The objectionable section was eliminated on Dec. 12, 1911, by a vote that was practically unanimous. The proclamation for-

mally admitting Arizona to the Union as a State was signed on Feb. 14, 1912. At the election held on Dec. 12, 1911, officers and a member of Congress for the new State were elected. An advisory vote for United States Senators was also taken. State officers had been nominated at a primary election held in March, 1911. The Democrats elected the entire State ticket, headed by George W. P. Hunt for Governor. The candidates for the United States Senator receiving the highest votes were Marcus A. Smith and Henry F. Ashurst. The Legislature elected included 15 Democrats and 4 Republicans in the Senate, and 30 Democrats and 5 Republicans in the House. Governor Hunt was inaugurated on Dec. 31, 1911. On March 27, 1912, the Legislature elected Marcus A. Smith and Henry F. Ashurst United States Senators. The result for the vote for President in Nov. 5, 1912, was: Wilson, 10,324; Roosevelt, 6949; Taft, 3021. As noted above, an amendment provided for woman's suffrage was carried at this election, as well as an amendment to the constitution restoring the provision for the recall of judges. The Legislature which met in 1913 passed measures restricting the ownership of land by aliens, intended to eliminate the ownership of land in the State by Japanese. These provisions were similar to but more severe than those passed by the Legislature of California in 1913. (See CALIFORNIA, *History*.) In spite of the protest by the Japanese government the bill was signed by Governor Hunt.

Following is the list of governors:

TERRITORIAL

John N. Goodwin	.. Republican..	1863-65
Richard C. McCormick	.. "	1865-69
A. P. K. Safford	.. "	1869-77
John P. Hoyt	.. "	1877-78
John C. Fremont	.. "	1878-81
John J. Gosper	.. "	1881-82
Frederick A. Tittle	.. "	1882-85
C. Meyer Zulick	.. Democrat ..	1885-89
Lewis Wolfley	.. Republican	1889-90
John N. Irwin	.. "	1890-92
Nathan B. Murphy	.. "	1892-93
Louis C. Hughes	.. Democrat ..	1893-96
Benjamin J. Franklin	.. Republican	1896-97
Myron H. McCord	.. "	1897-99
Nathan B. Murphy	.. "	1899-1902
Alexander O. Brodie	.. "	1902-05
Joseph H. Kibbey	.. "	1905-09
Richard E. Sloan	.. "	1909-11

STATE

G. W. P. Hunt	.. Democrat ..	1911-

ARIZONA, UNIVERSITY OF. A State university at Tucson, Ariz., established by act of the Legislature in 1885 and opened in 1891. It had in 1913 buildings and grounds valued at \$450,000; a library of 20,000 volumes and 15,000 pamphlets; a faculty of 42; and 180 collegiate, 71 sub-collegiate, and 77 non-collegiate students. It receives \$50,000 annually from the United States government and \$120,000 (approximately) from the State. It maintains departments of liberal arts, agriculture, civil, electrical, mechanical, and mining engineering, commerce, and home economics. President, A. H. Wilde, Ph D.

ARJISH, ĩr-jēsh'. See EBJISH DAGH.

ARJISH, or AKHĪLAT. A small town of Turkish Armenia, vilayet of Erzerum, on the north shore of Lake Van (Map: Turkey in Asia, K 3). Pop., about 4000. The modern Arjish consists of three parts. The fortress, with near-by mosques and houses, is on the shore of the lake. The old city, at a little distance from the present town, in a ravine, was the residence of the kings of Armenia and was the scene of many conflicts between Greeks, Armenians, and Persians. It was taken and devastated in 1229 by Jelal-ed-Din and completely destroyed by an earthquake in 1246. The residential portion, containing the gardens, is on an upper level. Arjish is the seat of an Armenian bishop.

ARJUNA, *Hind. pron.* ar'joo-nā. The grandson of Indra, and the hero of episodes in the *Māhābhārata*, one of the two national epic poems of India. Next to Krishna, he is the chief personage in the Bhagavad-gītā, the poetic episode of the *Māhābhārata* in which the religious and philosophical beliefs of India have found their most popular expression.

ARK. In the English version of the Bible the word is applied to three different objects: 1. To the craft which Noah built and in which he preserved himself, his family, and numerous animals alive during the flood. It is described in Gen. vi. It was of "gopher wood," which is perhaps conifer cypress, of which the Phœnicians built ships, and the "pitch" used was asphalt. Its dimensions were, in English measure: Length, 525 feet; breadth, 87½ feet; height, 52½ feet. It was not built for speed and merely floated about until the waters subsided. 2. To the basket of bulrushes (papyrus reed) daubed with slime, prepared by the mother of Moses, in which Moses floated on the Nile until Pharaoh's daughter rescued him (Ex. ii. 3 et seq.). 3. To the Ark of the Covenant (q.v.).

AR/KADELPHIA. A city and the county-seat of Clark Co., Ark., 65 miles southwest of Little Rock, on the St. Louis, Iron Mountain, and Southern Railroad and on the Ouachita River (Map: Arkansas, C 3). Arkadelphia, 300 feet above sea level, has good natural drainage and water power. Its manufactures comprise the products of lumber, stove, roller, and cotton mills, and foundry and machine shops. It is the site of Ouachita College (Baptist) and Henderson College (Methodist), founded 1886 and 1890, respectively, and has Baptist and Presbyterian schools for colored pupils, and a public library.

The charter of Arkadelphia, in effect since 1873, provides for a biennially elected mayor and a city council. Pop., 1890, 2455; 1900, 2739; 1910, 2745.

ARKANSAS, *är'kan-sq* (popularly known as the "Bear State"). A south central State of the United States, bounded by Missouri on the north, the Mississippi River (which separates it from Tennessee and Mississippi) on the east, Louisiana on the south, and Oklahoma and Texas on the west, with Texas touching the southwest corner. Nearly a square, each side measures about 250 miles. Its area is 53,335 square miles, of which 810 square miles are water. Among the States of the Union it ranks twenty-sixth in area and twenty-fifth in population.

Topography and Drainage. Excepting a few high ridges and the Grand Prairie of Lonoke, Prairie, and Arkansas counties, the eastern margin of the State is subject to inundation from the Mississippi River. But the region to the westward attains a higher elevation, and the surface is broken by numerous ranges of hills and low mountains, which have a general trend from east to west. These highlands cover almost half of the State. The mountains in the northwest are a part of the Ozark uplift, being continuous with the elevations in Oklahoma to the west and Missouri to the north. The highest points in the State do not exceed 2800 feet. The lowlands in the east and southeast have an average elevation of a little over 200 feet. The Arkansas River bisects the State from northwest to southeast and joins the Mississippi. The White River enters the State from southwestern Missouri, flows toward the southeast, receives the Black and Cache rivers from the north, and joins the Arkansas near its mouth. The Ouachita, Saline, and Bartholomew, tributaries of the Red River, drain the southern part. The Arkansas is navigable for boats of light draught throughout its course within the State: the White for 260 miles; the Ouachita and Bartholomew each for 150 miles; the Saline, Red, and Black each for 100 miles, making a total of some 3000 miles of waterways. The upper courses of some of the streams furnish water power.

Climate. Comparatively mild, the climate is pleasant and healthful. The snowfall is light, and prolonged droughts are unknown. The mean rainfall for the State is 40 inches; at Fort Smith, 46.5 inches. The heaviest annual rainfall is 54 inches in the region of the Ouachita Mountains. Mean temperatures for January and July respectively are as follows: At Little Rock (central), 40.8 and 80.3°; at Fort Smith (northwest), 36.1 and 80.0°.

Soils. The hill country of the northwestern part of the State has little land of agricultural value, the soil being sandy and thin; but the bottom lands are very productive. In the limestone regions are found much red clay and loam, the residual materials from the decomposition of the limestone. The higher lands of the Arkansas valley, from Fort Smith to Little Rock, are composed of a dark sandy loam. Below Little Rock a sandy, sometimes clayey, soil borders the river, and this grades toward the south into black, sandy, and "buck-shot" soils, which are the richest in the State and which yield from 2000 to 3000 pounds of seed cotton to the acre. The bottom lands of the Red River valley contain a black sandy loam or a red sticky clay called "gumbo." A

yellow loam is characteristic of some of the southern counties, which are underlain by deposits of the Tertiary Age.

Geology and Mineral Resources. A line drawn from a little north of Texarkana in the southwestern corner, through Little Rock to Pochontas in the northeast, divides the State into two approximately equal parts; the northwestern portion is underlain by Paleozoic rocks, with a small area of Cretaceous in its southernmost corner; the southeastern portion is occupied by the less consolidated strata of Tertiary and Post-Tertiary ages. The Paleozoic area is essentially the "hill country"; the Tertiary district is a part of the coastal plain. The oldest rocks known in the State are of the Ordovician or Lower Silurian Age. They extend over the line from Missouri and lie on the southern flanks of the Ozark uplift, and consist of sandstones, quartzites, and limestones, the latter in the upper part of the series. They furnish good building stones, quartz sand for glass making, and lime. Along the southern boundary of the Ordovician formations, in the vicinity of Batesville and Cushman in Independence and Izard counties, are deposits of manganese ore which have been worked to some extent. Another area of Ordovician rocks is found in the Ouachita Mountains west of Little Rock. In these mountains are large masses of a silicious rock, novaculite, from which are made the finest known whetstones, called in the markets "Arkansas" and "Ouachita" stones.

These whetstones are obtained in Garland, Howard, Hot Springs, Montgomery, Polk, Pulaski, and Saline counties, and their quarrying constitutes an important industry. In connection with the Ordovician rocks of the Ouachita uplift are found some deposits of manganese ore, but these are of little importance compared with those of the Batesville region. Around the edges of the Ordovician area of the northern part of the State is a narrow strip of Silurian limestone, the St. Clair limestone, that furnishes a fine quality of pink marble useful for ornamental purposes. The Devonian formation is poorly developed. It is known as the Eureka shale and the Sylamore sandstone, but is of importance for the reason that in connection with it are found phosphate deposits which give promise of yielding valuable returns. Despite reports, the State geologist says that there is little gold or silver in the Ouachita Mountains. Deposits of zinc blende have been discovered in Sevier County, and other occurrences of this ore, as well as of galena, are known in the northwestern part of the State. Aluminum ore in the form of bauxite occurs near Little Rock and farther west at Bryant in Saline County. Iron ores are of little importance, though they are found, at many places, in the form of limonite. Nickel is also known, but sparingly, in Saline County. The coal measures cover large areas and furnish a good quality of bituminous coal in abundance. Oil and gas have been found only in small amount. In the Cretaceous and Tertiary areas no metals have been found, but there are deposits of lignite and greensand.

Igneous rocks of great geologic interest are found at Magnet Cove and Fourche Mountain, in the eastern end of the novaculite region near Hot Springs. Mineral springs are common especially so in the Ouachita Mountains. Those at Hot Springs are famous for their medicinal

qualities and have led to the foundation there of a renowned health resort. Another hot spring has been discovered in Montgomery County. Mammoth Spring, in Fulton County, is one of the largest in the world and is reported to discharge 9000 barrels of water a minute.

Mining. For various reasons, such as lack of interior transportation facilities, mining in Arkansas has not progressed to an extent which its mineral resources warrant. It has, however, shown continual development in some directions. Coal is the chief mineral product. In 1912 coal production in the State was 2,120,000 short tons, compared with 1,950,000 short tons in 1911 and 2,220,000 in 1906. That the coal-mining industry has shown no marked increase in recent years is shown by the fact that the production in 1906 was 2,220,000 tons. Zinc is produced in considerable quantities. The value of the product of this mineral in 1912 was \$105,222. Lead is produced in small quantities. The product of 1912 was valued at \$2792. The State is a large producer of bauxite. Of this mineral there were mined, in 1912, 126,105 long tons, valued at \$768,932, compared with 125,448 tons, valued at \$750,649, in 1911. This figure included a small percentage mined in Tennessee. Arkansas is the only State in which diamonds have been found in any considerable quantity. The first discovery was made Aug. 1, 1906, near the mouth of Prairie Creek in the vicinity of Murfreesboro, Pike County, and since that time, approximately 1655 stones aggregating 550 carats have been found in this locality. Further search has resulted in the finding of three new areas in the same neighborhood. In 1913 a plant to wash the diamond-bearing earth was being erected near the mouth of the Prairie Creek. Among other minerals found are phosphate rock, oilstones, granite, limestone, slate, and building clay. Mineral waters are bottled at eight springs, and the yearly value of the product is in excess of \$100,000.

Forest and Forest Products. About three-fourths of the area of Arkansas is estimated to be still covered with forests, which are made up of about 125 species of trees. The bulk of the forest consists of two species of pine (on uplands), one of cypress (in the southeastern lowlands), several of oak and hickory, and the red or sweet gum, tupelo gum (in swamps), cottonwood (along rivers), yellow poplar ("tulip trees"), ash, maple, and elm. The hard woods predominate in most parts of the State, but most of the lumber cut at present is pine, because that is easier to handle in almost every way.

The thirteenth census reports 2060 saw mills in the State, with the following production of lumber, laths, and shingles for the year 1909: Pine, 1,313,668,000 feet; oak, 358,556,000; red gum, 200,953,000; cypress, 55,012,000; cottonwood, 55,507,000; hickory, 45,133,000; ash, 33,212,000; maple, 18,500,000; elm, 13,056,000; tupelo, 6,084,000; sycamore, 5,406,000; poplar, 4,484,000; all others, 2,729,000. Total, 2,111,300,000 feet, valued at \$31,839,283, which is about 4½ per cent of the total lumber production of the United States.

These figures do not include fuel, cross-ties, poles, posts, staves, veneers, etc., which of course are turned out in large quantities, or whole logs shipped to St. Louis, Memphis, New Orleans, etc. About 75 per cent of the pine lumber and 40 per cent of that from deciduous trees was

dressed or still further manufactured within the State.

Agriculture. Arkansas is one of the most distinctively agricultural States in the Union. Its soils are varied and are adapted to many forms of cultivation. Rainfall over the whole of the State is ample for all ordinary crops. The State is divided naturally into two agricultural sections. A line drawn through Little Rock from the northeastern to the southwestern point of the State would divide it about equally into a southeastern lowland division and a northwestern highland division. The Mississippi River and its principal tributaries are bordered by broad alluvial bottoms of low elevation and nearly level surface, above which rise the more rolling and elevated parts of the Coastal Plain. Within the Coastal Plain division are several flat inter-stream prairies and more rolling forested uplands. The valley of the Arkansas River lies in the northern and west central parts of the State.

The total number of farms in 1910 was 214,678, compared with 178,694 in 1900, or a gain of over 20 per cent. Out of the land area of 33,668,000 acres, 17,416,075 were in farms in 1910. The improved land in farms was 8,076,254, compared with 6,953,735 in 1900. The average number of acres per farm was 81.1 in 1910, compared with 93.1 in 1900. In 1910 the land, buildings, and live stock were valued at \$400,089,303, while in 1900 they had the value of \$181,416,001, a gain of 120.5 per cent. The average value of all property per farm in 1910 was \$1864, compared with \$1015 in 1900, while the average land was valued at \$14.38 per acre in 1910, and \$6.32 in 1900. Of the total number of farms, 214,678 in 1910, 107,412 were operated by owners and managers, and 107,266 by tenants. While the total number of farm operators increased 127.3 in the decade 1900-10, the number of tenants increased 267.5. Of 106,649 owned farms in 1910, 82,321 were free from mortgage, 22,374 were under mortgage. The native white farmers in 1900 numbered 148,627. There were 2458 foreign-born whites and 63,593 non-white farmers. Of the non-white farmers, nearly all were negroes, only 15 being Indians.

The most important agricultural product of Arkansas is cotton. In 1909 the acreage devoted to cotton was 26.7 per cent of the entire improved farm land in the State, and the value of the cotton crop was more than half the combined value of all other crops. Acreage value and production of the principal crops in 1909 and in 1912 are shown in the following table:

		Acreage	Production bushels	Value
Corn	1912	2,475,000	50,490,000	\$33,828,000
	1909	2,277,116	37,809,544	27,910,044
	1912	94,000	940,000	884,000
Wheat	1909	60,426	526,414	532,712
	1912	175,000	3,482,000	1,741,000
	1909	197,449	3,212,891	1,641,752
Oats	1912	1,000	10,000	10,000
	1909	1,080	7,354	6,834
	1912	90,800	3,405,000	3,201,000
Rye	1909	27,419	1,282,830	1,158,103
	1912	25,000	1,750,000	1,610,000
	1909			
Rice	1912	286,000	352,000*	4,224,000
	1909	435,915	461,817	4,487,139
	1912	800	520,000†	94,000
Potatoes	1909	758	316,418	40,489
	1912	1,191,000	1,021,000‡	55,246,000
	1909	2,153,222	776,879	54,559,503

* Tons.

† Pounds.

‡ Bales of 500 pounds each.

The acreage devoted to cotton, cereal crops, and potatoes has shown a steady increase from 1879 to 1909. Orchard and small fruits are of considerable importance, value of the former in 1909 being \$3,011,377. Of these peaches and nectarines were the most important and were valued at \$1,502,996. The value of the apples produced in that year was \$1,322,785. Other orchard fruits grown are plums, pears, cherries, and apricots. Of small fruits, strawberries are by far the most important, and the value of this fruit in 1909 was \$549,041. The raising of flowers and plants and of nursery products is also of some importance. In 1909, 554 acres were devoted to these products, and the output was valued at \$352,000. Sugar beets are grown on a small scale. In 1909 they were valued at \$3945. Sorghum cane and sugar cane are grown in considerable quantities. The value of sorghum cane in 1909 was \$658,075; of sugar cane, \$152,298.

farms reporting irrigation for rice growing in 1910. According to reports of the United States Department of Agriculture, the acreage in 1912 was 90,800, the product being 4,405,000 bushels and the value \$3,201,000.

Manufactures. The industries of Arkansas have shown marked increase in recent years. While in 1849, 261 manufacturing establishments then reporting gave employment to an average of 842 wage-earners, representing .4 of one per cent of the total population of the State, in 1909 an average of 44,982 wage-earners were employed, representing 2.9 per cent of the total population. During this period of sixty years, the gross value of products per capita of the entire population increased from \$2.56 to \$47.58. The following table gives a comparative summary of 1909 and 1904 of the most important facts relating to the manufactures valued at \$1,000,000 or over:—

COMPARATIVE SUMMARY FOR 1909 AND 1904

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY				Capital	Salaries	Wages	Value of products
			Total	Proprietors and firm members	Salaried employees	Wage-earners (average number)				
Expressed in thousands										
State — All industries	1909	2,925	51,730	3,455	3,293	44,982	\$70,174	\$3,461	\$19,113	\$74,916
	1904	1,907	37,557	2,140	2,328	33,089	46,306	2,310	14,544	53,864
Bread and other bakery products	1909	133	491	161	20	310	421	12	161	1,177

Oil, cottonseed, and cake	1909	44	1,350	3	261	1,086	5,239	281	441	7,789
	1904	42	1,135	3	210	922	4,106	197	329	4,940
Printing and publishing	1909	295	1,672	417	274	981	1,910	212	538	2,082
	1904	277	1,360	361	104	895	1,315	93	438	1,443

According to the thirteenth census the total value of live stock on farms in the State was \$71,794,486 in 1910. Of this, cattle numbered 1,028,071, valued at \$15,460,666; horses, 254,716, valued at \$23,152,209; mules, 222,200, valued at \$5,170,924; sheep, 144,189, valued at \$327,984. The United States Department of Agriculture reports for Jan. 1, 1913, 270,000 horses, 233,000 mules, 892,000 cattle, 130,000 sheep, and 1,529,000 swine. The total value of poultry on farms in 1910 was \$2,063,432.

Irrigation. Irrigation has made rice culture an important activity in the State since 1900. The rice growers almost universally provide their own water supply, only one enterprise furnishing water under contract in 1909. The total acreage irrigated for rice growing in 1909 was 27,753. The quantity raised in 1910 was 1,282,830 bushels, valued at \$1,158,103. There were 232

This table shows that the manufacture of lumber and timber products is by far the most important. The total number of wage-earners engaged in manufacturing industries in 1909 was 44,982. Of this number, all but 750 were males. Wage-earners under 16 years of age numbered 525, and of these 469 were males. There are only five cities in the State which are important as manufacturing centres. These are Little Rock, Argenta (a suburb of Little Rock), Fort Smith, Pine Bluff, and Hot Springs. There were in 1909 2157 wage-earners in Argenta, 2017 in Little Rock, 1455 in Fort Smith, 1118 in Pine Bluff, and 335 in Hot Springs. The value of the product of the manufactures of Little Rock, the leading manufacturing city, in 1909 was \$6,881,662.

Transportation and Commerce. The chief waterway is the Mississippi River, which gives an outlet to the Atlantic Ocean and water

communication with other States of the Mississippi valley. In addition to this there are many smaller streams which afford navigable waterways. Railroad facilities are good, except in the mountainous regions of the north central and west central sections. The railroad mileage on Jan. 1, 1913, was 6162.26 miles, compared with 4357 miles in 1906. There were, in 1913, 95.15 miles of electric railways in the State. The State Railroad Commission has general charge of fixing rates. Railways and other public service corporations are assessed for their franchises as well as for their property. An act passed by the Legislature of 1911 regulates the liability of common carriers for injuries to their employees. Contributory negligence does not bar recovery if the employer's disregard of the law has contributed to the injury. A law provides full train crews. Foreign commerce, much of which passes through New Orleans, consists chiefly of cotton and lumber.

Banks. The total number of banks in Arkansas in 1912 was 376, and their deposits totaled \$48,856,407. National banks numbered 49 with deposits of \$16,464,452; savings banks 5, with deposits of \$331,063; and State banks 310, with deposits of \$25,266,613.

Finance. Receipts of the treasury for the fiscal year 1911-12 were \$6,899,247, and the expenditures \$6,734,915. The balance on hand at the close of the fiscal year was \$800,880. The State debt in 1913 was \$1,250,500 in 3 per cent 30-year bonds to mature in 1929. These bonds are held by the permanent school fund and by the University of Arkansas endowment funds. The chief source of revenue is a direct tax on all property.

Education. Arkansas, like other southern States, labors under difficulties disadvantageous to the improvement of educational conditions. However, it has shown in recent years commendable zeal in attempting to better the situation. In 1907 the tax laws were amended allowing for an increase of the school tax from 1 to 3 mills on the dollar. A compulsory education law became effective the beginning of the school year 1909-10, and the Legislature of 1909 passed measures providing for the consolidation of school districts and made provision for four agricultural schools.

The thirteenth census showed 142,954 illiterates, a percentage of 12.6 per cent of the entire population. In 1900 the percentage was 20.4. The percentage of white illiterates of native parentage in 1910 was 7.1; of foreign or mixed parentage 2.8, and of negroes 26.4. The percentage of illiteracy among negroes in 1900 was 43. The school population of persons from 6 to 20 years was 551,672. Of these 324,035, or 58.7 per cent, were in attendance in school. Statistics of the State Department of Education showed a school population on June 30, 1913, of 617,265. Of these 435,575 were white, and 181,790 colored. There were enrolled in 1912 in the public schools 409,756 children, of whom 300,015 were white and 109,731 were colored. Average daily attendance was 261,747. Teachers employed numbered 10,175, and of these 8227 were white and 1948 were colored. Expenditures for the maintenance of schools in 1913 were \$4,279,478. There were 93 State high schools in 1911-12, and 60 unaided high schools. In 1912 school property was valued at approximately \$10,000,000, while in 1900 its value was only \$2,500,000. The

Legislature of 1911 provided liberal appropriations for the maintenance of the State University, State normal school, the four agricultural schools, and the deaf, mute, and blind schools. This Legislature passed a provision making the Medical Department of Arkansas Industrial University a part of the State University. A constitutional amendment providing for uniform text-books was defeated at the election held in September, 1912, by a small majority. A commission of 20, appointed by the Governor, with the State Superintendent of Public Instruction as chairman, carries on work with funds provided by the Southern Educational Board. The first report of this commission was made in 1911. In 1912-13 an educational building was erected at the State University; for this the Peabody Board gave \$40,000. The four district agricultural schools referred to above, which were opened in 1912, are at Jonesboro, Russellville, Magnolia, and Monticello. Universities of higher education in the State include the University of Arkansas, at Fayetteville; Philander Smith College, at Little Rock; Ouachita College, and Henderson College, at Arkadelphia, and Central Baptist College, at Conway.

Charitable and Penal Institutions. These include a lunatic asylum, schools for the blind, the deaf and mute institute, and a State penitentiary, all located at Little Rock. The Legislature of 1911 provided for juvenile courts in the counties of the State, and the Legislature of 1909 made provision for tuberculosis sanitariums. Convicts are leased to contractors, and the system has led to abuses similar to those which have marked its use in other States. Governor Donaghey recommended to the special session called in 1911 the adoption of provisions for the proper management and control of the State Penitentiary and the abolition of the convict labor system. These recommendations were disregarded, and on December 16 the Governor paroled 360 State convicts. As the result of this action, three county convict camps in which convicts were leased to contractors were wiped out of existence. Governor Donaghey claimed that his fight against this system received little or no support in the Legislature. He recommended that the Legislature of 1913 abolish the system.

Religion. As is common in the southern States, the Baptist and Methodist churches contain the bulk of the church membership. Of the other churches represented, the Presbyterian and the Christian are the only ones that have obtained any considerable following.

Population. The population of the State by decades is as follows: 1820, 14,273; 1830, 30,388; 1840, 97,574; 1850, 209,897; 1860, 435,450; 1870, 484,471; 1880, 802,525; 1890, 1,128,179; 1900, 1,311,504; 1910, 1,574,449. The density of population in 1910 was 30 per square mile, compared with 24.7 in 1900. Of the total population in 1910, 1,131,026 were white and 442,891 colored, or 71.8 per cent white and 28.1 per cent colored. In 14 of the 75 counties of the State, more than half the population were negroes, but in 26 counties negroes form less than five per cent of the total. Negroes are most numerous in the southwest. The native whites of native parentage constitute 68.4 of the total population, and 95.3 of the white population. The native whites of foreign or mixed parentage constitute only 2.3 per cent of the total population, and foreign-born whites 1.1 per cent. Arkansas is

notable for the large percentage of its rural population. In 1910 the 28 incorporated places having each 2500 or more inhabitants contained only 12.9 per cent of the total population. The strictly rural population, not in cities and towns, however, decreased from 82.9 per cent in 1900 to 76.1 in 1910. Males of voting age in 1910 numbered 395,824, compared with 313,836 in 1900. The total number of foreign-born whites, which represents the number added by immigration, was, in 1910, 53,517. Of these, only 16,909 were foreign born. The largest percentage of immigrants came from Germany. The largest cities in 1910 were Little Rock, the capital, 45,941; Fort Smith, 23,975; Pine Bluff, 15,102; Hot Springs, 14,434; Argenta, 11,138; Helena, 8772; Jonesboro, 7123; Texarkana, 5655, and Paragould, 5248. For further details on these towns see separate articles under each.

Government. The present constitution, which is the third for the State, was adopted by a vote of the people in 1874. Either house may propose an amendment to the constitution, which, if approved by a majority of both houses and by a majority of the voters at the next general election, is adopted. To enjoy the right of suffrage one must have resided in the State one year, in the county six months, and in the precinct or ward one month, while an amendment passed in 1893 further restricts the suffrage to those who have paid a poll tax. State elections are held every two years, on the second Monday in September. Some further provisions of the constitution are: "No person who denies the being of a God shall hold any office in the civil departments of this State, nor be competent to testify as a witness in any court." Six per cent is the legal rate of interest; all contracts for a greater rate than 10 per cent are void. Arkansas has nine electoral votes.

As will be noted in the paragraphs on *History* below, a constitutional amendment providing for the initiative and referendum was carried by vote of the people in 1910. The Legislature of 1911 formulated laws to carry this amendment into effect. In the main, these measures are similar to those enacted in other States. Five per cent of the legal voters of the State may, 90 days after the adjournment of the Legislature, by petition, order a referendum upon any law of general character passed by the Legislature; and five per cent of the voters in the cities and towns may order, by similar petition, a referendum on measures perfecting these municipalities. A majority of the votes cast in such referendum makes a law effective.

Eight per cent of the legal voters may, at any time more than four months before the regular session of the Legislature, propose any amendment to the constitution or measure of general legislation, except measures pertaining to the regulation of liquor. If such laws or amendments receive a majority of the legal votes cast, they become laws or amendments of the State.

Legislative.—The representatives to the State Legislature are elected for a term of two years, and cannot exceed 100 in number, each county being entitled to one member, while the extra members are distributed among the more populous counties. Thirty and 35 are respectively the minimum and maximum limits to the number of Senators, who are elected from districts of contiguous counties for four years. Legislative sessions are limited to 60 days, unless extended by a two-thirds vote of each house.

Executive.—The Governor, Secretary of State, Treasurer, Auditor, and Attorney-General are each elected for a term of two years. The salary of the Governor is \$4000 per annum. His veto may be overridden by a majority vote of each house. If the office of Governor becomes vacant 12 months before the expiration of the term, a new election is held to fill the vacancy—if the vacancy occurs within that period, the President of the Senate completes the term.

Judiciary.—There is a supreme court of five members, each elected for eight years; a number of circuit courts, each member of which is elected for four years; a probate and county court for each county; and at least two justices of the peace for each township, the justices of the peace and county judges being elected for terms of two years. The General Assembly also vests such jurisdiction as may be deemed necessary in municipal corporation courts, courts of common pleas, where established, and when deemed expedient, and establishes separate courts of chancery.

Elections.—The Legislature of 1909 passed an act regulating primary elections of the State. This law legalized all primaries, held for State or national offices. The law makes it a misdemeanor to solicit gifts for candidates and provides that the latter must file itemized accounts of the expenses and expenditures during the campaign.

Local Government.—Each county has a sheriff, assessor, coroner, treasurer, and surveyor, each elected for two years. Each township has a constable, who is elected for two years. The Legislature may create other local offices. The county court, together with a majority of the justices of the peace, levies road taxes when the people have voted in favor of such a measure. The Legislature provides, by general laws, for the organization of cities (which may be classified) and incorporated towns and can place certain restrictions upon them.

Militia.—The total number of males of militia age in the State in 1910, according to the thirteenth census, was 311,792. According to the report of the Adjutant-General in 1912, there were in that year 326,565 males available for military duty. The organized militia is composed of two regiments of infantry, of 12 companies each. These are combined into a brigade called the First Brigade. The total number of enlisted men in these regiments in 1912 was 1328 with 139 officers. The designation of the organized militia is the Arkansas National Guard.

History. The name "Arkansas" was that of an Indian tribe found by the first explorers within the limits of the present State. About 1685 Frenchmen settled at Arkansas Post. Arkansas formed a part of Louisiana Territory till 1812, and of Missouri Territory till 1819, when it was organized as Arkansas Territory, including the land within the boundaries of what was formerly Indian Territory. On June 15, 1836, it became a State. Though settled chiefly from the South, it was fairly divided between Unionists and Secessionists in the early part of 1861; but President Lincoln's call for troops led to the passing of an ordinance of secession on May 6, 1861. The Confederates were defeated at Pea Ridge, March 7-8, 1862, and at Prairie Grove, December 7. Helena was occupied by Union forces, and Arkansas Post was captured on Jan. 11, 1863. With the fall of Little Rock, Sept. 10, 1863, the Confederate power in the State collapsed. In October and November Union delegates from

20 counties met at Fort Smith to take steps to reorganize the State government, and in January, 1864, a convention met at Little Rock and framed a constitution, which was accepted by the people, but rejected by Congress. Under the Reconstruction Act of 1867, a constitutional convention met, Jan. 7, 1868, at Little Rock, and framed a constitution, which was ratified March 13, by a small majority. On June 22 the State was readmitted to the Union. In April, 1874, an armed collision occurred between the adherents of two rival claimants for the governorship. Federal aid was invoked, and President Grant formally recognized Baxter, Republican, as the lawful Governor. In 1874 a new constitution was adopted. It marked a radical change in the existing law and was in the main a return to ante-bellum conditions. The prosperity of the State has increased with the development of its rich mineral resources.

The Legislature of 1907 passed a number of severe laws aimed at the regulation and control of railways passing through the State. Their attempted enforcement brought the authorities into conflict with the Federal government. (See STATE RIGHTS.) In the election of Nov. 3, 1908, Bryan received 87,015 votes; Taft, 56,624. George W. Donaghey, Democrat, was elected Governor, receiving 111,478 votes, to 45,400 cast for the Republican candidate. The Legislature of 1909 voted to submit to the people amendments to the constitution providing for the initiative and referendum, and for the exemption from taxation for a period of years of capital invested in cotton manufacture. Election on the amendments was held in September, 1910. The amendment providing for the initiative and referendum was carried by a majority of 52,303 votes. The amendment relating to cotton manufacture failed. At this election Governor Donaghey was reelected for a second term. At the session of 1911 the Legislature made a provision for a vote on an amendment to the constitution carrying into effect the so-called "Grandfather Clause," for the purpose of eliminating the negro vote. At a special session held in the same year measures were passed carrying into effect the initiative and referendum law, adopted in 1910. The State campaign in 1912 was on the issue of State-wide prohibition of the sale of intoxicating liquors. Governor Donaghey, who was a candidate at the primaries for renomination, favored prohibition, while his opponent for the nomination, Joseph T. Robinson, favored local option. Governor Donaghey was defeated, and Mr. Robinson became therefore the Democratic candidate for Governor. At the State election held on Sept. 9, 1912, four acts and five amendments to the constitution were voted upon. The acts provided for the reduction of rate of taxation, for State-wide prohibition, for amendments to the election laws of the State, and for the creation of a text-book commission. The amendments provided for the "Grandfather Clause" referred to above, the amendment previously adopted providing for the exemption from taxation of capital invested in cotton mills and for the recall of State officers. Other amendments provided for the changes in the State laws for taxation. Of these nine acts and amendments, only the amendment providing for the limitation of the pay of legislators for 60 days was accepted. The amendment providing for the recall of State officers received a majority of the

votes cast, but not a majority of the votes of the candidate who received the highest vote. The courts therefore ruled that this amendment was not adopted, and furthermore that it was illegally proposed, having been the fifth amendment submitted, whereas by law only three amendments may be submitted at a time. At this election Joseph T. Robinson was elected Governor, receiving 109,826 votes, against 46,240 votes cast for his Republican opponent. The Progressive party had no candidate for Governor. The vote for President in the election held on Nov. 5, 1912, was, for Wilson, 67,838; for Taft, 24,297; for Roosevelt, 22,673. The death of Senator Jeff Davis on Jan. 3, 1913, made it necessary for the Legislature to choose his successor. Governor Robinson, inaugurated on January 14, was elected Senator on January 29. On March 8 he resigned and was succeeded by W. K. Oldham, President of the Senate, who served until March 23, and was succeeded by J. M. Futrell, who had been elected President of the Senate to succeed him. George W. Hays was elected Governor in July, and took office August 6.

Since 1876 the Democrats have been victorious in State and national elections. The electoral vote has been cast as follows: in 1836 and 1840, for Van Buren and Johnson, 3; 1844, Polk and Dallas, 3; 1848, Cass and Butler, 3; 1852, Pierce and King, 4; 1856, Buchanan and Breckenridge, 4; 1860, Breckenridge and Lane, 4; 1864, no vote; 1868, Grant and Colfax, 5; 1872, 6 votes not counted; 1876, Tilden and Hendricks, 6; 1880, Hancock and English, 6; 1884, Cleveland and Hendricks, 7; 1888, Cleveland and Thurman, 7; 1892, Cleveland and Stevenson, 8; 1896, Bryan and Sewall, 8; 1900, Bryan and Stevenson, 9; 1904, Parker and Davis, 9; 1908, Bryan and Kern, 9; 1912, Wilson and Marshall, 9.

The following is a list of the Governors:

TERRITORIAL

James Miller	1819-25
George Izard	1825-29
John Pope	1829-35
William S. Fulton	1835-36

STATE

James S. Conway	Democrat	1836-40
Archibald Yell	"	1840-44
Samuel Adams	"	1844
Thomas S. Drew	"	1844-48
John S. Roane	"	1848-52
Elias N. Conway	"	1852-60

ARKANSAS, UNIVERSITY OF. A State institution at Fayetteville, Ark., founded in 1871. It has a medical and a law school at Little Rock and a branch normal college for negroes at Pine Bluff. The main divisions of the university, situated at Fayetteville, comprise a College of Liberal Arts and Sciences, a College of Engineering, a College of Agriculture, a Department of Education, and an Agricultural Experiment Station. These divisions are supported by the aid of Federal and State endowments and appropriation and have an income of about \$240,000; grounds, buildings, and equipments valued at more than \$1,000,000; and a library of about 35,000 volumes. In 1913 there were 80 professors and instructors and 800 students in the divisions at Fayetteville. The Medical School at Little Rock receives from the State an annual appropriation of about \$20,000 in addition to the fees paid by students. The Law School has only a nominal connection with the university and is entirely supported by students' fees. The Branch Normal College at Pine Bluff receives support from both the Federal and State governments. Tuition is free in all the divisions of the university except in the professional schools. Acting president, John C. Futrall, M.A.

ARKANSAS CITY. A city in Cowley Co., Kan., 51 miles south by east of Wichita, on the Atchison, Topeka, and Santa Fe, the Missouri Pacific, the Kansas Southwestern, the Midland Valley, and the St. Louis and San Francisco railroads (Map: Kansas, E 8). The principal features of interest are the United States Indian School, a Manual Training College, a Carnegie library, a high school, an opera house, two parks, and several bridges. The city is near the confluence of the Arkansas and Walnut rivers, which are connected by a canal that furnishes water power for manufacturing. It is the centre of a highly productive agricultural and stock-raising country; manufactures flour, lumber, windmills, mattresses, ice, yeast, carriages, and creamery products; contains railroad repair shops and planing mills; and from its location near the southern boundary of Kansas, has an important trade with the Indian agencies and military posts in Oklahoma. It is the centre of the new Western oil fields. Settled in 1870, Arkansas City was incorporated the following year, and in 1912 adopted the commission form of government. The water works are owned and operated by the municipality. Pop., 1890, 8347; 1900, 6140; 1910, 7518.

ARKANSAS RIVER. Next to the Missouri, the largest affluent of the Mississippi

River (Map: United States, Eastern Part, G 3). It rises in central Colorado, flows east into Kansas, and out again east of the middle of the south boundary of the same State, south-east across Oklahoma and diagonally across Arkansas, bisecting it into nearly equal parts and emptying into the Mississippi. The river is about 2000 miles long, navigable for small steamboats to Wichita, Kan., 650 miles, and drains an area of 188,000 square miles. Much of the water in its upper course is used for irrigation purposes. In Fremont County, central Colorado, it flows through the Royal Gorge, one of the deepest cañons in the United States. In its upper course the current is very rapid, but in its lower portion it is slow, and the tortuous river bed is sandy and broad. It receives the Salt Fork, Cimarron, and the Canadian from the west in Oklahoma, and the Verdigris and Grand rivers from the north.

ARKANSAS STONE. See NOVACULITE.

ARKANSAS TRAVELER, THE, är'kan-sq. A comic dialogue or rustic drama, with musical accompaniment, in which the two parts represented are an Arkansas squatter (a fiddler) and the Arkansas Traveler. It was a great favorite in the taverns and hotels of the West and Middle West when there were but few railroads. The person who took the part of the squatter was usually seated on a broken-backed chair or a box on the table in the centre of the room, where he attempted to play on a violin the first part of the tune "The Arkansas Traveler," which he was supposed to have heard at a theatre in New Orleans. During the attempt, which was unsuccessful, he was subjected to a running fire of teasing questions by a person who approached him, and who proved to be the Traveler himself. The latter, after more dialogue, took the violin and played the second part, but refused to play the first. Consult *Ohio Archaeological and Historical Society Publications*, vol. viii, pp. 296-307 (Columbus, 1900).

ARK'LOW. A small seaport town of county Wicklow, Ireland, about 50 miles south of Dublin (Map: Ireland, E 4). Powder is manufactured, and fishing is carried on to a large extent. Lead and copper are exported. Near the town is Shelton Abbey, the seat of the Earl of Wicklow. In the uprising of 1798 the Irish were defeated here by the British. Pop., 1891, 4172; 1901, 4944; 1911, 5042.

ARK OF THE COVENANT, ARK OF THE TESTIMONY, ARK OF YAHWE, or ARK OF GOD. According to the data furnished in the Bible, this was one of the most important parts of the furniture of the tabernacle constructed in the Wilderness, and afterward of the temple built by Solomon at Jerusalem. We have two descriptions of it in the Pentateuch, Ex. xxv. 10-22 and xxvii. 1-9.

From these descriptions it appears that the ark was a chest of shittim-wood (very generally supposed to be the wood of a species of acacia, but by some regarded as that of the wild olive), overlaid with gold within and without, two cubits and a half in length, one cubit and a half in breadth and in height, with a crown or raised border of gold round about. Within the ark was deposited the "testimony," consisting of "the two tables of the Law"—i.e., the stone tablets upon which the Ten Commandments were inscribed (Ex. xl. 20). The golden lid of the ark was called the *mercy-seat* or *propitiatory*; above it were the *cherubim* (see CHERUB),

inade of the same piece of gold with it, and between them the place of the *Shechinah*, or manifestation of the Divine Presence. It should, however, be mentioned that neither in Deuteronomy nor in the Books of Kings are these figures of the cherubim mentioned. The ark had golden rings, through which passed staves of shittim-wood, overlaid with gold, for carrying it in the journeyings of the Israelites, concerning which very particular rules were laid down (Num. iv.). While being carried from one place to another, it was covered first with a "covering of badgers' skins," and above this with a "cloth wholly of blue"; and when reposing in the tabernacle and temple it was put into the "most holy place," into which the high priest alone was to enter upon the Day of Atonement. After the tabernacle had been set up at Shiloh, the ark was deposited there (Josh. xviii. 1). When Israel sustained defeat at the hands of the Philistines at Eben-ezer, they sent to Shiloh for the ark (1 Sam. iv. 3-5). In the battle which followed, the Philistines captured the ark; they carried it about to several places in their land, but in each place misfortune followed its arrival, and at the advice of their diviners the Philistines returned the ark to Israel at Beth-Shemesh, whence it was removed to Kirjath-Jearim (1 Sam. iv. 11-viii. 2); hence David removed it to Jerusalem (2 Sam. vi. 1), and Solomon assigned it a place in the temple (1 Kings viii. 6). What finally became of the ark is unknown; perhaps it was captured in Nebuchadnezzar's siege of Jerusalem. At any rate, there was no ark in the second temple (Josephus, *B. J.*, 5, 5). In Jer. iii. 16, 17, an oracle is preserved foretelling that in the prosperous time to come the ark shall not be remembered or thought of or made again, but Jerusalem is to be the throne of Yahwe. There apparently was a plan of building a new ark. According to 2 Maccabees ii. 1, Jeremiah hid the ark on Mount Nebo, and Syriac Baruch vi. 5-10 relates that during the siege of Jerusalem by the Chaldeans the temple mountain opened itself, at the command of an angel, and swallowed up the ark and other sacred vessels to be kept there until the time of the restoration.

It is not easy, from the various accounts of, and references to, the ark in the Old Testament to obtain a clear idea of what the ark actually was, or what was its age. Egyptians, Babylonians, and other ancient nations carried the images of their gods about in portable shrines, and arks containing sacred symbols were brought in solemn procession from one sanctuary to another or into the battle. The ark of Yahwe seems to have been regarded as his abode. Its cover was his throne. Hence his name: "Yahwe Zebaoth who sits upon the cherubs" (1 Sam. iv. 4). When the ark was brought with the army to the battle, it was said, "Rise, O Yahwe, thine enemies be scattered! Let those who hate thee flee before thy face!" After the battle the anxiety that his presence in the midst of his people should insure continued prosperity expressed itself in the cry, "To Israel's thousands, O Yahwe, return!" (Num. x. 35, 36). The account of the capture of the ark by the Philistines shows that where it rested, there Yahwe himself was supposed to have his abode for the time being. It should be borne in mind, however, that a stone, a chest, or a building may be thought of as the place where a divine being chooses by preference to dwell or to mani-

fest himself without excluding on this account the idea that his power may be independent of it and extend far and wide beyond its boundary. In fact, the glory of Yahwe, sitting on this throne, suggests a celestial being whose home may also be said to be in heaven. Our account of the ark is supposed by some scholars to be a description of this ancient palladium as it appeared in the days of Solomon. As to the original contents of the ark, it has been assumed by some that it once consisted of a stone symbolizing the deity, but there is no evidence for this assumption. The name it had at the time when Deuteronomy was written (see PENTATEUCH) shows that it was then at least regarded as containing the tables of stone engraved with commandments. Consult: Dibelius, *Die Lade Jahwes* (1906); Budde, "War die Lade Jahwes ein leerer Thron?" in *Theologische Studien und Kritiken* (1906); Grossmann in *Die Religion in Geschichte und Gegenwart*, vol. ii (1910); Schmidt, *The Messages of the Poets*, pp. 321 ff. (1911).

ARKO'NA. The most northern point of the Wittow Peninsula, on the Prussian island of Rügen, in the Baltic (Map: Prussia, E 1). It rises about 145 feet above the sea, and has a lighthouse, erected in 1826.

ARKOSE, är-kös'. See SANDSTONE.

ARK SHELL, or NOAH'S ARK. A marine bivalve mollusk, common along the eastern coast of the United States and representing the cosmopolitan family Arcadæ. The shells do not exceed 3 inches in length, are ventricose, hairy, and have the hinge margin long and perfectly straight. As the umbones are wide apart, this leaves a sort of flat "deck," which probably led Linnaeus to the rather fanciful designation. They dwell near shore, especially where weedy rocks abound, but one species is known in the inland fresh waters of India. The commonest American species is *Arca paxata* (called "bloody clam," on account of its red gills and exudations), which is covered with coarse hairs. See Plate of ABALONE, ETC.

The genus *Arca* has existed for a great length of time, its ancestors being found in the rocks of all geological periods since the Ordovician, but in special abundance in the Tertiary deposits of all countries.

ARK'WRIGHT, SIR RICHARD (1732-92). Celebrated for his invention of cotton-spinning machinery, was born at Preston, in Lancashire, England. Of humble origin, the youngest of 13 children, and bred to the trade of a barber, his early opportunities of cultivation were exceedingly limited. In 1761 he gave up his business as a barber in Bolton, to become a traveling dealer in hair, and the profits of his trade were increased considerably by a secret process for dyeing hair which he had acquired. His residence in the midst of a cotton-spinning population naturally led him to take an interest in the processes used in that manufacture, and his mind was soon turned toward improved methods. Having no practical skill in mechanics, he secured the services of a watchmaker, named Kay, to assist him in the construction of his apparatus. About 1767 he seems to have given himself wholly up to inventions in cotton-spinning machinery. In the following year he removed to Preston, where he set up his first machine, the celebrated *spinning-frame*, consisting chiefly of two pairs of rollers, the first pair, which were in contact, revolving with a slow

motion, and passing the cotton to the other pair, which revolved with such increased velocity as to draw out the thread to the required degree of fineness. A subsequent operation was to spin the yarn from these threads. No previously invented machinery had been able to produce cotton thread of sufficient tenuity and strength to be used as warp. An invention, indeed, by Charles Wyatt of Birmingham, which was patented in 1738, but never succeeded, deprives Arkwright of the honor of having been the first to use rollers in spinning; but there is no reason to believe that he owed anything to this previous attempt. The first suggestion of the idea, he said, was derived from seeing a red-hot iron bar elongated by being made to pass between rollers. At this time Arkwright was so poor that he needed to be furnished with a suit of clothes before he could appear to vote at an election as a burgess of Preston. Soon after, he removed to Nottingham, to escape the popular rage, which had already driven Hargreaves, the inventor of the *spinning-jenny*, out of Lancashire. Here he fortunately fell in with Jedediah Strutt of Derby, the celebrated improver of the *stocking-frame*, who entered into partnership with him, in conjunction with his partner, Mr. Reed. In 1769 Arkwright set up his first mill, driven by horses, and took out a patent for his invention. In 1771 he set up a larger factory, with water power, at Cromford, in Derbyshire. Not only was his labor-saving machinery well arranged and ingeniously devised, but he effected such a division of labor and organization of his employees that the greatest efficiency of production was secured. From these mills of Arkwright the modern factory system takes its origin. He was one of the first to introduce the steam-engine into his factories, and the mill at Nottingham was supplied with a Boulton and Watts steam-engine of 1790. The remarkable capabilities of his mind were strikingly evinced in the management of the great business. In 1775 he took out a fresh patent for various additional improvements in machinery. The success attending these undertakings stimulated rivals to invade his patent; and to such an extent did other cotton-spinners use his designs that he was obliged, in 1781, to prosecute at once nine different manufacturers. The first action against Colonel Mordaunt, backed by a strong combination of Lancashire manufacturers, was lost, solely on the ground that the description in his specification was not sufficiently clear and distinct. The other actions were abandoned; and in the following year Arkwright published a pamphlet containing a statement of his case. In a new trial, in 1785, he obtained a favorable verdict. The whole question, however, was brought finally before the Court of King's Bench, a few months after, when Arkwright's claim to the inventions patented was for the first time called in question. On the doubtful evidence of a person named Highs, or Hayes, combined with that of Arkwright's old assistant, Kay, the jury decided against him, and his patent was annulled. This was but the formal outcome of an opposition which had from the beginning marked out Arkwright as an object of hostility. The manufacturers at first combined to discountenance the use of his yarn. When the yarn was made into calicoes, and Parliament was petitioned to lessen the duty on that cloth, they strenuously opposed the measure, but in vain. Popular animosity was also excited

against the man who apparently displaced labor but in reality increased its sphere; and on one occasion a large factory belonging to Arkwright was destroyed in the presence of a powerful military and police force, without a word of interference from the magistrates. The energy and good sense of Arkwright triumphed over all opposition, and at the time of his death, in 1792, the value of his property amounted to about \$500,000. In 1786 he was appointed high sheriff of Derbyshire and was also knighted by George III. Consult Baines, *History of the Cotton Manufacture* (London, 1861), and Ure, *The Cotton Manufacture of Great Britain* (London, n.d.). See SPINNING.

ARLBERG, Ärlbërk. A famous mountain pass between the Rhetian and the Lech Alps, connecting Tyrol with Vorarlberg (Map: Austria, B 3). It lies at an altitude of 5840 feet, along the watershed between the Danube and the Rhine. In 1786 a road was laid across the pass which in those times formed the only means of communication between Vorarlberg and the rest of Austria. The construction of the Arlberg Railway from Innsbruck to Bludenz, begun in 1880, necessitated the cutting of a tunnel through the pass. The tunnel, situated between St. Anton and Langen, with a length of 6.5 miles, completed the most direct route between Vienna and Paris. The highest point of the tunnel is 4260 feet, and the difference between the altitudes of the eastern and western ends is 280 feet. The tunnel was completed in 3½ years, at a cost of over \$7,500,000, and was opened to traffic in September, 1884.

ARLES, *Fr. pron.* ärl; *Eng. pron.* ärlz (anciently, Lat. *Arclatæ*, or *Arelas*, from Celt. *Ar-laeth*, on the marshy land). One of the oldest towns in France, in the department of Bouches-du-Rhône, situated on the left bank of the principal branch of the Rhône, after it has divided into a delta (Map: France, S., J 5). Although 27 miles from the mouth of the river, Arles carries on considerable trade. It has manufactures of silk, hats, flour, etc., and forms a market for the productions of the surrounding country. It possesses a college, a naval school, a public library, and several museums, one of which occupies the old church of St. Anne. The most interesting of these is located in the Tribunal de Commerce and was patronized by Mistral. A canal has been cut which connects Arles with the Mediterranean. Railways bring it into easy communication with Marseilles, Avignon, Nîmes, Montpellier, etc. Under the Romans it was the seat of a prefecture; afterward, for some time, the residence of the Gothic King Euric, and from 879 the metropolis of the kingdom of Arles, or of Cisjurane Burgundy (see BURGUNDY). This kingdom was united in 933 with that of Transjurane Burgundy, and this larger Arletan realm was ruled by native kings until 1032. On the extinction of this line the Arletan territories were taken possession of by the German Emperor Conrad II. In the early Christian times several important councils were convened here (in 314, 353, 452, and 475). At the famous council (synod) of 353 the cause of Arianism gained a temporary triumph. Among the antiquities of Arles are an amphitheatre (Les Arènes), which accommodated between 20,000 and 30,000 spectators; the ruins of a theatre; also of a palace of Constantine the Great; an obelisk of granite dug up from the mud of the Rhône in 1389; a burial-place (the Elysian

Fields) used by the Romans; and a Romanesque cathedral dedicated to St. Trophimus, the western portal of which is a unique example of Gallo-Byzantine art. Pop., 1896, 12,755; 1901, 15,506; 1906, 16,363; 1911, 16,746.

ARLES, THE KINGDOM OF. See **BURGUNDY**.

ARLINCOURT, ar'lân'kôor', CHARLES VICTOR PRÉVOT, VICOMTE D' (1789-1856). A French poet and novelist, born near Versailles. He commended himself to the favor of Napoleon by the publication of the flattering allegory *Une matinée de Charlemagne* (1810), for which he was rewarded with offices at court. Under Louis XVIII he was appointed *maître-des-requêtes*, but after the Hundred Days was obliged to resign. He wrote several novels, including *Le solitaire* (1821), *Le renégat* (1822), and *L'étrangère* (1825), of which the first named was extensively read and many times translated. His tragedy *Le siège de Paris*, played at the Théâtre Français, in 1827, was greeted with outbursts of derisive laughter.

ARLINGTON. A residential town of Middlesex Co., Mass., on the Boston and Maine Railroad, 6 miles northwest of Boston. Market gardening, ice cutting, and the manufacture of piano cases, picture frames, and machines are leading industries (Map: Massachusetts, E 3). Arlington has a fine public library, a hospital, and its water supply is furnished under the metropolitan system. Town meetings are held in March and November and at special times on all matters of appropriation. Settled about 1650, Arlington was separated from Cambridge and incorporated as West Cambridge in 1807 and received its present name in 1867. Pop., 1900, 8603; 1910, 11,187. Consult Cutter, *History of the Town of Arlington* (Boston, 1880) and Parker, *Town of Arlington, Past and Present* (Arlington, 1907).

ARLINGTON. A village in Alexandria Co., Va., opposite Washington, D. C. It was formerly the home of Robert E. Lee, but his property was seized by the government during the Civil War and is now the site of a national cemetery, in which some of the most prominent officers of the United States army are buried. The cemetery is one of the largest and most beautiful in the United States. There are 18,151 graves, 4608 of which contain unknown dead. The old Lee mansion, with its stately portico, is one of the finest specimens of Colonial architecture. Pop. (district), 1890, 2013; 1900, 3200; 1910, 5850.

ARLINGTON, HENRY BENNETT, EARL OF (1618-85). An English statesman of the period of Charles II. He was born at Arlington, studied at Oxford, and for a long period fought in the Civil War. He soon left England, however, for France, where he became in 1654 secretary of James Stuart. In 1658 he was sent to Madrid, and there he remained until after the Restoration. In 1662 he returned and was made Secretary of State, in which position his knowledge of foreign affairs made him an influential counselor. He joined the party opposed to Clarendon and after his fall became a member of the famous Cabal. He had assisted in the formation of the Triple Alliance of England, Holland, and Sweden to oppose Louis XIV, but in 1670 turned directly about and joined with the rest of the Cabal in the negotiation of the Treaty of Dover, by which Charles promised to assist Louis against Holland. Together with this open treaty was a secret one by which Charles promised to declare himself a Catholic

and to work for the restoration of Catholicism in England. To this secret Arlington, as a reputed Catholic, was admitted, and he assisted with great success in the work of deceiving the other members of the Cabal. The Dutch War and the Declaration of Indulgence, which Arlington supported, destroyed the Cabal ministry, and Arlington fell with them. An attempt was made to impeach him in Commons for furthering Popery, embezzlement, and betrayal of trust, but the attempt failed. However, his influence was gone, though he tried desperately to retain it by throwing himself into the popular party. In 1678, after a disastrous break with Denby, he retired to private life and died in comparative obscurity, July 26, 1685. Arlington, though no great statesman, at times showed gleams of brilliancy, especially in his handling of the secret Treaty of Dover. He was reputed a Catholic, and the charge was probably true, though religion sat as lightly on him as it did on his royal master. Consult *The Arlington Letters* (London, 1710). See **TORY**.

ARLON, ar'lôn' (anciently, Lat. *Orolaunum*). The capital of the Belgian province of Luxemburg, situated 16½ miles, by rail, northwest of Luxemburg, on an elevated plateau of the Ardennes (Map: Belgium, D 5). It contains a museum with a collection of Roman antiquities found in the neighborhood. The town has frequently suffered the ravages of war and was occupied by the French from 1684 to 1697. It came into the possession of Belgium in 1831. Pop., 1900, 10,466; 1910, 12,012.

ARLT, ärlt, FERDINAND, RITTER VON (1812-87). An Austrian oculist, born near Teplitz. He studied medicine at Prague and was professor of diseases of the eye there from 1849 to 1856, when he was appointed to a similar chair at the University of Vienna. Arlt was the author of a number of works on the eye and its diseases including *Die Pflege der Augen im gesunden und kranken Zustand* (1846); *Ueber die Ursachen und die Entstehung der Kurzsichtigkeit* (1876), a number of memoirs in the *Archiv für Ophthalmologie*, which he founded in 1854 and edited for many years. His best-known work is *Die Krankheiten des Auges für praktische Aerzte geschildert* (3 vols., 1851-56), which passed through several editions. Consult his autobiography (Wiesbaden, 1887).

ARM (Lat. neut. pl. *arma*, arms, weapons). A weapon of any kind; also used to designate a branch of the military service; as, the cavalry arm, the infantry arm, etc. It has, in addition, a wide application in naval and military terminology to express the end, or branch, of anything, particularly of articles or objects that have two similar ends, as yard arms, axle-tree arms (gun carriage), anchor arms, etc. See **ARTILLERY**; **ORDNANCE**; **SMALL ARMS**; **SWORDS**, and other weapons.

ARM (Ger., Dan., Swed., and Dutch *arm*, AS. *earm*, Icel. *armr*, Goth. *arms*, Lat. *armus*, the shoulder, Gk. *ἀρμός*, *harmos*, shoulder joint, all from the Indo-European root *ar*, to fit, join). The upper extremity of the human body. It consists of two portions—the arm, strictly so called, and the forearm; the former having one bone, the humerus, which moves freely by a globular head upon the scapula, forming the shoulder joint; and the latter having two bones, the radius and ulna, which move on the lower end of the humerus, forming the elbow joint, and below, with the carpus, forming the wrist joint.

The humerus is attached by a loose capsular ligament to the scapula, allowing great freedom of motion, and were it not for the muscles would be frequently dislocated, but it is supported by muscles on all sides except underneath or opposite the armpit, in which direction the head of the bone is often driven by violence. The roundness of the shoulder is due to the head of the humerus, so that any displacement is accompanied by a flattening, which at once suggests the nature of the accident. On the shoulder there is a large triangular muscle, the deltoid, which lifts the arm from the side. At the back is the triceps, which extends the forearm; in front are two muscles which flex or bend it—the biceps and the brachialis anticus; and on each side below are muscles passing to the forearm and hand; while above, the great muscle of the back (*latissimus dorsi*) and that of the chest (the *pectoralis major*) are inserted on each side of a groove, wherein lies one of the tendons of the biceps (q.v.). The ulna is flexed by the biceps, and extended by the brachialis anticus and the triceps. The movements of the hand are principally due to the radius, the head of which rotates upon the ulna, thereby turning the palm downward (pronation), or upward (supination), these movements being effected by muscles, which, taking their fixed points from the humerus and ulna, pull the radius round on the latter. The elbow joint is ginglymoid or hinge-like, and therefore has strong lateral ligaments; but it is liable to dislocation and fracture. The accident being often followed by severe inflammation, the joint is very apt to stiffen (see *ANKYLOSIS*), thereby seriously impairing the usefulness of the limb; it is, therefore, inadvisable to keep the limb too long in any one position after such an injury. (See *JOINTS, DISEASES OF*.) The upper extremity is supplied with blood by the brachial artery, the continuation of the axillary trunk. The veins collect into large superficial trunks, which unite at the bend of the elbow and then pass on to the axillary, on the outside by the cephalic vein, on the inner side by the basilic. These veins, being superficial and easily accessible, are generally selected for venesection, transfusion, or the injection of medicinal substances. Deep veins also accompany the arteries and pass upward to join the axillary at its commencement.

The nerves of the arm are the musculo-spiral, which winds around the upper part of the humerus to become the radial and posterior interosseous nerves; the ulnar running behind the internal condyle, for which it has obtained the term "funny bone," from the electric-like thrill which passes along the arm when the nerve is struck. The median nerve, as its name implies, keeps a middle course with the artery.

In wounds of the forearm, bleeding may be at once controlled by pressure on the brachial artery, on the inner side of the biceps.

ARMADA, är-mä'dä or är-mä'dä (Sp. an armed force), *TUE*. A name especially applied to the powerful Spanish fleet equipped by Philip II in 1588 for the conquest of England. By permitting the execution of Mary, Queen of Scots, Elizabeth had awakened the indignation of all Catholics; and Scotch, French, and papal leaders forgot their differences and urged Philip to undertake the invasion of England. Santa Cruz, the ablest seaman in Spain, prepared elaborate plans for the fleet which was to subdue England. All his specifications (as to vessels, men, and

equipment) had to be considerably reduced, but the King raised enormous supplies in utter disregard of the already almost intolerable burdens of the nation. No attempt was made to disguise the purpose of the unusual activities which took place in the Spanish docks between 1586 and 1588. In consequence, the English were on the alert, the crisis was prepared for, so far as the parsimony of Elizabeth would permit; and in the spring of 1587 Drake raided the Spanish coast and burned all the equipment and supplies of the fleet, causing a delay which gave the English another full year in which to prepare for the attack. Early in 1588 Santa Cruz and his vice-admiral, Paliano, died, and the expedition was intrusted to the Duke of Medina Sidonia, who was wholly unfit for the command. Similar want of judgment was shown in the appointment of the other officers, destined to meet in battle such English seamen as Howard, Drake, Frobisher, and Hawkins. The Spanish counted the victory already won and named the fleet the "Invincible Armada." The English, on the other hand, were anxious but determined. The Spaniards blundered at the very outset. Alessandro Farnese, Duke of Parma, was in Flanders with a large army intended for the invasion of England, but failed to cooperate with Medina Sidonia. The fleet itself, which consisted of 131 vessels with 8000 sailors and 19,000 soldiers, left Lisbon on May 29, 1588. On account of delays due to storms and mismanagement, it was the 30th of July before the English Channel was reached. The fleet now numbered only about 120 ships, of which 70 could not be used in an engagement. The main English fleet, under the chief command of Lord Howard of Effingham, consisted of about 80 ships, all of them available for action; considerably smaller than the Spanish vessels, but much more easily handled and with superior fighting equipment. The English commanders took advantage of this fact and avoided a close contest, such as the Spanish hoped for. Hardly a battle occurred, but for a whole week the light English vessels hung on the rear and flanks of the Armada as it lumbered up the Channel, raking the galleons with rapid shot and escaping almost unharmed from the Spaniards' slow delivery. On August 7 the Armada was driven close to the port of Gravelines, where on the following day Drake made a spirited onslaught upon the Spanish ships. Many of the galleons of the invaders were riddled by the English guns. After a hasty council of war it was recognized that Parma's army could not be transported to England, and Medina Sidonia turned toward Spain. The English gave chase for a short distance, but soon retired, not being provisioned for a long pursuit. It was necessary for the Armada first to sail around the Orkneys, on account of the direction of the wind. A fearful voyage followed, ship after ship being wrecked on the rocky coasts of Scotland and Ireland, and only about 50 vessels returned home. Both Philip and Elizabeth seem to have ascribed the failure of the expedition to the storms, which in fact did very largely influence the result; but the English fleet had almost every advantage that counts in a naval engagement, so that the result under any circumstances could hardly have been otherwise. The destruction of the Armada was the collapse of Spain's naval power.

For a detailed account, consult: Froude, *History of England* (London, 1856-70), and *The*

Spanish Story of the Armada (London, 1892); Creasy, *Fifteen Decisive Battles* (New York, 1858); Hakluyt, *Principall Navigations* (London, 1589); Corbett, *Drake and the Tudor Navy* (London, 1898); Gardiner, *Historical Biographies*, "Drake" (London, 1894); Hale, *The Story of the Great Armada* (London, 1913).

ARMADILLO (Sp. dim. of *armado*, armed, referring to its bony shell). 1. An edentate mammal of the South American family Dasypodidae, especially characterized by its bony armor. The term "edentate" is singularly inapplicable to these creatures, as all are provided with true teeth, and indeed from 40 to as many as 90. These are weak, destitute of true roots, and set well apart. The muzzle is elongated, and the tongue is smooth and slender, with a glutinous saliva, adapted to the capture of ants and other insects, after the manner of the ant-eaters, but not long and extensile, like theirs. The limbs are short and strong, as are also the claws, and the animals have a great aptitude for digging and burrowing, by means of which they seek to shelter themselves from enemies—burrowing in sand or soft earth with such rapidity that it is almost impossible to dig them out, and indeed it can only be done by persevering till they are exhausted.

The feature which peculiarly distinguishes the *armadillo*, and in which the animal differs from all the other mammalia, is the bony armor with which the body is covered, and which consists of polygonal plates not articulated, united on the head to form a solid covering, and similarly to form solid bucklers over the shoulders and the haunches; and between these, disposed in transverse bands, which allow of freedom of motion to the body, similar bands in most species protecting also the tail. When alarmed or exposed to danger, armadillos, which have the middle portion of the armor divided into several bands, protect themselves by rolling up into a ball, which exposes only the hard, armored surface. The three-banded armadillo, or apar, of the Argentine pampas (*Tolypeutes tricinctus*) is famous for this and for walking on the tips of its foreclaws.

Armadillos feed not only on insects, but on vegetable and animal food of almost every kind, which by decomposition or otherwise has acquired a sufficient softness. Some of them prefer vegetable food, others delight chiefly in carrion. They are all natives of the warm and temperate parts of South America, in the woods and pampas of which they were formerly found in immense numbers; but all except the omnivorous and adaptable hairy one (*Dasypus villosus*) disappear quickly from the plains wherever a settlement is made. They are timid and inoffensive, although, when they are incautiously assailed, injury may be received from their claws. Their flesh is esteemed a delicacy, particularly that of the species which feeds chiefly on vegetable food. The largest species is fully 3 feet long, exclusive of the tail; the smallest not above 10 inches. The species are numerous, and they are divided among half a dozen or more genera, representing probably three families. The nine-banded armadillo (*Dasypus novemcinctus texanus*) occurs as far north as Texas. This armadillo may be killed by a dog biting through the outer shell, and it is probable that the hard outer covering is of more value in protecting the animal from thorns as it pushes through the tangles of cacti and other

plants. The armor also reduces surface evaporation, an important factor in these semi-arid regions. Many thousand are killed annually for the sake of their armor, which is shaped into baskets. (Consult Newman, *The American Naturalist*, September, 1913.) The name "peba" is wrongly applied to the above species and properly belongs to certain South American species of the genus *Dasypus*, to which the non-burrowing peludos, common in the pampas, belong. One of the rarest and most interesting of these animals is the little picichiago (*Chlamydomorphus truncatus*), 5 or 6 inches long, a native of the Argentine Republic, living underground like the mole, which it much resembles in its habits, and feeding on the same kind of food. Its fore feet are adapted for digging, although in a different manner from those of the mole.

The skull is destitute of sutures; there are resemblances to the osteology of birds in the ribs and their union to the sternum; the hinder part of the body is altogether unlike that of any other known animal, in its terminating quite abruptly, as if cut off almost where its thickness is greatest, or as if the back were suddenly bent down at right angles, the tail not springing from where the line of the back appears to terminate, but far below. The whole upper and hinder parts of the body are covered with a coat of mail, made up of a series of square plates; the under parts and legs are covered with long silky hair. See Colored Plate of MAMMALIA; and Plate of ANT-EATERS AND ARMADILLOS.

Fossil remains of gigantic extinct armadillos have been found in the Pleistocene strata of South America, forming the genus *Glyptodon* of Owen.—In *Entomology*, armadillo is a name for wood-lice. See WOOD-LOUSE.

ARMADO, ār-mā'dō. A bragging Spanish knight in Shakespeare's *Love's Labour's Lost*, evidently conceived in mockery of the euphuists.

ARMAGEDDON, ār-mā-géd'dōn. The name used in Rev. xvi. 16 to describe the place where the last battle is to be fought on the day of judgment. Some scholars regard it as a transliteration of the Hebrew *har megiddo*, 'mountain of Megiddo,' and quote in support the Argarizim, 'mountain of Garizim,' of Eusebius in Eusebius, ix. 17, and the references to the plain of Megiddo as a battlefield. Others think that some myth is referred to. The name "Ysemmigadon" (Ἰσεμμιγῶδων) is found on a tablet of lead discovered in Alexandria and published in *Rheinisches Museum*, xviii, 563 (1863), and also in a magical formula in a Greek papyrus published by Kuhnert in *Rheinisches Museum*, xlix, 49 (1894), as that of a chthonic deity, the consort of Ershkigal, the goddess of the nether world. Ysemmigadon may be a Sumerian epithet of Nergal, or Migado may be the name of another consort. The Mountain of Migado would then be the place where the battle occurred in primeval times between Migado and Ershkigal and was expected to occur again at the end of time. Hence the phrase has come to be used for any great slaughter or final conflict.

ARMAGH, ār-mā' (anciently, Gael. *Ard-macha*, Macha's Height, from *ard*, height, high). A small inland county in the province of Ulster, Ireland (Map: Ireland, E 2). Its area is about 500 square miles, of which about one-twentieth is bog and waste land. Oats, wheat, potatoes, fruit, turnips, and flax are grown, and the making of linen is an important occupation. Large

numbers of cattle, sheep, and hogs are raised. The chief towns are Armagh, Lurgan, Portadown, and Camlough. Pop., 1841, 233,024; 1891, 137,877; 1901, 125,238; 1911, 120,291.

ARMAGH. The capital of the county of Armagh, Ireland, near the Ulster Canal, 34 miles southwest of Belfast (Map: Ireland, E 2). It is situated on rising ground and is built largely of limestone quarried in the neighborhood. There are two cathedrals, a Protestant and a Roman Catholic. The former, a cruciform structure dating from the twelfth century, is built of red sandstone and is supposed to occupy the site of one erected in the fifth century by St. Patrick, the traditional founder of the city. The other is a modern building. Armagh is the seat of the archiepiscopal see of the Primate and Metropolitan of All Ireland, in the Catholic and Anglican churches, and has two archiepiscopal palaces. This city has a barracks, a college, a large library founded by Primate Robinson, and a famous observatory. Its benevolent institutions include an infirmary, a fever hospital, and a lunatic asylum. Its chief industries are linen weaving and the manufacture of yarns. Pop., 1901, 7588; 1911, 7356. Armagh, from the year 495 to the ninth century, was the metropolis of Ireland, the native kings living at Emania, 2 miles to the west of the city. It was then renowned for its school of theology and literature. Between 839 and 1092 the town was sacked five times by the Danes. After the Reformation it suffered severely in the conflicts between the English and Irish. It contained only three slated houses in 1765, but since then, owing to the exertions of Lord Rokely and his successors to the primacy, it has been largely rebuilt. Consult J. Stuart, *Historical Memoirs of Armagh* (Dublin, 1900).

ARMAGNAC, ár'má'nyák' (anciently, Lat. *Ager Aremonicus*, Aremonian territory). The name of an old district in Gascony, France, now mainly included within the department of Gers. Its capitals were Auch and Lectoure. It is a fertile, hilly country, chiefly devoted to the growing of grapes, from which the famous Armagnac brandy is made. The Counts of Armagnac played an important part in French history from the tenth century to the sixteenth. The most celebrated of the line was Bernard VII. During the Hundred Years' War they were leaders of the Nationalist party, opposed to the Burgundians and English. When peace was declared their followers turned to ravaging the country until Charles VII sent them to fight with the Emperor Frederick III against the Swiss.

ARMAGNAC, BERNARD VII, COUNT D' (?-1418). The leader of the Orleanist party, in the reign of Charles VI of France, which, from him, took the name *Armagnacs*. The rise of this party was due to the feud between the dukes of Burgundy and Orleans over the possession of the royal power during the incapacity of Charles VI. In the struggle the Duke of Orleans was assassinated and the Burgundians gained the upper hand. Bernard, father-in-law of the Duke of Orleans, assumed the leadership, and in 1413 got possession of Paris. After the battle of Agincourt, in 1415, he became Constable of France. He ruled Paris so oppressively that the populace rose, June 12, 1418, and killed him and all of his party they could find.

ARMAGNAC, JEAN V, COUNT D' (c.1420-1473). A grandson of Bernard; a notoriously passionate and wicked man. He secretly mar-

ried his own sister, fraudulently securing a papal dispensation. Charles VII took away his possessions, but they were restored by Louis XI. Armagnac later joined the "League for the Public Good," and in consequence was driven into Aragon by the King, and his estates were forfeited. At the intercession of the King's brother the estates were returned, but Armagnac remained a fugitive and was put to death by the King's soldiers.

ARMAMENT (Lat. nom. pl. *armamenta*, implements or utensils for any purpose; tackle of a ship). The guns and other weapons of offense supplied to a ship or fortification for use against an enemy. It includes ammunition and gun mountings, torpedoes, torpedo tubes, etc. In a broader sense, it is used to designate the whole or a part of the military and naval equipments or forces of a nation.

ARMAND, ár'män', CHARLES TEFFIN, MARQUIS DE LA ROUARE (1756-93). A French soldier in the American Revolution. Dismissed from the French service for fighting a duel about an actress, he came to America and (in May, 1777) entered the Continental army as a colonel. In October, 1779, he succeeded Pulaski in command of the "Pulaski Legion" (soon renamed "Armand's Partisan Corps") and in 1783 became a brigadier-general. He returned to France in 1783 and took an active part, on the Royalist side, in the French Revolution. Consult a *Memoir* by Townshend Ward in vol. ii, *Pennsylvania Magazine of History and Biography* (Philadelphia, 1878).

ARMANDE, ár'mänd'. The elder sister of Henriette, in Molière's *Les femmes savantes*.

ARMANSBERG, ár'máns-pérk, JOSEPH LUDWIG, COUNT VON (1787-1853). A German statesman, born in Lower Bavaria. In 1826 he was appointed Bavarian Minister of Foreign Affairs, and soon after exchanged that office for the portfolios of the Interior and the Finances. He drew upon himself the hatred of the Camarilla by his strenuous opposition to the claims of Rome, as well as by his attempts to identify himself with the Liberal party, and the Roman Catholic clergy brought about his dismissal. He accompanied the young King Otto to Greece in 1833, where for four years he acted as regent or chancellor. Greece derived many benefits from his administration.

ARMATOLES, ár'má-tölz. A body of Greek militia, first formed under the reign of Sultan Selim I about the beginning of the sixteenth century. They were organized to preserve the fertile plains from the ravages of the *klephts*, Christian mountain robbers of Thessaly, Epirus, and Macedonia (from Gk. *κλέπτης*, *kleptēs*, robber), who had never been entirely conquered by the Turks. The Armatoles themselves were originally *klephts*, but received their more honorable designation when the Porte had transformed them into a sort of military police. The safety of the public roads was intrusted to their care. The whole of northern Greece was divided into 14 districts, each placed under the supervision of a chief of these militia, who, however, had himself to receive orders from a Turkish pasha or Greek bishop. But although the Armatoles frequently suppressed the brigandage of the *klephts*, they still regarded them in the light of brothers, inasmuch as they had a common origin and faith; both detested the oppressors of their country, and the sentiment of patriotism overruled every other consideration.

This sympathy at last appeared to the Turks so dangerous that they grew alarmed, and desired to substitute for the Armatoles, the Mohammedan Albanians, who were the implacable enemies of the Greeks, which resolution did not a little to hasten the insurrection which the Porte ever dreaded. The moment it broke out, the Armatoles pronounced themselves in favor of the national cause, and in the war of independence that ensued, distinguished themselves by their brilliant exploits. Marco Bozzaris (q.v.), leader of the Suliotcs, was a good type of the Armatole leader.

ARMATURE (Lat. *armatura*, armor; Ger. *Anker*). The mass of iron or other magnetizable substance upon which is exerted the power of attraction possessed by a magnet, or which is placed in contact with its pole or poles. In the case of a permanent magnet of the horse-shoe pattern, the armature may be of soft iron and is known as the *keeper*, as it helps to retain and preserve the magnetism by completing the magnetic circuit through the two poles. The armature of an electro-magnet is placed near its poles, and whenever a current of electricity is sent through the coils of the latter the armature is attracted. If the armature is a piece of soft iron, attraction always takes place, and on this principle is based the action of the electric bell, the telegraph sounder, and other forms of electrical apparatus. Such an armature, as soon as the flow of the current ceases, returns to its normal position under the action of gravity or of a spring. If the armature is a permanent steel magnet or another electro-magnet, it may move either toward or away from the main electro-magnet, depending on its polarity, and in that case is known as a polarized armature. In dynamo-electric machinery, the term "armature" is used to designate that portion of the machine comprised where an active conductor is moved across the magnetic lines of force of the field magnets and in which the differences of electric potential producing the current are generated. The term is generally employed to describe the part which is revolved between the poles of the field magnets of a dynamo or electric motor, though in alternators the armature may be stationary and the field coils revolve. The iron cores on which the coils comprising the armature are wound afford a magnetic connection between the poles. Consult Cramp and Cramp, *Armature Windings of the Closed Circuit Type* (London, 1906); Kinzbrunner, *Continuous Current Armatures* (New York, 1906). See MAGNETISM; DYNAMO-ELECTRIC MACHINERY, and the authorities there cited.

ARMBRUSTER, ärm'brūs-tēr, CARL (1846—). An anglicized German orchestral conductor. He was born at Andernach and studied with private teachers at Cologne, where he began his career as a pianist. In 1863 he settled in London. Here he soon became prominent as an ardent advocate of Wagner, whose works he conducted after 1881 at the Royal, Haymarket, Covent Garden, and Drury Lane theatres. During the London Wagner Festivals of 1882 and 1884 he acted as Hans Richter's assistant and from 1884 to 1894 he was one of the conductors at Bayreuth. In 1901 he became musical adviser to the London County Council. His most effective means of propaganda in behalf of Wagner, and some other modern composers also, was the illustrated lec-

ture. In his capacity as lecturer he made a successful tour of the United States in 1900-01.

ARME BLANCHE, ärm' blänsh'. A term of French origin, meaning 'white arm.' It has special application to the dueling foil or rapier (see FENCING), but is often applied to all weapons other than firearms, such as foil, rapier, sword, lance, and dagger.

ARMED NEUTRALITY, THE. An association of European powers which, under the leadership of Russia, first gave international validity to the doctrine, proclaimed by Prussia in 1752 and by France in 1778, that "free ships make free goods." Because England insisted on her right to search neutral ships for her enemies' goods in the early years of her war with America, France, and Spain (1775-83), and in consequence crippled the commerce of non-combatant powers, Catharine of Russia, on March 8, 1780, issued her famous proclamation laying down the principles: (1) That neutral ships may freely sail from port to port and along the coasts of belligerents; (2) that a blockade, to be recognized, must be effectual and real; and (3) that, except in the case of contraband, free ships make free goods. These principles were immediately indorsed and adopted by the United States, France, and Spain; and an association, ultimately composed of Russia, Denmark, Sweden, the Netherlands, Prussia, the Empire, Portugal, Austria, and the Two Sicilies, was organized for the purpose of enforcing them upon the belligerent powers. The immediate effect was greatly to embarrass England by placing her in diplomatic hostility to the rest of Europe, by increasing the probability of an extended war, and by lessening the advantage which her naval preponderance gave her. The enunciation of the doctrine of "free ships, free goods," at that time marked an epoch in the history of international maritime law. Consult Fauchille, *Le Iague des Neutres de 1780*.

ARMED SHIP. A ship carrying an armament in contradistinction to one without armament. The term is generally used to designate merchant vessels taken into the service of the government and supplied with a battery; but it was formerly used with reference to private vessels fitted out, by permission of a government, to operate against an enemy's commerce; that is, a privateer. The term has acquired additional importance in recent years, as certain unarmed vessels of the enemy, such as cartels and hospital ships, are exempt from capture; and the tendency of the usages of maritime war, in respect to private unarmed ships, is toward increased exemption from capture.

ARMENGAUD, ärm'äng'ô', JACQUES EUGÈNE, called ARMENGAUD THE ELDER (1810-91). A French inventor and draughtsman. He was born at Ostend and was educated at the Ecole des Arts et Métiers at Châlons. He was professor of mechanical drawing at the Conservatoire des Arts et Métiers at Paris, where, in collaboration with his brother, he published a monthly review entitled *Le Génie Industriel*. His works on engineering include: *Traité théorique et pratique des moteurs hydrauliques et à vapeur* (1858); *Nouveau cours raisonné de dessin industriel appliqué à la mécanique et à l'architecture* (with his brother Charles, 1848-60). He was decorated with the Legion of Honor in 1863 and his work has been recognized by many scientific associations.

ARMENIA (Assyrian *Urartu*, OPers. *Ar-*

maniya, Pers. *Armina*). A tableland in western Asia, about 6000 feet high, situated to the southwest of the Caucasus Range, stretching southward toward the lowlands of Mesopotamia, and extending from the highlands of Asia Minor on the west to the vicinity of the Caspian Sea. Armenia, in the widest sense of the name, is included between the parallels of 37° 30' and 41° 45' N. lat., and the meridians of 37° and 49° E. long. It embraces the northeast corner of Asiatic Turkey, the southern part of Transcaucasia (Asiatic Russia), and the northwest corner of Persia. The principal portion, having an area in round numbers of about 70,000 square miles, belongs to Turkey (Map: Turkey in Asia, J 2), and is included in the vilayets of Erzerum, Van, Bitlis, Mamuret-ül-Aziz, and Diarbekr. The Russian portion (acquired in part from Persia in 1828 and in part from Turkey in 1878) is included in the governments of Erivan, Yelisavetpol, and Tiflis, and the Territory of Kars. Persian Armenia forms part of the province of Azerbaijan. A great part of the region called Kurdistan is included in southern Armenia. In antiquity Armenia was divided into Greater and Lesser Armenia, the latter (a small fraction of the whole) being separated from the former by the western head stream of the Euphrates. The plateau surface is covered with a series of mountain ranges, mostly of volcanic origin, inclosing elevated plateaus of archaic and Palæozoic origin in the north, with sedimentary rocks in the south, the surface of which consists in part of pasture land. Of the mountain peaks, Mount Ararat, situated where the frontiers of Russia, Turkey, and Persia meet, has an altitude of nearly 17,000 feet. Armenia is watered chiefly by the Euphrates, Tigris, Churuk Su, and Aras. It contains two extensive salt lakes—Van, in Turkish Armenia (elevation 5100 feet), Urmia, in Persian Armenia (elevation 4000 feet). Lake Gokcha, in Russian Armenia, sends its waters to the Aras.

The climate of Armenia is generally healthful, but the temperature has great variations, in some places ranging from -20° to 85° F. Long and severe winters are followed by very short springs, beginning in April. The summers are hot, and grains and fruit ripen very early. The rainfall is generally scant, and artificial irrigation has been resorted to for centuries. The flora varies considerably, in accordance with the elevation of the surface. Trees are found at an altitude of nearly 9000 feet, and even higher on the southern slopes. Wheat grows freely as high as 7000 feet above the sea. Southern fruits, such as olives and figs, are cultivated successfully in the warmer regions, while the common fruits are found everywhere. Tobacco, cotton, and rice are cultivated in the warmer valleys. The domestic animals, especially horses and sheep, are well known; while the wild animals, such as the bear, wolf, tiger, hyena, leopard, etc., are still found in the forests. The soil is generally fertile and well adapted for agricultural purposes.

The turbulent state of the country under the despotic rule of Turkey has always been a serious obstacle to natural development, and as a result agriculture is very much neglected. Armenia has considerable mineral wealth. The chief minerals are marble, saltpetre, iron, copper, quicksilver, lead, and gold. The population of Turkish Armenia (the chief city of which is Erzerum) is estimated at

about 2,470,000. Of this number, about 650,000 are Armenians, the bulk of the population consisting of Turks and Kurds. The Armenians in Transcaucasia number 1,118,094 by the Russian census of 1911. The number of Armenians in European Turkey is estimated at 500,000, and the Armenian population in Asiatic Turkey outside of Armenia at 576,000. Persia is supposed to contain about 100,000 Armenians, and there are about 30,000 in Ciscaucasia. Hungary, Transylvania, and Galicia have about 15,000, and there are several thousand in India and also in Africa. In the past 15 years considerable numbers have emigrated to the United States.

Ethnology. By language the Armenians, or, as they call themselves, Haik, are entitled to rank as a very old branch of the Aryan stock, in some respects intermediate between the Aryans of Europe and the Aryan peoples of Greater Asia. Physically also they are of a primitive type, short and thickset, dark-skinned, and of exaggerated brachycephalism, in part artificially induced. They are thought to be related, on the one hand, to the "Alpine" stock in Europe, and, on the other, to the Galtchas, etc., of central Asia. Their physical type is probably less pure than is assumed by Ripley (1899), but not so mixed as Deniker (1900) supposes. They inhabited in early prehistoric times a considerable portion of Asia Minor and have contributed to, or borrowed from, Aryans of other types, Semites, Caucasian peoples, and later intruding Europeans and Turks. Prof. F. von Luschan (1911) is of opinion that the modern Armenians are the descendants of the pre-Semitic population of the region, whom he identifies with the old Hittites. He also believes that from this same Armenoid race came the so-called "Alpine race" of Europe. Their racial, social, and religious solidarity, and their position in a land that has seen so much of the beginnings of the civilizations of the white race, make them one of the most interesting peoples of Asia. They are conspicuous by their industry, intelligence, and aptitude for commercial pursuits, and in many cities of the East they are the principal merchants and money lenders. The bulk of them belong to the so-called Armenian church. Consult Chantre, *Recherches anthropologiques dans l'Asie occidentale* (Lyon, 1895), and Von Luschan, "The Early Inhabitants of Western Asia," in the *Journal of the Royal Anthropological Institute* (London, 1911).

Archæology. Cities abounding in superb palaces and temples existed in Armenia from remote antiquity. Armais, grandson of Haik, the conqueror of Nimrod, is said to have built the town of Armavir, long the capital of Armenia, on the banks of the Araxes. When, according to the tradition, Semiramis conquered the country, Semiramocerte, now Van, was built, where important excavations and discoveries have been made in recent years. Christianity, introduced by Gregory the Illuminator, and adopted by his royal convert, Tiridates, c.312, resulted in the demolition of the pagan temples throughout the kingdom and the endowment and building of Christian churches. Among the most interesting examples of Armenian architecture dating from this period are the remains of fortifications, the castle, cathedral, and chapel at Ani, the ruins at Akhlat and at Talin, the troglodyte city of Vardzia, the mediæval castle of Khertvis, the church at Saba, built by

Atabeg Sargis (1306-34), and the one at Etchmiadzin, the cathedral of St. Gregory, the monastery and the churches of St. Gaina, St. Ripsima, and of Shoghakath, with its finely sculptured stones.

History. The Armenians trace their descent from Haig, or Haik, the grandson of Japhet. His descendant, Aram, is the eponymous hero of the land, which was called Armima by the Persians, and Haik, or Hairstan, by the Armenians themselves. Though possessed of an old civilization, the Armenians first appear in history about the middle of the sixth century B.C., when Dikran, or Tigranes, of the Haig dynasty, freed his nation from its subjection to the Assyrians and the Medes. Subdued by Alexander the Great, the country was ruled by the representatives of the Seleucid kings until 190 B.C., when the satraps Artaxias and Zariadres revolted against Antiochus the Great and divided the province between them, the former taking the country east of the Euphrates, or Armenia Major, the latter the western portion, or Armenia Minor. Armenia Major was subdued by the Parthians about 150 B.C., and ruled, except for a brief period of Persian domination, (232-260 A.D.), till 428 A.D. by the family of the Arsacidae (q.v.). The most celebrated prince of the line was Tigranes the Great, who, drawn by his father-in-law, Mithridates, into a quarrel with Rome, was completely overthrown at Tigranocerta (69 B.C.) by Lucullus, but was left in power as a client king of the Romans. Armenia thus became a buffer state between the Roman Empire and the Parthians and was controlled in rapid alternation by the two powers. In 387 A.D. the Byzantines and the Persians definitely partitioned the country, the line of the Arsacidae continuing to rule in Persarmenia 40 years longer.

About the year 285 Christianity was introduced into Armenia by Gregory the Illuminator, who succeeded in converting the King, Tiridates III. Zoroastrianism, the old religion of the country, collapsed, the people imitated the example of their monarch, and the earliest national Christian Church in the world arose. The Sassanid rulers of Persia vainly endeavored to extirpate Christianity and succeeded only in plunging the country into anarchy. The first 250 years of Arab rule (636-885) were marked by bitter conflicts between Mohammedans and Byzantines, but in 885 Ashod I, a descendant of the ancient Jewish family of the Bagratids, or Pagratids, was made King, under the suzerainty of the Caliph, and for more than 100 years the land enjoyed peace. Then ruin came upon it in the shape of Byzantine and Mongol invasions. The Seljuk Turks and after them Timur devastated the land and occupied a portion of it, while the Byzantines seized the rest. The land was subjugated by the Persians in 1472, but part of it was wrested from them by the Ottomans 50 years later and permanently incorporated into their Empire. The northeastern portion of Armenia Major was taken from the Persians by Russia in 1828, who added to her possessions in 1878 the Turkish country of Kars and Batum.

Armenia Minor for a long time had a history of its own. It was made a Roman province in 70 A.D.; was conquered from the Byzantines by the Arabs about 633, and recovered by the Byzantines 120 years later. In 1080 Rhupen, a descendant of the Bagratids, made himself independent in Armenia Minor; his successors ex-

tended their power over Cilicia and Cappadocia and aided the Crusaders against the Saracens. The house of Rhupen fell in 1393, and the land, after passing through the hands of the Egyptians and the Persians, came into the possession of the Turks in 1541.

Armenia, therefore, at the present is merely an historical conception. The ancient land is divided among the Turks, the Russians, and the Persians, and the Armenian people have been scattered over Asia Minor and a considerable territory in Europe. Aspirations toward national unity have not been wanting among the Armenians, especially those dwelling in Asiatic Turkey. After 1885 a revolutionary movement, inspired by the Russian Nihilist propaganda, attained formidable dimensions. The Porte intrusted the pacification of the country to the Kurds, who constitute the national police. Sanguinary conflicts, marked by outrageous cruelty on both sides, occurred between the revolutionists and the police in the provinces of Trebizond, Bitlis, and Erzerum, and it was the news of the atrocities, committed by Kurds, acting in their official capacity, that stirred Europe and America to horror in the years 1895 and 1896. Signs of anti-Armenian feeling had appeared throughout Asiatic Turkey as early as the spring of 1894. In August of that year a massacre of Armenians was perpetrated at Sassun, and the fever of murder spread all over Asiatic Turkey. All through the spring and summer of 1895 the slaughter of Armenian men, women, and children continued, until the representatives of England, France, and Russia, backed up by their assembled warships, wrested from the Sultan the promise of reparation and reforms. A commission was sent to the scene of conflict to investigate conditions there, and the Armenian Patriarch was summoned to Constantinople to state the demands of the Armenians, which included a share in the making of laws and the administration, and proportional representation in the national police. The Sultan's *irade* went forth, the commission labored, and the massacres continued. During the months of October and November Armenians were butchered at Trebizond, Erzerum, Akhissar, Bitlis, Zeitun, Swas, Kurun, and Marash. At Diarbekr a pitched battle was fought between Turks and Armenians, in which 5000 men perished. In the provinces of Erzerum and Trebizond entire villages were devastated, famine and plague attacked the survivors of the massacres, and the Turkish government was forced, only after the greatest reluctance, into permitting the work of relief organized by Clara Barton and the Red Cross Society to be carried on. The outrages subsided in 1896, but in August occurred a fearful carnage of Armenians in the streets of Constantinople, perpetrated by a mob at the instigation of the government, in retaliation for the attack on the Ottoman Bank made by Armenian patriots, August 26-28. At least 4000 Armenians were beaten to death by the clubs of hired ruffians. (For the revolutionary movement and disturbances of 1905-06 in Russian Armenia, see RUSSIA.) Nor could reparation be demanded of the Turkish government, inasmuch as the Armenian revolutionists, by their riotous action, had put themselves and their innocent countrymen outside of the law. Since 1896 the sporadic slaughter of Armenians on a minor scale has continued to the present day; and no real guarantees for the safety of the

unhappy people have been exacted from the Turkish government.

Religion. See ARMENIAN CHURCH.

Bibliography. The best modern work on Armenia is Lynch, *Armenia* (New York, 1901), which contains a good map and an exhaustive bibliography; Noguères, *Arménie; géographie, religion, mœurs, littérature, situation actuelle* (Paris, 1897); Tchobanian, *L'Arménie, son histoire, sa littérature, son rôle en Orient* (Paris, 1897); Ozhderian, *The Turk and the Land of Haig, or Turkey and Armenia, Descriptive, Historical, and Picturesque* (New York, 1898); Tiele, *Western Asia, According to Most Recent Discoveries* (London, 1893); Kolenati, *Die Bereisung Hoch Armeniens* (Dresden, 1858); Bryce, *Trans-Caucasia and Ararat* (London, 1896); Barkley, *A Ride through Asia Minor and Armenia* (London, 1891); John Catholicos, Patriarch of Armenia, *Histoire d'Arménie*, translated by Saint-Martin (Paris, 1841); Langlois, *Rapport sur l'exploration archéologique de Cilicie et de la Petite Arménie* (Paris, 1854); Sayce, *The Cuneiform Inscriptions of Van* (London, 1882-88-93-94); Hyvernât, *L'histoire ancienne de l'Arménie et les inscriptions cunéiformes du bassin de Van* (Paris, 1892); Deniker, *Races of Man* (London, 1900); Belck and Lehmann have published a number of valuable articles on Armenian Archaeology and Ethnology in the *Verhandlungen der Gesellschaft für Anthropologie* (Berlin, 1900-01); De Cursons, *La Rébellion Arménienne* (Paris, 1895); Lepsius, *Armenia und Europa* (Berlin, 1896); Gladstone, *The Armenian Question* (London, 1893); Nazarbek, *Armenian Revolutionists upon Armenian Problems* (London, 1895); Zahn, *Die Stellung Armeniens in Gebirgsbau von Vorderasien* (Berlin, 1908); Adossidès, *Arméniens et leurs Turcs* (Paris, 1910).

ARMENIAN ART. This art and that of Georgia are so closely related as to form but a single style, which might be called the art of the Caucasus. Its early antiquities are not very well known: they are related to those of the Sarmathians and Scythians of Turkestan and Siberia and of the cities of Crimea and the Bosphorus. In northern Armenia there are thousands of graves in the form of large mounds, and especially near Kaaban there are many dolmens. It is from these tombs (e.g., Koban and Kamunta) that the objects have come which show us the condition of the arts here just before and after the Christian era began. It was rather late when both Persian and Roman influences penetrated simultaneously. Building had been almost entirely in wood, except in the case of the numerous fortresses. The only ruins yet studied of the Roman period are those of Karni. This region seems to have become an important centre for the propagation of that most interesting form of barbaric art which we associate with Goths, Celts, Scandinavians, Anglo-Saxons, Lombards, and other early Germanic tribes, and of which the treasury of Guerrazar is the most brilliant example. Its main characteristics are the technique of cloisonné enamel, the setting of colored glass in metal bands soldered to a metal ground, and the use of geometric ornamentation. Beginning in central Asia, it passed westward, apparently with the emigration of the Goths, by whom it was presumably imparted to the other tribes. Shortly after, when the country had become christianized, the history of architecture and monu-

mental sculpture in this region began. The churches built between the seventh and sixteenth centuries are not large, but have considerable character.

The Caucasus felt the influence of Byzantine art at all times, but added to it, and to its own inherited traits, something from Syria, whose missionaries had converted it and formed its literature. At one time Armenia became, in fact, a province of the Empire politically as well as artistically. Then, during the Middle Ages, the crusaders gave a western tinge, and still later came the influence of Russian art. The earliest known church of Armenia, St. Ripsima's at Vagashabad (618), is thoroughly Byzantine, a Greek cross with its four arms ending in apses and a central dome raised on a drum, circular inside and polygonal outside. As in so many Byzantine churches, the cruciform plan does not appear on the outside, as chapels fill in the spaces between the arms. The church at Usunlar, with its peristyle colonnade, dates from 718 to 729. Both are still without ornament. It is possible that the church at Dighbur, from its similarities to buildings in central Syria of the sixth century, may be even earlier. Pitzcudá (c. fifteenth century), with its high dome and tunnel vaults, is very Byzantine. The culmination of a new style appears in the cathedral of Ani (1010 A.D.), the most interesting church of Armenia. The exterior, with its central dome raised on a high square drum, its exterior decorated with colonettes, its internal clustered piers and pointed arches, as well as its vaulting system, reminds us in many ways of the European architecture. At the same date a church was built at Mokwi, Byzantine in every particular, and with the greatest similarity to the early Russian church of St. Sophia at Novgorod. The contemporary cathedral of Kiutas in Imerethia is of equal importance, but its plan is basilical instead of a Greek cross. This century was most prolific. In Abkhasia, the church of Mowki, with a charming dome and five naves with slender stone piers and cornices of great delicacy; that of Martvili, in Mingrelia, with exquisite decorative details, are samples of a numerous class of which others are at Manglisi, Kaben, Sion, Zarzma, etc. Later, in the twelfth century, are others at Bethania, Vardzia, Gbelathi. The purely architectural moldings are very simple: a cornice of a simple cove, sometimes decorated with painted or carved palmettes or foliage; a rude, ball-shaped capital; a torus molding woven into patterns and often carried out so as to join the windows and decorative plaques in one scheme of ornament covering the whole façade. The climax is reached in the fifteenth century in the church of Mtzkhet in Georgia, Armenian in its dome and plan, Byzantine in its proportions, Georgian in its rich interlaced decorative patterns with the addition of Byzantine floral designs. Statuary and figures in relief appear to have been systematically avoided, and when used were crude and provincial. In some churches the king, bishop, or architect is represented holding the model of the building; or Christ is blessing. But the animal and decorative sculpture is much more artistic. The fighting animals are a reminiscence of Persian art; the peacocks, doves, griffins, and dragons, heraldically arrayed or intertwined with vines, are derived from Byzantine models.

The most successful use of decorative sculp-

ture is in the broad bands surrounding the church windows and in the panels let into the walls. These are in very flat and low relief, and are often highly original, differing from Byzantine work and bearing a most remarkable resemblance to the patterns in Celtic-Irish, Anglo-Saxon, and Frankish illuminated manuscripts. This is especially the case in churches of the eleventh to the fifteenth centuries. It is interesting that inscriptions were turned to extremely decorative purposes, just as they were in Mohammedan art. The most decorative class of smaller works are the sepulchral slabs usually erected like antique stiles on pedestals in the open air. Their design is graceful in outline and delicate in the detail of their arabesque and lace-work patterns around a central cross or rosette. One cannot help seeing in such as these the originals of the famous Irish, Welsh, and Saxon stone crosses, which are far less exquisite in design and execution. Wood carving and ivory carving were practiced, as is shown by some church doors and a multitude of images, book covers, crosiers, crosses, and other bits of handiwork. But the highest efforts of Georgian and Armenian decoration, with its amalgamation of Sassanian-Persian, of Byzantine and Mohammedan design, are shown in the goldsmith's work, where the metals are combined with enamels and set stones. The treasures of monasteries and churches in Suanetia, Mingrelia, and other provinces are still extremely rich in such works; especially Etchmiadzin, the national sanctuary of Armenia, Ghelathi, Khopi, Tehukul, etc. None of them are earlier than the tenth century. In most cases the ornamentation surrounds some sacred image. The elaborate geometric design, so difficult to follow and yet so thoroughly scientific, winds over the entire gold surface inclosing the enamels surrounded by pearls, the precious stones framed in golden *cloisons*. The cloisonné enamel employed is another link both with Byzantium and with the primitive jewelry of the Goths and their imitators, the Germanic tribes. It is probable that the process originated in this very region. The local style of figured enamels, of great originality in the ninth to twelfth centuries, and independent of Byzantium, is brilliantly shown in those of the Khakul image at Ghelathi and others at Sion, Djumati, Khopi, etc. In jewelry, figured compositions were not avoided, as in large sculpture, especially where the art came strongly under Byzantine influence, and the figures in their crude realism and exaggerated movement again connect with Carolingian and other branches of the north European art of early mediæval times rather than with Byzantium. Religious, gold images, triptychs, crosses, chalices, book covers, are among the forms taken by this jewelry. They are found in dozens of church treasures. Wall painting was very general during the entire period, and here again considerable independence of Byzantium was shown. The only example of the mosaic work so universal among the Greeks is at Ghelathi and was a present to King David from Emperor Alexis Comnenus. Caucasian painting was far less stiff and classic than Byzantine. It admitted historic scenes more frequently, and the desire of the artists to glorify events of national interest is shown vividly in frequent portraits of the sovereigns of Georgia and Armenia. Such frescoes are at Sion (eleventh century), Nekresi (eleventh cen-

tury), and especially Ghelathi and Bethania. On the other hand, in the numerous illuminated MSS. of the same period (eleventh to fifteenth centuries), Byzantine influence predominated. The Georgian are the earliest, and attained perfection in the eleventh century. More numerous, but later, are the Armenians. The largest collections of such MSS. are in the Armenian Library in Venice, and in that of the monastery of Etchmiadzin. The thirteenth century marks for this, as well as for most other branches of art, the highest point of perfection. In the seventeenth century foreign influences—especially Italian and Persian—began to predominate. See ARCHITECTURE; ART, HISTORY OF; BYZANTINE ART.

Bibliography. ARMENIAN CHURCH. Christianity appears to have been introduced in Armenia as early as the second century. It was for the first time firmly established, however, when Bishop Gregory the Illuminator baptized Tiridates, the King (301), and a great party of the people became immediately baptized Christians. (See ARMENIA.) The Bible was translated into the Armenian language in the fifth century by Mesrob and Sahak. After this period great activity prevailed in the Armenian church. Numbers flocked to the colleges at Athens and Constantinople. In the ecclesiastical controversy concerning the twofold nature of Christ the Armenian Christians held with the Monophysites, refused to acknowledge the authority of the Council of Chalcedon, and constituted themselves a separate Church, which took the title of Gregorian from Gregory himself. For several centuries a spirit of scientific inquiry, especially in theology, manifested itself among them to a far wider extent than in the other Eastern churches. Their greatest divine is Nerses IV, Patriarch of Armenia, and Catholicos, from 1166 to 1173, whose works have been repeatedly published (Lat. trans., 2 vols., Venice, 1833); his *Prayers* in 36 languages (1882). The Gregorians have continued to entertain a deeply rooted aversion to the Orthodox church. The Roman Catholic Popes at various times, especially (1145, 1341, 1440) when the Armenians accepted the help of the West against the Mohammedans, tried to persuade them to recognize the papal supremacy; but for the most part only the nobles consented to do so, while the mass of the people clung to their ancient opinions, as we see from the complaint of Pope Benedict VII, who accuses the Armenian church of 117 errors of doctrine. There is a sect of United or Roman Catholic Armenians in Italy, Galicia, Persia, Russia, and Marseilles, who accept the papal supremacy. It dates from 1439. Seventeen dioceses are now subject to their patriarch, but he has no authority over Armenians in Russia and Austria. The attempt of Pius IX, in 1867, to Romanize the sect still further, led to a split, and the rebellious fraternized with the Old Catholics in 1872. The congregation of the Mechitarists, founded by the Abbot Mechitar in 1701 at Venice, have done much to

spread the Roman faith among their people. In theology the Orthodox Armenian church attributes only *one* nature to Christ, and holds that the Spirit proceeds from the Father alone, this doctrine, however, being held by it in common with the Orthodox Greek church, although contrary to the theology of the Western churches. With respect to the "seven sacraments," it holds that at baptism one must be sprinkled three times and as often dipped; that confirmation is to be conjoined with baptism; that the Lord's Supper must be celebrated with wine and leavened bread; that the bread, before being given, must be dipped in the wine; and that extreme unction is to be administered to ecclesiastics alone, and immediately after (and not before) their death. It believes in the worship of saints, but not in purgatory. It exceeds the Greek church in the number of its fasts, but has fewer religious festivals. These, however, are more enthusiastically kept. Divine service is held in Turkey chiefly by night. Mass is celebrated in the old Armenian language; preaching is carried on in the new. The sacerdotal constitution differs little from the Greek. The head of the Armenian church is called the Catholicos. He resides at Etchmiadzin, in Russian Armenia. Under him are bishops. The Russian government claims the right of appointing him. But of more consequence are the patriarchs of Jerusalem and Constantinople, who are nominally under the Catholicos. The monks of this church follow the rule of St. Basil. The wartabieds (vartabeds) form a peculiar class of ecclesiastics: they live like monks, but are devoted exclusively to learning and preaching. Secular priests must marry once, but none is at liberty to take a second wife. Since 1830 very successful Protestant missions have been carried on among the Armenians. Consult Malan, *Divine Liturgy of the Armenian Church* (London, 1870), and Adonew, *Greek and Eastern Churches* (New York, 1908).

ARMENIAN LANGUAGE AND LITERATURE. The Armenian language forms one of the eight main divisions of the Indo-Germanic group. Owing to the presence of many loan words from the Iranian languages, Armenian was for a long time supposed to be an Iranian dialect, and this theory was defended especially by Paul de Lagarde and Friedrich Müller. A more scientific investigation of the language, however, has overthrown this view, and the independence of the Armenian has been conclusively shown. For this great contribution to philology we are indebted most of all to Heinrich Hübschmann. Valuable studies on the Armenian language and literature have also been made by Meillet, Bartholomæ, Bugge, and others. The Armenian language is divided into two parts: The Old, or Classical (*grabar*) Armenian and the Modern Armenian. The Classical Armenian language shows no dialectic variations, but the Modern Armenian has many dialects, whose study is most important for a correct philological knowledge of this Indo-Germanic tongue. The Classical Armenian is a fully inflected language, possessing seven declensions with six cases (nom., gen., dat., acc., abl., and instr.), and two supplementary cases (narrative and circumlocutory). There is also, as in all Indo-Germanic languages, a special mode of declension for the pronouns. There is no gender in Armenian, and but two numbers, singular and plural. Comparison of adjectives,

which are often uninflected, is chiefly by auxiliary adverbs or by repetition of the adjectives to be compared. There are four conjugations, of which the fourth is generally passive in force, with present, imperfect, first and second aorist, and first and second future, present and future participle, and infinitive tenses. As in Greek, but one of the futures and aorists is commonly found in the same verb. The moods are the indicative, subjunctive, imperative (or more properly, prohibitive). The Modern Armenian differs from the *grabar* chiefly in the decay of its inflectional system, in the development of postpositions, in the influx of loan words from the Turkish, and in the interchange of pronunciation of the old *tenues* and *media* with the new (Classical Armenian *b, g, d, k, p*, etc., pronounced *p, k, t, g, b*, etc., in Modern Armenian). The Armenian is fond of harsh combinations of consonants, and it is particularly rich in affricative sounds. The accent is usually on the last syllable. The Armenian alphabet consists of 36 letters, to which two others, *ô* and *f*, were added in the twelfth century. This alphabet was introduced by Mesrop, a bishop of the Armenian church, early in the fifth century, and was probably based upon the Greek letters, with additions from other sources to provide characters for sounds not represented in the Greek alphabet. In addition to the sounds familiar to our ears, Armenian possesses characters for the indefinite *e* in *the man*, for *zh* (French *j*), *h* (as in German, Greek χ), *sh, ts, ds, tch, dsh, thsh, tsh*, rolled *r*, for the aspirates *th, ph, kh*, and for a deep glottal catch corresponding somewhat in pronunciation to the Arabic *ghain*. As for its relation with the other Aryan languages, it is generally placed about half-way between the Indo-Iranian and the Letto-Slavic groups.

Armenian literature, properly speaking, begins only with the fifth century, when Mesrop devised the alphabet, and the entire Bible was rendered into Armenian by 410. Before the time of Mesrop there had been no Armenian literature (although a few Armenian songs are preserved by Moses of Chorene) despite the claims made for Agathangelos (ed. Venice, 1862, Tiflis, 1883) and Faustus of Byzantium (ed. Venice, 1889), who probably wrote in Greek, and was translated into Armenian later. Armenian literature is especially strong in history and in theology; but in poetry and belles-lettres it is very weak, and the drama does not exist. The principal Armenian writers (exclusive of translators) are as follows: Fifth century, Eznik of Golp, *Refutation of Heresies*, especially valuable for its account of the Zoroastrian and Manichean religions (ed. Venice, 1850); Moses of Chorene, *History of Armenia*, a good source of material, though not always reliable (ed. Amsterdam, 1695, London, 1736, Venice, 1762, 1827, 1865, 1881, trans. by Le Vaillant de Florival, Venice, 1841, and by Lauer, Regensburg, 1869), and a geography often attributed to him (ed. and tr. Venice, 1881); David the Philosopher (ed. Venice, 1823); Elisæus, *History of Vardan and of the Battles of the Armenians* (ed. Constantinople, 1764, 1823, Venice, 1828, 1852, 1859, 1893, tr. Neumann, London, 1830); eighth century, John of Ozim, a theological writer (ed. Venice, 1834); tenth century, Thomas of Ardsruni, an important historian; Gregor Narek, religious writer (ed. Venice, 1827-40); eleventh century, Gregor Magistros, theologian, grammarian, and poet; twelfth century, Nerses

Klayensis, poet, theologian, historian (ed. of his poetry, Venice, 1830), and his nephew, Nerses of Lampron, theologian, poet, and translator; Meehitar Gosh, fable writer (ed. Venice, 1854) and lawyer (ed. Etchmiadzin, 1880); thirteenth century, Vardan, who composed an important history of Armenia (ed. Venice, 1862), a book of beast fables (ed. in selection, Paris, 1825), and theological works; Vahram of Edessa, historian (ed. Madras, 1810); Johannes Erzincensis, historian, grammarian, theologian, and astronomer fourteenth century, Gregor Dathériensis, theologian. The last great author who wrote in Classical Armenian was Tschamtschean (died 1823), whose most important work was a history of Armenia from the earliest times to 1784 (ed. Venice, 1784-86). The golden ages of Armenian literature are the fifth century and the twelfth century, and the fourteenth century marks the beginning of a steady decline. The first book printed in Armenian was the Psalms (Venice, 1565), and during the seventeenth and eighteenth centuries printing houses were established in many cities in Europe, as well as in Asia—at Julfa, Smyrna, and Madras. A special impetus toward the preservation of Armenian literature was given by the establishment of a college and convent by Meehitar on the island of San Lazaro near Venice in 1717. The *Zeitschrift für armenische Philologie* was founded at Marburg in 1901.

ARMENTIERES, ár'män'tyär'. A town of the department Nord, France, on the Lys, 8 miles from Lille. The town manufactures table linen, cotton goods, and hemp, and has a considerable trade in grain. Pop., 1901, 29,401; 1906, 28,613; 1911, 28,625.

ARMFELT, CHARLES GUSTAVUS (1666-1736). A Swedish general, born in Ingernmanland. After serving with distinction in the French armies he returned, in 1700, to his native country, and as commander of the Swedish troops in Finland fought valiantly against the Russians, whose superior strength, however, forced Armfelt to abandon the province in 1714. In 1718 he led a Swedish expedition into Norway, met with ill success, and on the retreat lost almost his entire army through starvation and disease. Subsequently he received his old post of commanding officer of Finland.

ARMFELT, GUSTAV MAURITZ (1757-1814).

A Swedish courtier whose public life was characterized by striking vicissitudes of fortune. He was born in the government of Åbo. His loyalty to Gustavus III gained him the favor and friendship of that monarch. Armfelt distinguished himself in the war between Sweden and Russia and, as military representative of Gustavus, had the honor of concluding a peace at Wärelä in August, 1790. By the will of Gustavus, who was assassinated in 1792, Armfelt was made Governor of Stockholm and a member of the council assigned to the regent, Charles, Duke of Sudermania. The Duke, however, could not brook the idea of a check being placed upon his liberty of action, and found means to destroy the will, the conditions of which he never intended to observe. Armfelt soon became conscious that his influence was rapidly disappearing. He was rarely permitted to see the young King; and at last, after a secret interview with the Crown Prince Gustavus, departed as Ambassador to Naples in July, 1792. While in Italy he entered into correspondence with certain parties in Sweden for the purpose of overthrowing the regency and inducing the states to proclaim Gustavus IV of age. The correspondence was discovered. Armfelt fled to Poland and afterward to Russia. He was condemned during his absence for high treason and stripped of his goods and titles, while many of his friends were visited with torture and exile. In 1799 Gustavus IV received the crown at the age of 18, and Armfelt was restored to all his honors. In 1805 he was appointed Governor-General of Finland, in 1806 he commanded the Swedes in Pomerania, and in 1808 he commanded the Swedish army raised for the invasion of Norway; but his plans were so completely frustrated that he was compelled to witness the invasion of Sweden by the successful Norwegians and was in consequence recalled and dismissed by the King. In the following year a revolution took place, Gustavus was deposed, the Duke of Sudermania elected in his place, and Armfelt was appointed President of the Military Council. But shortly after he resigned and retired to Russia, where he lived during the remainder of his life in high honor. The title of Count was conferred on him; he was made chancellor of the University of Åbo, President of the Board of Finnish Affairs, and member of the Russian Senate. He died at Tsarskoye-Selo. Consult Tegnér, *Gustav Mauritz Armfelt* (Stockholm, 1887).

ARM'GART. A dramatic poem by George Eliot, published in *Macmillan's Magazine* in July, 1871, and containing a female character of singular strength and fortitude, of the same name.

ARMIDA, är-mě'dä. A beautiful sorceress in Tasso's *Jerusalem Delivered*. She was employed by Satan to seduce Rinaldo and other crusaders upon their arrival before the Holy City. Lured away by Armida to her pleasure palace, Rinaldo for a time forgets his vows, but is released from the spell by a powerful talisman. He returns to the war, but is followed by the sorceress, who at last rushes into battle against him. She is defeated by Rinaldo, who then declares his love for her, converts her to Christianity, and vows to be her faithful knight. The story of Armida has been made the subject of operas by Lully (1686), Gluck (1777), Cherubini (1784), Zingarelli (1786), and Rossini (1817). Consult Belloni, *Gli epigoni della Gerusalemme liberata* (Padova, 1893).

ARMIES (Fr. *armée*, through ML. *armata*, an armed force, seen in Sp. *armada*, properly fem. of Lat. p.p. *armatus*, from *armare*, to arm). Armed forces, organized under a regular system, for purposes of defense. The term "army" may describe the military strength of the nation of which the force is a part or by which it is employed; but it may also be used to describe an army which is only a part of the military forces of the country to which it belongs; as, for instance, the United States army in the Philippine Islands. The fundamental principle of combat is the same, whether between two individuals or two nations, and out of that principle has developed the art and science of war. From the earliest times when men first joined with one another for warlike purposes, there have been changes and developments in methods of association, discoveries in the realm of strategy and the application of tactics, as well as a constantly increasing number of inventions of weapons, mechanical devices, and other engines of destruction. In a primitive state of society the army as such does not exist, and the fighting force is coequal with the group, the tribe, or the nation. Military service is not only a duty but a privilege, and the right of carrying arms is one of the great distinctions between the free-man and the slave. Citizenship and warriorship as a rule go together; and among the early Germans the attainment of a youth's majority and his admission to a share of political rights was marked by an elaborate ceremony of assumption of arms, which with time passed into the chivalric ritual of admission to knighthood. The closest identification of army and nation is perhaps to be found among nomad tribes, where from time to time the shifting of the entire population is necessitated by failing of pasture. Such a migration, peaceful when unresisted, assumes the character of a hostile invasion when the desired territory is in the possession of a tribe strong enough to attempt resistance. Thus, too, in the great migrations preceding and succeeding the fall of the West Roman Empire, the Germanic warriors, marching from their old homes in the north to the conquest of a new home within the Empire, and accompanied by their wives, their children, and their household goods, offered a complete example of army and nation as one. With the establishment of permanent states the differentiation between citizen and warrior begins, and this development is greatly hastened by the growth of industry; for if the farmer finds it a hardship to be summoned from the plow to the field of battle, the burden falls still heavier on the industrial laborer, with whom the conditions of production are such as to require constant application. The process thus begun continues until, in countries like Great Britain or the United States, where military service is on a contractual basis, the total separation of warrior and citizen is attained. These considerations must be borne in mind in discussing the history of the evolution of the army.

ANCIENT ARMIES

Egyptian. Under the Old and Middle empires (down to about 1900 B.C.) the wars of Egypt were comparatively unimportant. During this period a sort of feudal system prevailed, and the main strength of the army was furnished by the militia of the nomes, commanded by the

nomarchs or their deputies, together with the contingents of the great temple estates and of the royal domains. In addition, a certain number of mercenary troops were drawn from the tribes of northern Nubia. Under the twelfth dynasty, and perhaps earlier, there was also a permanent corps, the "Retainers of the King," which seems to have filled the place of a standing army. No cavalry or chariot force existed, as the horse does not appear to have been introduced into Egypt until about 1600 B.C.

The Hyksos wars, which swept away the old feudal system, aroused the military spirit of Egypt, and under the New Empire (from about 1580 B.C.) a standing army was a necessity. It was composed chiefly of barbarian mercenaries, the native troops playing a rather unimportant part. Under the Saitic dynasty (645-525 B.C.), Greek mercenaries were largely employed. The bulk of the army under the New Empire was formed by the infantry, armed with spear and heavy shield or with light buckler and bow. The chariot force constituted the flower of the army. Each chariot contained two soldiers, of whom one fought with his bow and other weapons, while his comrade drove the horses. Great attention was paid to organization and discipline. The troops were divided into regiments and companies, and, in time of war at least, the regiments were formed into brigades or divisions. A special force, called the Mazay, was organized as a gendarmerie, or armed constabulary, but was sometimes employed in war. Consult Erman, *Life in Ancient Egypt*, chap. xx (London and New York, 1894).

Indian. Quite extensive descriptions of armies, battle arrays, and warfare among the ancient Hindus are preserved in the *Mahābhārata* or *Iliad* of India, and in the seventh book of the great legal code of Manu. The information which these sources furnish with reference to the constitution of the military force of early India serves to supplement such allusions to armed equipments and fighting as may be gathered from the earlier times represented by the Veda. Among the organizations of an army early recognized in India was a distribution of the forces into nine subdivisions, on the ascending scale, ranging from a squad (Sanskrit *patti*), composed of 1 chariot, 1 elephant, 5 foot soldiers, and 3 horsemen, up to an army corps (Skt. *akṣauhini*), comprising 21,870 chariots, 21,870 elephants, 109,350 foot soldiers, and 65,610 cavalry. The code of Manu likewise provides for various arrangements for drawing up of the forces in maneuvering, fighting, and encamping. These are interesting for students of military tactics to look up. On the march and in action the King was naturally stationed in the centre for safety; the commander was in the vanguard, unless, through the exigency of the situation, his presence was demanded elsewhere. Details may also be gathered from the sources mentioned with reference to the armor and accoutrement of the soldiers and all matters appertaining to military forces and warfare. The best work on the subject is Hopkins, "Ruling Caste in Ancient India," published in the *Journal of the American Oriental Society*, vol. xiii (New Haven, 1889).

Persia. The organization of the Persian army in ancient days appears to have corresponded largely with the divisions introduced into the forces of Media at an earlier date by

King Cyaxares (q.v.), as mentioned by Herodotus (c.103). This general distribution into infantry, composed of spearmen, bowmen, and others, and into cavalry, supplemented by warriors mounted on chariots, prevailed throughout the history of the Persian Empire. The cavalry was the flower of the army, as Persia was ever famous for her horses and her excellence in horsemanship. These mounted forces occupied the wings of the main body. This latter mass was composed of the people and was often little better than an armed mob. The scythe-bearing chariots were drawn up as a division in front of the army, and they seem to have inspired terror into the foe, but were often less effective than the other forces. The use of elephants is found as early as in the campaigns to oppose the invading Alexander. From Herodotus (vii, 61, 84) and other sources we learn that the characteristic equipments of the Persian soldiers were a short straight sword, a long spear, a bow, quiver, battle-axe, mace, or club, and a sling, according to the special district or province from which the levies came. A large wicker shield and a close-fitting leather tunic and trousers, a coat of mail, or a quilted corselet, completed the outfit. The horses as well as the riders were protected by mailed trappings—at least if we can judge from the comparison of the war horses on the sculptures in Sassanian times. A division of the army on the decimal scale of tens, hundreds, thousands, and tens of thousands may be gathered from Herodotus (xii, 81), and seems to be as old as the Avesta. The Persian hosts have ever been proverbial for numbers, and even allowing for exaggeration, the figures must have been enormous. The army which Xerxes led against Greece has been estimated at hardly less than 2,000,000, and Darius is reputed to have opposed the world-conquering Alexander with a force of between 750,000 and 1,000,000 men. The development and history of the Persian army during the Parthian and Sassanian periods, down to the overthrow of the Persian dominion by the Arab conquest and its subsequent results, may be obtained from a study of those times. On Persian armies and armor consult: Jackson, *Classical Studies in Honour of Henry Drisler* (New York, 1894); Zoroaster *the Prophet*, chap. vii (New York, 1899); Spiegel, *Erânische Alterthumskunde*, vol. iii, pp. 638 ff. (Leipzig, 1878); Kelsey, *Xenophon's Anabasis, Introduction* (Boston, 1895); G. Rawlinson, *Story of Parthia*, pp. 397 ff. (New York, 1893).

Greece. In the Homeric poems the mass of the infantry is of little account, at least to the poet. The fighting is chiefly carried on by the individual heroes, armed with lance and sword, and defended by helmet and shield and sometimes corselet. These heroes go to and from the battlefield in chariots, but in general fight on foot. When the historic period opens, we find that the war chariots have disappeared, and even cavalry, though the arm of the nobles, is not of decisive value. The army is composed of the hoplites, or heavy infantry, armed with helmet, breastplate, greaves, and shield, and carrying a short sword and long spear. These men fought in close formation, usually eight deep, supported at times by cavalry on the wings, and with light troops, armed with javelins, bows, or slings, to skirmish in front and cover the rear. *Lacedæmonian.*—Through the early days of Greek history the Spartan hoplites

were regarded as model troops. Their success seems to have been due in part to their rigorous gymnastic training; but still more to a severity of drill such as the other Grecian states seldom required. From the age of 20 to 60 every Spartan could be called upon to serve, though the older men were not called out except in emergencies. This discipline enabled them to change front in the presence of the enemy and held them steady in defeat or victory. *Athenian.*—The Athenian army was a militia. Every man was supposed to receive training and to serve when called upon—the richer as hoplites, the poorer as light-armed troops, while the cavalry was made up from young men of the wealthy families. As the Athenians never spent so much time in drill as the Spartans, they do not seem to have reached their combination of firmness and mobility, though Athenian bravery and skill were shown in many hard battles.

The general formation of the Greek armies remained but little changed for over a century. Marathon, Plataea, and Mycale were fought by the phalanx of hoplites against light-armed Orientals, and the same tactics and the same results are seen in 401 B.C., at the battle of Cunaxa, when the 10,000 Greeks overthrew the Persians opposed to them. *Thæbans.*—These had long enjoyed high repute as hoplites; but their contribution to the Greek art of war was rather in the development of a formation in deep column (50 deep at Leuctra, 371 B.C.). This heavy mass was hurled against one wing of the enemy, while the rest of the line, in ordinary formation, was held back to prevent any flank movement upon the attacking column. This innovation contributed largely to the success of Epaminondas and the establishment of Theban supremacy in Greece. *Macedonian.*—Upon these tactics of the Thebans, Philip of Macedon and Alexander the Great developed their armies. The central principle was personal duty to the King on the part of noble and peasant. "Companions" and "Foot-Companions" were the names of the heavy cavalry and infantry. The former wore metal cuirasses and carried lances; the latter had a small shield and a pike about 18 feet in length for the rear ranks. They were drawn up in very close order. In general, Alexander seems to have preferred the old depth of eight men; but under his successors the phalanx was deepened to 16 men, and became an unwieldy mass, formidable on level ground, but easily broken if a rough surface opened up the close ranks. This was shown again and again in the battles between the Romans and the Greeks. An important change in the art of war was the introduction by Philip and Alexander of a charge by heavy cavalry as the decisive feature of the attack, instead of the column of infantry used by Epaminondas. The Macedonians also developed the use of military engines hurling huge stones and arrows, both for siege purposes and also to some extent like modern artillery in actual battle.

Rome. While to the Greek belongs the credit of developing warfare into a science, it was left to the Roman legionary, with his perfect discipline and still more perfect organization, to make it effective. The leading characteristic of the Roman soldier was discipline rather than individual prowess. Great national characters like Camillus, Cincinnatus, Papirius Cursor, and Fabius Maximus were not so much heroes or strategists as commanders and disciplinarians.

The fact that the Roman soldier was never the military equal of the Greek hoplite at his best, and that he had no great advantage, man to man, in a pitched battle even with savages, was demonstrated over and over again during his career of world conquest.

In the earliest period of Roman military history all able-bodied citizens, under the King as commander-in-chief, were compelled to serve in the army in time of war. It was under Servius Tullius, however (according to Roman legends, the sixth King of Rome, 578-534 B.C.), that the first real organization took place. On the basis of a property qualification, citizens were divided into classes or grades (*centuriæ*); and each class subdivided into *seniores*, or elderly men, assigned only to light garrison duty, and *juniores*, or effective warriors; with the addition of two *centuriæ* of *fabri* (pioneers), two of *cornuines* (military musicians), and one of *proletarii*. The armies were made up by tribal levies, made in a general public assembly, usually on the Campus Martius, and each tribe was called upon to furnish an equal number of men. Out of a total of 25,000 men there would be 8000 *seniores* and 17,000 *juniores*. The soldiers thus chosen were formed into four legions and a cavalry corps of about 1800 horsemen. The legion (q.v.) on service consisted normally of about 3000 men, not including the *velites*, or lightly armed skirmishers, and a squadron of cavalry. In regular formation the *hastati* (heavily armed infantry), about 1200 strong, and arranged in 10 files, constituted the advance guard; following, was a similar body of *principes*, and a reserve or rear guard of *triarii*, usually arranged in five files.

The equipment of all three divisions was practically identical, and consisted of a short cutting and thrusting sword worn on the right thigh; two javelins, one light and one heavy; metal breastplate, large shield, and brazen helmet and greaves. The Roman attack differed from that of the Greek phalanx, in that, instead of fighting shoulder to shoulder and closing in together as gaps were made, they adopted a loose formation, which permitted the soldiers in the rear to fill up gaps caused by casualties and thus maintained their front intact. In combat the *triarii* used the *pilum*, a short, heavy spear which they threw into the ranks of the enemy before engaging them with the sword. The three divisions of the legion (*hastati*, *principes*, and *triarii*) were each arranged in 10 companies (*manipuli*), to each of which was assigned a detachment of *velites*. The *manipulus* was under the command of a centurion (*centurio*), whose lieutenant was a junior centurion. In the event of the disablement or absence of the officer commanding the legion, command would devolve on the senior centurion of the first company of the reserve (*triarii*). Normally, the chief command was taken two months at a time by each of the six military tribunes (*tribuni militum*). With the first civil war, however, arose the necessity of a single permanent chief, which arrangement was eventually adopted; a single officer (*legatus*) commanding each legion, assisted by a staff composed of the former military tribunes. The year 276 B.C. witnessed the advent of the professional or paid soldier. The long and heavy wars with Pyrrhus and Carthage led to the formation of a regular army; so that dating from the time of Marius (or from the beginning of the first century

B.C.) the enlisted man served for a period of 20 years. The legion, as now arranged, was composed of 6000 men, divided into 10 cohorts of 600 men each, all armed with the *pilum*. The *velites* were replaced by foreign mercenaries, of whom the most famous were *sagittarii* (bowmen) from Crete; *iaculatores* (javelin men) from Mauretania; and *funditores* (slingers) from the Balears. With the exception of a few Roman *equites*, who held the more important positions, the cavalry also was entirely foreign. Organized into cohorts were auxiliary troops of infantry and cavalry. The next reorganization took place toward the close of the first century B.C. under Augustus, who, besides confirming the period of service as 20 years, also introduced the pensioning of veterans. Twenty-five legions were now established and distributed in different parts of the Empire. Subsequently great changes took place in the army. The typical Roman soldier was no longer the invincible legionary, who, covered by his shield, had fought his way through the most stubborn pikemen, beaten back great hordes of Eastern horsemen, and resisted the wild rushes of impetuous Celts and Germans.

At the beginning of the third century A.D. the work of Augustus and others was beginning to fall to pieces; in the fourth, it was scarcely anywhere in evidence, and by the end of the fifth it had become a thing of the past. The exigencies of border warfare, with the extended system of permanent camps connected by patrols, had developed cavalry and light infantry at the expense of the older legion. In the third century A.D. the elaborate system of frontier defense and interior garrisons broke down, and the Empire was subjected to both civil war and foreign invasion. While the legions were engaged in civil strife, the opportunity of the enemy arrived. The frontiers were simultaneously attacked, and the Empire reeled under the shock. The Persians were rising to power in the East (226 A.D.); the German tribes were confederating and becoming correspondingly formidable; and the Franks, Alemanni, and Goths appeared along the Rhine and the Danube. Diocletian, however, with the reconquest of Britain in 297 A.D., restored the Empire to a semblance of its former power and unity. With the aid of wholesale taxation he replenished the exchequer and regarrisoned the military frontier. The changes and additions brought about by Diocletian are remarkable for the value he placed on the troops of mixed nationality and for the growing neglect of the ancient Roman legion. He also enlisted many new bodies of horsemen; *cunei*, *ala*, *vevillationes*, etc., being raised alike for the limitary, the comitatensian, and the Palatine armies, among whom Germans, Moors, and Persians were more numerous than the born subjects of the Empire. Under Constantine, the old legionary cavalry disappeared altogether, and cavalry and infantry became separate commands; yet under him and his successors, though cavalry grew considerably in relative importance, the infantry still remained the more important arm. The decadence in physique and morale of the Roman army at this time was largely due to the fact that the corps were less homogeneous, and the substitutes and recruits bought by the land-holding classes were often of bad material. The increasing boldness of their foes and the constant civil and internal dissensions had a baleful effect on the old-time

esprit-de-corps of the rank and file, and, together with the growing luxury and increasingly enervating vice of the times, soon brought about the disintegration and decay of the magnificent Empire. It is interesting to note that in many instances modern conditions have compelled the adoption of units of military command and forms of military procedure strikingly similar to those of the Romans; while the legionaries' sword, after passing through the radical forms and changes of the Middle Ages, has again appeared in the shape of the modern infantry sword-bayonet, which in shape and size closely resembles the Roman sword.

MODERN ARMIES

The evolution of the modern army has been along the lines of national and mechanical development; national needs and aspirations dictating its origin, organization, and strength, and the progress of mechanical invention its tactics and equipment. Mediæval armies, whose organization and characteristics will be found discussed under FEUDALISM, were made up chiefly of the retainers, dependents, and followers of the nobility, and were usually employed in the petty struggles of their leaders, or in assisting the King to make war on a larger scale. The success of the King invariably meant gifts of land to the victorious nobles fighting under his banner; who, in turn, rewarded their knights and squires by smaller gifts of land, or land privileges, thus building up the feudal system. The holding of lands implied service due to the giver, and as a consequence many of the nobility vied with their King in power and prestige. The crusades did much to develop the idea of coöperation; but at the best the different armies participating were practically independent of each other. It was an age when science was unknown, and the want of intellectual occupation made war the favorite occupation of the higher classes. Individual prowess and bravery were the standards by which battles were fought and won, the fate of a battle frequently depending on a personal combat between two knights. Under such circumstances, the science of war could never attain a high degree of efficiency; nor could any general organization be effected.

It was not until the reign of Charles VII of France that any regular attempt at organizing a standing army was made, although the Turkish janizaries (q.v.) had been in existence for almost a century before. The Swiss mercenaries, bodies of professional soldiery, were in great demand during the Middle Ages, their military qualities often successfully deciding the issue of a battle. The employment of mercenaries consequently soon became general; so much so, that voluntary patriotic service ceased altogether. Widespread dissatisfaction, however, soon developed, owing to the heavy expense involved, and the danger of intrusting the safety of the State to hired foreigners, who, recruited from the very dregs of society, had to be kept under the strictest discipline and surveillance. It followed as a natural result that organization and the consequent sinking of the individual in the mass eradicated the older forms of knighthood, with their attendant feats of arms and examples of personal skill and daring.

In the reaction from the burden and expense of mercenary armies the present European Con-

tinental military system had its inception. The use of firearms by this time had become more general; the proportion of musketeers in the various armies between the beginning of the sixteenth and the end of the eighteenth centuries had considerably increased, and the pike was superseded by the bayonet. Changes of weapons naturally influenced and brought about a change in tactics. In the Thirty Years' War (1618-48), Gustavus Adolphus and Wallenstein employed directly opposite infantry formations. (See INFANTRY.) The former arranged his men six ranks in depth and gained corresponding length of line. Wallenstein, on the other hand, used a narrower front by placing his men in from 20 to 30 ranks. The gradual thinning down to the famous "thin red line" made historic by the English, who have always used the line in preference to the mass of columns of their opponents, and from that to the widely extended front rendered necessary by modern rapid and long-range firearms, is a matter of comparatively recent military history. In the reign of Louis XIV of France (1643-1715) the grouping of brigades and divisions was first introduced, and in the next century Frederick the Great of Prussia (1740-86) reduced his infantry formation to three ranks and introduced a most rigid and exact system of drill and discipline. He was also the originator of horse artillery (1759). (See ARTILLERY.) The contest waged by France against Europe from 1792 to 1797, together with her terrible internal warfare, had largely exhausted the tremendous levies which had hitherto supplied her armies, and in 1798 a law was passed establishing compulsory military service. (See CONSCRIPTION.) This compelled all continental Europe to follow Napoleon's example, so that to-day voluntary enlistment in Europe survives in England alone. Not only conscription, but the development of modern systems of national finance whereby large sums of money could be raised by loans had its effect on European armies. The placing of the entire credit of a State for the support of its military forces enabled armies of greater size to be maintained for a threatened emergency, and these too could be increased far more rapidly and to a much greater degree than was possible when merely the actual wealth of the treasury itself was concerned. In other words, by conscription and loans large armies could be raised speedily and maintained so that the commander-in-chief was relieved of the necessity of thinking of the strength of his forces and the means and methods for their supply and support. This made the European army of the nineteenth century a far more mobile force, for it was relieved from the necessity of subsisting on an enemy's country, by an elaborate system of supply from a home base which the additional funds provided. With this increased mobility naturally followed more elaborate organization and perfection of methods, so that to an extent never before logistics shared with strategy and tactics in the planning of military operations. Furthermore, with the later development of railways even greater ability to mobilize the army rapidly was presented, and this, too, had its effect on the strategy and organization so that the forces were arranged to be placed at the theatre of war much earlier and in much greater strength than in former days. Accordingly, in the nineteenth century the organization and operation of an army were

governed by more vigorous strategy and tactics. The employment of larger forces under the control of an individual took the place of the wider distribution that had previously ruled, and the large army, in turn, was made possible by the new system of conscription or universal service in place of the systems of recruiting which had hitherto prevailed, where desertion and the necessity of maintaining smaller units more closely controlled were factors. Furthermore, the composition of European armies became changed under the new conditions of the nineteenth century, for with conscription and universal service the well-drilled veteran of the eighteenth century, often a professional soldier for life, whose presence in the ranks made possible the older line tactics, disappeared and his place was taken by the young man serving for the stated time. Experience now counted for little with the rank and file, but experience and study of contemporary problems were everything for the officers. In case of war, the standing army was augmented by men of previous military experience obtained from the reserve or militia. More truly than ever, the armies of Europe were now national forces, and while the recruits lacked experience, there was a corresponding increase in patriotism and loyalty, as the hired foreigner of the previous century was eliminated in favor of the young peasant serving with the colors, often with the companions of his home district, for army corps arrayed on a territorial basis. These larger armies and their changed composition also had their effect on the tactics of the day, which were further influenced by the development of high-power arms and other technological advances. The line of battle had given place to the formation of the army in column, and now this was changed by the distribution of part of the forces in the form of skirmishers. The older rules of strategy and tactics governing military operations became disregarded, and the lesson of Napoleon that the main object was the destruction of the enemy's army and that the battle is the end to be sought, governed in the organization and training as well as the actual use of armies. The increase in the national feeling manifested throughout Europe led to the formation of standing armies, not merely for the aggression of a monarch, but for purposes of defense, and the desire for national strength had the support or, at least, the consent of the people. Accordingly, a field army was maintained organized for immediate use, but it was followed by a land militia with retired soldiers as drill masters and leaders of recruits. Such a militia, while requiring a small amount of time from the ordinary occupations of the citizens, made possible a military force of large dimensions in times of war. Again, reserve forces were organized so that the losses in the field could be made up and the commander-in-chief no longer had the worry of seeing his forces depleted. Thus, in the Franco-Prussian war of 1870, drafts of 2000 officers and 220,000 men were sent out to make good the loss suffered by the Prussian army in one way or another as the campaign progressed.

Such conditions as the foregoing were reflected both in the composition and use of armies and in their organization. Napoleon stated that tactics should be altered every ten years with the change of conditions, and the same consideration applies in a large degree to all schemes of national defense which are reflected in the

organization of the army. This will be found discussed under **ARMY ORGANIZATION**, while the present composition of the forces of the great powers is treated under the section *Army* of the articles on the foreign countries. As to the employment of an army, the reader is recommended particularly to the articles on **STRATEGY** and **TACTICS, MILITARY**.

Bibliography. Authorities and statistical reports from which much valuable information on armies may be obtained are: Oman, *Art of War in the Middle Ages* (London, 1885); Jerram, *Armies of the World* (London and New York, 1900); and the *Reports of the Military Information Division* of the War Department, issued by the Government Printing Office at Washington, D. C. The annual issue of the *Statesman's Year Book* (London and New York) contains the latest reliable statistics regarding the armies of the world. Other sources of information are the regular service magazines, and the *Journal of the Military Service Institution* (Governor's Island, N. Y.). For a further treatment of the subject of armies and detailed information as to their organization and principal characteristics, the reader is referred to the articles, **ARMY ORGANIZATION**; **ARTILLERY**; **CAVALRY**; **INFANTRY**; **FRONTIER, MILITARY**; **LANDWEHR**; **MILITIA**; **MILITARY EDUCATION**; **MOBILIZATION**; **TACTICS, MILITARY**; **VOLUNTEER, MILITARY**. Detailed information on military technical subjects will be found under **AMMUNITION**; **BALLISTICS**; **ENGINEERING, MILITARY**; **COAST DEFENSE**; **FORTIFICATION**; **FIELD ARTILLERY**; **ORDNANCE**; **SIGNALING AND TELEGRAPHING, MILITARY**; **SMALL ARMS**; and also under numerous titles relating to military matters in general. In addition to the special article on **TACTICS, MILITARY**, such specific operations as **ADVANCE GUARD**; **ATTACK**; **BATTLE**; **ENGAGEMENT, MILITARY**; **INSPECTION**; **PATROL**; **MARCHING**; **REAR GUARD**; **OUTPOST**, will be found under their respective titles.

AR/MILLARY SPHERE (Lat. *armilla*, a ring). An instrument intended to give a just conception of the constitution of the heavens and of the motions of the heavenly bodies, as seen by an observer on the earth. It consists of a number of rings fixed together so as to represent the principal imaginary circles of the celestial sphere, and these are movable round the polar axis within a meridian and horizon, as in the ordinary celestial globe. It was by means of such rings furnished with sights that Hipparchus, Ptolemy, and other ancient astronomers made many of their observations, and we find even Tycho Brahe making most of his planetary observations with the help of such an instrument. The armillary sphere can now be used only for instruction in astronomy, and even in this respect it is altogether supplanted by the celestial globe.

AR/MIN, ROBERT. An English actor and writer. He is spoken of in *Pierce's Supererogation* as one of the "common pamphleteers of London," but he is chiefly remarkable as having been one of the original actors in Jonson's *Alchemist*. He created the part of Dogberry. He is the author of *A Nest of Ninnies*, published in 1608.

ARMINIAN, or GENERAL, BAPTISTS. See **BAPTISTS**.

ARMINIANISM. The name given to a school of Protestant theology which arose in the Netherlands toward the close of the sixteenth

century, taking the name of the leading early representative, Jacob Arminius (q.v.). It consisted at first of a protest against the strict predestinarian doctrine of Calvin and Beza (see CALVINISM), but developed gradually into an increasing liberal theology. The accepted teachers of the Reformed church, at the time the Arminian movement began, emphasized the importance of unconditional election and a limited atonement. Against these views objection was raised in 1578, when Koornheert, a *secretarius* of Haarlem, began his agitation to secure a simpler doctrinal system. Arminius, who was the most influential preacher in Amsterdam from the year 1588 on, was called upon to refute Koornheert's alleged errors; but while studying the question became himself infected by them. Thus gradually he adopted views at variance with the Calvinistic doctrines named above, and began to teach that God, who knows beforehand how all men will act, decrees their salvation or condemnation accordingly; in other words, that election is conditional. He further taught the universality of the atonement—that is, that Christ offered a sufficient sacrifice for all mankind, although it becomes efficient only for such as have faith and believe in Him. (This should be distinguished from modern Universalism, q.v.)

After the death of Arminius (1609), his followers, to the number of 46, presented to the Estates of Holland and West Friesland a "Remonstrance," drawn up by one Uytenbogaert, embodying a moderate statement of their views under five articles, which they declared to be "agreeable to the Word of God" and "sufficient for salvation." These articles were substantially as follows: 1. Predestination depends upon God's foreknowledge. 2. The atonement is universal in the sense that all men are salvable. 3. No one can exercise saving faith until regenerated by the Holy Spirit. 4. It is possible to resist the operation of divine grace. 5. It is not certain that all who seem to be called will persevere unto the end. The publication of this remonstrance was met by a "Counter-Remonstrance" from the Orthodox side, setting forth in five articles the high Calvinism which most of the Dutch churches agreed in maintaining. From these two documents the progressive and conservative parties came to be known as "Remonstrants" and "Counter-Remonstrants," respectively, and from the number of articles in dispute, the struggle is sometimes called the "Quinquarticular" controversy. In the vain hope of reconciliation, conferences were arranged at The Hague (1611) and at Delft (1613), but without result. The toleration law, issued by the States-General in 1614, was no more successful. It had become clear by this time that the theological question was inextricably interwoven with politics. Hugo Grotius, scholar and diplomatist, and John van Olden Barneveldt, Advocate-General of Holland, sided with the Arminians, who supported their republican policy; while the Stadtholder, Prince Maurice, favored the Calvinists, who in turn gave their support to his party of political centralization. No decision upon the doctrinal questions at issue was reached before the meeting of the national synod at Dordrecht (Dort) in 1618.

The Synod of Dort (November, 1618, to May, 1619) is one of the most important councils in the history of the Reformed church. It bears an international stamp, having been attended

by delegates sent from England, Switzerland, the German States of the Palatinate, Hesse, and Bremen. King James, of England, was personally represented by John Hales, "the ever-memorable," and an interesting incident of the synod was this man's change of view, when he "forever bade John Calvin good-night." The two opposing parties were led by Gomarus, a Calvinist, and Simon Episcopius, an Arminian. The Orthodox members were largely in the majority, and it soon appeared that the Liberals were there merely to be tried, not to deliberate and consult in equal debate. Episcopius and 13 other Remonstrants were condemned as heretics and excluded from the synod, which then proceeded to formulate the true faith in a series of decrees, afterwards confirmed by the States-General. Episcopius himself was banished, and some 200 Arminian pastors were deposed. Proceedings were begun by the civil government against the political leaders who sided with the Remonstrants. Barneveldt had already been executed before the adjournment of the synod. Grotius was condemned to life imprisonment, but escaped after about two years' confinement. The doctrinal decrees of Dort were accepted by the churches in Holland and in France, but they met with some opposition elsewhere. They are still the official standard of the Reformed Dutch church in America.

After the death of Maurice (1625) the severity of the laws against Arminianism was relaxed, and Episcopius was allowed to return from his exile. The closing years of his life were spent in teaching theology at the new Remonstrant college in Amsterdam (founded in 1630). His successor here was a French theologian, Courcelles, who died in 1659. There followed in turn three eminent Arminian scholars, Limborch (d.1712), Le Clerc (d.1736), and Wetstein (d.1754). Wetstein is noted for his contribution to the cause of biblical criticism, especially for his work upon the text of the New Testament. Arminianism has continued in Holland down to our time, though without any large numerical following. There are Remonstrant churches in Rotterdam and Amsterdam. The movement put forth its best energy in the period of controversy, upon which, as has frequently been remarked, it seems to have thriven better than upon peace. In this respect it shares the fate of most movements that are based upon protests against some real or fancied grievance. During the eighteenth century not a few Arminians went over to the Socinian or Arian position, discarding more and more of the Reformed system of belief. But, aside from this radicalism, the Arminian influence has been widespread. It passed over into England, and, from the time of Archbishop Laud, controlled the theology of the Established church, leaving Calvinism to the non-Conformists. It took on new life in the time of Wesley, and, with some modifications, became the theology of Methodism. It is substantially the faith of many Protestants, of other names, who suppose themselves to be Calvinistic. Indeed, it would be a mistake to think of Arminianism as an isolated phenomenon, for it is akin to the teaching of some of the early Greek theologians, to the semi-Pelagianism of the fifth century, and to some views imputed to Erasmus. Protestants in general shared in the controversy on the doctrines of Arminianism, and all opponents of Calvinism are still often characterized as Arminians.

ARMINIUS (17 B.C.-c.21 A.D.). A chief of the Cherusci, a German tribe inhabiting parts of what is now Hanover and Brunswick. In his early years he served in the Roman army. The period of Arminius's youth was a time of great peril for Germany. To secure the frontiers of the Empire against the attacks of the Teutonic tribes, the Romans had advanced into the more turbulent districts and erected a series of strong fortresses. Between 9 B.C. and 4 A.D. Drusus and Tiberius penetrated into the northwest of Germany as far as the Elbe and reduced the various tribes to virtual subjection. With so much prudence and caution, however, had Tiberius proceeded, that the Germans continued to all appearance on the best terms with the Romans, gradually adopted Roman habits, and frequently took service in the Roman armies. Arminius and his brother Flavius enrolled themselves under the Roman standards, and as leaders of Cheruscan auxiliaries not only obtained Roman citizenship and the rank of knighthood, but likewise acquired a knowledge of the Latin language, and an insight into the arts of war and policy, as practiced by the Romans. On returning home, about 7 A.D., Arminius found his people oppressed by the Roman Viceroy, Quinctilius Varus, and conceived the plan of delivering his country from the Romans. All the tribes and leaders as far as the Elbe were secretly united; Varus was lulled into security and induced to scatter most of his forces, and with the remaining portion, over three legions, which was just on the point of leaving the territory of the Cherusci for the Rhine, to quit the highway for a shorter route across the country. He was thus lured into the impassable districts of the Teutoburg Forest, perhaps between the towns of Detmold and Wiederbruck, near the sources of the Ems and the Weser. Arminius, who commanded the rear guard of the Roman army, fell upon the legions unexpectedly, and annihilated the entire force, 9 A.D. When intelligence of the disaster reached Rome, it excited the greatest consternation; but the Germans carried their victory no farther, and for a few years both parties refrained from hostilities. In 15 A.D., however, the Romans pressed once more into Germany. In two successive campaigns, 15 and 16 A.D., Germanicus reduced Arminius to great straits and took his wife, Thusnelda, captive, but was recalled to Rome by the Emperor Tiberius, 17 A.D., and the results of his victories were lost. (See GERMANICUS CÆSAR.) From this time no Roman army ever ventured to penetrate into the interior of Germany. After the expulsion of the Romans internal feuds broke out with great violence among the Teutonic tribes. In the course of these Arminius was slain by his own relatives about 21 A.D. Tacitus says of him (*Annals*, ii, 88): "Arminius fought with vicissitudes of fortune, and fell at last by the treachery of his own relations; a man of

warlike genius, and beyond all question the deliverer of Germany." A colossal statue of Arminius by Bandel was erected on a hill near the town of Detmold in 1875.

ARMINIUS, JACOBUS or JACOB HARMENSEN, commonly called ARMINIUS (1560-1609). One of the most influential of the Dutch theologians of the Reformed church, and founder of the theological system which bears his name. He was born in Oudewater-an-der-Yssel, Oct. 10, 1560, and died in Leyden, Oct. 19, 1609. His father, a cutter by trade, died when Jacob was a child, and the boy was brought up by friends in Utrecht and Marburg. He spent several years (1575-82) at the newly founded University of Leyden, where he imbibed a distaste for the Aristotelian philosophy, which still had great power. Proceeding to Geneva, the Mecca of the Reformed church, Arminius studied for nearly six years under Beza (1582-87), with the interruption of a few months' stay in Basel (1583), where he heard Grynæus, who became very fond of his gifted pupil. In Basel Arminius delivered some lectures on his own account, as was the custom with especially promising students, and he would have been rewarded with the degree of doctor had he not modestly declared himself too young to receive this distinction. At the close of his period of study Arminius made a trip to Italy, visiting Padua and Rome (1587). During most of his student life he had been supported by the city of Amsterdam, which recognized his promise and, knowing him to be dependent, had extended to him a sort of municipal patronage.

In 1588 Arminius became preacher of the Reformed church in Amsterdam, where he remained for 15 years, with growing fame and influence. His orthodoxy was as unquestioned as his ability, and we find that appeal was several times made to him to defend the Calvinistic system against attacks. In its influence upon Arminius himself the most important of these controversies was with one Koorneert, of Haarlem, who had attacked Calvin's doctrine of predestination. While studying the question, Arminius began to incline toward similar views himself, and this tendency appeared in his public sermons on St. Paul's Epistle to the Romans, especially chaps. vii.-ix. Yet he always maintained that his opinions were not inconsistent with the doctrinal standards of his church, the Belgic Confession, and the Heidelberg Catechism. In spite of some opposition on the part of the conservatives, Arminius, in 1603, was appointed professor at the University of Leyden, the great training school for ministers of the Reformed church in Holland. His colleague, Gomarus (q.v.), was a staunch Calvinist, and controversy soon broke out between them, which continued throughout the remainder of Arminius's life. This was by no means a mere academic dispute, but rather one in which the whole of Dutch Protestantism was engaged. The chief points on which Arminius differed from the orthodox majority were the doctrines of divine grace and of election. Arminius taught that grace was universal and election conditional. Gomarus taught that grace was confined to the elect, and that their election was not dependent upon God's foreknowledge of their

faith or good works, but was merely from God's good pleasure. Disputations were held, but without result. Arminius was charged with holding Pelagian and Socinian views, which latter charge he denied with especial vigor. His position at the university remained secure, for the authorities declined to permit clerical interference. Nevertheless, he was constantly under fire, and repeated attempts were made to bring him to trial before a synod. The struggle was still going on when Arminius died, worn out by the strain of theological strife. His influence, however, was never greater than after his death, and his followers under the leadership of his pupil Episcopius (q.v.), prolonged the struggle, even through temporary defeat at the Synod of Dort, until religious toleration was secured under Prince Frederick Henry. The details may be found under ARMINIANISM.

The works of Arminius are accessible in Latin and English. Consult: *J. Arminii Opera Theologica* (Leyden, 1629); *The Works of Arminius*, Eng. trans., reprinted from the London ed. (Buffalo, 1853). There is a life by Nichols (London, 1843).

ARMISTEAD, GEORGE (c.1780-1818). An American soldier, born at New Market, Va. He entered the United States army as second lieutenant in 1799, became a captain in November, 1806, and a major in March, 1813. He was conspicuous for gallantry at the capture of Fort George (Canada), on May 27, 1813, and subsequently distinguished himself and earned the brevet rank of lieutenant-colonel by his defense of Fort McHenry (near Baltimore) against the attack of Admiral Cochrane's fleet, on Sept. 13, 1814.

AR'MISTICE (Fr. *armistice*, from Lat. *arma*, arms + *statum*, supine of *stare*, to stand; for the form *stice*, cf. *sol-stice*). A cessation of hostilities for any period of time that may be mutually agreed upon by the combatants. An armistice is sometimes called after a severe action, to enable both sides to search for and bury their dead; or it may be called as a prelude to overtures for peace. A local armistice may be entered into or arranged between any part of the opposing forces which will only affect the respective commands. A general armistice, affecting all the troops in the field and all operations, can only be entered into by the commanders-in-chief, or their home governments. The term "armistice" is also applied to an opportunity given to rebellious citizens or subjects of a state to present themselves, surrendering their arms and renewing professions of loyalty to the state, immunity from punishment for acts against the state done while in rebellion being guaranteed all who accept the terms of the armistice. See INTERNATIONAL LAW; WAR.

AR'MITAGE, EDWARD (1817-96). An English historical painter. He was born in London; was educated in Germany and France and was a pupil, in 1837, of Delaroche, whom he assisted in painting the famous Hémicycle in the Ecole des Beaux-Arts. His more noteworthy frescoes are in St. John's (Roman Catholic) Church, Islington, London, and in the Houses of Parliament. He was appointed professor of painting in the Royal Academy in 1875, of which he had become a member three years earlier. His *Lectures on Painting*, delivered to the students of the Royal Academy, were published in 1883. His influence contributed not a little to the re-

vival of fresco painting in England and was always directed in favor of a grand and lofty, if somewhat cold and severe, style. A volume of his *Pictures and Drawings* appeared in 1898.

ARMITAGE, THOMAS (1819-96). An American Baptist clergyman who was born in Yorkshire, England, and came to America in 1838. At 16 years of age he entered the ministry of the Methodist Episcopal church, but in 1848 became a Baptist, and was pastor of the Fifth Avenue Baptist Church, New York, retiring in 1889. He was active in the organization of the American Bible Union, and was its president from 1856 to 1875. He was a strong advocate of the revision of the Bible, with a view to bringing out what he thought the correct interpretation of the words which relate to baptism. He published *Preaching: Its Ideal and Inner Life* (1880)—lectures which he had delivered before Baptist theological seminaries—and *A History of the Baptists* (1886).

ARMOR (through OF. *armure*, *armeüre*, from Lat. *armatura*, armor). In common usage, clothing or coverings worn to protect the body against weapons. (In the English statutes it includes offensive weapons as well.) Among primitive nations the armor ordinarily consisted of the shield alone. Before gunpowder was commonly used, each nation, as it gained greater skill in warfare, adopted other means of defense, in addition to the shield. Skins, leathers, various materials like cloth, metals in many forms, were adopted as protections. The Greeks of the Homeric Age had helmets, cuirasses, greaves, and shields of bronze. The later Greeks used the same pieces of bronze armor, but developed them so as to protect the whole body more thoroughly, and frequently used a corselet of quilted linen, of Oriental origin, in place of the metal cuirass. The shield was smaller than the Homeric shields. The Romans used practically the same armor, but endeavored to develop it along the lines of superior protection and less weight. For part of the body armor they substituted iron in place of bronze. For the cuirass they used frequently leather, on which iron rings were sewed. The shield was of wood, covered with leather, and had a metal rim.

The early Germans had no armor except the shield. From contact with Roman weapons, they learned the necessity for more, and accordingly adopted some of the Roman armor. But for a long period armor was rare and costly. Charles the Great enacted laws repeatedly forbidding the sale of byrnies (q.v.) outside his realm. If any merchant disobeyed, he was to forfeit all his property. Every large landowner had to own a byrnie; and if he appeared without it, he forfeited his benefice. As, in place of national levies, feudal armies became the rule, more stress was laid upon a knight's having a complete suit of armor. The foot soldiers and attendants were protected mainly by gambesons, but the knight strove to cover every portion of his body with metal armor.

The period beginning with the twelfth century, when the use of the crossbow became common and when the crusaders came into conflict with the armies of the East, is the time in which armor developed most rapidly and became most perfect. For the byrnie was substituted, first, the grand hauberk, and later, in the fourteenth century, plate armor. The small, conical-shaped helmet of the eleventh century was discarded for a much larger one, cylindrical in form, which

ARMOR

1. SPANISH ARMOR, END OF SIXTEENTH CENTURY

2. ITALIAN ARMOR, ABOUT 1460

3. GERMAN ARMOR, 1600

4. ENGLISH ARMOR, SIXTEENTH CENTURY

SPECIMENS OF EUROPEAN ARMOR FROM THE COLLECTION OF THE METROPOLITAN MUSEUM OF ART, NEW YORK CITY

covered both head and face. When the visor was down, only a few openings were left for seeing and for getting air. The body also was entirely covered with plate armor. When thus clad a knight was unrecognizable, and this necessitated armorial bearings as a means of identification. The shields were still made of wood, and elm seems to have been preferred. In thoroughly equipped bands of mounted men the horses were also partially protected by plates of armor.

Armor, by its development, had been able to keep pace with the improved forms of the cross-bow and the longbow. But when gunpowder came into use, armor was of little service. Consequently it was discarded for the most part, except among the very wealthy, who continued to wear coats of mail as late as the close of the seventeenth century, and in certain troops of cuirassiers, some of which still retain in their uniforms traces of armor. Even now some of the helmets worn by cavalry may be classed as armor. After coats of mail were discarded because they were ineffective and cumbersome, buff coats and jerkins were much used for defense.

For this whole subject consult Demmin, *Die Kriegswaffen* (4th ed., Leipzig, 1898), which contains thousands of illustrations, and Ashdown, *Arms and Armor* (New York, 1909). For the separate pieces of armor see AILETTES; BARD; BRASSARDS; BREASTPLATE; BRIGANTINE; BYRNIE; CHAMFRON; CHAUSSES; COAT OF MAIL; COIF; GAMMESON; ETC. See also CHAIN MAIL.

ARMORER. Formerly a maker of, or an expert in, armor; hence one who had the care of the arms and armor of a knight or man-at-arms and equipped him for action. In modern use an armorer is a manufacturer of military arms, or one who has the supervision of any collection or equipment of arms. In the British Army an armorer is attached to each troop of cavalry and to each company of infantry to clean the arms. Aboard a man-of-war the armorer and armorer's mate did the blacksmith work of the vessel, but of late years the armorer is a petty officer and one of the gunner's gang, his duties being the care of the arms used by the ship's company. Aboard ship each man is not responsible for the care of his weapon, as is the case with soldiers.

ARMORICA, corrupted from **AREMORICA** (Celt. *ar*, on or near + *mor*, sea; Lat. *mare*, Slav. *more*; cf. *Pomerania*, Slav., coastland, and *Paramaribo*, the dwelling near the sea). The country of the Aremorici, the name by which the people occupying the coast of Gaul between the Seine and the Loire were known to Cæsar. At a later period the name Armorica was confined to the country afterward styled Britannia Minor, or Bretagne.

ARMORIC LANGUAGE. See **CELTIC LANGUAGE**.

ARMOR PLATE. The protection of vessels of war by metallic plating began soon after the introduction of heavy guns on board ship, but was a matter of little importance until the introduction of shell fire and the increased power of guns made the protection afforded by thick wooden sides wholly inadequate. The demand for armor became more imperative as time went on, owing to the greater use of machinery and apparatus which needed protection, even against comparatively small guns; and, in recent years, its use has been further stimulated

by the increased speed of fire of guns of all calibres. The first important use of armor plate was made in the operations against Gibraltar in 1782. The Chevalier d'Arçon had caused to be constructed 10 floating batteries of 600 to 1200 tons, armed with 10 to 20 guns each. The hulls were of wood, protected with bars of iron laid on at short intervals, with an outer covering of cork. Sand was placed in the spaces between the bars, and it was to be kept wet to avoid danger of fire from red-hot shot. The deck over the guns was of very solid construction and covered with thick green hides. At the attack on Gibraltar of Sept. 13, 1782, one of the vessels took fire, and, as they were moored very close together, the conflagration spread to the others, and they were all destroyed. No provision had been made for extinguishing fire, as it was thought the means to prevent it were ample. Boats, even, were not supplied, so that of the 5260 men who formed the crews, only 487 were saved. Subsequent to this were many suggestions as to the employment of armor plating. About 1812 Col. John Stevens, of New Jersey, prepared plans for an armored steam vessel for harbor defense. Explosive shells, which had hitherto been used only in mortars, were in 1824 prepared for service in the ordinary smooth-bore guns of the French ships; and at that time General Paixhans, in an official letter to the French government, predicted that this new departure would force the creation of armored ships. About 1830 the French government began experiments (the first were carried out at Metz) to determine the resistance of earth, wood, and different types of masonry to the penetration of spherical projectiles. These experiments were continued at intervals for several years, and the results obtained are still considered of some value.

In 1841 General Paixhans, who invented the shell for low-angle fire, recommended the application of armor plate to the sides of vessels as a protection against his own missiles. His plans were rejected, but they attracted much attention. In 1841, also, the sons of Col. John Stevens proposed to the United States Navy Department to build an ironclad steamer of high speed, in which all of the machinery, including the propellers, was to be below the water-line. The proposal was accepted, and the act of Congress, approved April 14, 1842, authorized the Secretary of the Navy to "contract for the construction of a war steamer, shot and shell proof, to be built principally of iron, upon the plan of the said Stevens." The Stevens brothers had been carrying on armor experiments of their own, and as a result of them had decided that a thickness of 4.5 inches would be sufficient to render the new vessel invulnerable. Just as the Stevens ship was about to be constructed the performances of John Ericsson's large wrought-iron gun showed that 4.5 inches of laminated armor was insufficient for the purpose in view, so that when the Stevens battery was finally begun in 1854—two months before any armored craft in Europe had been laid down—it was as a larger vessel than that originally designed, in order to carry armor of 6.75 inches. The Stevens battery was never completed, largely because general interest in the project subsided, but specifically because Congress refused further appropriations.

In 1841 Theodore R. Timby submitted to the United States War Department plans for a revolving armor-plated battery, and in 1843 he

fled a caveat for "a metallic revolving fort, to be used on land or water, and to be revolved by propelling engines located within the same and acting upon suitable machinery." In 1845 M. Dupuy de Lôme submitted the plans of an iron-hulled armor-plated frigate. He believed that by substituting iron for wood he could reduce the weight of the hull from 42 per cent of the displacement to 23, and this saving would be sufficient to give the ship an armor belt 8 feet wide and 6.5 inches thick. The plans were rejected on the ground that he had overestimated the weight which would be saved; that, even if the proposals were feasible, a 6.5-inch belt was not invulnerable, and that, moreover, the battery was left without protection. In 1846 the French constructors were called upon for plans of an armored floating battery for coast defense. One of these provided for an iron hull and was at first accepted, as the light hull permitted an increased thickness of armor, but it was finally rejected on account of the anticipated deterioration and loss of speed from the fouling of the bottom. No steps were taken to build any of the batteries at this time; but at the outbreak of the Crimean War the plans of the batteries were again taken up and experiments with armor were begun at Vincennes to determine what the proper kind should be. These tests resulted in showing the inferiority of laminated plating as compared with solid plates of the same thickness. Solid plates 4 inches thick were broken, but not pierced, by both 32-pounder solid shot and 8-inch and 9-inch hollow shot. It was therefore decided to armor the batteries with 4.5-inch plates. About 1846 or 1847 Lieutenant Hunter, of the United States navy, brought out a plan of an armor-deck for the protection of the machinery of vessels, and it very closely resembled, in all its features, the protective deck of 30 years later. In September, 1854, the French government began the construction of several of the armored floating batteries fitted with weak auxiliary steam power, for which designs had been prepared some years before. Three of them took part—the principal part—in the attack upon the Russian batteries at Kinburn, Oct. 17, 1855. While practically uninjured themselves, they were able to lie so close to the enemy's works, 800 yards away only, that they dismounted nearly half his guns and compelled him to surrender after four hours' firing, though these batteries had held at bay the combined wooden fleets of France and England for months. The plans of these armored vessels were sent to England by the French Emperor. After considerable opposition and delay the Admiralty began the construction of similar vessels, but they were completed too late to join in the attack on the Kinburn forts, as they did not reach the Crimea until October 24, seven days afterward. The success of the French armor-clads was followed at once by renewed and widespread interest in the armoring of ships. The French Conseil des Travaux de la Marine then determined to construct some sea-going armor-clads. Before elaborating a design, further experiments were made with armor plates, which resulted in the adoption of armor five inches thick. The thickness of plating and the general features of the design having been decided upon, plans were invited. Those of Constructor Audenet were accepted, and were carried into effect by the building of the *Couronne*. In the meantime

M. Dupuy de Lôme had been studying the results of the recent armor trials. In November, 1857, he laid his plans and proposals before the government, and in March, 1858, was begun the conversion of the 13-knot, 5000-ton wooden line-of-battle ship *Napoléon* into an armor-clad. On this ship, which was renamed the *Gloire*, the armor was applied very liberally, extending from well below water to the deck above the battery; the water-line belt being 4.75 inches thick, backed by 26 inches of oak, and the armor of the battery 4.5 inches thick with 24 inches of backing.

With the armor trials for the plating of the batteries used at Kinburn, in which the superiority of the solid plate was shown, the steady development of armor commenced. Before the application of armor to sea-going ships, which began with the *Couronne* and *Gloire*, the investigation of its qualities naturally lacked impetus, but henceforward its improvement was steadily sought, and its manufacture soon became a separate industry. The quality of the early plates was very poor, showing lack of facilities for manufacture and experience in producing pure and homogeneous metal and in working it. This condition of affairs was speedily altered; heavy hammers and rolls were rapidly brought into use, and by 1862 the manufacture of homogeneous wrought-plate was brought to the highest state of perfection, both in England and France. In the meantime gun and projectile makers had not been idle. The 32-pounder and 68-pounder smoothbores using solid cast-iron projectiles were the standards for armor testing; the 8-inch, 9-inch, and 10-inch shell guns were brought out long before the application of armor to seagoing ships, but shells from these guns were too light, and the shot of too low velocity, to render them superior to the longer pieces mentioned.

Rifled guns began to be used commonly about 1860; France, Prussia, and Russia adopted them in 1858, the two latter deciding upon the breech-loader. France retained the muzzle-loading system until 1864; the *Gloire* was armed with a battery of muzzle-loading rifles in 1859, though her designed armament consisted of smoothbores. In 1855 Armstrong brought out a breech-loading piece of small calibre, and Whitworth submitted to the government in 1856 designs for breech-loading and muzzle-loading guns of all calibres. The Armstrong system was adopted for use in the British navy, but repeated accidents led to an outcry against the breech-loading system, and in 1863 the Committee on Designs for Artillery conducted experiments with muzzle-loading guns which led to the adoption of the Woolwich type of muzzle-loader. But whether breech-loading or muzzle-loading, the guns were all rifles, and the increased penetrative power rendered all armor so far produced easily vulnerable. The armor makers endeavored to meet the new situation in various ways. The thickness of the plate was increased; steel plates of various kinds were tried, as were plates made up of layers of steel and iron. The steel plates resisted perforation better than wrought iron, but were so easily cracked and destroyed that they failed to gain favor. Whitworth, always in the van in the development of ordnance, made and used forged steel projectiles in 1862, but their value was not generally realized, because the soft iron armor then in vogue was equally penetrable by the cast-iron shot. As the thick-

ness of the wrought-iron plate increased, the difficulties of its manufacture grew rapidly. Neither rolls nor hammer could successfully handle the thickness demanded by ship designers. Resort was had to welding, but this was not satisfactory, first, because it could not be effectively done except by machining the faces to be joined, which added greatly to the expense, and, secondly, because even then the weld was usually imperfect. The next step was to "sandwich" several plates with a layer of wood between them. The result was found to be inferior to that obtained from a single plate, but the plan was for a time accepted as the best available one. In 1866 Gruson in Germany and Palliser in England brought out cast-iron shell with hard, chilled points. These further increased the penetrative power of the gun.

The question of the backing of armor received attention from time to time, and the results obtained are interesting even now. With the low velocities in use up to 1880, wood backing played a very important part, but its importance has diminished in recent years; all thick armor is still backed with wood, but its thickness is about a quarter of that considered desirable in the days of wrought-iron plate. The backing of the *Warrior's* 4.5-inch armor was of teak, 20 inches thick, in two layers of 10 inches each. A less thickness of backing and 5 inches of armor gave inferior resistance to penetration. As projectiles improved in quality and acquired greater velocity, the advantage of thick backing was less apparent; indeed, except for the purpose of reducing the shock to a ship's framing, it is now regarded as disadvantageous, for the same weight added to the plate to increase its thickness will give greater resistance to penetration.

Notwithstanding the confessed weakness of homogeneous wrought-iron plate, a successful competitor was long in coming, though both compound and steel plates early appeared in the competition, as has already been stated. In 1859 the Mersey Works in England submitted 2.5-inch plates made up of three layers, the outer ones of wrought iron welded to a middle one of steel; the welding was imperfect and the brittleness of the steel affected the outer layers; moreover, they were constructed on a wrong principle, as will be seen presently in connection with capped projectiles. In 1861 compound and steel plates were tested in England; while a long series of tests with steel was carried on in France from 1857 to 1861. The theoretical advantages of steel and compound armor were thoroughly understood at this time, but brittleness defeated one and imperfect welding combined with brittleness precluded the use of the other. The preëminence of wrought-iron plate continued practically undisputed until 1876. In 1875 the Italian government called for test plates of 22-inch solid armor from all the principal manufacturers in the world. Four responded—Brown & Co. submitted two solid iron plates; Cammell & Co. one solid plate and one sandwich target; Marrell et Cie. presented the same; and Schneider et Cie. presented for test two solid steel plates. The trials took place at Spezia in 1876, and the result was overwhelmingly in favor of the steel plates; though these cracked more than the others, the difference in resistance to penetration was great. As a result of the Spezia test, wrought-

iron plates were fully discredited. In England, where the prejudice against steel was fostered to some extent by national jealousy of a French manufacturer's success, compound armor was rapidly developed. This consisted of a hard steel face welded to a wrought-iron back.

In the Wilson process (Cammell & Co.) molten steel was poured on a white-hot iron plate, thus adding one-third to the thickness of the plate, which was afterward rolled. In the Ellis process (Brown & Co.) a wrought-iron and a rather thin, hard steel plate were separately made. The lower plate was placed in the furnace; iron bars were placed around the edge, forming a berm, and the steel plate laid on the bars. After they were raised to a welding heat, molten steel was poured into the space between the plates, welding all together. There were other systems of compound plate manufacture, but these attained the greatest eminence, if extent of use is a criterion, and they exemplify the type. The first really successful compound plates appeared in 1877, and from that date they competed with steel plates on apparently equal terms until 1889, when Schneider brought out his first nickel-steel plate. The trial of this plate took place in July, but it was not until the next year that attention was fully drawn to the importance of the new metal. The United States naval authorities, having purchased in Europe a compound plate from Cammell & Co., a steel plate and also one of nickel steel from Schneider et Cie., held a competitive test at the naval proving ground, Annapolis, in September, 1890. The compound plate was ignominiously defeated, both by the steel plate and by that of nickel steel. Indeed, the defeat was so complete and convincing that it stopped the manufacture of compound plates at once. The Navy Department had already committed itself to the manufacture of steel armor, and large contracts for it had been given out some years before. The wisdom of the decision in favor of steel had been questioned in Congress and in the public press, and the trial was instituted to convince the doubters; the occasion also served to effect a trial of a nickel-steel plate which had been acquired on account of the promising results obtained by Messrs. Schneider et Cie. the year before. The important results of this trial had hardly appeared when a second trial of like revolutionary character took place. A year or two before, Mr. Harvey, a manufacturer of fine-grade tool steel, was at the Washington gun factory. In a conversation with him, Captain Folger, the superintendent of the naval gun factory, suggested the attempt to adapt the Harvey system of hardening tool steel to armor plate. After considering the matter Mr. Harvey decided to make some experiments looking to surface hardening armor; and the result was the Harvey process of surface carburization and hardening. In this process the plate is placed on the floor of a suitable furnace in a bed of refractory material, leaving the surface to be hardened uppermost. This is covered with carbonaceous material, which is rammed down upon it; over the carbon is put a layer of sand covered in with firebrick. The temperature of the furnace is then raised to about the temperature of melting cast iron and kept so for several days, until the required additional carburization—usually about 1 per cent—is effected. The plate is then removed, and, when cooled to a dull cherry red, is hardened

by a water jet or immersion in running water. The trial of the first plate made by the Harvey process took place Feb. 14, 1891, and was very successful. The popularity of the new armor was immediate, and the cause is not far to seek, for in its construction it embodied the combined views of armor theorists.

Supporters of compound armor accepted the defeat of the year before with reservations. They still adhered to the idea of a hard face and soft back; and they were right in so doing. The advocates of a single, practically homogeneous plate were also satisfied; they held, very properly, that the strength of armor plate must not lie solely in defeating the projectile by breaking it up, but in keeping it out by the toughness of the plate. A third class of critics—more or less in sympathy with the compound armor people, but not completely so, and declaring that no armor is fit to put on a ship which breaks up under attack and leaves the side bare afterward, even if it stops that particular projectile—were also satisfied. In England the Harvey system was adopted almost at once, but notions of misplaced economy and the difficulty of working the resulting metal caused the rejection of nickel in steel. But this view was held only a few years. The next improvement, in 1895, was effected by the Carnegie Company, which found that a reforcing of plates after carburizing considerably improved the quality. Soon after the appearance of Harveyized armor, Krupp, Schneider, the Terni Works, and several other European makers began experiments along the same lines. The ones mentioned alone produced any noteworthy results, and it is to be remarked that all three adopted the method of carburization by means of gas rich in carbon. Of these three kinds, the product of Krupp is generally re-

Steel Company, and the Midvale Steel Company. The armor made by them is considered equal to any made in Europe.

The object of having a hard face to armor is to break up projectiles by shock, or so to strain or deform them as to reduce their penetration. It is particularly effective on oblique impact. To combine hardness with toughness was the aim of armor makers for a quarter of a century, and success was not obtained until the advent of nickel steel. The use of chromium, tungsten, and other substances has further improved these qualities. Had not the improvement of projectiles and guns kept pace with the development of armor, ships could now be made invulnerable; but both have improved so that the relation of guns and armor is now less favorable to the latter than at almost any time in its history. Nevertheless, armor is absolutely indispensable to the protection of ships and their crews against all classes of gun fire. The power of good Harvey nickel-steel armor to resist penetration is about equal to that of double the thickness of wrought iron, and the resisting power of the best modern armor is 20 to 30 per cent greater. These figures are for attack by ordinary armor-piercing projectiles. Projectiles of this type which are fitted with soft caps (see PROJECTILES) penetrate almost as deeply in Krupp as in Harvey armor, and the gain by the use of caps is equal to a reduction in thickness of 8 to 10 per cent in Harvey armor and 15 to 20 in Krupp, i.e., a capped projectile will perforate a Harvey plate 8 to 10 per cent thicker, or a Krupp plate 15 to 20 per cent thicker, than will a projectile not provided with a cap. The penetration in armor of recent United States guns is seen in the accompanying table:

Gun. Calibre and mark	Length of gun in calibres	Weight of gun Tons	Weight of projectile Lbs.	Muzzle velocity Ft. sec.	Muzzle energy of projectile Ft tons	Penetration of capped projectiles in armor of recent type			
						At muzzle In	At 3000 yards In	At 6000 yards In	At 9000 yards In
3-inch, Mark VI	50	1.0	13	2,700	658	3.3	1.2	0.8	
4-inch, Mark VIII	50	2.9	33	2,800	1,794	5.3	2.6	1.5	1.2
5-inch, Mark VII	51	5.0	50	3,150	3,439	6.8	3.4	1.8	1.4
6-inch, Mark VIII	50	8.6	105	2,800	5,707	11.3	5.2	3.2	2.3
7-inch, Mark II	45	12.7	165	2,700	8,338	12.0	9.0	7.0	5.0
8-inch, Mark VI	45	18.7	260	2,750	13,360	14.5	12.0	9.5	7.5
10-inch, Mark III . . .	40	34.6	510	2,700	25,772	19.4	15.5	12.0	9.0
12-inch, Mark VII . . .	50	56.1	870	2,950	52,483	25.7	22.0	18.5	15.5
14-inch, Mark II	45	70.3	1,400	2,600	65,006	28.3	24.8	22.0	19.7

garded as the best. Krupp armor differs from that previously made, not only in the process of manufacture, but in its chemical constitution. Its exact character is a jealously guarded trade secret, which has been sold at a high price to nearly all the great armor manufacturers of the world, but that it contains a small amount of chromium as well as carbon is now generally understood. Previous attempts to produce chrome steel armor had not been successful, though the trials had been numerous and persistent. Nearly all of the armor now applied to ships, except very thin plates is made by some modification of the Krupp process. The Terni Works in Italy, and Schneider in France, have continued the development of their own processes, which give nearly equal results. In the United States the principal armor makers are the Carnegie Works (United States Steel Corporation), near Pittsburgh; the Bethlehem

Thin armor of hardened steel plate, but not surface-hardened, is very extensively used in the interior of recent ships to localize the effects of shell explosions and to resist the explosions of torpedoes.

Another form of armor, not used for ships, but only for fortifications, is made of chilled cast iron, and was developed by Gruson, whose works were located at Magdeburg-Buckau. Herr Gruson died in 1895, and his establishment was then purchased by Krupp. The metal was a specially excellent low carbon cast iron, chilled in the casting on its outer surface, without apparently weakening its tenacity. It is designed and shaped to be used in cupolas of special dome-like form covering one or more guns. Where weight is of no importance it is a very effective defense. Works for its manufacture in the United States were established near Philadelphia.

A full account of the early development of armor by Lieut. E. W. Very, U. S. N., is found in the *United States Naval Institute*, vol. ix, no. 3 (1883). Numerous other papers of less length, but of much value, appear in later numbers of the *Proceedings*, in every number of which there is a brief account of the latest advances in armor development. For additional information consult C. Orde Brown, *Armor and its Attack by Artillery* (London, 1887); also the *Annual of the Office of Naval Intelligence*, United States Navy, especially for the years 1891 and 1892; and *Text-Book on Ordnance and Gunnery for Use at the Naval Academy*, which is revised at frequent intervals. From time to time important articles on armor appear in Brassey's *Naval Annual*.

For further information in regard to armor, see BALLISTICS, *Ballistics of Penetration*; SHIPS, ARMORED; PROJECTILES; GUNS, NAVAL.

ARMORY (from *armor*, ultimately from Lat. *arma*, arms). A military depot or building set apart for the use of troops, storage of arms and equipment, or purposes of defense. In the United States the term "armory" is generally applied to local headquarters for parts of the national guard or militia, which are used for purposes of drill, organization, regimental or departmental offices, and the storage of all stores and equipment pertaining to the troops occupying them. In many instances they are magnificent examples of military architecture, from both the interior and exterior points of view. Equipped with every modern convenience and many luxuries, they afford many of the characteristics and advantages of a first-class gymnasium or social club. Such features, however, are secured generally by the officers and men themselves, and contribute largely to the success and good standing of the organization in its particular community. In case of local disturbances, the buildings are admirably adapted for defense, or use as a basis of operations. In England and Continental Europe the name "armory" is sometimes applied to a museum of military antiquities, as the armory at Warwick Castle, England, or at the Tower of London, which, however, contains a store of modern as well as ancient and medieval arms and armor; it also, and more generally, applies to that part of an arsenal, barracks, camp, cantonment, or fort where are situated the offices and workshops of the armorer and his assistants, or are stored supplies of arms and accoutrements. Examples of the latter may be found in every European military post or station.

ARMOUR, HERMAN OSSIAN (1837-1901). An American merchant. He was born at Stockbridge, N. Y., was in business at Milwaukee, Wis., from 1855 to 1862, and as a grain commission merchant at Chicago from 1862 to 1865. He became the New York representative of the Milwaukee packing firm of Armour, Plankinton & Co. in 1865. The firm name of H. O. Armour & Co. was retained at Chicago until 1870, when it was altered to Armour & Co., now controlling the largest provision industry in the world.

ARMOUR, JONATHAN OGDEN (1863-). An American capitalist and packer, born in Milwaukee, Wis. He entered Yale, but did not graduate, entering instead the business house of Armour & Co., then conducted by his father, Philip Danforth Armour (q.v.). Upon the death of the latter he succeeded him and became one of the most successful merchants of the coun-

try. In later life he became director of important banks and commercial corporations and in 1906 wrote *The Packers, the Private Car Lines, and the People*.

ARMOUR, PHILIP DANFORTH (1832-1901). An American merchant and philanthropist, born and educated in Stockbridge, N. Y. In Milwaukee, in 1863, he became the head of the firm of Armour, Plankinton & Co., pork packers, whose main office was transferred to Chicago in 1870, where a reorganization was soon afterward effected under the name Armour & Co. The business increased with great rapidity and sent exports to every civilized country. The firm also invested heavily in collateral enterprises such as the refrigerator car service on the railways and the storage and handling of grain. At the time of Armour's death the firm owned more grain elevators than any other house in the world. Armour was noted no less for his philanthropy than for his business acumen and executive ability. He endowed the Armour Institute of Technology (q.v.) and the Armour Mission, in Chicago, giving them a total of over \$2,500,000.

ARMOUR INSTITUTE OF TECHNOLOGY. An institution in Chicago for the advancement of technical and practical education. It was founded in 1892 by Philip D. Armour for the purpose of giving young men an opportunity to secure at moderate expense a broad and thorough knowledge of applied science. The College of Engineering offers four-year courses in mechanical, electrical, civil, chemical, and fire-protection engineering, architecture, and industrial arts. The four-year courses in mechanical and electrical engineering were first established and later the course of architecture was included by union with the Art Institute of Chicago. The course in civil engineering was established in 1899, in chemical engineering in 1901, in fire-protection engineering in 1903, and in general science in 1905. In 1912-13 the college faculty numbered 62 and the students 1338. The total value of the institute's property was \$5,000,000. President, Frank Wakeley Gunsaulus, D.D.

ARMS, ARMORIAL BEARINGS, or ENSIGNS. Names given to such devices as, when painted on a shield, form a coat. These terms in popular speech include all the accompaniments of a shield—viz., the crest, helmet, and, where such exist, the supporters, etc. See HERALDRY.

ARMS, ASSUMPTIVE. See HERALDRY.

ARMS, SERGEANT AT. See SERGEANT AT ARMS.

ARMS, STAND OF. A general title for one or more rifles or other military weapons. It is generally used to describe a complete set of arms for one soldier, including rifle, bayonet, and cartridge box and belt. The term has become almost obsolete in modern military parlance.

ARMSBY, HENRY PRENTISS (1853-). An American agricultural chemist, born at Northbridge, Mass. He received the degree of B.S. from the Worcester Polytechnic Institute in 1871 and that of Ph.D. from Yale in 1879. He taught chemistry successively at the Worcester Polytechnic Institute (1871-72), the Fitchburg, Mass., high school (1874-75), and at Rutgers College (1876). After three years as chemist to the Connecticut Agricultural Experiment Station, he was appointed, in 1881, vice-president of the Storrs Agricultural School, two years later professor of agricultural chemistry at the University of Wisconsin, and in 1887 director of

the Pennsylvania Agricultural Experiment Station. This last position he relinquished only after 20 years of service, in order to accept the directorship of the Institute of Animal Nutrition at the Pennsylvania State College. In 1893 he was chairman of the committee on the exhibit of the experiment stations at the Chicago Exposition, and at the Paris Exposition in 1900. In 1898 he began a long service as expert in animal nutrition in the United States Department of Agriculture. Within the same year the Association of American Agricultural Colleges and Experiment Stations elected him their president. He wrote *Manual of Cattle Feeding* (1880); *Principles of Animal Nutrition* (1903); *The Maintenance of the Rations of Farm Animals* (1912).

ARMSTEAD, HENRY HUGH (1828-1905). An English sculptor, known also as a worker in metals. He was born in London and studied at the School of Design, Somerset House, and later in the Royal Academy schools. Influenced at first by the superficial elegance of his early instructor, E. H. Baily, he later gained greater insight and strength, and from the time when he was employed by Sir Gilbert Scott to execute parts of the Albert Memorial, his position was assured. He became an associate of the Royal Academy in 1875 and a full member in 1879. Among his portrait statues that of Bishop Wilberforce in Winchester Cathedral is noteworthy; among the few imaginative works, "Remorse," now in the Tate Gallery. Consult his biography by his daughter (1906).

ARMSTRONG, ANDREW CAMPBELL (1860—). An American scholar and educator, born in New York City. He graduated from Princeton in 1881, was a fellow of that university for two years, and then entered Princeton Theological Seminary. His course finished in 1885, he went abroad for a period of study at the University of Berlin, but returned to Princeton to become associate professor of ecclesiastical history at the seminary. After two years in this position, and one year as instructor in history at Princeton College, he was called to begin what proved many years of service at Wesleyan University (Middletown, Conn.). In 1887-88 he was associate editor of the *New Princeton Review*, and in 1904-09 was cooperating editor of the *Psychological Review*. He made contributions to several psychological and philosophical encyclopedias, translated Falckenberg's *History of Modern Philosophy* (1903), and wrote *Transitional Eras* (1904).

ARMSTRONG, DAVID MAITLAND (1836—). An American decorative artist and genre painter. He was born at Newburgh, N. Y., graduated in 1858 at Trinity College, and studied art at Paris and Rome. He served for four years as Consul-General for Italy and at the Paris Exposition of 1878 he was director of the American art department. His activity he confined to decorative art, principally to mural decorations and stained glasses. Among the latter are memorial windows in the Ascension, St. Michael's, Holy Communion, and Holy Trinity churches in New York, and 15 memorial windows in All Souls' Church, Biltmore, N. C. He was made an associate of the National Academy, a member of the Architectural League, and a member of the Legion of Honor.

ARMSTRONG, EDWARD (1846—). An English historian and educator, born at Grahams-town, South Africa, and educated at Exeter Col-

lege, Oxford. He took his final examinations in 1869, became a fellow at Queen's College the same year, and a tutor the year following. After serving as assistant master at Rugby School in 1871-73, he returned to Oxford, where he became prominently identified with Queen's and the university. At the college he served as bursar (1878-1911) and was made lecturer on modern history; by the university he was chosen lecturer on foreign history and a member of the board of finance. He also became curator of the Taylor Institution and of the Botanic Garden, and warden of Bradfield College. Besides contributions to the *Cambridge Modern History* and to leading English reviews, his writings include: *Elisabeth Farnese* (1892); *Lorenzo de' Medici* (1897); *The Emperor Charles V* (2 vols., 1902); *The French Wars of Religion* (2d ed., 1904).

ARMSTRONG, EDWARD COOKE (1871—). An American scholar and educator, born at Winchester, Va. He graduated from Randolph-Macon College in 1890 and after advanced work at Johns Hopkins received the degree of Ph.D. from that university in 1897. Additional graduate studies he took at the universities of Berlin and Paris. He was appointed professor of the French language (1897) and chairman of the Romance department (1910) at Johns Hopkins University. He was made a member of several American and foreign learned societies.

ARMSTRONG, GEORGE FRANCIS SAVAGE (1845-1907). A British writer, called "The Poet of Wicklow." He was born in County Dublin, Ireland, and was educated in Dublin. In 1871 he became professor of English literature in Queen's University and in 1871-1905 was professor at Queen's College, Cork. His works include: *Poems* (1869); *A Tragedy of Israel*, a trilogy (1872-76); *Stories from Wicklow* (1886); *Ballads of Down* (1901), and *The Crowning of the King* (1902). An edition of his poems in 10 volumes was published in 1892. In later life he used the hyphenated surname, Savage-Armstrong.

ARMSTRONG, GEORGE FREDERICK (1842-1900). An English engineer. He was educated at King's College, London, and at Cambridge. Developing a strong taste for mechanics, he studied engineering, and was professor of engineering in the School of Applied Science at McGill University in Montreal during 1871-76. He was then called to a similar chair in the Yorkshire College of Science, Leeds, and in 1885 became regius professor of engineering in the University of Edinburgh. He is a member of many learned societies and the author of numerous papers and addresses.

ARMSTRONG, HENRY EDWARD. An English chemist, professor of chemistry at the City and Guilds College, South Kensington. He was awarded the Davy Medal by the Royal Society in 1911. His publications include: *Introduction to the Study of Organic Chemistry: the Chemistry of Carbon and its Compounds* (5th ed., 1886); *Marine Hygiene* (1893); *The Teaching of Scientific Method* (1903; 2d ed., 1910); *Low-Temperature Research* (1909).

ARMSTRONG, JOHN (1709-79). A Scottish poet, born in the parish at Castleton, Roxburghshire. He took the degree of M.D. at Edinburgh University in 1732; in 1746 was appointed physician to the London Hospital for Lame, Maimed, and Sick Soldiers, and in 1760 physician in the German army. He gained a wide popularity by

a didactic poem called the *Art of Preserving Health* (1744), containing some of the very best blank verse written in the eighteenth century; and was also a master of terse prose. Particularly brilliant is *Sketches or Essays on Various Subjects*, published under the pseudonym of Launcelot Temple (1758). He was a friend of many wits and authors of his day, among them Thomson, who is believed to refer to him in canto I, stanza lx of the *Castle of Indolence*; and Wilkes, who probably obtained for him the post in the army. He wrote also *An Essay for Abridging the Study of Physic* (1735) and *Economy of Love* (1737). Consult Ward, *English Poets*, vol. iii (New York, 1894-1903).

ARMSTRONG, JOHN (1725-95). An American soldier, born in the north of Ireland. He led a successful expedition in 1756 against the Indians at Kittanning, Pa. He became a brigadier-general in the Continental army in March, 1776, but resigned in April, 1777, to take the same rank in the Pennsylvania militia, which he commanded at Brandywine (September 11) and at Germantown (October 4), becoming a major-general in January, 1778. He served twice in the Continental Congress (1778-80 and 1787-88). He died at Carlisle, Pa.

ARMSTRONG, JOHN (1758-1843). An American soldier and diplomat, son of John Armstrong, the soldier. While a student at Princeton he enlisted in the army and was soon made aid-de-camp to General Mercer, with the rank of major, which rank he retained until the close of the war. He wrote and published anonymously the famous *Newburgh Addresses* in 1783, in an effort to force Congress to pay certain amounts due army officers, and in 1784 conducted a campaign against the Connecticut settlers in the Wyoming valley. (See WYOMING VALLEY.) At the close of the war he served as Secretary of State and Attorney-General of Pennsylvania and in 1787 was elected a member of Congress from that State. In 1789 he married the sister of Chancellor Livingston, of New York, and, removing to that State, was in 1800 elected United States Senator and served in the Senate until 1804. From then until 1810 he was Minister to France, being also Minister to Spain (1806-10). He was appointed brigadier-general in July, 1812. In January, 1813, he was made Secretary of War, but in consequence of the failure of the Canada expedition and the capture of Washington he became very unpopular and resigned in September, 1814. He published *Notices of the War of 1812* (1836), memoirs of Generals Montgomery and Wayne in Sparks's *American Biographies*, and partially prepared a history of the American Revolution. Consult Henry Adams, *History of the United States, 1801-1817* (New York, 1889-90).

ARMSTRONG, JOHN (1784-1829). An English physician and medical writer. He was born at Ayres Quay, near Bishop Wearmouth. He studied medicine at the University of Edinburgh and in 1811 was chosen physician to the infirmary at Sunderland. In 1816 he published a work on *Typhus*, which greatly increased his reputation. Two years later he removed to London, where his practice became extensive, and he was elected physician to the Fever Hospital. He was instrumental in establishing two medical schools in London. His lectures were published after his death. Consult *Memoirs of the Life of J. Armstrong*, by F. Boott (London, 1834).

ARMSTRONG, JOHNNIE. The hero of several old Scottish songs and ballads, among which are "Armstrong's Goodnight," and two others, both called after his name. A border freebooter, who lived with his lawless followers in the early part of the sixteenth century, he was finally hanged with 36 of his retainers, by James V in a forest near Hawick.

ARMSTRONG, PAUL (1869-). An American playwright, born at Kidder, Mo. He was for five years, from 1890 to 1895, a licensed master of steamships plying on the Great Lakes, but in 1904 began the writing of plays, and produced many successful dramas. These include: *The Heir to the Hoorah* (1904); *St. Ann* (1904); *Salomy Jane* (1905); *In a Blaze of Glory* (1906); *Via Wireless* (in collaboration with Winchell Smith, 1909); *Going Some* (with Rex Beach, 1909); *Alias Jimmy Valentine* (1909); *The Deep Purple* and *The Greyhound* (with Wilson Mizner, in 1910 and 1911, respectively); *A Romance of the Under World* (1911); *The Escape*, played in New York in 1913.

ARMSTRONG, ROBERT (1790-1854). An American soldier, born in Tennessee. In the Creek War of 1813-14 he commanded an artillery company, and was severely wounded at Talladega, Jan. 24, 1814. He commanded the artillery at the battle of New Orleans (Jan. 8, 1815) and was a brigadier-general of volunteers in the second Seminole War (1835-37). From 1845 to 1852 he was Consul at Liverpool. Later he became proprietor and editor of the *Washington Union*, at which time he acted as confidential adviser of President Polk.

ARMSTRONG, ROBERT ALLEN (1860-). An American scholar and educator, born at Frenchtown, Va. (now a part of West Virginia). He graduated from West Virginia University in 1886 and then took advanced work at the University of Chicago, Columbian (now George Washington) University, and at Harvard University. While acting as principal of the West Liberty State Normal School he studied law and in 1890 was admitted to the bar. Appointed professor of English at West Virginia University in 1893, he was 10 years later made head of the English department. In addition to his regular academic duties, he spoke much before institutes in a number of States (after 1886), was secretary of the West Virginia Board of School Examiners (1899-1909), and undertook in 1904 the editing of the *School Journal* of the same State. In 1909 he received the degree of L.H.D. from Allegheny College. His publications include, beside articles contributed to educational journals: *Geography of West Virginia—Supplement to the Natural Geography* (1899); *Life out of Death* (1906); *The Law of Service* (1907); *Historical and Literary Outlines of the Bible* (1907); *Dramatic Interpretation of Shakespeare's Tragedies* (1907); an edition of Stevenson's *Inland Voyage* (1913).

ARMSTRONG, SAMUEL CHAPMAN (1839-93). An American soldier and educator. He was born in Hawaii, where his father was a missionary of the American Board and Minister of Public Instruction. He began his collegiate course at Oahu College, Hawaii, and completed it in 1862 at Williams College. He was for a short time chief clerk of the Department of Public Instruction in Hawaii and editor of *Hae Hawaii*. He then entered the Union army, and in 1863-65 was colonel of the Eighth United

States colored regiment. At the close of the war he was brevetted brigadier-general of volunteers. He was superintendent of a district of 10 counties in Virginia in the Freedman's Bureau, 1866-68. In the latter year he founded and became principal of the Hampton Normal and Agricultural Institute. His constant endeavor was to show the best methods of educating the negro and Indian races in this country, adopting to that end a system of combined labor and study, to give them the means of self-support, develop manual skill, and promote manliness and self-reliance. His work for the neglected races produced most beneficial results. Several published papers give his views on the education of negroes and Indians. Consult R. C. Ogden's *Sketch of Armstrong* (New York, 1894).

ARMSTRONG, SIR WALTER (1850—). An English writer and art critic. He was born in Roxburghshire, Scotland, and was educated at Harrow and at Exeter College, Oxford. After serving as an art critic on the staff of the *Pall Mall Gazette* and *St. James's Gazette*, he was in 1892 appointed director of the National Art Gallery, Dublin, and was knighted in 1899. Although a very prolific writer upon art subjects, he is at the same time considered one of the soundest and most critical scholars in this line that the United Kingdom has produced, combining a knowledge of the technique of art with a profound appreciation of its historic significance. His principal works are: *The "Art of Velazquez"* and the *"Life of Velazquez"* (1896) written for the *Portfolio*; *Scottish Painters* (1888); *Art in Great Britain and Ireland* (1909); and excellent biographies of Gainsborough (1898), Sir Joshua Reynolds (1900), J. M. W. Turner (1901), Sir Henry Raeburn (1901), and Sir Thomas Lawrence (1913).

ARMSTRONG, WILLIAM GEORGE, BARON (1810-1900). An English engineer, scientist, and inventor of hydraulic machinery and ordnance. He was born at Newcastle-upon-Tyne and received his early education at Whickam and Bishop Auckland. Yielding to his father's wishes, he determined to follow the profession of law and spent several years in a solicitor's office, but was diverted from this calling by a taste for scientific research and mechanics. His first important discovery was the hydro-electric machine, which consisted of an insulated boiler from which steam at high pressure, escaping through nozzles of peculiar design, produced frictional electricity. In recognition of this discovery, Armstrong was made a fellow of the Royal Society in 1846. Soon afterward he invented the hydraulic crane, and for the construction of hydraulic machinery he founded the Elswick Engine Works, in the suburbs of his native town. In 1854, at these works, were made the rifled cannon with which his name is associated as inventor, although previous unsuccessful attempts had been made to develop the rifled cannon. So successful was he in his construction of ordnance that he was appointed engineer of rifled ordnance at Woolwich, and was knighted in 1859. Some 3500 cannon were constructed under Sir William Armstrong's direction between 1859 and 1863, when he resigned his official position to resume his active connection with the Elswick Works. In 1863 he was president of the British Association, and delivered an address in which he called attention to the decrease in the coal supply of Great

Britain and the exhaustion of the deposits. In 1882 he was president of the Institution of Civil Engineers and served in a similar capacity for several terms in the Institute of Mechanical Engineers. A member of the Iron and Steel Institute of Great Britain, he received from that organization the Bessemer Medal in 1891, and was honored with the degree of LL.D. from Cambridge in 1862 and that of D.C.L. from Oxford in 1870. In 1887 he was raised to the peerage. The Elswick Works, which at first were concerned with the construction of hydraulic cranes, engines, accumulators, and bridges, were greatly expanded and became celebrated for the production of ships of war as well as ordnance and machinery. Lord Armstrong played an important part in the development of the breech-loading cannon and armor plate, and his improvements will be found discussed in the articles **ORDNANCE** and **ARMOR PLATE**.

ARMY. See **ARMIES** and **ARMY ORGANIZATION**.

ARMY ADMINISTRATION. See **ARMY ORGANIZATION**.

ARMY CORPS, kōr. See **ARMY ORGANIZATION**.

ARMY ESTIMATES, UNITED STATES ARMY. The estimates furnished annually by the heads of the various branches of the War Department, giving a statement of their requirements and the amount of money necessary for the same. The estimates are addressed to the Secretary of War, who, in his report to the President, submits the same, together with his comments thereon. The President, in his turn, sends the estimates to Congress, upon which the House of Representatives draws up the Army Appropriation Bill, which is then sent to the Senate for final action. The appropriations are expended by the heads of departments, under the general direction of the Secretary of War, after which the final accounts are audited by the auditor for the War Department of the Treasury. The same general procedure obtains in all other civilized countries, varying only in details due to the various governmental constitutions.

ARMY ORGANIZATION. The power of an army rests on two elements: its *material* strength and its *moral* strength; the former depending on the character of its commanders and soldiers and its organization, the latter being determined by its discipline, the system of military education, and the national spirit. *Organization*, in a military sense, comprises, in general, all the measures taken to insure to the army a regular and normal working of all its parts, to provide it with all the necessary machinery, to obtain for it regularly all that it requires, to insure its proper instruction, to protect the rights and prescribe the duties of each individual by suitable regulations, to supply the personnel and material which it needs, and, finally, to provide all the means whereby nothing may be wanting to enable it to fight under the most favorable conditions. In a limited sense the word "organization" is also used to designate the composition or formation of any body of troops; but this is only a particular application of the general meaning of the word.

The entire theory of organization rests upon the principle of individual responsibility and subordination, so that, no matter how small or how great the number of individuals gathered together, some *one* is responsible, to whom the others must be subordinate. This responsibility

and subordination are the great factors in the control of an army, and tactical organization may be defined as the arrangement of an army in such wise as to enable it, in whole or part, to respond at all times to the will of the commander promptly and efficiently. One of the first elements of strength in an army is the skillful organization of its *command*, and in this all nations are agreed as to the necessity for *unity*—i.e., for a *commander-in-chief* of the forces. Next in importance are the assistants to the commander-in-chief, viz., the staff and the entire corps of officers. Finally, arises the question of the number of men to be assembled under one leader, into bodies of various strength, their most advantageous subdivision, and the proportion of accessories of all kinds to be joined to the combatant forces. The army, then, is made up of a collection of units, differing according to the purpose of the organization. Thus, *tactical* units are the basis of organization for the tactical handling of troops in the field, while *administrative* units are the basis for administration and supply. A *tactical unit* is the largest body of men which can be directly commanded by the voice of a single commander. An *administrative unit* is the smallest organized subdivision having a complete administration of its own.

Infantry. The tactical unit of infantry in the great armies of the world is the battalion, composed of about 1000 men, and divided into four companies of about 250 men each. In the United States army the battalion has been of very variable strength in time of war, but is usually considerably smaller than the European battalion. The war strength of the battalion in the United States army is now fixed at 440 enlisted men and 15 officers. The company, in this service, is divided into two platoons, and each platoon into two sections, each section is composed of two or three squads, each squad comprising a corporal and seven privates. In the great European armies there are slight differences, but in the main the subdivision is similar. In Germany, however, the company has three platoons, each divided into half-platoons, and these again into sections; while France has four platoons, subdivided into sections and squads. The administrative unit of infantry is the regiment of three battalions, normally, sometimes four. A brigade is composed of two regiments in Europe, of three in the United States. It is the largest unit composed exclusively of infantry.

Mounted Infantry. Great Britain is the only nation that has organized and developed mounted infantry, an arm which proved so effective on both sides in the Boer War (1899–1902) that it will probably form a part of all future war armies. This body of troops does not exist in an organized form in England in time of peace, but a certain number of men, selected and detailed from the forces, are trained for this service. In time of war each battalion receives one of the four sections of a company, and a cavalry division receives a battalion of 8 companies. Each company is composed of 5 officers and 123 men; each battalion of 48 officers and 1094 men. Mounted infantry has been used by the United States in Indian campaigns and during the Philippine insurrection, but, in such cases, consisted merely of infantry organizations temporarily mounted.

Machine-Gun Batteries. These have acquired an enormous importance since the Russo-

Japanese War, and a special machine-gun company with eight pieces is now attached to each regiment of the Russian army. In Great Britain each battalion receives, in time of war, a section composed of two Maxim guns. In Switzerland each brigade of cavalry has a machine-gun company with eight Maxims attached to it, which practically gives it the fire power of two companies of infantry and at the same time an escort of great mobility. In the United States army a machine-gun platoon is attached to each regiment of infantry and cavalry, each platoon having two guns. In time of war these platoons are increased to provisional companies and troops of 108 and 86 men respectively, each having six guns. One section of each machine-gun company or troop is armed with rifles. The German machine-gun company has six guns and employs both wheels and pack transportation and one company is attached to each regiment. Machine-gun companies carry from 11,000 to 18,000 rounds of ammunition each. The number of machine guns per 1000 infantry in the principal armies of the world is as follows:—Germany, 2; France, 2; England, 2; Japan, 2; Russia, 2; United States, 4; Italy, $\frac{3}{2}$; Switzerland, $\frac{4}{5}$.

Cavalry. The tactical unit of cavalry is the squadron of 150 sabres. In the United States service the squadron is composed of four troops, each of 86 war strength. The administrative unit is the regiment, composed of four field squadrons and one dépôt squadron in Germany; of three squadrons in the United States. The brigade, in Europe, consists normally of two regiments; in the United States service, of three.

Artillery. The tactical unit of field artillery is the battery, composed in the United States of 4 guns, 12 caissons, 1 forge and battery wagon, 1 store wagon. The field battery has 171 men and 162 horses, and the horse battery 171 men and 235 horses. A battalion (*Abtheilung*, group, brigade, division), composed of from two to four batteries, now constitutes an important organization on the battlefield. The tactical unit of coast artillery is also the battery, composed in this case, however, of a variable number of guns, usually from one to four. The administrative unit of artillery in the principal armies of the world is the regiment, composed of from two to five battalions. It is the largest purely artillery organization. In the United States, since the recent reorganization of the field artillery into regiments and its separation from the coast artillery, which composes a separate corps (see ARTILLERY CORPS), the regiment, consisting of two battalions of three batteries each, is the administrative unit of the field artillery, the coast-defense command (the entire defense of harbor or post), or the coast artillery.

Mountain Artillery. The nations possessing mountainous regions generally have batteries of mountain artillery differing in organization and tactical use from the ordinary field batteries. Thus, the Alpine batteries of France have a strength of 5 officers, 156 men, with 96 animals, those of Italy, of 6 officers, 280 men, with 148 animals and 18 wagons; those of Switzerland of 7 officers, 162 men, and 83 animals. Switzerland has four battalions of mountain artillery, one assigned to each regiment of mountain infantry. The United States now has two regiments of mountain artillery, each consisting of two battalions of three batteries each. The batteries are of the same strength and organiza-

tion as field batteries, but the transportation is by pack animals. England has eight batteries of mountain artillery, each having 203 men and eight pieces. All of these batteries are on Indian service. The guns of mountain artillery are generally about 3.95 in calibre and throw a projectile weighing about 14 pounds.

Combined Arms. If we define the *strategical unit* as the smallest body composed permanently of two or more arms and capable of acting independently, then the *division* of the European armies (the *field army* of the United States army) must be regarded as that unit. The smallest unit in which any two of the arms are combined is the cavalry brigade, which often has a horse-artillery battery attached to it, but this is only done to make it temporarily independent and is not the rule. Ordinarily the brigade (cavalry or infantry) is the largest unmixed unit. The cavalry division is composed essentially of two brigades and two or three horse batteries, although in the United States it has three brigades and one regiment of horse artillery besides special troops. The infantry division (the smallest unit in which the three arms are combined) consists in general of two infantry brigades, one cavalry regiment, one field-artillery regiment, and other special troops differing in the different countries. In France, however, there is no cavalry attached to the infantry division, and in the United States there are three brigades, one brigade (two regiments) of field artillery, one regiment of cavalry, one battalion of engineers, one field battalion of signal corps, four ambulance companies, four field hospitals, one ammunition train (135 wagons), one supply train (162 wagons), and one pack train.

The highest definite unit of organization is the *field army*, and its strength is determined by the fact that in its most unfavorable formation it must be capable of being assembled or any portion of itself in a single day. It is composed of two or more divisions and the necessary auxiliary troops. In France, as there is no cavalry with the infantry divisions, a brigade of cavalry is attached to the army corps, and in the United States a brigade of cavalry is ordinarily added as an auxiliary to the *field army*, which is the unit corresponding to the French army corps. Since the artillery reserve was given up by Germany in 1899, the principal nations have followed this example, although a few still retain it. The total strength of an army corps or field army is about 30,000 to 35,000 in all armies, forming a column from 15 to 18 miles long, its rear, therefore, one day's march from its head. Armies are simply aggregations of army corps, or field armies and cavalry divisions, the artillery reserve being practically a thing of the past. The proportion of the three arms of the line is now considered to be best when the infantry and cavalry are in the ratio of 12 to 1, and there are 4 guns to every 1000 men of the other arms. The proportion of cavalry has been gradually made smaller since the days of Frederick, while that of the artillery has been gradually increased. In difficult mountainous country the cavalry is usually made less, but not if it can be used in raids at a distance. The proportion of artillery in flat, heavily wooded country, or in difficult mountainous country, or in country where the roads are bad, is usually decreased, because the full proportion cannot be used advantageously,

and a smaller proportion would diminish the length of the column, which is always desirable.

Thus far only the line of the army, in its most restricted sense, has been considered, but the efficient working of an army also requires a number of special troops, such as the engineers, pioneers, railroad engineers, pontoniers, sappers and miners, signalers, telegraphers, balloonists, and the medical corps. In foreign armies all the special troops, excepting the medical corps, are designated by the general term *technical troops*. Of course, these do not all exist in any one army, and, although the corresponding classes in the different armies have similar duties, there is still considerable difference. The term employed in the United States army to designate troops other than those of the line is "auxiliary troops"; but this term is also employed in the United States army to designate troops of the line assigned to a field army in addition to the line troops contained in the divisions composing it.

Engineers. The engineer troops of all armies are usually organized like infantry. In the German army they comprise the pioneers and the railroad engineers, the former organized into battalions of four companies each, the latter into regiments of two battalions each, including a balloon section. The latter is composed of six officers and about 150 men. The pioneers are charged with the construction of field fortifications and intrenched camps, bridge building, the construction and destruction of communications and obstacles, and siege operations. The bridge train of a division has material for a bridge 38 yards long, and that of a corps 135 yards long; hence the entire bridge material of a corps and its divisions is sufficient for a bridge 211 yards long. The railroad engineers have charge of the construction of the narrow-gauge field railroad: each company can construct in one day about seven miles of railroad complete, the track in working order ready for locomotives and cars. In the French army the engineer troops are organized into regiments, one of which is composed entirely of railroad engineers, the others being designated as sappers and miners, there is also a corps of telegraphers under the engineers. In the United States the engineers are organized into battalions of four companies each, but in time of war the engineer troops are provisionally organized into battalions of three companies, each of the companies having 164 men. Pioneer battalions may be mounted or dismounted. One pioneer battalion is attached to each division. One pontoon battalion is attached to each field army and carries with it 933 feet of bridge.

Signal Troops. The Signal Corps of the United States army has charge of the field telegraph, aviation, wireless telegraphy, and ordinary signaling by flag, torch, or heliograph. (See SIGNALING AND TELEGRAPHING, MILITARY.) In the field a division will have attached to it one field battalion of two companies of 96 men, each company carrying 20 miles of telegraph line. One aëro-wireless battalion is attached to each field army. All signal troops are either individually mounted or ride bicycles. In the United States army the organization of aviation companies is in process of development. Military telegraphers are organized in a different way in almost every existing army. In the United States and Great Britain the Signal Corps will, in time of war, be augmented by

telegraphers from civil life. In the United States volunteer signal organizations, composed almost entirely of telegraphers and electrical workers, are formed in time of war. In Germany one of the companies of a pioneer battalion is a telegraph company, while France has a field-telegraph battalion, as the fortification telegraph is in the hands of the engineers; Russia and Italy have a field-telegraph company for each army corps, and Austria-Hungary has a field formation of about 50 officers and 2000 men for this service.

Military Aviators. Since the successful scouting flights by *aéroplane* made by the Wright brothers in 1905, the balloon has been replaced in the armies of the world by *aéroplanes* and dirigible balloons. Although the *aéroplane* was developed in the United States, the United States army has only 17 *aéroplanes* and 19 military pilots and has no separate organization for aviation work, the Signal Corps having entire charge of it. France has 22 dirigibles, 611 *aéroplanes*, 620 military pilots, and 1174 officers and men on aviation duty organized into 3 *aéroplane* groups, each group having 2 aeronautical companies and 1 aviation company. The groups are located geographically so as to serve the various army corps. Germany has 20 dirigibles, 428 *aéroplanes*, 300 military pilots. Germany's aviation force consists of 5 *aéro* battalions of 3 companies each in Prussia, 2 companies in Bavaria, and 1 company each in Saxony and Württemberg. England has 8 dirigibles, 168 *aéroplanes*, 135 military pilots, and 628 men on aviation duty, organized into the Royal Flying Corps. Russia has 22 dirigibles, 200 *aéroplanes*, and 80 military pilots. Japan has 3 dirigibles, 23 *aéroplanes*, and 20 military pilots. Italy has 10 dirigibles, 153 *aéroplanes*, and 175 military pilots. Austria has 10 dirigibles, 136 *aéroplanes*, and 91 military pilots. Bulgaria has 1 dirigible, 28 *aéroplanes*, and 10 military pilots. Greece has 52 *aéroplanes* and 10 military pilots. Belgium has 2 dirigibles, 40 *aéroplanes*, and 68 military pilots. Many of the nations, some of them strong military nations, by 1914 had not made definite organizations for aeronautical work, but were operating dirigibles and *aéroplanes* with officers and men detailed from the line. France and Germany lead in the perfection of their organizations for aeronautical work.

While the full extent and limitations of the value of dirigibles and *aéroplanes* in warfare have not been determined, it has been found in recent wars in Morocco and in Turkey that they have great value as means of gathering information. Their practical value as destructive agencies, by dropping explosives, is yet undetermined. Guns for the destruction of air craft are being developed in almost every country. Such guns will be adjuncts of the field artillery.

Military Cyclists are formed into detachments and are used by all the great nations for orderly service, outpost, and reconnaissance duty and in fortifications for messenger duty. The troops are generally taken from the ranks, and trained especially for the work. In the European armies they are now organized into companies, of about 100 men each and are attached to the headquarters of divisions and army corps. Germany has 14 cyclist companies, which are attached to the light infantry and guard battalions. Holland has one company with each division, as have also France and Switzerland.

Carrier Pigeons have also been used on a

large scale, especially in Italy and France, not only in permanent stations, but also with cavalry on the march.

Medical Department. In the principal European armies every battalion has its own medical officer, and most of them have *attendants* as a permanent part of the regimental cadre, in addition to the company bearers. In Germany a *hospital corps detachment*, for discovering and removing the wounded on the battlefield, establishing *dressing stations* and giving *first aid*, comprises 7 surgeons, 1 apothecary, 8 hospital stewards, 8 attendants, 191 bearers, and 12 ambulance wagons. A *field hospital*, for about 200 patients, has 5 surgeons, 1 apothecary, 9 hospital stewards, and 12 attendants with 6 wagons. In the United States the sanitary organization of a field army proper comprises one medical director and a reserve of hospital corps men and material for about 6000 patients; each division has four field hospitals for a total of about 2000 patients; to each division, brigade, battalion, squadron, and battery is assigned a certain number of medical officers and non-commissioned officers and privates of the hospital corps. In the field, the ambulance companies establish dressing stations as near the firing line as is convenient, and hunt up and carry the wounded to them, whence the ambulances convey them, after the first bandaging and attendance, to the field hospitals. Four ambulance companies are attached to each division. General hospitals (not, as a rule, under the general commanding in the field) are established farther to the rear.

Police. The police of an army in the field usually receives a military organization. In most armies the police is a separate body of troops, but in the United States troops are detailed from the army to act as provost guard—for a division about one company, and for an army corps about one battalion. In Germany the *Landgendarmarie* is organized into brigades. In France the *gendarmerie* is an integral part of the army, and is organized into *legions* (one to each army corps), commanded by a field officer, and subdivided into companies (one to each department), commanded by a captain, and these into circuits, commanded by a lieutenant.

Train. The term *train* is applied not only to the wagons of an army, but also to the troops who drive them. In all countries except the United States these troops are specially organized and trained for the purpose, but in the United States army the train (except the ammunition column) has always been under the quartermaster's department, and the men have been detailed from the nearest organizations. Now, however, men are enlisted for service in the quartermaster's corps, and hereafter drivers of all wagons will be enlisted men trained for that purpose. In France the train is composed of train squadrons (one to each army corps), composed each of three companies, with a strength per squadron, in time of war, of 2300 men and 3500 horses. In Germany it comprises troops organized into battalions (one for each army corps), composed each of three companies, the battalion having a strength, in time of peace, of 14 officers, 70 non-commissioned officers, 252 privates, and 190 horses.

In France and Germany a part of the train battalions are being trained in the use of automobiles. Germany is able to mobilize 1000 automobiles for train service, and France about the

same number. In France automobiles carrying more than two tons are subsidized, the amount of subsidy being increased for each additional ton the car may be able to carry. In all armies automobiles are supplied for corps and division headquarters.

The *ammunition column*, in the United States, is subject to the orders of the division commander, and is under the command of an officer. The column has a personnel of about 150 and is divided into five sections of 21 wagons each, of which three sections carry small arms cartridges and the other two artillery ammunition, stores, and spare parts. The *supply train* (carrying three days' rations and forage) is part of the division train, as are also the baggage train and a horse dépôt, containing a reserve of 100 horses and 100 mules. The number of wagons required for the train varies much, and in Europe the number allowed for each unit is prescribed. During the Civil War the proportion of wagons in the Army of the Potomac was gradually reduced from 49 to 22 per 1000 men. One of these army corps required about 1086 wagons, while to the German army corps is allowed in all 2150.

An important feature of the organization of the army is the *STAFF* (q.v.), which may be either military or administrative. This branch, together with the subjects of *RANK AND COMMAND*, *RECRUITMENT*, and *DISCIPLINE*, will be found discussed under the appropriate heads; while the actual use and operation of an army and its component parts are treated under *TACTICS*, *MILITARY*; *COAST DEFENSE*. See *ARTILLERY*, *CAVALRY*, *INFANTRY*, and *MOUNTED INFANTRY* for the historical development of these arms in which the changes in organization are discussed. Ancient and modern armies will be found treated under *ARMIES* and *ARMY* under name of country. Under each of these articles will be found a bibliography. The works of reference mentioned in the article on *TACTICS*, *MILITARY* will be found, in most cases, to deal with the closely related subject of organization. Among these may be mentioned Wagner, *Organization and Tactics* (Kansas City, 1896), and Jerram, *Armies of the World* (London and New York, 1900).

ARMY REGISTER, UNITED STATES. The official publication issued each year from the Adjutant-General's office, by the Secretary of War. It contains a list of the officers of the army, giving the department, regiment, or corps to which they belong or are assigned; together with information regarding their place of birth, the State from which appointed, whether entered from civil life or the Military Academy, date of entry, and rank held at the time; also the dates of commissions held in the permanent establishment and in the volunteer service, together with the highest brevet rank. It also contains a list of retired officers and aids to general officers; the officers and professors of the Military Academy, and the first five cadets of each class. The lineal rank and the relative rank of officers are given, as well as the officers who have been commissioned for distinguished services, who have received the thanks of Congress, and who have held staff appointments other than under commission, and on whom brevet rank has been conferred. Recipients of congressional medals of honor and certificates of merit are also listed. The casualties during the year are given, as well as military commands and posts, armories, arsenals, and recruiting, engineer, and ordnance

dépôts, and the organizations or detachments of the army stationed there. There are included statements regarding the pay of the army and militia forces of the United States; the students at universities, colleges, etc. The data concerning officers also show those who have graduated from the service schools or from the war college at Washington. A table is appended showing in detail the complete organization of the United States army. All foreign nations issue similar lists; in Great Britain it is known as the *Army List* and is issued quarterly and in abridged form monthly. This is necessary owing to the constant changes of stations and assignments incidental to the itineration of the army.

ARMY SCHOOLS. Schools for the education of non-commissioned officers and men and their children. In the United States they are known as Post Schools. The most important factor in the making of a thoroughly efficient soldier is a good education. Modern war tactics place more and more responsibility on the individual soldier, and the comparative distance which the private often is, in action, from those from whom he usually takes his orders, makes it absolutely essential that he be trained in the proper use of every faculty. Non-commissioned officers are the backbone of the modern army, so that what is strongly encouraged in the private is an imperative necessity in their case. In all the armies of to-day the most exacting and rigid examinations are compulsory for all soldiers desirous of promotion. In the British and most of the Continental armies the education of the soldier is compulsory up to a certain point and is strongly encouraged beyond that. The educational test always precedes the military or purely professional examination, without the successful passing of which the latter is impossible. To such a high degree of efficiency, in fact, have these nations brought this branch that it is possible for a soldier to enlist, absolutely illiterate, and at the conclusion of his service leave with the equivalent of a civil college education, if he has applied himself assiduously and has taken full advantage of all opportunities. In Germany opportunities for technical mechanical education are also available. Schoolmasters are a part of their army system and are classified for purposes of pay and promotion. In the United States the post school is required to be established and is the direct concern of the officer commanding the post. Efficient officers supervise the work, and enlisted men possessing the required qualifications are detailed as instructors, in the proportion of not exceeding 1 to every 15 men attending school. If there is a chaplain stationed at the post, he is usually placed in charge. The general supervision of army schools is directed from the headquarters of the respective department commanders, but their official inspection is performed by officers of the inspector-general's department. Post schools for the children of officers, soldiers, and civilian employees of the government are also maintained where the number needing such instruction is sufficient, and where schools outside the post are not available; at these schools the attendance for the children of officers is optional, and for the children of non-commissioned officers and men compulsory. The government supplies all the books necessary. There is also a post school for officers, systematic instruction now being an important feature of an officer's training. See *MILITARY EDUCATION*.

ARMY WORM

MOTH, LARVA AND PUPA; with caterpillar in various stages of development.

AMBROSIA BEETLES

1. BEETLES (*Xyleborus dispar*): Male and female, enlarged, and antenna of female more enlarged.
2. AMBROSIA of *Corthylus punctatissimus*: *a*, detached dumb-bell shaped pairs of cells greatly enlarged.

3. GALLERIES of *Corthylus punctatissimus* in huckleberry roots; enlarged.
4. GNATHOTRICUS MATERIARIUS.
5. GALLERIES of *Monarthrum mali* in maple, showing brood cells (at the right).

ARMY-WORM' (so named from traveling in great numbers). In the northern United States the yellow-striped lava or caterpillar of a dark-gray moth (*Leucania unipuncta*), a species closely related to the cutworms. (See Plate of ARMY-WORM.) The army-worm is always present in the United States, but only occasionally becomes numerous enough to do much damage. During an early dry spring it may increase in numbers so that it is obliged to march—i.e., to go in search of food. It usually feeds on grass, but may destroy fields of grain and Indian corn. The term is frequently applied to other caterpillars of occasional prevalence and harm in fields, especially the so-called "fall" army-worm (*Lophygma frugiperda*), elsewhere described as GRASS-WORM. Consult *Third Report United States Entomological Commission* (Washington, 1883).

ARNA, är'nä (Hind. fem. *arni*). The Indian buffalo. See BUFFALO.

ARNABOLDI, är'nä - bōl'dē, ALESSANDRO (1827-98). An Italian lyric poet. He was much admired for his *Versi* (1872), his *Poeti d'azione*, and his *Nuovi versi* (1888), remarkable for the æsthetic quality of the descriptive passages, especially in the long series of poems, in the manner of Carducci, devoted to Greece and Sicily. For translations, see E. Lee Hamilton's *Poems and Transcripts* (Edinburgh and London, 1878), and G. A. Greene, *Italian Lyrists of To-day* (New York, 1893). Consult *Quarterly Review*, October 1877. There is a Czech translation by Vrehlicky.

ARNASON, är'nä-son, JON (1819-88). An Icelandic writer, born at Reykjavik, Iceland. He is called the Grimm of Iceland because of his collection of *Popular Legends and Tales of Iceland* (2 vols., 1862-64), and other folklore of his country, of which he was for many years the national librarian. The collection of popular tales is extensive and faithful to oral tradition. It is one of the most valuable in any literature and has become a classic handbook to students of comparative folklore. Stories from his collection have been translated into Danish, Norwegian, German, English, and French.

ARNAUD, är'nō', EMILE (1864—). A French economist and for many years an ardent advocate of peace. He was born at La Chapelle, France. As editor of *Les Etats-Unis d'Europe* over a long period, and as a delegate to all the international peace congresses, which began in 1889, he became so important a figure as to be chosen in 1891 president of the Ligue Internationale de la Paix et de la Liberté and in 1903 president of the Twelfth Peace Congress. He was also tendered the vice-presidency of the Bureau international permanent de la Paix, de Berne. Arnaud's reputation was largely increased by his writings and lectures in behalf of international peace.

ARNAUD, FRANÇOIS THOMAS DE BACULARD D' (1718-1805). A French author. While a student at the College of Harcourt he dedicated a play to Voltaire, who thenceforth took a lively interest in his welfare. For two years (1748-50) he was the literary correspondent of Frederick the Great in Paris. He went to Berlin in 1750, and afterward to Dresden, where he became counselor of the French legation. On his return to France he published a series of novels and romances entitled *Epreuves de sentiment* (12 vols., 1772-81). These works were very popular in their day and were highly praised by Rousseau, who declared that "other writers

employed their head and their hands, but Arnaud worked from the heart." A complete edition of Arnaud's novels, romances, dramas, and other writings appeared at Paris in 1803.

ARNAUD, HENRI (1641-1721). The historian of the Vaudois, pastor, and soldier. Born in France, his family returned to Piedmont, while he was still a youth. Encouraged by the English Revolution and the enthronement of William III and probably with pecuniary assistance from England, Arnaud undertook to bring back to their native valleys the Vaudois expropriated by Victor Amadeus of Savoy. In September, 1689, he led about 1000 of the exiles into the valley of the San Martino and overcame a superior force; but being in danger of attack by French troops, he retired to the high tableland of the Balsille, making such fortifications as he could. Here he was assaulted, May 2, 1690, by the allied armies of France and Savoy under Marshal Catinat, numbering, as he says, 22,000 men, although Catinat's actual force was probably much smaller. The attack was heroically repulsed without loss to the Protestants, while the allied troops lost heavily. Arnaud did not risk another fight, but withdrew to Angrogna, and, just when final capture seemed assured, he learned that war had begun between France and Piedmont, and that the Piedmontese King had suddenly become a friend of the exiles, ready to receive them. The Vaudois were at peace in their valleys for a brief space only. In the latter part of the War of the League of Augsburg, from 1689 to 1697, Arnaud and his men did good service against France; but when that was over, the King of Piedmont again leagued with France against them, and 3000 Vaudois were expelled, finding an asylum in Württemberg. Arnaud was invited to England by William III, but preferred to remain pastor among his exiled countrymen at Schönberg, where he wrote his *Histoire de la glorieuse rentrée des Vaudois dans leurs vallées* (1710), dedicated to Queen Anne. Consult Mason, *History of the Waldenses* (London, 1875).

ARNAULD, är'nō', ANGÉLIQUE (DE SAINT-JEAN) (1624-84). A daughter of Robert Arnauld d'Andilly, born in Paris, Nov. 24, 1624. She became a nun at Port-Royal-des-Champs in Paris, where she had been educated by her aunt, Jacqueline Marie Angélique Arnauld, sister of the great Arnauld. She was made sub-prioress (1653), and on removing some years later to Port-Royal-de-Paris she held the same office. During the persecution of the Port Royalists, because they were strong Jansenists (see JANSENISM), Angélique Arnauld, by her piety and courage, sustained the spirit of the sisterhood. They were scattered, and when reunited they were watched by soldiers, lest they should hold communication with persons outside of the convent. In 1669, however, was issued the edict of Clement IX for the peace of the Church, which was a kind of compromise on this vexed question of Jansenism and Jesuitism. The nuns received back the privileges of which they had been stripped and constituted their society anew. Angélique Arnauld was again elected prioress. In 1678 she was made abbess. The next year her protectress, the Duchesse de Longueville, died, and the persecution recommenced by the prohibition to receive any more novices. Still Angélique did not despair. She consoled the nuns and exerted all her influence with persons in power, but with little effect. She died on Jan. 29, 1684, leaving behind her a bright and beautiful memory. She

was learned without being pedantic, pious without bigotry, and gentle to others in proportion as she was severe to herself. Angélique Arnauld wrote several works, the most valuable of which is *Mémoires pour servir à la vie de la Mère Marie Angélique Arnauld de Sainte Madeleine, réformatrice de Port Royal* (Paris, 1742). For her life, consult Martin (London, 1876), and R. Monlau (Paris, 1901).

ARNAULD, ANTOINE (1560-1619). An eloquent French advocate, born at Paris. His zealous defense of the University of Paris against the Jesuits, in 1594, won for him a wide celebrity and secured their temporary banishment. The Jesuits accused him of being a Huguenot, but the accusation seems to have been unfounded, for he displayed no personal predilection in favor of Protestantism as a distinct religious system. He had 20 children, some of whom formed the nucleus of the Jansenists and Port Royalists. He published *Le franc et véritable discours au roi sur la rétablissement qui lui est demandé des Jésuites* (1602).

ARNAULD, ANTOINE (1612-94). A French theologian and polemical writer, known as the great Arnauld. He was born at Paris, Feb. 6, 1612, and was the son of Antoine Arnauld, the celebrated jurist, from whom the younger Antoine seems to have inherited his vigorous intellect and that animosity for the Jesuits which characterized almost his entire life. After a thorough training in the liberal arts Arnauld began the study of law, but, in compliance with his mother's wishes, he abandoned his legal studies for theology. He became a priest in 1641 and in 1643 was made a member of the Society of the Sorbonne. He had previously made a thorough study of the works of St. Augustine, whose doctrine of sin and grace especially recommended itself to him. In 1643 he published a work entitled *De la fréquente communion*, which at once drew upon him the hostility of the Jesuits and plunged him into a controversy with that society which lasted for nearly 40 years. Arnauld was by nature a controversialist. He was iron-willed, passionate, narrow, crude, and firmly convinced of his own infallibility. The defense of truth, as he conceived it, was the sole object of life, and in the defense of truth he spared neither himself nor his friends, nor, it must be confessed, truth itself at times. Within the Church he carried on a fierce polemic against the Jesuits; without, he wrote against the Calvinists and Freethinkers. His indefatigable ardor is illustrated by a characteristic reply made in his old age to his friend Nicole, who urged that, after many years of conflict and exile, the aged man should seek some rest. "Rest!" he retorted, "have I not all Eternity to rest in?" The controversy which began with *De la fréquente communion*, in 1643, was continued in the *Théologie morale des Jésuites*. Upon the outbreak of the Jansenist controversy (see JANSENISM), Arnauld took the field against his hereditary enemies. In 1641 he published a series of tractates against them, and these were followed, after intervals of peace, by new attacks in 1649 and 1656. In the last year the Jesuits succeeded in bringing about his expulsion from the Sorbonne. Since 1648 he had been living at Port-Royal-des-Champs, in friendship with Nicole, and with the great Pascal, the material for whose *Provincial Letters* Arnauld is said to have supplied. After the Jansenist controversy had been set at rest by the Peace of

Clement IX, in 1668, Arnauld came into conflict with the Calvinists, whom he attacked in his *La perpétuité de la foi de l'église catholique défendue* (1669), written in collaboration with Nicole and followed by *Le renversement de la morale de Jésus-Christ par la doctrine des Calvinistes* (1672), and *L'impie de la morale des Calvinistes* (1675). Although he enjoyed for a time the protection of Louis XIV, and seems to have been in close touch with the powers at Rome, Arnauld, in 1679, was forced to flee to Belgium owing to the unrelenting hostility of the Jesuits. In exile the old man continued his feverish activity. After 1680 he plunged into a bitter controversy with his old friend Malebranche, concerning the latter's theory of grace. In 1681, too, he published a defense of the English Catholics in reply to the accusations brought against them in connection with the Titus Oates episode, in which Arnauld strangely enough took up the cause of his ancient enemies, the Jesuits. He also wrote a book directed against William of Orange, calling him "a new Absalom, a new Herod, a new Cromwell" (1689). He died Aug. 8, 1694, near Liège, shortly after he had written a work entitled *Réflexions sur l'éloquence des prédicateurs*. The title of the "great Arnauld" was given him by the Jansenists, one of whose foremost champions he was. His voluminous writings, comprising over 100 volumes in their original editions, were published in 48 volumes at Lausanne (1775-83), the last volume being a biography of Arnauld.

ARNAULD, JACQUELINE MARIE (1591-1661). A French abbess, usually called by her conventual name, Marie Angélique de Sainte Madeleine. She was the daughter of the celebrated advocate, Antoine Arnauld. In her ninth year she assumed the dress of a novice; and concealing her age, her father induced the Pope to nominate her abbess of Port-Royal-des-Champs when she was a little over 11 years old. At first she longed for the freedom of the world. But in 1608 a sermon fully converted her. She then established discipline of especial severity and became famous for her piety. Like the rest of her family, she was a Jansenist. She was afterward superior of a new religious community in Paris; then prioress at Port-Royal, where her sister Agnes was abbess. She died in the convent of Port-Royal, Paris. Consult her life by Frances Martin (London, 1873).

ARNAULD D'ANDILLY, ROBERT (1588-1674). A French writer, born in Paris. He was the eldest son of Antoine Arnauld, the advocate, and brother of the great Arnauld, and was a person of considerable consequence at the French court, where his influence was beneficial, owing to his great power in controlling the licentious Anne of Austria. At the age of 55 he retired to the solitude of Port-Royal-des-Champs, where he devoted himself to religious history and biography. His chief works are translations, such as those of the *Confessions de Saint Augustin*, written in cameo-like French, and his *Vies des Saints Pères du désert* (1668), translated into English as *Lives of the Fathers of the Desert* (1757). He also wrote some religious verse.

ARNAULT, HENRI, ANTOINE VINCENT (1766-1834). A French poet and dramatist. He was born in Paris, Jan. 1, 1766, and died at Goderville, Sept. 16, 1834. He is remembered for his satirical fables, for his *Souvenirs d'un sexagénaire* (4 vols., 1833), which contain many interesting facts concerning the inner history of

France up to 1804; and, most of all, for several graceful poems, one of which, "La Feuille," is known to every French school-child. He first obtained celebrity through his tragedies, *Marius à Minturnes* (1791) and *Lucrèce* (1792), and he wrote the libretti to Méhul's operas, *Horatius Coelés* and *Phrosine et Mélidore*. His tragedy, *Les Vénétiens*, was produced at the Théâtre Français, in Paris, Sept. 12, 1798, and was very successful. Upon the second restoration of the Bourbon dynasty Arnault was officially included in the proscription of 1816 and fled to Belgium, where he wrote his two books of fables. These books, together with six others of a similar nature, written in 1813, were published in 1826 under the title of *Fables et poésies*. Arnault was a representative of classicism and a pronounced opponent of the Romantic school. (See ROMANTICISM.) In 1819 he collaborated with Jay, Jouy, and De Norvins in the publication of the once famous *Biographie nouvelle des contemporains* (8 vols., 1820-25). In recognition of his celebrated biography, *Vie politique et militaire de Napoléon* (2 vols., 1822-26), a work full of curious facts and piquant revelations, Napoleon, while at Elba, settled upon the author a legacy of 100,000 francs. The works of Arnault were edited by himself in 1818, 1823, and 1827. All of these editions are somewhat incomplete.

ARNDT, ärrnt, ERNST MORITZ (1769-1860). A distinguished German poet and patriot. He was born at Schoritz, which was then in Sweden, Dec. 26, 1769. His father had been a serf, but achieved a sturdy peasant independence, and designed Arndt for the ministry. He has described his early years delightfully in *Marchen und Jugenderinnerungen* (1818). He studied at Greifswald and Jena and was influenced especially by Goethe, Fichte, Klopstock, Bürger, and Voss. After he left the university he made journeys in Austria, Hungary, France, and Italy, and published an account of these travels in 1802. The first of his many political services was rendered in his book, *Versuch einer Geschichte der Leibeigenschaft in Pommern und Rugen* (1803), which contributed greatly to the mitigation and partial abolition of serfdom. He became privat-docent at Greifswald in 1880, and was made professor there in 1806. After the battle of Jena he fled to Sweden, whence he continued stirring appeals against Napoleon, under the title *Der Geist der Zeit*. He returned after three years to his professorial work. In 1812 he sought refuge in Russia, called thither by Baron von Stein, the great German statesman, who was there organizing the agitation against Napoleon. Arndt's finest poems—among them "Was ist des Deutschen Vaterland," and "Der Gott der Eisen wachsen liess"—belong to this period; also stirring appeals in prose, such as *Deutscher Volkskatechismus* (1812); *Was bedeutet Landwehr und Landsturm?* (1813); *Der Rhein, Deutschlands Strom aber nicht Deutschlands Grenze* (1813); collated in *Schriften für und an meine lieben Deutschen* (3 vols., 1845). After the French disaster in Russia (1812), he returned to Prussia, in which his hopes of German unity centred, and gave himself up to the agitation that resulted in the War of Liberation, which culminated in the battle of Leipzig (1813). In 1817 he married a sister of the great liberal preacher and philosophic theologian, Schleiermacher, and in 1818 was made professor of history in the newly established university at Bonn. As his liberal views were at variance

with the government's reactionary policy, he was soon suspended (1820) and passed the next 20 years in honorable and honored retirement, writing historical essays of minor value, and his interesting *Erinnerungen aus meinem äussern Leben* (Leipzig, 1840). On his accession to the Prussian throne, Frederick William IV restored Arndt to his professorship (1840). German unity was still his dream. He took a lively interest in the events of 1848 and was one of the deputation to offer to the Prussian King the Imperial Crown of Germany. The ninetieth birthday of Father Arndt, as he had come to be called, was celebrated throughout his still dis-united country; a month later he died at Bonn, Jan. 29, 1860. Eleven years later the ideal of his life was realized by the proclamation of the German Empire at Versailles. Arndt was neither a great scholar nor a great poet, but he was a noble character and a manly patriot. Editions of his war songs are numberless. His *Erinnerungen* form the basis of E. M. Seeley's *Life and Adventures of E. M. Arndt* (1879). There are German *Lives* by Schenkel (2d ed., Elberfeld, 1869); Langenberg (Bonn, 1869); and Baur (Hamburg, 1882); R. Thiele (Güttersloh, 1894); G. Lange, *Der Dichter Arndt* (Berlin, 1910); P. Meinhold, *Arndt* (Berlin, 1910); and a volume of Arndt's *Letters to a Friend* (*Briefe an eine Freundin*), edited by Langenberg (Berlin, 1878). The publication of his *Works* was begun in 1892 by H. Rösch and H. Meisner.

ARNDT, or **ARND**, JOHANN (1555-1621). A German Lutheran divine. He was born at Balenstedt, Anhalt, Dec. 27, 1555, and was educated at Helmstedt, Wittenberg, Strassburg, and Basel. He became pastor at Badeborn, Anhalt, in 1583, but was deposed in 1590 because he resisted the order of Duke John George to remove the pictures from his church and cease the use of exorcism in baptism. Later that year he was appointed to a place at Quedlinburg, but was glad to leave it in 1599 and go to Brunswick, because he had fallen into disfavor with the townspeople. His ardent piety was an offense to the dead orthodoxy of his associates, and he welcomed the call to Eisleben (1608), but only stayed until 1611, when he became general superintendent at Celle, Hanover, and there died, May 11, 1621. His enduring fame rests upon his *True Christianity* (Magdeburg, 1610) and his *Garden of Paradise* (Magdeburg, 1612); new editions of both, with biographical sketch by F. W. Krummacher (2d ed., Leipzig, 1850); best English translation of the former is that edited by Charles F. Schaeffer (Philadelphia, 1868); of the latter there is an English translation by A. W. Boehm (London, 1716). Arndt nourished his soul upon the Scriptures and the mystics, and his works develop that spirit which afterward was called pietistic. (See PIETISM.) For his biography consult F. Arndt (Berlin, 1838), and the Krummacher sketch quoted above.

ARNDT, WILHELM (1838-95). A German historian. He was born at Lobsens, province of Posen, Prussia, and after studying history at the University of Göttingen became established at the University of Leipzig. He published, in addition to other writings, *Kleine Denkmäler aus der Merowingerzeit* (1874), and *Schrifttafeln zur Erlernung der lateinischen Paläographie* (1874; 3d ed., 1897-98). He was for many years collaborator on the *Monumenta Germaniae Historica*, and in 1881 published at Leipzig a

second edition of *Goethes Briefe an die Gräfin Auguste zu Stolberg*.

ARNDTS VON ARNESBERG, ärnts fön är'nës-bërk, LUDWIG (1803-78). A German jurist, who did much to develop the science of jurisprudence. He was born in Arnberg, Prussia, and was successively professor of jurisprudence in Bonn, Breslau, Munich, and Vienna universities, being at the last institution from 1855 until his death. He favored warmly Austria's claims for admission to the German Empire and used his influence to that end in 1848, when in the National Assembly of Frankfurt. He was knighted by Austria in 1871. His best known works are the *Lehrbuch der Pandekten* (14th ed., 1889); the *Juristische Encyclopadie und Methodologie* (9th ed., 1895); *Die Lehre von den Vermächtnissen* (3 vols., 1869-75); *Gesammelte zivilistische Schriften* (3 vols., 1874). He collaborated with Bluntschli and Pözl on an eight-volume work called *Kritische Ueberschau der deutschen Gesetzgebung und Rechtswissenschaft* (1854).

ARNE, ärn, THOMAS AUGUSTINE (1710-78). An eminent English composer. He was born in London, and received his early education at Eton. His father, who was an upholsterer, intended to educate him for the bar, but the love of music was too strong to be restrained. Young Arne became skillful as a violin player, forming his style chiefly on the model of Corelli; and his zeal in the study of music induced his sister (afterward celebrated as Mrs. Cibber) to cultivate her excellent voice. He wrote for her a part in his first opera *Rosamond*, which was first performed with great success in 1733. Next followed his comic operetta, *Tom Thumb, or the Opera of Operas*; and afterward his *Comus* (1738), which displayed greater cultivation of style. He married a singer, Cecilia Young (1736), and after a successful visit to Ireland was engaged as composer to Drury Lane Theatre and wrote many vocal pieces for the Vauxhall concerts. The national air "Rule Britannia," which was originally given in a popular performance, the masque of *Alfred*, is of his composition. He composed also two oratorios, *Abel* and *Judith*, a number of operas, including *Artaxerxes*, in the Italian style (1762). His genius was better adapted to simple pastoral melody than to great dramatic compositions, and he wrote many glees, catches, canons, and songs, and the music to Garrick's "Ode to Shakespeare" for the Jubilee at Stratford-on-Avon in 1769. His son, Michael (1741-86), was also a composer. He died in London. Consult W. A. Barrett, *English Glee and Part Songs* (London, 1886); Horner, *Life and Works of Dr. Arne* (London, 1893).

ARNETH, är'nët, ALFRED, RITTER VON (1819-97). An eminent Austrian historian. He was born in Vienna, and after completing a course of legal studies entered the Austrian government service as an employee in the Imperial archives at Vienna. In 1848 Arneth was sent to the Frankfurt Parliament as a representative from the district of Neunkirchen, and in 1861 was elected to the Diet of lower Austria. In 1868 he was appointed director of the state archives and in 1869 he was nominated by the Emperor a life member of the Austrian Upper Chamber. In 1879 he was chosen president of the Imperial Academy of Sciences at Vienna. Arneth wrote a number of scholarly works on eighteenth-century Austrian history, especially the eventful

reign of Maria Theresa. His chief works are: *Geschichte Maria Theresias* (10 vols., 1863-79); *Prinz Eugen von Salogen* (3 vols., 1858-59); *Joseph II und Leopold von Toscana, ihr Briefwechsel* (2 vols., 1872); *Marie Antoinette: Correspondance secrète entre Marie Thérèse et le comte de Mercy-Argenteau* (3 vols., 1874). He also edited the correspondence between Joseph II and Catharine of Russia (1869); miscellaneous letters of Maria Theresa (1881), and wrote as well an interesting autobiography, *Aus meinem Leben* (Vienna, 1891).

ARNETH, JOSEPH CALASANZA, RITTER VON (1791-1863). An Austrian numismatist and archaeologist, born at Leopoldschlag, upper Austria. He became custodian of the cabinet of Coins and Antiques in Vienna, and director of that institution in 1840, in which capacity he rendered very valuable services to the department of numismatics. Among his more important works are: *Synopsis Numorum Græcorum* (1837); *Synopsis Numorum Romanorum* (1842); *Das k. k. Münz- und Antikenkabinett* (1845); *Die antiken Kameen des k. k. Münz- und Antikenkabinetts* (1849); *Die Cinque-Cento-Kameen und Arbeiten des Benvenuto Cellini und seiner Zeitgenossen* (1858).

ARNHEIM, ärn'him. See ARNHEM.

ARNHEIM, HANS GEORG. See ARNIM, HANS GEORG.

ARNHEM (anciently, Lat. *Arenacum*), or ARNHEIM. The capital of the Dutch province of Gelderland, on the Rhine, 35 miles southeast of Utrecht (Map: Netherlands, D 3). It is a place of historic interest and is situated in one of the most picturesque districts of Holland. It has elegant promenades constructed on the ramparts of the old city. One of its notable edifices is the Groote-Kerk, or Dutch Reformed Church, which was begun in 1452 and restored from 1895 to 1902. This has a tower 305 feet high and contains the tomb of the Duke of Gelderland, the opponent of Charles V. The town hall, erected in the fifteenth century and restored in 1898, is popularly called the Duivelhuis, from its grotesque decorations. Arnheim has a normal school for women, an art museum, the Museum van Oudheden en Kunst, and a public library. The trade of the town is with Germany, chiefly in grain and tobacco, while it manufactures furniture, wagons, mirrors, and scientific instruments. Arnheim was formerly the residence of the Dukes of Gelderland. In the thirteenth century and during the Middle Ages it was a member of the Hanseatic League. It was taken by the French in 1672, and stormed by the Prussians in 1813. Pop., 1900, 56,812; 1910, 65,685.

ARNICA (commonly given as corruption of *ptarmica*; doubtful). A genus of plants belonging to the family Compositæ. The species are few in number and are found only in the north temperate and Arctic regions. The root and flowers of the mountain arnica (*Arnica montana*), sometimes called mountain tobacco, were formerly much valued in medicine, and were administered in various forms as a stimulant in paralytic affections, typhoid fevers, and other diseases. The drug is now rarely given internally, but in small doses it stimulates the digestion. Externally in the form of the tincture, arnica is a favorite household remedy for bruises, to relieve soreness and promote the absorption of extravasated blood. It is also used in the form of a plaster. The plant contains a peculiar volatile oil, a resin, caprylic and capronic acids,

tannin, and a bitter principle called arnicin. The root is perennial and crooked, the stem about 2 feet high, simple or little branched, with few leaves, bearing on the summit a head of flowers of dark golden yellow, often 2 inches in breadth. It flowers from June to August, forms an ornament of mountain meadows in Germany and Switzerland, and is found, upon the continent of Europe, as far south as Portugal and as far north as Lapland. Other species have locally the same qualities attributed to them as *Arnica montana*. For illustration, see DICOTYLEDONS; FLOWER; ARNICA; ACACIA.

ARNIM, ärn'nim, COUNTESS VON (MARY ANTOINETTE BEAUCHAMP). An English writer. She married Count Henning August von Arnim, a German nobleman, who died in 1910. Her first book, *Elizabeth and her German Garden*, was published anonymously in 1898. The delightful picture which it gives of outdoor life in Germany and the charming vivacity of its style made it at once a great success in England and the United States. In similar vein is *The Solitary Summer*, brought out in 1899. Other volumes which followed, some novels, and some books of travel in the guise of fiction, include: *The Bonefactress* (1902); *The Adventures of Elizabeth in Rugen* (1904); *The Princess Priscilla's Fortnight* (1906); *Fraulein Schmidt and Mr. Anstruther* (1907); *The Caravaners*, containing admirable characterization (1909); *Priscilla Runs Away* (1910).

ARNIM, ärn'nim, ELISABETH VON, better known as BETTINA (1785-1859). A sister of Clemens Brentano, and wife of Ludwig Joachim von Arnim, born at Frankfort-on-the-Main. She is noted chiefly for her friendship with Goethe (1807-11) and her pretended *Correspondence of Goethe with a Child* (*Goethes Briefwechsel mit einem Kinde*, 1835), which is in large part fictitious. Genuine sonnets of Goethe in it were addressed, not to her, but to Minna Herzlieb. As a work of fiction its merits are great. It is original, fresh, lively, and graphic, though with the usual romantic faults of construction and in its speculative pages it is unintelligible. A similar volume of correspondence with Caroline von Gunderode (*Die Gunderode*, 1840), is equally interesting as is also a collection of real *Letters* to and from her brother Clemens. In the *King's book* (*Dies Buch gehört dem Könige*, 1843) and its hardly intelligible continuation *Conversations with Demons* (*Gespräche mit Dämonen*, 1852), she advocated certain social reforms, such as the emancipation of the Jews. She was a true member of a brilliantly eccentric family, keen, witty, capricious, vain, untruthful. Her translation of her *Correspondence* with Goethe into English is one of the curiosities of literature. Her *Collected Works* were published in Berlin, 1853. Consult: M. Carrière, *B. v. Arnim* (Breslau, 1887); W. Oehlke, *B. v. Arnims Briefromane* (Berlin, 1904); M. Dege, *Bettina von Arnim* (Kiel, 1904).

ARNIM, ärn'nim, or **ARNHEIM**, ärn'him, HANS GEORG VON (1581-1641). A German general in the Thirty Years' War. He was born at Boitzenburg in Brandenburg. He fought under Gustavus Adolphus against Russia in 1613, served in the Polish forces, and in 1626 entered the Imperial service under Wallenstein and was appointed a field-marshal. Being a Protestant, he left the Imperial service on account of the Edict of Restitution, entered that of the Elector John George of Saxony, and was in command of

the left wing of the army of Gustavus Adolphus at Breitenfeld (1631). He was one of the principal agents in the negotiations between John George and Wallenstein, which were terminated by the latter's death in 1634. After this he defeated the Imperialists at Liegnitz and operated in conjunction with Baner in Bohemia. In 1635 John George abandoned the Protestant cause, making peace with the Emperor Ferdinand II, and Arnim now left the Saxon service. He was seized by Oxenstierna in March, 1637, for alleged intrigues against Sweden, and was taken to Stockholm, but escaped to Hamburg in November, 1638, and thereafter devoted himself to freeing Germany from foreign domination. He was carrying on a campaign, as lieutenant-general of the Imperial and Saxon forces against the French and Swedes, when he died at Dresden, April 18, 1641. Consult: Helbig, *Wallenstein und Arnim 1632-34* (Dresden, 1850); Irmer, "G. von Arnim als kaiserlicher Feldherr in Pommern und Polen," in *Forschungen zur deutschen Geschichte* (Göttingen, 1879), and *H. G. von Arnim, Lebensbild* (Leipzig, 1894). See THIRTY YEARS' WAR; WALLENSTEIN.

ARNIM, HARRY, COUNT VON (1824-81). A German diplomat, born at Moitzelfitz, Pomerania. He studied law and entered the diplomatic service; was appointed Ambassador to the Pope in 1864, and during the Vatican Council of 1869-70, as Ambassador of the North German Confederation, supported the German bishops who opposed the dogma of infallibility. He was made a Count in 1870, and during the next year took a prominent part in the negotiations preceding the Treaty of Frankfort. During 1872-74 he was Ambassador to France, but as he was opposed to the policy of Bismarck, the latter secured his transfer to Constantinople, and a little later caused him to be arrested on the charge of stealing and publishing State documents from the German Embassy in Paris. For this he was sentenced to nine months' imprisonment. But he escaped punishment by remaining outside of the Empire, chiefly in Austria, where he published *Der Munzio kommt* (1878), and *Quid Faciamus Nos?* (1879), two pamphlets on the German church situation. He also wrote two attacks on Bismarck entitled *Reichsglocke* and *Pro Nihilo*, attacking Bismarck. He died at Nice.

ARNIM, LUDWIG JOACHIM (ACHIM) VON (1781-1831). A German novelist and poet, born in Berlin. He is best known for a collection of folk songs made with Clemens Brentano, and published (1806-08) under the title of the initial song, *Des Knaben Wunderhorn*. He studied the natural sciences at Göttingen and Halle, and received the degree of M.D., but never practiced medicine. He married Brentano's sister, Bettina, in 1811. His first work, *Theorie der elektrischen Erscheinungen*, showed a leaning to the supernatural, common among the German romantics, still more strongly marked in his *Hollins Liebeleben* (1802) and *Ariels Offenbarungen* (1804). *Der Wintergarten* (1809), a collection of romantic tales, was followed in 1810 by a striking novel, *Die Gräfin Dolores*. *Halle und Jerusalem* (1811) is a humorous romance, and *Isabelle von Ägypten* (1811) a mediocre novel. Two years later he collected his dramas. In 1817 he produced his last and best romance, *Die Kronenwächter*, a story of the days of Emperor Maximilian. His works are careless in form, incoherent in structure, and romantically whimsi-

cal, but they show a remarkable originality of invention. They were collected, with an introduction by Wilhelm Grimm, in 20 volumes (1839-48). There is a brilliant eulogy on Arnim in Heine's *Deutschland*. Consult R. Steig and H. Grimm, *Achim von Arnim* (Stuttgart, 1894), and M. Hartmann, *L. von Arnim als Dramatiker* (Breslau, 1910).

ARNO (anciently, Lat. *Arnus*). One of the largest rivers in Italy, rising on Mount Falterona in the Apennines, at the eastern end of Tuscany, at an elevation of over 5000 feet (Map: Italy, E 4). Near Arezzo it is connected with the Tiber through the canalized portion of the Chiana, and near that place enters the Val d'Arno, one of the most fruitful and beautiful valleys of Italy. It passes Florence and enters the Mediterranean 6 miles west of Pisa. In former times that city was situated at its mouth. The entire length of the Arno is about 140 miles; its most important tributaries are the Chiana and the Sieve. It is navigable for barges as far as Florence. The Arno is subject to frequent rises and in some parts of its course the banks are protected by dykes.

ARNOBIUS, called **AFER**. An early Christian writer sometimes called Arnobius the Elder. He lived about 300 A.D. and was a native of Numidia in Africa. He was a professor of rhetoric at Sicca and, although at first an opponent of the Christians, was early converted. His fame rests chiefly upon his treatise, in seven books, entitled *Adversus Nationes* (c.303 A.D.), which displays slight knowledge of Christianity, but is of interest as showing the arguments then employed in the conversion of heathendom. An English translation has been published under the title *The Seven Books of Arnobius against the Heathen* (New York, 1888). There is an edition of the original (Latin) text by Reifferscheid (Leipzig, 1875).

ARNOLD, **ARNOLD**, **ABRAHAM KERNS** (1837-1901). An American soldier. He was born in Bedford, Pa., graduated at West Point in 1859, was appointed a brevet second lieutenant in the same year, became a first lieutenant in 1861, and served with marked ability throughout the Civil War, being breveted captain in June, 1862, and major in May, 1864, "for gallant and meritorious services" at Gaines's Mill and Todd's Tavern, respectively. He received a regular major's commission in June, 1869, and became lieutenant-colonel in 1886 and colonel in 1891. Appointed brigadier-general in 1898, he commanded the second division of the Seventh Army Corps in Cuba during the war with Spain. He is the author of *Notes on Horses for Cavalry Service* (New York, 1869).

ARNOLD, **BENEDICT** (1615-78). A colonial governor of Rhode Island. He was born in England, but was brought by his father to America in 1636. He removed to Newport in 1653 and became first Governor of Rhode Island (under the new charter) in 1663 and was reelected in 1664, 1669, 1677, and 1678. He seems to have built the celebrated windmill in Newport, whose erection was long ascribed to the Northmen. He was the great-grandfather of the better-known Benedict Arnold of Revolutionary days.

ARNOLD, **BENEDICT** (1741-1801). An American general known in the annals of the American Revolution as "The Traitor." He was descended from a prominent Rhode Island family and was born in Norwich, Conn., Jan. 14, 1741. He received a fair education, but, being ambi-

tious and reckless, twice left his home and joined the Provincial troops on the northern frontier. In 1762 he established himself at New Haven, as bookseller and druggist, embarked in the West India trade, prospered, and in 1767 married Margaret Mansfield, a lady of good family, who died in 1775. On receipt (April 20, 1775) of the news of the battle of Lexington, Arnold led a military company to Cambridge and proposed an expedition to capture Ticonderoga and Crown Point, and was commissioned as colonel to raise troops in western Massachusetts, but was obliged to join as a volunteer the expedition under Ethan Allen, already on the way thither. Prevented by the Connecticut authorities from taking command of Ticonderoga after its capture, he armed a vessel and with a few troops took St. Johns, together with a royal sloop and several bateaux. Jealous persons in Connecticut prompted the Continental Congress to question his capacity and conduct, and, while planning the conquest of Canada, he was superseded, but was selected by Washington to head an expedition against Quebec. Late in 1775 he led 1100 men through the forests of Maine, enduring great hardships, and on December 3 was joined by General Montgomery. In the daring but unsuccessful assault, December 31, in which Montgomery fell, Arnold was wounded, but, recovering, took command at Montreal, Congress having made him brigadier-general. In June, 1776, he retreated by way of Lake Champlain and was immediately selected to construct and command a fleet to control that important body of water. On October 11, near Valcour Island, he attacked a British fleet twice the size of his own; held his position until night, and then, aided by the darkness, stole with his crippled flotilla between the enemy's lines and escaped.

In spite of Washington's confidence in Arnold, the latter's enemies influenced Congress, and in 1777 five of his inferiors in rank were made major-generals—a slight which his sensitive and ambitious nature could not forgive—yet at Washington's request he did not resign. The British having invaded Connecticut, he joined the militia raised to repel them, and at the battle of Ridgefield showed remarkable courage, barely escaping death. Congress now appointed him a major-general, but still denied him proper relative rank. He cooperated with Washington in opposing the advance of Howe toward Philadelphia, and was appointed to act with General Schuyler in checking the progress of Burgoyne through eastern New York. He raised the siege of Fort Schuyler (Stanwix), and at the battle of Bemis's Heights, Sept. 19, 1777, was recklessly prominent, but General Gates, who by intrigue had superseded Schuyler, became jealous of Arnold; a quarrel ensued, and Arnold was deprived of his command. Upon the earnest solicitation of his brother officers he remained with the army and, despite Gates's effort to keep him in the background at the second battle of Saratoga (October 7), he played a brilliant part in it and was severely wounded. Congress gave him a vote of thanks and at last his proper relative rank. In May, 1778, he joined the camp at Valley Forge, but, being incapacitated for active service, was placed in command of Philadelphia after the British retired. Here he married, April, 1779, Peggy (Margaret) Shippen, a beautiful and cultivated woman, youngest daughter of Edward Shippen, a loyalist, and afterward chief justice of the State. Moving in fashionable society

and living extravagantly, Arnold naturally incurred criticism, and to this the executive council of Pennsylvania added definite charges of arbitrary exercise of military authority and of favoritism to Tories. At his request a court-martial was appointed, but nearly a year elapsed before it was held (January, 1780), when he defended himself without counsel and was acquitted of intentional wrongdoing, but was sentenced to be reprimanded by Washington, who, while rebuking Arnold, urged him to regain the esteem of his countrymen; but this disgrace, added to the injustice of Congress and the feeling that his sacrifices of health and property were unappreciated, led Arnold to reconsider the overtures of treason made some months, if not years, before. In August, 1780, he took command of West Point, which through a correspondence with Major André (q.v.) he offered to surrender to the British; and to consummate the plan, Arnold and André met at midnight on the shore of the Hudson (September 21); but the capture of André, September 23, frustrated the scheme, and Arnold fled to the British sloop of war *Vulture*.

Having been made a brigadier-general in the British army, Arnold in December headed a naval expedition against Virginia, but did little besides destroying property along the James River and burning Richmond. In 1781 he led another expedition against Connecticut, which resulted in the burning of New London and the massacre of the surrendered garrison of Fort Griswold. In December, 1781, he sailed for England with his family, who were pensioned by the British government. He himself received £6315 (about \$31,755) for his alleged losses in joining the British, was kindly treated by the royal family, and at the King's request prepared a plan for reconciling the colonies; but received either neglect or abuse from both political parties, and, failing to get a position in the army, was forced to take up his old trade of merchant. The years 1787-91 were chiefly spent at St. John, N. B., where he carried on trade with the West Indies, but he returned with his family to London in the summer of 1791. On the breaking out of the war between England and France he was exposed to great risks in prosecuting his West India trade, and on one occasion was captured by a French ship, but escaped with his customary daring. The government still refusing to give him active service in the army, he strove, by fitting out privateers against France, to recover his lost fortune, but being unsuccessful, weighed down by debt, and despised by two continents, he sank into a state of melancholy, and died June 14, 1801, regretting, tradition says, his treason.

His wife, who appears to have been guiltless of any complicity in his treason and who had great strength of character, died in 1804. By his first wife Arnold had three sons, and by his second wife, several other children. His eldest sons received commissions in the British army; and his second son by his second marriage, James Robertson, who inherited his father's daring and military ability, rose to be a lieutenant-general, was made aid-de-camp to King William IV and was created a knight. Others of Arnold's children held honorable positions, and one of his grandsons, Capt. William Traill Arnold, a brave fighter, was killed in the Crimean War. Consult: Sparks, *Life of Benedict Arnold* (Boston, 1838); Todd, *The Real Benedict Arnold* (New York, 1903); Arnold, *Life of Benedict Arnold* (Chi-

cago, 1880). All the above must be used with caution.

ARNOLD, BION JOSEPH (1861—). An American electrical engineer, born at Casnovia, Mich. He graduated from Hillsdale College in 1881 and took advanced work at Cornell and the University of Nebraska. After 1893, when he established himself as an independent consulting engineer, he became known throughout the country as a traction expert. Among numerous important undertakings where he was chief engineer or where his advisory services were employed, are the construction of subways in New York and Chicago, the rebuilding of the Chicago street railway system, and the electrification of the New York Central Railroad's approach to New York. In addition, he was employed at various times as consulting engineer by the Wisconsin State Railway Commission; by the cities of Pittsburgh, Providence, Los Angeles, San Francisco, and Detroit; and by numerous transportation systems. He invented various devices for use on electric railways and was a pioneer in the use of alternating current and single phase electric traction systems. In 1903-04 he was president of the American Institute of Electrical Engineers; and he also identified himself with other scientific societies, American and foreign.

ARNOLD, ärn'olt, CHRISTOPH (1650-95). A German peasant (born near Leipzig), who carried out interesting astronomical observations and wrote *Göttliche Gnadenszeichen, in einem Sonnenwunder vor Augen gestellt* (Leipzig, 1692). He constructed an observatory at his own house and devoted himself to astronomical studies. He was the first to observe the comets of 1682 and 1686 and observed the transit of Mercury in the fall of 1690. An account of the latter observation is given in the work before mentioned.

ARNOLD, ärn'old, SIR EDWIN (1832-1904). A popular English author, born at Gravesend, June 10, 1832. From King's School, Rochester, he went to King's College, London, and thence to University College, Oxford, where he won the Newdigate Prize for a poem in 1853. In 1854-56 he was master of King Edward's School, Birmingham; and in 1856 he became principal of the Government College at Poona, Bombay. Returning to England in 1861, he obtained a place on the editorial staff of the *Daily Telegraph*. At the death of Thornton Hunt he became chief editor of the paper. While at this exacting work he found time to translate a volume of Greek poems and to produce his best-known work, *The Light of Asia* (1879), a production notable for its lofty philosophy and the vividness and reality with which the scenery, climate, manners, and people of Hindustan, as they were 2000 years ago, are portrayed. Its full title is *The Light of Asia; or, The Great Renunciation; being the Life and Teachings of Gautama (as told in verse by an Indian Buddhist)*. He subsequently published *Pearls of the Faith* (1883); *The Gulistan* (1889); *Poems, National and Non-Oriental* (1888); *The Light of the World* (1891); *The Tenth Muse and other Poems* (1895); *East and West* (1896); *The Voyage of Ithobal* (1901), and numerous other works. He was made a Companion of the Order of the Star of India in 1877; a Knight Commander of the Order of the Indian Empire in 1888, and was decorated by the Sultan of Turkey and other Oriental rulers. He frequently visited the United States, reading there in 1891.

During the 10 years following the publication

of *The Light of Asia* Arnold attained his highest popularity. In the final estimate of his poetry it will be discovered that his immense vogue was due largely to the freshness of his subject. He, above all others, popularized the philosophy of India. He was excellent at translation and paraphrase, but lacked the creative genius of the greater poets.

ARNOLD, GEORGE (1834-65). An American poet and humorist, born in New York City. As a child, while living in Illinois, he showed talent for drawing and, on his return to the East, studied with a portrait painter in New York. He abandoned this career for literature, wrote several unimportant biographies, and contributed stories, poems, sketches, and critical essays to various periodicals, especially *Vanity Fair*, in which appeared the earlier of his once famous *McArone Papers* (begun in 1860). He served as a soldier in the Civil War. William Winter edited his *Poems with a Memoir* (Boston, 1870; new ed., 1889). Some of these are characterized by melodious sweetness and pathos, but recent anthologists pay slight attention to them.

ARNOLD, ä'r'nôlt, GOTTFRIED (1666-1714). A German theologian. He was born at Annaberg, Saxony, studied theology at Wittenberg, and in 1697 was appointed professor of history at Giessen. His chief work is his *Unparteiische Kirchen und Ketzerhistorie* (1699-1700), which, by reason of its spirit of toleration, may be said to have marked an epoch in church history. During his life he was constantly exposed to attacks from the orthodox party. His 53 other works include *Die erste Liebe* (1696; ed. by Lämmert, 1844), and *Die Verklärung Jesu Christi in der Seele* (1704). Consult Dibelius, *Gottfried Arnold* (Berlin, 1873).

ARNOLD, ä'r'nôld, ISAAC NEWTON (1815-84). An American lawyer and politician. He was born in Hartwick, N. Y., taught school, studied law, was admitted to the bar in 1835, and in the following year removed to Chicago, where he soon became prominent as a politician. Beginning in 1843, he served several terms in the Legislature. He was elected to Congress in 1860 and served for two terms, part of the time as chairman of the important committee on manufactures. He was also conspicuous as an advocate of the immediate abolition of slavery. In 1865 he was Auditor of the United States. For many years he was an intimate friend of Abraham Lincoln, and he published an able *Biography of Lincoln* in 1866 (4th ed., 1887). He also wrote what is probably the best *Life of Benedict Arnold* (1880). Consult E. B. Washburne, *Isaac Newton Arnold*, an address delivered before the Chicago Historical Society, of which Arnold was for many years president (Chicago, 1884).

ARNOLD, ä'r'nôlt, JOHANN. A miller of the Neumark (Brandenburg), who lived in the time of Frederick II of Prussia and became famous as the instigator of an extraordinary interference of that monarch with the ordinary processes of justice. Arnold complained to the King that his landlord, by making a pond, had taken away water from his mill; that he (Arnold) had therefore refused to pay rent for the mill, of which he held a lease, but had been condemned to pay by the unanimous decisions of two courts. The King, as the fountain of justice, took up the case and, regarding it as an oppression of the poor, arbitrarily reversed the decisions of the courts, dismissed his high chancellor, imprisoned several other officers of justice, and

ordered that restitution should be made to the miller. Soon afterward the King died, and under Frederick William II the case was more coolly investigated, and the condemned officials were exonerated and recompensed for their losses by the State.

ARNOLD, JOHANN GEORG DANIEL (1780-1829). A jurist and poet of Alsace. He was born at Strassburg, studied there and at Göttingen and Paris and from 1806 to 1809 was instructor in French civil law in the law school at Coblenz. In the latter year he was appointed to the chair of history at Strassburg and in 1811 was transferred to that of Roman law. His great work in jurisprudence is the *Elementa Juris Civilis Justiniani cum Codice Napoleoneo et Reliquis Legum Codicibus Collata* (1812). He also wrote in High-German, "Blessigs Totenfeier," and numerous other lyrics, and in the Strassburg dialect, *Der Pfingstmontag* (1816), a comedy in rhymed Alexandrines, much praised by Goethe.

ARNOLD, ä'r'nôld, LEWIS G. (1815-71). An American soldier. He was born in New Jersey, graduated from West Point in 1837, and served as second lieutenant in the second Seminole War (1837-38). During the Mexican War, as first lieutenant in an artillery company, he accompanied General Scott's army and participated (1847) in all the operations from Vera Cruz to Mexico City. He was brevetted captain for bravery (August 20) at Churubusco, and major for gallant conduct (September 13) at Chapultepec. During the Civil War he helped repel the Confederate attack upon Santa Rosa Island (Oct. 9, 1861) and distinguished himself, as executive officer, in the defense of Fort Pickens during the bombardments of November, 1861, January, 1862, and May, 1862. He was then appointed brigadier-general of volunteers and commanded successively the department of Florida and the Union forces at New Orleans and Algiers, La., but was disabled by a stroke of paralysis (November, 1862), and was retired from the service, as lieutenant-colonel of regulars, in August, 1864.

ARNOLD, MATTHEW (1822-88). An English poet and essayist. He was a son of Dr. Thomas Arnold, the famous head master of Rugby, and was born Dec. 24, 1822, at Laleham, a village near Staines, in the valley of the Thames. With the exception of a year (1836-37) at Winchester under Dr. Moberly, later Bishop of Salisbury, Arnold passed his school days at Rugby, where his "Alaric at Rome" won the prize for poetry (1840). He was elected a scholar of Balliol College, Oxford, in November, 1840, but did not begin residence till October of the next year. In 1843 he gained the Newdigate Prize with a poem entitled "Cromwell," and in March, 1845, was elected a fellow of Oriel. Among his colleagues at Oriel were Dean Church, John Earle, subsequently known as professor of Anglo-Saxon in the university, and Arthur Hugh Clough, to whom Arnold has paid tribute in "Thyrsis," justly ranked with "Lycidas" and "Adonais," as one of the finest elegies in the language. After a short period of teaching the classics in the fifth form at Rugby, he became, in 1847, private secretary to the Marquis of Lansdowne, Lord President of the Council, who in 1851 appointed him an inspector of schools. This inspectorship he held until November, 1886. He appears ever to have felt repugnance toward the details of the official routine—the hearing of recitations by

students of training colleges and the correction of endless examination papers. Yet even here his influence was felt by the English public, and his annual reports, appearing from 1852 to 1882, aroused an interest seldom accorded to such publications. From 1857 to 1867 he was successor to Wharton and Keble in the more congenial post of professor of poetry at Oxford. It was then, by his famous series of prelections *On Translating Homer* and *On the Study of Celtic Literature*, that he began a reform of English criticism so important in the history of nineteenth-century literature. Three times, in 1859, 1865, and 1885, he was commissioned to visit the Continent for study of the school discipline and methods of education there in vogue; and in 1883-84 he came to the United States as a lecturer. The visit to America was repeated in 1886. As a lecturer he was disappointing, both because of his awkward manner and the feebleness of his voice, which was inaudible to the greater part of his audience. He died April 15, 1888, and was buried in the churchyard of All Saints at Laleham.

Like Dryden and Coleridge, Arnold gained high distinction both as critic and as poet. Even his prize poems, though not foreshadowing his later work, display more talent than is usual with a poet's first efforts. In "Alaric at Rome" (Rugby, 1840; reprinted, 1893), a difficult stanza is managed with skill; and the heroic verse of "Cromwell" is smooth and agreeable. In 1849, under the initial "A," he published *The Strayed Reveller and Other Poems*, containing the beautiful "Mycerinus" and "The Forsaken Meiman." This volume was followed, still under "A," by *Empedocles on Ætna and Other Poems* (1852), where first appeared the narrative "Tristram and Isult," and several lovely lyrics, such as "A Summer Night," "The Youth of Nature," "The Youth of Man," and "Faded Leaves." In 1853 Arnold threw off the mask of anonymity. The *Poems* of that year (3d ed., 1857) include "Sohrab and Rustum," his popular poem, founded upon a story in Firdausi's *Shah-Namch*; "Requiescat," "The Scholar-Gypsy," and many pieces from the earlier collections. "Empedocles," however, was omitted as structurally weak. Time now singles it out as one of Arnold's most attractive dramatic poems. The songs of Callicles, the harp-player, are among his choicest lyrics. The volume was prefaced with an admirable statement of the author's aim—an essay since famous not only for its brilliancy, but also as suggesting a different field in which Arnold was to become well known. Arnold's other volumes of verse comprise *Poems*, Second Series (1855), of which the chief new poem is the magnificent episode "Balder Dead," and in which four songs of Callicles are grouped as "The Harp-Player on Ætna"; *Merope*, a rather frigid tragedy (1858); *New Poems* (1867), memorable for "Thyrsis," and containing "Empedocles on Ætna" revived; *Poems* (the first collected edition, 1869; reissued, 1877), in which was included "Rugby Chapel," that noble elegy on the death of his father; and a fine edition complete in three volumes (1885), containing "Westminster Abbey," a splendid elegy on Dean Stanley. In this edition Arnold classified his poems as Early Poems, Narrative Poems, Sonnets, Lyric Poems, Elegiac Poems, Dramatic Poems, and Later Poems—a division since carefully observed by his editors.

It will be noted that the bulk of Arnold's verse
Vol. II.—12

is relatively small—a fact doubtless to be attributed to the preoccupation of official duties. It is equally noticeable that throughout his body of verse a level of excellence is maintained so nearly invariable that at most there are perhaps not more than a round dozen titles which one would not regret to see removed. Although it can no longer with accuracy be said that Arnold is not a popular poet, it is nevertheless true that he does not appeal to the wide audience of Tennyson and Browning. His poetical work will, it is certain, have always a peculiar grace for not a few. In its grave and noble music as in its stoic austerity, it will claim its own fit audience.

But it is a question whether Arnold will not in time take a place as the third great poet of the Victorian age. On this point Arnold himself wrote: "My poems represent, on the whole, the main movement of mind of the last quarter of a century; and thus they will probably have their day as people become conscious to themselves of what that movement of mind is, and interested in the literary productions that reflect it. It might be fairly urged that I have less poetical sentiment than Tennyson, and less intellectual vigor and abundance than Browning; yet because I have, perhaps, more of a fusion of the two than either of them, and have more regularly applied that fusion to the main line of modern development, I am likely enough to have my turn as they have had theirs."

Among Arnold's prose writings are: *On Translating Homer* (1861-62), and the *Study of Celtic Literature* (1867), both redactions of Oxford lectures; *Essays in Criticism* (1865); *Culture and Anarchy* (1869); *St. Paul and Protestantism* (1870); *Literature and Dogma* (1873); *Mixed Essays* (1879); *Irish Essays* (1882); *Discourses in America* (1885); *Essays in Criticism*, second series (1888). Two volumes of his letters were published in 1895 under the editorship of G. W. E. Russell. These, though they are likely to add little to his literary fame, do, as the editor hoped they might, "reveal aspects of his character . . . which could be only imperfectly apprehended through the more formal medium of his published works." Besides all these, there are other theological and social essays, and reports and books on education. He also edited selections from Dr. Johnson (1878), Wordsworth (1879), Byron (1881), and Burke (1881), with noteworthy prefaces. Arnold's work in prose is not altogether uniform in value. Naturally what pertains to schools is of interest primarily to educators; although students of Arnold's style will find *A French Eton* (1864) a valuable document. Likewise much that he wrote on politics and theology, though it served its purpose, now possesses chiefly an historical value. *Literature and Dogma* and *God and the Bible*, the former of which he himself considered his most significant work, were in his own time much misunderstood. Their purpose was to assert the natural truth of the Christian religion as against its dogma, to emphasize the literary aspect of the Bible, and in the words of Mr. Brownell, to make "each a theme, a topic of literature"—a part of that generous culture of which he was so persuasive an advocate. Arnold was among the earliest thus to apply to these subjects the methods of literary criticism—he wrote of them in a style quite new in treatises of the sort; but he failed at the time to satisfy either orthodox or radical. His permanent place as a critic is

made secure by such volumes as the first series of *Essays in Criticism*. Not only is the thought here of the first order, but the style is of the best, ranking with that of Newman, his master. The essays follow the sympathetic method of Sainte-Beuve. Especially brilliant is the essay on Heine, an author from whom Arnold derived many of his ideas and the sting with which he attacked Philistinism, a term which he introduced into English from the slang of the German universities. The essay on "Pagan and Mediæval Sentiment" is a charming contrast between Greek and mediæval ideals as represented by Theocritus and St. Francis of Assisi. The Oxford lectures above referred to are now classics. Of the discourses delivered in America, the one on "Literature and Science" is a strong plea for literature against the encroachments of science; and the one on "Emerson," though clearly inadequate as an estimate, contains passages of great eloquence. Arnold's influence is still paramount in English criticism. Many of his phrases, such as "sweetness and light," "the great goddess Lubricity," the "lyrical cry," the definition of poetry as "a criticism of life," the contention that criticism should be "a disinterested endeavor to learn and propagate the best that is known and thought in the world," the description of conduct as "three-fourths of life," the phrase "the not-ourselves that makes for righteousness," the division of the British public into "Barbarians, Philistines, and Populace," the infusion of new meaning into the terms "Hebraism" and "Hellenism"—all these have become common property; but more, his general manner of treating literary themes very widely prevails. Even during his lifetime his judgments in this field were received as *ex cathedra*. He did away with the pompous rhetoric and blustering animosities of the eighteenth-century school, and substituted therefor restraint, poise, taste—in short, the ethical element. It was thus that he introduced into English criticism a new era. What Principal Shairp has happily called "the sparkling banter" of his occasional manner (for example, in *Culture and Anarchy*), has led to the ascription to Arnold by the careless and the unperceptive of a flippancy which, it is hardly necessary to state, was not characteristic of his temper.

Bibliography. Arnold, like Thackeray, expressed a wish that he should not be the subject of a biography. In fact, it is not his somewhat humdrum life that interests those who most admire him; and for biographical details, the reader may consult the charming *Letters* cited above. One may also refer to V. Scudder, *Matthew Arnold* (Boston, 1898); Garnett, *Matthew Arnold* (London, 1900); and Dawson, *Matthew Arnold* (New York, 1904). For his influence on education see Fitch, *Thomas and Matthew Arnold* (New York, 1897); and for the social aspect of his work, Robertson, *Modern Humanists* (London, 1891). For Arnold as a poet, see V. Scudder, *Neo-Paganism: The Poetry of Doubt* (Boston, 1897); R. H. Hutton in his *Literary Essays* (London, 1892); and Hunt, *The Poetry of Matthew Arnold* (New York, 1898). Good appreciations of Matthew Arnold in general are to be found in Galton, *Two Essays on Matthew Arnold* (London, 1897); Aronstein (Berlin, 1904); Saintsbury, *Matthew Arnold* (London, 1899); Woodberry in *Makers of Literature* (New York, 1900); Brownell in his *Victorian Prose Masters* (New York, 1902); Paul, *Matthew Arnold* (London,

1902); Henry James, *Matthew Arnold's Essays* in his *Views and Reviews* (Boston, 1908); Chapman in his *English Literature*, pp. 423-459 (Boston, 1910); and Benson in *The Leaves of the Tree* (New York, 1911); Russell, *Matthew Arnold* (New York, 1904).

ARNOLD, RICHARD (1828-82). An American soldier. He was born at Providence, R. I., and graduated at West Point in 1850. He was made captain of an artillery company early in 1861, served with gallantry at Bull Run (July 21, 1861), at Savage's Station (June 29, 1862), at Port Hudson (May-July, 1863), and at Fort Morgan (August, 1864), and after various promotions was brevetted major-general of volunteers in August, 1865. On 1875 he became a major in the regular service, and in 1877 he was appointed acting assistant inspector-general of the Eastern Department. In 1882 he became a lieutenant-colonel.

ARNOLD, RICHARD (1845—). An American violinist. He was born in Eilenburg, Prussia, but received his first musical training in America where he had come as a child. His was a case of remarkable precocity. When only four years of age he received regular instruction on the violin, and entered upon the duties of leader of a theatre orchestra when a boy of 12. In 1864 he went to Leipzig, where he spent three years at the Conservatory and always stood at the head of the class. After his return to America he became a member of Theodore Thomas's orchestra. In 1877 he joined the New York Philharmonic Society, and three years later became the concert-master, which post he held without interruption until 1909. In 1878 he founded the New York Philharmonic Club, of which he was the director and solo violinist until 1891. He is also highly esteemed as a teacher.

ARNOLD, SAMUEL (1740-1802). An English composer. He was educated under Dr. Nares in the Chapel Royal, and when 23 years old was appointed to compose an opera for Covent Garden, and produced *The Maid of the Mill* (1765), which was successful. In 1776 he became composer for the Haymarket; in 1783 was appointed organist and composer to the Chapel Royal, and 10 years afterward organist in Westminster Abbey. He produced 43 dramatic compositions and his oratorios include *The Curc of Saul* (1767), *The Resurrection* (1773), and *The Prodigal Son* (1777). He edited an edition of Handel's works in 36 volumes, incomplete and faulty; but he is best remembered by his collection of *Cathedral Music* (1790).

ARNOLD, SAMUEL GREENE (1821-80). An American historian. He was born at Providence, R. I., graduated at Brown University (1841) and at Harvard Law School, and was admitted to the bar in 1845. He was Lieutenant-Governor of his State in 1852, 1861, and 1862, and was in the United States Senate from December, 1862, to March, 1863. He published an excellent *History of Rhode Island and Providence Plantations* (New York, 1859) and several addresses, including *The Spirit of Rhode Island History* (1853).

ARNOLD, SARAH LOUISE (1859—). An American educator, born at North Abington, Mass., and educated at the Bridgewater (Mass.) State Normal School. For some years after her graduation in 1878 she taught in the schools of several States and later became successively principal of a training school at Saratoga, N. Y., supervisor of schools in Minneapolis and in Bos-

ton, and dean of Simmons College. To the last-named position she was chosen in 1902; in the same year Tufts College conferred upon her an honorary M.A. degree. All of her numerous writings on educational subjects bear the stamp of wide experience coupled with ripe scholarship. Besides various other texts for schools and aids for teachers, she published: *Waymarks for Teachers* (1894); *Stepping Stones to Literature*, a series of excellent readers widely used in graded schools (1897 et seq.); *Reading: How to Teach It* (1899); *The Mother Tongue*, with G. L. Kittredge (1900); *Plans for Busy Work* (1901). Many of her writings have been printed in Spanish and Portuguese, as, for example, *Primeiro livro de leitura*, with G. C. Benajah (1911). In 1913 there was published a *Manual for Teachers* of which she was joint author.

ARNOLD, THOMAS (1795-1842). An English scholar and educator, best known as master of Rugby. He was born June 13, 1795, at West Cowes, Isle of Wight, where his father was collector of customs. Upon the death of his father in 1801, Arnold was put in charge of his aunt, Miss Delafield, with whom he remained for two years. At the age of eight he was sent to Warminster School in Wiltshire, whence, four years afterward, he was sent to Winchester. From this famous school at 16 he went up to Oxford as a scholar of Corpus Christi College, where he remained three years. Here he fell in with a small group of men, chief among whom were John Keble, the originator of the Tractarian movement and author of the *Christian Year*, and John Taylor Coleridge, afterward judge of the Queen's Bench, by whom he was greatly influenced. He took a first in classics in 1814 and in the following year was elected fellow of Oriel College, a position which he held for the next four years. In 1815 he took the Chancellor's Prize for a Latin essay and in 1817 the same prize for an English essay. It was during his residence at Oriel that he laid the foundation for his later work in the classics and history by wide reading along those lines, especially in Thucydides and Aristotle. Here, too, though at first reserved and shy, and later very disputatious in his maintenance of bold, if not very well-matured, opinions, he gained consideration and won distinction among the group of able men by whom he was surrounded.

He took deacon's orders in 1818 and in the following year left the university to settle at Laleham, near Staines, where he occupied himself chiefly in preparing pupils for the university and in the pursuit of his own studies. Here he spent eight quiet years, devoting himself particularly to the study of Thucydides and Roman history, in which he was profoundly influenced by the works of Niebuhr and other German historians whose influence was very apparent in his own writings. Here, too, he began his *History of Rome*. Besides these activities he devoted much attention to problems of the Church as well as to questions affecting the lower classes, and to practical work among the poor, all of which led to the maturing of ideas on Church and social problems that brought upon him fierce attacks in later years. His political opinions, affected by his life and work here, tended to crystallize into a form of advanced liberalism, which his opponents afterward characterized so bitterly as dangerous radicalism.

Any final estimate of Arnold must rest on his influence at Rugby. The head-mastership of

Rugby fell vacant in 1827, and, though Arnold entered late in the contest and was not personally known to the electors, he was chosen for the position, largely, it would appear, on the recommendation of one of his friends, who predicted that if elected he would change the face of the public-school education throughout England. After being chosen in December, 1827, he took priestly orders and proceeded to the degrees of B.D. and D.D. He entered on his duties in August, 1828. The remaining 14 years of his life were spent at Rugby and at Fox How in Westmoreland, an estate which he bought in 1832, and his career was that of the school to which he devoted himself. Dr. Percival, successor of Arnold in 1887-95, afterward Bishop of Hereford, has said. "If I were called upon to express in a sentence or two my feeling in regard to Dr. Arnold's influence in school life, I should describe him as a great prophet among schoolmasters, rather than an instructor or educator in the ordinary sense of the term. . . . His influence was stimulative rather than formative, the secret of his power consisting not so much in the novelty of his ideas or methods, as in his commanding and magnetic personality and the intensity and earnestness with which he impressed his views and made them—as a prophet makes his message—a part of the living forces of the time."

Arnold was not the originator of any didactic system. In general, he accepted the system which he found, and infused into it a new meaning. Thus, without doing away with "fagging," he tempered it into a responsible supervision of the lower forms by the sixth form. He insisted upon the preeminence of classical studies, but enriched the ordinary school course of the day with mathematics, modern languages, and modern history. Above all, without its "accredited phraseology of piety," he emphasized the moral and spiritual interest. True scholarship he held to be associated with Christianity. He aimed, in the common lessons and in the weekly sermon, to mold the public opinion of the school. As the headmaster of Rugby, he looked as much to the development of manly character as to the training of students. His policy, in which he was eminently successful, was to send to the universities not a number of men trained to take firsts in the schools, but rather "thoughtful, manly-minded men, conscious of duty and obligation," who were almost certain to do uniformly well whatever they undertook. One immediate result was that, after the passage of the Reform Bill in 1832, Rugby men represented the best reform sentiment. His own character, his deep religious sense, his noble estimate of duty, of justice, of honesty, and of truth, were strongly impressed on the school. His great ability as an organizer and administrator of men and measures did much to work, at Rugby and elsewhere, the revolution which it had been predicted he would stir up in English education.

Profoundly religious, Arnold came naturally to take part in those theological discussions which attained prominence in the early decades of the last century. He wished to conserve the faith of the Church and also to liberalize its thought. The clergy of his time appeared to him negligent and apathetic; hence he welcomed the new life promised by the Oxford Movement and in 1829 published his pamphlets on *The Christian Duty of Conceding the Roman Catholic Claims*. But he soon perceived that for him dogma could not

be the sole basis of Christianity; and when, in 1836, the party in power at Oxford sought to keep Dr. Hampden from a professorship on a charge of heresy, he wrote for the *Edinburgh Review* an article of unsparing rebuke. For many years he was misunderstood by broad and by high churchmen alike. Because of the temper of his *Christian Duty*, the Archbishop of Canterbury refused to permit him to preach Bishop Stanley's consecration sermon. His *Edinburgh* article nearly cost him his Rugby post. But by 1840, with the passing of the first shock of the religious controversies of 1830-40 and with the lessening of his early strenuousness, as well as by the increasing recognition of his great work as master of Rugby, much of this friction passed away and his last years were full of honors. The honor most prized by him was his appointment by Lord Melbourne to the professorship of modern history at Oxford in 1841. His enjoyment of this was, however, very short. He died suddenly June 12, 1842.

His domestic relations were most happy. In 1820 he married Mary, youngest daughter of Rev. John Penrose, rector of Fledborough, Nottinghamshire, and sister of one of his school and college friends, Trevenen Penrose. The story of his relations with his family and friends forms one of the most tender and beautiful chapters in a life rich beyond that of most men in charm of personal associations. His four sons, who survived him, were Matthew; William Delafield (1828-59), director of public instruction in the Punjab and author of *Oakfield*, who is commemorated in Matthew Arnold's poem, *A Southern Night*; Thomas; and Edward Penrose (1826-78), a fellow of All Souls', Oxford, and an inspector of schools from 1866 to 1877.

Arnold endeavored to promote a better understanding between the poor and the well-to-do. He lectured before mechanics' institutes from May to July, 1831, published the *Englishman's Register* in aid of working people, and afterward, with similar purpose, contributed a series of articles to the *Sheffield Courant*. Some of the *Register* and *Courant* papers were reprinted by Stanley in a volume of *Miscellaneous Works* (1845). He was also a member of the senate of the University of London from 1836 to 1838, when he resigned because of disagreement with the majority of the members as to the requirements for degrees in Arts.

As a classical scholar, Arnold was deficient in the elegances of the eighteenth-century tradition. Regardless of style he viewed even the history of Livy with dislike. In the classroom his scholarship was most manifest in extemporaneous renderings. That he was well versed in the wider reaches of philological principle is shown by his three-volume edition of Thucydides (1830-35; 2d ed., 1840-42); although it is to be admitted that the value of that work lies chiefly in its exposition of those ideas respecting the essential continuity of history which, voiced in Arnold's Oxford inaugural, afterward determined the philosophy of Freeman. Dr. Arnold's literary fame rests finally upon his *History of Rome*, vols. i-iii (1838-42), which, as projected, was to terminate in the coronation of Charlemagne, but was not brought beyond the close of the Second Punic War. The history was based on the epochal *Römische Geschichte* (3 vols., 1811-22) of Niebuhr. It seems generally conceded that the representative portion of the work is that which offers what Archdeacon Hare has termed the

first "adequate representation of the wonderful genius and noble character of Hannibal" (Stanley, chap. iv). Free from partisanship or paradox, dignified without being wearisome, the history is notable both for its finished style and its sound and extensive learning. That it attends closely upon the *ipse dixit* of the German authority has been regretted by many. His other works include a volume of lectures on the *Study of History* delivered at Oxford, six volumes of sermons, besides traveling journals and miscellany. His chief claim to remembrance must rest on his noble life and character. "His *Thucydides*, his history, his sermons, his miscellaneous writings, are all proofs of his ability and goodness. Yet the story of his life is worth them all." See the lines of his son, Matthew Arnold, in *Rugby Chapel*.

Consult: A. P. Stanley, *The Life and Correspondence of Thomas Arnold, D.D.* (Boston, 1860), the authoritative work on Arnold and one of the classics of English biography; Hughes, *Tom Brown's School Days* (London, 1857); Worboise, *Life of Dr. Thomas Arnold* (London, 1859); Fitch, *Thomas and Matthew Arnold and their influence on English Education*, "Great Educator Series" (New York, 1897); also, in German, Zinzow (Stettin, 1869) and Wittig (Hannover, 1884).

ARNOLD, THOMAS (1823-1900). An English scholar. He was the son of Dr. Thomas Arnold of Rugby, brother of Matthew Arnold, and father of Mrs. Humphry Ward, the novelist. He was educated at Rugby and Oxford, taking his degree in 1845, and became a colonial school inspector in Tasmania. He embraced Roman Catholicism in 1856 and joined John Henry Newman at Dublin. He became professor in the Roman Catholic university there and followed Newman to the Oratory at Birmingham. In 1865 Dr. Arnold temporarily abandoned the Catholic church, and removed to Oxford, being a lecturer and examiner there and at the Royal University of Ireland. After the death of his wife in 1888 he was more closely associated with Cardinal Newman. He published a *Manual of English Literature*, which has been widely used, edited old English texts, including Wyclif and Beowulf, and with the Rev. William Addis, the *Catholic Dictionary*. A few months before his death he published *Passages in a Wandering Life*, containing much of interest concerning Cardinal Newman and other friends famous in the Tractarian Movement.

ARNOLD, THOMAS KERCHEVER (1800-53). An English clergyman and author. He was born at Stamford, graduated in 1821 at Trinity College, Cambridge, and in 1830 was appointed rector of Lydon, Rutlandshire. He started and at different times edited the *Churchman's Quarterly Magazine*, the *Churchman's Monthly Companion*, and the *Theological Critic*, and published theological pamphlets and treatises, *Short Helps to Daily Devotion* (1847), and two volumes of sermons (vol. i, 1845; vol. ii, posthumously, 1858). His reputation chiefly rests, however, on his large list of school books, including particularly an *English-Latin Lexicon* (with Rev. J. E. Riddle, 1847), based on a similar German work by C. E. Georges, and a *Practical Introduction to Greek Prose Composition* (1838), and a *Practical Introduction to Latin Prose Composition* (1839), both of which have in England been highly valued and have passed through numerous editions.

ARNOLD, WILLIAM ROSENZWEIG (1872—). An American Orientalist, born at Beirut, Syria. He graduated from Ohio Wesleyan University in 1892 and from Union Theological Seminary in 1895. From 1896 to 1898 he was curator of the department of antiquities in the Metropolitan Museum of Art in New York. He became a lecturer on the Old Testament (1902) and professor of Hebrew language and literature (1903) at Andover Theological Seminary, and while continuing in the latter position took up in 1908 a similar work at Harvard. His publications include *Ancient Babylonian Temple Records* (1896); *The Rhythms of the Ancient Hebrews* (1907).

ARNOLD, й́р'но́лт, YURIY VON (1811–98). A Russian composer. He was born at St. Petersburg, was an army officer from 1831 to 1838, and subsequently a member of the secret service. In 1839 he won the prize of the St. Petersburg Philharmonic Society for the best cantata with his *Svyetlana*. Subsequently he lectured on musical topics at Moscow and St. Petersburg, was a musical critic on the *Signal* at Leipzig from 1863 to 1868, and was appointed professor of vocal music in the Moscow Conservatory in 1870. His works include, besides the above-mentioned, an opera entitled *The Gypsy*, an *Overture to Boris Godunoff*, and many songs. In 1888 he became professor of the history of musical art at the Moscow University. His most important contributions to the literature of music are a *Theory of the Ancient Russian Church and Folk-Singing*, and *Is it Possible in Musical Art to Establish a Characteristically National School of Singing, and on what Data must it be Based?* published in the *Bayan* (St. Petersburg, 1888–89).

ARNOLD-FORSTER, HUGH OAKELEY (1855–1909). An English statesman and publicist. He was the son of William Delafield Arnold, the nephew of Matthew Arnold, and the grandson of Dr. Thomas Arnold. Educated at Rugby and at University College, Oxford, he studied law and was admitted to the bar, but after some years of practice relinquished it to enter the publishing house of Messrs. Cassell. In 1896 he was elected to Parliament from Belfast as a Liberal Unionist, and in 1900 he was made Parliamentary Secretary of the Admiralty. Soon after this he went to South Africa as chairman of the Small Land Settlement Commission. In 1903, immediately after accepting the portfolio of the War Office, he appointed a commission to report on a reorganization of the office; but his efforts to bring about a new army scheme were not supported by his colleagues, and before any practical steps could be taken the Unionist Parliament and government came to an end. Arnold-Forster was a profound student of military matters and a keen and efficient debater in Parliament. He wrote: *Things Old and New; Stories from English History* (7 vols., 1893–96); *Our Home Army* (1892); *A History of England* (1897); *Army Letters* (1898); *Our Great City* (1900); *The Army in 1906* (1906); *English Socialism of To-day* (1908); *Military Needs and Military Policy* (1909). Consult the *Memoir* by his wife (1910).

ARNOLDI, й́р-но́л'дэ, ERNST WILHELM (1778–1841). A German manufacturer and financier. He was born at Gotha, established a dye works there and an earthenware manufactory at Elgersburg, and did much to encourage export trade. He was the chief promoter of the so-called Mer-

cantile Institute of Gotha (1817), founded the Mutual Fire-Insurance Bank at Gotha (1821), and the Mutual Life-Insurance Bank, the first institution of the sort in Germany (1829). The beet-sugar industry was greatly extended by him. For his biography, consult Hopf (Gotha, 1878) and Emminghaus (Weimer, 1878).

ARNOLDI, WILHELM (1798–1864). A Bishop of Treves. He was born at Baden, Prussia, studied at the seminary of Treves, and was appointed pastor and capitulary of the cathedral church there in 1834. In 1839 he was elected bishop, but in consequence of governmental opposition, was not enthroned until 1842. It was his exhibition of the Holy Coat which, through the attacks of Ronge, gave the first impetus to the German-Catholic movement. He did much to promote Church art, and in matters of Church policy was a firm ultramontanist. For his biography, consult Kraft, *Wilhelm Arnoldi, Bischof von Trier* (Treves, 1865).

ARNOLD OF BRESCIA, бра'шá (c.1100–55). An Italian cleric, born at Brescia, celebrated in connection with the movement for ecclesiastical reform in the twelfth century. He studied at Paris, probably under Abélard (q.v.), and attempted to apply the philosophical teachings of the latter to political conditions. Arnold of Brescia was possessed with the idea that he was destined to reform his age, and argued that the Church must revert to its apostolic poverty in order again to be virtuous. On returning to Brescia, he preached vigorously that the Church ought neither to own property nor to exercise temporal power. By his preaching the people of Brescia were exasperated against their bishop, and the revolutionary spirit spread widely. Consequently Arnold was banished from Italy. He retired to France, but, experiencing the bitter hostility of St. Bernard, who denounced him as an enemy to the Church, he took refuge in Switzerland. There he remained for about five years. In the meantime the people at Rome revolted, in 1143, against the papal rule and established a commune. Arnold proceeded thither and soon became leader of the populace. For 10 years the city was in a state of disorder and Eugenius III was obliged to flee from the city. These commotions were subdued by Adrian IV, who, feeling the weakness of his temporal authority, made use of the spiritual, and resorted to the extreme measure of laying the city under an interdict. The revolutionary party became discouraged and disintegrated. Arnold was obliged to take refuge with friends in Campania. On the arrival of the Emperor Frederick in 1155, Arnold was arrested and brought to Rome, hanged, his body burned, and the ashes thrown into the Tiber. Consult: Gregorovius, *History of the City of Rome in the Middle Ages*, vol. iv (London, 1896); Castro, *Arnoldo da Brescia e la rivoluzione del XII secolo* (Leghorn, 1875).

ARNOLD OF WINKELRIED. See WINKELRIED.

ARNOLDSON (FISCHOF), SIGRID (1864—). A Swedish opera singer. She was born at Stockholm, studied under Madame Artôt in Berlin and Maurice Strakosch in Paris, and made her first appearance at Moscow, Russia, as Rosina, in *Il Barbiere di Siviglia*. She has a finely cultivated soprano voice of extensive range, and has been very successful as Mignon, Rosina, and Carmen. She sings regularly in the Italian opera at St. Petersburg and was a member of the

Metropolitan Opera House troupe in New York City during the season of 1893-94.

ARNOLD VON LÜBECK, ăr-nôlt fôn lübək (?-1212). A German abbot and chronicler of the Middle Ages. He was abbot of the cloister of St. John at Lübeck and continued the *Slavic Chronicle* of Helmold from 1171 to 1209. This continuation, published frequently, may be found in the *Monumenta Germaniæ Historica*, vol. xxi; separately in the *Scriptores in Usum Scholarum* (1868); or, translated by Laurent, in the *Geschichtschreiber der deutschen Vorzeit* (1853; 2d ed., 1896). Consult Damas, *Die Slawen-schronik Arnolds von Lubeck* (Lübeck, 1872).

ARNOLFO DI CAMBIO, ăr-nôl'fô dē kîm'-byô (c.1232-1302). The most notable Florentine architect of the Gothic period, perhaps one of its greatest sculptors. He was born at Colle, in Tuscany, and, according to traditional view, he was a pupil of the sculptor Niccola Pisano; and also came under the influence of the Roman school. But his architecture is unlike that of Niccola's school, or what one would expect of a sculptor, in that it lacks sculptural decoration. His earliest known architectural masterpiece is the important church of Santa Croce (q.v.) in Florence (begun in 1295), which shows that he excelled rather in conception and construction than in elaboration of details. When the cathedral of Florence was rebuilt (1296), its construction was intrusted to him, and he built a complete wooden model, which was esteemed the wonder of the age. After his death his plans were not followed above the first story, owing to the adoption of a more extensive plan. (See FLORENCE.) The famous Palazzo Vecchio there has been attributed to him, probably wrongly.

ARNOLFO DA FIRENZE, ăr-nôl'fô dâ fê-rên'tsâ. The preceding architect is usually identified with a very important sculptor, a pupil of Niccola Pisano, who assisted his master in the pulpit of Siena and elsewhere and appears in 1277 as sculptor to Charles of Anjou. His most important independent works are: the monument of Cardinal de Braye (d.1282), in San Domenico, Orvieto, which became typical for such monuments; the tabernacles of San Pietro fuori le mure, Rome (1285), the mosaic of which was probably by Pietro Cavallini, and St. Cecilia in Trastevere (1293); and the tomb of Boniface VIII in the Vatican grottoes. Venturi has attributed other works to him in Florence and elsewhere, the principal of which is the celebrated bronze statue of St. Peter with the Keys in St. Peter's, Rome, heretofore considered antique—a startling attribution, which lacks proof.

In the inscriptions of these works their sculptor is generally called Arnolfo da Firenze, whereas in Florentine documents the sculptor is called Arnolfo da Colle. For this, and for other reasons, Frey considers that the two cannot be identical, arguing also that the tomb of Pope Boniface VIII was executed at a time (1300) when the architect was occupied in Florence. But Venturi points out that the inscription on this tomb reads "Arnolphus architectus," and maintains the possibility of Arnolfo having kept up his Roman workshop until the tomb was completed. At all events, the sculptor in question was the most important of the older pupils of Niccola Pisano, and the principal representative of the classical tendencies of his school, as distinct from the more naturalistic represented by Giovanni Pisano. See PISANI.

Consult "Arnolfo di Cambio," in Thieme and Becker, *Allgemeines Lexicon der bildenden Künstler*, vol. ii (Leipzig, 1908); Venturi, *Storia dell' arte italiana*, vol. iv (Rome, 1906).

ARNOLPHE, ăr-nôlf'. A character in Molière's *Ecole des femmes*. He believes that all women of the world will make inconstant wives, and thus tells a friend, in the first act of the play, that he has been rearing a spouse for himself in the seclusion of the country—a peasant's daughter, Agnes by name. The succeeding action of the play shows that Arnolphe's theory is more sound than the preventive is efficacious.

ARNON. A river issuing into the Dead Sea, the modern Wady Mojib. The main stream is only 13 miles long. The banks are lined with limestone and basalt rocks, some reaching the height of 1700 feet. The Arnon once formed the boundary line between Reuben and Moab. In Num. xxi. 14, 15, Arnon is said to be Moab's border, probably against Sihon's kingdom, whose advance to Arnon is also described in xxi. 28. It is referred to in the Mesha inscription; its fords are mentioned in Isa. xvi. 2, and it is referred to as Arnona (Arnonas) by Jerome. Schmidt explains the name as derived from *ranan*, characterizing the river as a "roaring" stream, and al Mojib as an Arabic translation. This explanation was accepted by De Goeje. The stream, which is perennial, has cut its way through a deep gorge. The mouth of the river, as one approaches it from the Dead Sea, is of extraordinary beauty and impressiveness. Beyond the last bend there are two waterfalls of inconsiderable height which, however, occasion a tremendous volume of sound because of the reverberation from the steep mountain walls. Schmidt and his party in 1905 went farther up the stream than Lynch (1848), De Luynes (1863), Rothe (1874), Hill (1897), Cady (1898), or Abel (1909), the other visitors; but no explorer has been able to follow the entire course of the river, either from above or below. For description and photographs, see N. Schmidt, "The River Arnon," in *Journal of Biblical Literature* (1906); and on the songs in Num. xxi. his *Messages of the Poets*, pp. 323 ff. (New York, 1911).

ARNOT, WILLIAM (1808-75). A Scottish clergyman. He was born in Scone, was educated at Glasgow, was appointed pastor there in 1838 and at Edinburgh in 1863. He joined the Free Church Movement (1843) and in 1873 was a delegate to the meeting of the Evangelical Alliance at New York. His works have been much read and include *Illustrations of the Book of Proverbs* (1869) and *The Parables of Our Lord* (1870). Consult *Autobiography with Memoir by his Daughter* (London, 1877).

ARNOTT, NEIL (1788-1874). A Scottish physician and physicist. He was born at Arbrogath, Scotland, and was educated at the Grammar School of Aberdeen and at Marischal College in the same city. After studying medicine at Aberdeen he went to London in 1806 and soon entered the East India Company's service in China. In 1811 he returned to London and engaged in general practice. In 1836 Dr. Arnott participated in the foundation of the University of London and was appointed a member of its senate. He was afterward elected a fellow of the Royal Society and of the Geological Society. In 1837 he was appointed a physician extraordinary to the Queen. In 1823-24 Dr. Arnott was induced to deliver a course of lectures at the

Philomathic Institute on natural philosophy in its applications to medicine. The substance of these lectures formed the basis of his *Elements of Physics, or Natural Philosophy, General and Medical*, published in 1827. It is in connection with improvements in the warming and ventilating of houses that the name of Dr. Arnott became best known. In 1838 he published a treatise on *Warming and Ventilating*, and in 1855 another on *The Smokeless Fireplace, Chimney-Valves*, etc. He was the inventor of the "Arnott Stove" and "Arnott Ventilator," for which he received the Rumford Medal of the Royal Society in 1854. In 1861 he published *A Survey of Human Progress*, full of interesting and enlightened views on improvement generally. In 1864 appeared part i of the revision of the *Physics*; this was followed by part ii, which contained the subjects of optics and astronomy for the first time, and also an interesting supplement entitled *Arithmetic Simplified*. Arnott's last publication was a small work on national education. He was a liberal benefactor to the University of London and the various Scottish universities. For memorial notice, consult *Proceedings of the Royal Society*, vol. xxv (London, 1877).

ARNOTTO (probably the native name), or **ARNATTO** (also called **ARNATTO** and **ANNOTTA**; Ger. *Orleans*; Fr. *rocou*). A coloring matter of vegetable origin used to some extent in dyeing and calico printing; it is also used as a coloring ingredient in plasters, ointments, and in certain varnishes; farmers use it for coloring butter and cheese. It is made from the seed pellicle of an evergreen plant, the *Bixa orellana*, growing in Brazil, Cayenne, and several other places. To obtain it, the seeds of the fruit capsules are crushed and allowed to ferment in water; they are next rubbed upon a sieve, completely mashed, and the coloring matter washed away; after some time the water is decanted and the coloring matter allowed to dry in the shade. It is then broken up into cakes and wrapped in leaves. Urine is sometimes used to keep it from decomposing. Arnotto is insoluble in water; it dissolves with a red color in alcohol, in alkalies, and in fixed oils. It gives beautiful but fugitive shades; its employment in dyeing and calico printing is therefore limited. Indians prepare from it a paint for the body, used partly for the purpose of protecting themselves against mosquito bites; in South America it is largely used to improve the color and flavor of chocolate. The chief coloring principle of arnotto is a crystalline yellow substance called *bixin*.

ARNOULD, är'nōō', SOPHIE (1744-1802). A celebrated French actress and singer. She was born at Paris in the same room in the Rue de Bethisy in which Admiral Coligny was murdered. She made her début at the Grand Opera, Dec. 15, 1757, with splendid success. During a period of 21 years (1757-78) she was the most prominent and popular singer at the Royal Opera at Paris, one of her rôles being Iphigenia, in Gluck's *Iphigenia in Aulis*, which she was the first to interpret. Her voice was sweet and effective, her interpretation true to the intentions of the composer, her acting vivacious and graceful. She was not less remarkable for beauty and wit, and her home was frequented by such eminent scholars as D'Alembert, Helvetius, Diderot, and Rousseau. She has frequently been compared with Ninon de l'Enclos, and many of

her epigrams and witticisms have been collected under the title of *Arnouldiana*.

ARNOULD-PLESSY, är'nōō'ple-sè', JEANNE SYLVANIE (1819-97). A French actress. She was born at Metz, and made her début at the Comédie Française as Emma in *La fille d'honneur*. Afterward she took prominent parts in *La passion secrète*, *Le verre d'eau*, *Julie*, and in many other successful plays. In 1845 she suddenly severed her contract and went to London, where she married J. F. Arnould, the dramatic author. Condemned by the French courts in the following year to pay damages to the amount of 100,000 francs (about \$20,000), she went to St. Petersburg in 1846, where for nine years she was engaged at the Théâtre Français. She returned to Paris in 1855 and was again a member of the Comédie Française until 1876, her principal triumphs here being associated with the later dramas of Emile Augier. During her long histrionic career she is said to have created 53 distinct rôles.

ARNPRI'OR. A town of Renfrew Co., Ontario, Canada, on Chats Lake, at the junction of the Ottawa and Madawaska rivers, 38 miles by rail west of Ottawa, on the Canadian Pacific and the Grand Trunk railroads (Map: Ontario, G 2). It has large lumber and woolen mills, and marble works, and there are iron mines near by. The town owns its water works and sewerage system. The United States is represented by a consular agent. Pop., 1891, 3341; 1901, 4152; 1911, 4405.

ARNSBERG, ärns'bèrk. The capital of the government district of the same name in the Prussian province of Westphalia (pop., 1910, 2,399,849), on the Ruhr, about 44 miles south-east of Münster (Map: German Empire, C 3). It has several churches, a gymnasium, a municipal hospital, a library, a public slaughterhouse, water works, and gas plant, and is the seat of the district government. Its principal article of manufacture is paper, and there are distilleries, breweries, and railroad repair shops. On a hill above the town stand the ruins of the ancient castle of the counts of Arnsberg. Near the castle is pointed out the spot where the chief tribunal of the Vehmgerichte (q.v.) was held. Between Arnsberg and Soest in the valleys of the Helve and the Mölme is a dam reputed to be the largest water-storage reservoir in Europe. (See DAMS and RESERVOIRS: IRRIGATION.) Pop., 1895, 7786; 1900, 8448; 1910, 10,256.

ARNSTADT, ärn'stât. The capital of the German principality of Schwarzburg-Sondershausen, situated in a picturesque country on the banks of the Gera, 12 miles south of Erfurt (Map: German Empire, D 3). Among its noteworthy buildings are a castle, containing a picture gallery and valuable porcelain collection, the Rathaus, and the Liebfrauenkirche, with a richly decorated portal. Arnstadt possesses numerous schools and a municipal hospital. Formerly it was the chief emporium for the trade in fruit and timber between the fertile lowlands and the Thuringian Forest region, and is still an important market for grain and agricultural products. It is also a manufacturing town, the industries including weaving, shoe and glove making, brewing, the manufacture of pottery, etc. There are copper deposits in the neighborhood, and mines of rock salt. Warm brine baths have made Arnstadt an important watering place in summer. The composer, J. S. Bach, was for several years organist at the church of

St. Boniface. Pop., 1890, 12,800; 1910, 17,907. Arnstadt is one of the oldest of Thuringian cities, its existence being traceable as far back as A.D. 704.

ARNULF (c.850-899). King of Germany and Roman Emperor. He was a natural son of the East Frankish King, Carloman, who was a great-grandson of Charles the Great. In 887 he led the revolt which forced Charles the Fat to abdicate and was elected King of the East Franks—i.e., of Germany. In 891, in the battle of Louvain, on the Dyle, he won a decisive victory over the Northmen who were invading his kingdom. He invaded Italy in 894, was crowned Emperor in 896, and died in 899.

ARNULF, SAINT (c.582-641). An ancestor of the Carolingian emperors, who derived their name, Arnulfinger, from him. He was Bishop of Metz from about 612 to 627, when he resigned his position and retired to a hermitage in the Vosges Mountains. His body was afterward buried in the famous church bearing his name at Metz.

ARNUS. See ARNO.

AROA, á-rô'á. A town in the State of Falcon, Venezuela, on the Aroa River, 70 miles by rail from Tucacas (Map: Venezuela, D 1). It is famous for copper mines in the neighborhood.

AROER, ár'ô-ër or á-rô'ër. A city on the banks of the Arnon, mentioned in Deut. ii. 36 and iii. 12 as the southern limit of Reuben's territory. According to the Mesha inscription it belonged to Moab. In Num. xxi. 15, Arnon is said to fall where the city stands; this probably refers to Aroër. It is no doubt the modern 'Ara-ir, on the Wady Mojib, 11 miles from the Dead Sea, where there are ruins of the old city. Consult: Burckhardt, *Travels in Syria*, p. 372 (1822); Tristram, *Land of Moab*, pp. 129 ff. (2d ed., 1874); Musil, *Moab* (1906). Schmidt, *Messages of the Poets*, pp. 323 ff. (1911).

AROKSZALLAS, ör'ók-sál'ash. A town of Hungary, about 44 miles northeast of Budapest (Map: Austria-Hungary, G 3). It contains a fine church and carries on a considerable trade in grain. Pop., 1890, 11,190; 1900, 12,067.

AROLAS, á-rô'lás, JUAN DE (1805-49). A Spanish romantic poet. He was born at Barcelona, was a member of the Piarist Order, and was appointed an instructor in the school of the order at Valencia. His collected poems, which first appeared in three volumes in 1860, were published in 1890 as the forty-third volume of the *Biblioteca selecta* (Valencia, 1840 et seq.). For a study of this remarkable poet-friar and his works, consult Lomba y Pedraja, *El P. Arolas, su vida y versos* (1898).

AROLSEN, ár'ól-sen. The capital of the German principality of Waldeck, on the Aar, about 22 miles west-northwest of Cassel (Map: German Empire, C 3). There are a gymnasium, a parish church, and a castle, the latter containing a valuable library, a picture gallery, a fine collection of engravings, antiquities, and weapons. Arolsen is the seat of a district court. The town is the birthplace of the sculptor Rauch and of the painters Wilhelm and Friedrich Kaulbach. Pop., 1895, 2768; 1905, 2811.

ARO'MA (Lat. Gk. *ἄρωμα*, *arōma*, spice, sweet herb). A term employed to designate a spicy or a pleasantly pungent odor. Thus we speak of the *aroma* of roast meat and of the *aroma*, or *aromatic* smell, of hyssop, mint, and other plants. Aromatic smells are very characteristic of some natural orders of plants, as Labiatae

(mint, etc.) and Compositae (milfoil, etc.). They depend largely on the presence of volatile oils. See NOSE; SMELL; AROMATICS.

AROMATARI, á-rô'má-tá'rè, GIUSEPPE DEGLI (1586-1660). An Italian physician and naturalist, born at Assisi. He studied at Montpellier and Padua and practiced for many years at Venice. He became widely known and declined flattering invitations from the Duke of Mantua, Pope Urban VIII, and King James I of England. His "De Generatione Plantarum in Seminibus," a letter addressed to Nanti, and first published as part of the volume, *Disputatio de Rabie Contagiosa* (1625), was once very famous.

AR'OMATICS (Gk. *ἀρωματικός*, *arōmatikos*, aromatic). A class of medicines which owe their efficacy to oils obtained from them by distillation, and called volatile, distilled, or essential oils. They emit an agreeable, aromatic odor and usually have a warm, pungent, spicy taste. Aromatics include also certain other drugs and some animal substances. Among the families which yield the most important aromatics are the Labiatae, Umbelliferae, Lauraceae, Myrtaceae, Aurantiaceae, Coniferae, Scitamineae, Orchidaceae, etc. In some cases, the aromatic principle is diffused throughout all parts of the plant, but it is usually condensed in particular organs, such as the root, in ginger; or the bark, in cinnamon, canella, and cascarilla; or the flowers, as in cloves; or the fruit, as in anise and vanilla; or the wood, as in sandalwood and aloes-wood; or the leaves, as in the case of the Labiatae, Umbelliferae, etc.

Aromatics may be arranged in the following sub-classes: 1. Those in which the active principle is an essential oil, as the oil of thyme, lavender, cajeput, neroli, fennel, etc. 2. Those containing camphor, or an allied body, such as artificial camphor obtained from turpentine. 3. Bitter aromatics, in which there is a mixture of a bitter principle and an essential oil, as chamomile, tansy, wormwood, etc. 4. Those of which musk is the type, such as civet and amber; and certain plants with a musklike odor, such as *Malva moschata*, *Mimulus moschatus*, and *Hibiscus abelmoschus*. 5. Those containing a fragrant resin, as benzoin, myrrh, olibanum, storax, and the balsams of Peru and Tolu, which possess stimulant properties.

They are employed internally to disguise the taste of other drugs. Locally they are used as counter irritants, local anesthetics, and antiseptics.

ARONA, á-rô'ná. A town in north Italy, 42 miles northwest of Milan, near the southern end of Lake Maggiore. Steamers connect it in summer with Locarno in Switzerland. It has silk, cotton, and metal works and is commercially very active because of its transportation facilities. A noteworthy feature of the town is a metal statue, 70 feet high, erected in 1697 to the memory of Cardinal Carlo Borromeo, who was born here in 1538. Pop., 1881, 4182; 1901, 4700; 1911, 6271.

ARONHOLD, ár'on-hólt, SIEGFRIED HEINRICH (1819-84). One of the founders of the mathematical theory of invariants, to which he contributed in particular the symbolic notation afterward developed by Clebsch and Gordan. His name is also associated with the plane curves of the third and fourth orders. He was professor in the technical school at Berlin in 1863-83.

ARO'NIA. See CRATÆGUS.

AROO ISLANDS. See ARU ISLANDS.

AROOSTOOK, á-roos'tuk. A river rising in Piscataquis Co., northern Maine, 1050 feet above the sea, flowing northeast through Aroostook County, and entering the St. John River, in New Brunswick (Map: Maine, H 2). It is the chief tributary of the St. John River, and along its valley lies some of the richest soil in the State. It is about 125 miles long, and drains an area of 2290 square miles, most of which is in Maine. It falls 705 feet from its source to the State line, a distance of 117 miles, thus affording extensive water power. It possesses historical interest from its connection with the long-agitated question of the northeastern boundary between British America and the United States.

AROOSTOOK, LADY OF THE. The title of a novel by W. D. Howells. The heroine of it takes passage across the Atlantic on a trading vessel, the *Aroostook*, no other woman being on board. The book is among the best of Howells's earlier period.

AROUET, á-roo'á'. See VOLTAIRE.

ARPACHSHAD, ár-pák'shád. In the list of eponyms of the nations in Gen. x., Arpachshad appears as the third son of Shem, ancestor of the Terahites and consequently of the Hebrews. The name is supposed by many scholars to represent Arrapachitis (q.v.). Recently discovered Babylonian inscriptions have added to the probability of this view by showing the great importance of the ancient Semitic kingdom of the Gutians, with its capital Arrapcha. That the first part of the word refers to Arrapachitis is now generally held. The ending *shad* is more difficult to explain. The absence of Babylonia in the list has caused some surprise. Josephus (*Ant.* i, 6, 4) declared that the Chaldeans were formerly called Arphaxadaeans. Schlözer, Michaelis, and others gave up Arrapachitis to find Kesed-Chaldea in the word; Cheyne secured both Arpach and Kesed by the insertion of a letter. Less plausible are the suggestions of Hommel that the word is composed of *Ur*, the Egyptian *pa*, and *Kesed*, and of Delitzsch that it was originally *Ariba kishadi*, meaning 'the four sides.' Schmidt explains the word as made up of *Arpach* and *shadu*, 'mountain,' Arpachshadi meaning 'the Arrapcha of the mountain,' i.e., Kara Dagh. This theory can only be verified by a certain identification of the site.

AR/PAD (Assyrian *ar-pad-da*). An ancient city of Syria, the site of which is 13 miles northwest of Aleppo. It is mentioned in the time of Adadnirari IV (812-783 B.C.) and frequently afterward in the Assyrian inscriptions. In 740 B.C. it fell into the hands of Tiglath Pileser IV. Its importance may be judged from the fact that it becomes one of the eponym cities from whom *limmi*, or 'archonts,' are taken. It is mentioned in Isa. x. 9. The modern Tell Erfad represents its locality.

ARPÁD (?-907). The national hero of Hungary and a semi-mythical personage. He led the Magyars into Hungary, c.875, and by c.906 he had conquered much of the territory. He also made incursions into Italy about 900 and returned laden with booty. He died in 907. The first crowned King of the house of Arpád was St. Stephen, who became ruler in 997. The Arpád dynasty became extinct in the male line with Andrew III in 1301. Arpád lives in the popular songs of the country; his history, even in the oldest chronicles, is mixed up with the national legends.

ARPEGGIO, ár-péd'jò (It. harping, from *arpa*, harp). In music, a chord of which the notes are sounded not simultaneously, but in succession, in a broken manner, as on a harp. In older music arpeggios are to be played twice: once beginning on the lowest note up to the highest, and then again down, ending on the lowest.

AR/PENT, *Fr. pron.* ar'pan'. The old French land measure, corresponding to our acre. The word is derived from *arepennis*, *arapennis*, the Latin form of the name of a Gallic land measure. It was identified by Columella with the Roman *actus*, or half *iugerum*. The measure varies with different localities. As used in lower Canada and Louisiana, it equals about five-sixths of an acre (.845) or a little over 34 ares (34.191).

ARPINO, ár-pé'nò (anciently, Lat. *Arpinum*). A town in the province of Caserta, south Italy, 14 miles north of Roccasecca, and 94 miles northwest of Naples, near the river Garigliano (ancient Liris), situated high above the valley at an altitude of 1475 feet (Map: Italy, II 6). It was a very ancient town of the Volsci and was celebrated as the birthplace of Marius and Cicero. Extensive remains of Cyclopean masonry testify to the importance of the city in ancient days. The Romans wrested the town from the Samnites in 305 B.C.; in 188 B.C. its inhabitants became full citizens of Rome. By imperial times, however, it had lost its importance. Cicero often mentions it and lays his *De Legibus* there, on his ancestral estate, at the junction of the rivers Liris and Fibrenus. Near Arpino are a Trappist convent, called Casamari, and a bridge called Ponte di Ciccone. The public school bears the name Collegio Tulliano, and the local theatre is Teatro Tulliano. The local cloth manufacturers proudly proclaim that in the time of the Roman Republic Arpinum was famous for woollens, and that the father of the immortal orator was superintendent of a fulling mill. Arpino also manufactures parchment, paper, and leather, and quarries excellent marble. Pop., 1881, about 5000 (commune, 11,368); 1901 (commune), 10,607; 1911, 10,309. Consult Kelsall, *Classical Excursion to Arpinum* (Geneva, 1820).

ARPINUM. See ARPINO.

ARQUA, ár-kwa'. A village in north Italy 12 miles southwest of Padua. Here the last five years of Petrarch's life were passed (1569-74). His house has faded frescoes of scenes from his poems, and a few souvenirs, and his sarcophagus rests on red marble columns in front of the church. Pop., 1900, 1600.

ARQUEBUS, ár'kwé-büs, or **HARQUEBUS**, (*Fr. arquebuse*, *OF. harquibuse*, from Dutch *haakbus*, from *haak*, hook + *bus*, gun barrel; cf. Eng. *hagbut*, and Ger. *Hakenbüchse*, a gun with a hook). A gun resembling the modern musket. Hand-guns are mentioned as early as 1414, but not until the second half of the fifteenth century do we find illustrations of them. The gun at this period consisted of a metal tube, fixed in a straight stock of wood, with a vent at the top of the barrel, where the match was applied. Some time between the close of the fifteenth century and the middle of the sixteenth the lock was added. Of locks there were two kinds: the first moved toward the gunner when the trigger was pressed; the second, like the modern lock, receded. It was not until toward the middle of the sixteenth century that firearms became important in war-

fare. The arquebus of the period is of two principal kinds, fired with a rest or without one. The arquebusiers were both footmen and cavalry, and in England many yeomen of the guard became arquebusiers. By the beginning of the seventeenth century the arquebus was being displaced by the musket.

ARQUES-LA-BATAILLE, ärk-lä-batîy. A French village in the department of Seine-Inférieure, which contains the remains of an old castle built by William the Conqueror's uncle. Here Henry IV defeated the Duke of Mayenne, 1589. Pop., 1911, 1598.

ARRACACHA, är-rä-kä'chá (Sp. from native name). A plant, *Arracacia xanthorrhiza*, of the family Umbelliferae, a native of Jamaica and of the elevated tablelands in the neighborhood of the cities of Bogotá, Colombia, and Caracas, Venezuela, and of regions of similar climate in other parts of tropical South America. It is much cultivated in its native country for its roots, which are used as an esculent. The roots divide into a number of parts, which resemble cows' horns or large carrots. When boiled, they are firm and tender, with a flavor not so strong as that of a parsnip. The plant is much like hemlock and has a similar heavy smell. The flowers are in compound umbels and are of a dull purple color. The arracacha was at one time very strongly recommended as a substitute for potatoes. It was introduced into Great Britain by the Royal Horticultural Society, and its cultivation perseveringly attempted; but it was found unsuitable to the climate of England and of other parts of Europe, where it was tried, perishing on the approach of the frosts of winter without having perfected its roots. The dry weather of summer is also unfavorable to it. It seems to require a very regular temperature and constant moisture. In deep loose soils it yields a great produce. It is generally propagated by offshoots from the crown of the root. By rasping and washing the root a starch similar to arrowroot is obtained. There are five or six other species of *Arracacia*, most of them Mexican.

ARRACK (Ar. *araq*, sweat, juice, spirituous liquor, from *araga*, to sweat), RACK, or RAKI. A term applied to Oriental distilled liquors, especially to that distilled from fermented rice and the fermented sap (toddy) of the coconut (palmyra) and other palm trees. Other substances used in making arrack are combinations of rice and sugar, or rice and molasses, and berries, dates, figs, or grapes. It is usually a colorless liquid, but when stored in casks it takes on a slight yellowish or brownish tinge. It has an agreeable taste. It improves with age and the better varieties are not unwholesome. The best varieties are from Batavia, Java, where the materials used are as follows: Rice, 35 parts; molasses, 62 parts; toddy, 3 parts, the yield of pure arrack being 23½ parts. In Ceylon it is made entirely from palm-flower juice. The Indian arrack is made from the flowers of the Mahwa tree. Excellent qualities are made in Madras, China, and Siam. The intoxicating power of arrack is sometimes increased by the addition of hemp, poppy leaves, and the juice of stramonium. Arrack is now made commercially in Germany and Holland. *Saki* is the local name given to the Japanese variety of arrack. As an average analysis of arrack Blyth gives the following: Alcohol, 52.70, extract, 0.82, ash, 0.24, and water, 47.194 per cent.

Besides the above constituents arrack contains various kinds of compound ethers (esters), aldehydes, etc., which give it its characteristic aroma and flavor.

AR/RAGONITE. Same as ARAGONITE.

ARRAH, är'ri. A town and railway station in the district of Shahabad in the presidency of Bengal, India, in lat. 25° 31' N. and long. 84° 43' E., 33 miles west of Patna (Map: India, D 3). It is situated in a fertile country and had a population, 1901, of 46,170. The various incidents in its history, the chief of which are connected with the Mutiny of 1857, constitute its chief claim to notice. The most thrilling was the siege sustained until deliverance after eight days by 12 Englishmen and 50 faithful Sikhs against a force of 2000 Sepoys.

ARRAH NA POGUE, är'ra nî pög. A play by Dion Boucicault, and, next to *The Shaughraun* and *London Assurance*, probably his best; first played in 1865.

ARRAIGNMENT (from OF. *aranier*, *araisnier*, Fr. *arraisonner*, Low Lat. *arrationare*, to call to court, from Lat. *ad*, to + *ratio*, reason, account). The bringing of a person who has been formally accused of crime before the court which is appointed to try him. The arraignment thus follows the indictment and may be regarded as the first stage in the trial of the accused. A prisoner is entitled to a speedy arraignment and may, in case of unnecessary delay, move to have the indictment dismissed. Its characteristic features are: 1. Calling the prisoner to the bar of the court by his name. 2. Reading the indictment to him, or furnishing him with a copy. 3. Asking him whether he pleads guilty or not guilty thereto. If the indictment is for a felony, the personal presence of the criminal is necessary to a valid arraignment at common law (changed in some States by statute); but in case of a misdemeanor he may appear by counsel. Having been arraigned, the accused may obtain from the court time in which to answer the indictment, or he may move to set aside the indictment, or he may demur or plead thereto. See DEMURRER; TRIAL, PLEADING, and the works there referred to.

ARRAIGNMENT OF PARIS, THE. A piece by George Peele, half pageant, half masque, played, in 1581, by the chapel children before Queen Elizabeth, who is impersonated in it as Diana. The plot, so far as there is one, is based on the legendary trial of Paris by Diana for error in judgment in giving the apple to Venus. A personage called Colin in this play is thought to stand for Spenser and to have caused the subsequent writing of that poet's *Colin Clout's Come Home Again*, as a retort to Peele, who there figures, perhaps, as Palin.

ARRAN, är'an. An island in the Firth of Clyde, and county of Bute, Scotland, 5 miles southwest of Bute, separated from Kintyre by the Kilbrennan Sound (Map: Scotland, C 4). It is of oblong shape, 20 miles long, from 10 to 11 miles wide, with an area of 165 square miles. The surface is mountainous, in the north reaching an altitude of 2866 feet above the sea, and is traversed by small streams and lochs. Arran is remarkable geologically, and intrusive igneous rocks give the northern half of the island wild and beautiful scenery. It has quarries of limestone, coal mines, and some of the mountains contain jasper, agates, and rock-crystal. Only a small part of the area is under cultivation, the most important industries being cattle raising

and herring fishery. There are two harbors on the east side, Brodick and Lamlash, the latter sheltered by Holy Island. Off the southern coast lies the small island of Pladda, with a lighthouse. Numerous prehistoric and Danish relics exist, and the names of some of the caves bear evidence of Robert Bruce's sojourn. The greater part of Arran belongs to the Duke of Hamilton, whose seat is Brodick Castle. The population of the island was 5234 in 1871, 4824 in 1891, and 4819 in 1901. About half the people speak both English and Gaelic. Consult *The Book of Arran*, edited by J. A. Balfour (Glasgow, 1910).

ARRANGING (Fr. *arranger*, to put into rank, order, from *à*, Lat. *ad*, to + *rang*, rank, order). In music the working over of a composition for performance by musical agencies other than those originally designated by the composer. Thus, orchestral works, as, e.g., symphonies or overtures, are arranged for the piano, or compositions written for the piano for four hands are arranged for one piano; vocal compositions, as, e.g., operas or songs, may be arranged for some instrument, usually for the piano. When the arrangement is not a mere mechanical transcription of the notes written by the composer, but implies some creative work of the arranger, inspired by the original music, then it bears various names, as, e.g., *pot-pourri*, *fantasia*, *paraphrase*, or *transcription*. Liszt was one of the most famous of arrangers.

ARRAPACHITIS, *ār'a-pā-kī'tis* (Gk. *Ἀρραχίτις*). A country located by Ptolemy (vi, 1, 2) between Armenia and Adiabene, consequently on the upper Zab, while the Babylonian and Assyrian inscriptions seem to indicate a location farther south between the lower Zab and the Diyala, the Tigris and some point in the Sulaimania Mountains. It was manifestly in the latter region that Arrapcha, the capital of the Gutian kingdom, was situated, though it has not yet been identified with any modern site. Probably the name "Arrapachitis" attached itself to the northern district, which, after the conquest of the Lulubians, belonged to the territory of Gutium. This district was called in Old Armenian Albach, and is still designated by the Kurds as Albak. The city of Arrapcha is mentioned in the time of Hammurabi (2124-2081 B.C.). It was apparently taken by Assurnazirpal III (885-860), since it is one of the Assyrian cities rebelling against Shalmaneser III (860-825). Its importance may be judged from the fact that during the next century its governors often appear as *lummi*, or archonts, for the year. After the fall of Nineveh, in 606, Arrapcha fell to the lot of the Chaldean kingdom, and Nebuchadnezzar gave orders to the people of the city. As late as in the time of Cyrus the territory of Arrapachitis was also known as the land of the Gutians. It was from there that the Gutians, probably under the leadership of their mighty King Erridu-pizir, fell upon Babylonia and overthrew the second dynasty of Uruk in the thirty-fifth century, if we follow Nabunaid's chronology. (See BABYLONIA.) The Gutian kings wrote their inscriptions in a Semitic dialect, and it is not improbable that the Gutians, like the Lulubians and the Assyrians, were akin to the Akkadians. This seems to be suggested also by Gen. x. 22, where Arpachshad (q.v.) is represented as a son of Shem. The land of Arpaha is also mentioned as a separate country with Assyria by the Egyptians in the fifteenth century B.C. (Lepsius, *Denk-*

maler, 89 g.). Consult: Delitzsch, *Wo lag das Paradies?* pp. 124 f. (Leipzig, 1881); W. Max Müller, *Asien und Europa*, p. 279 (1893). Scheil, in *Comptes rendus de l'Académie des Inscriptions*, pp. 318 ff. (1911).

ARRAS, *ā'rās'* (from *Atrebates*, Lat. name of a Gallic tribe). Formerly a fortified town, now capital of the department of Pas-de-Calais, in France, about 35 miles north-northeast of Amiens (Map: France, N., H 2). It was at one time the capital of the county of Artois. It is situated on the banks of the Scarpe, partly on an eminence and partly on a plain, and consists of four divisions—the city, upper town, lower town, and citadel. It is a principal station on the French Northern Railway, distant from Paris by this route 134 miles and from Brussels 97 miles. The houses are of hewn stone, and in the lower town they are handsomely built and uniform; the streets are straight and wide, set off with several fine squares and many beautiful public buildings. Among the principal edifices are the cathedral of Notre Dame, built in a composite Italian style, between 1755 and 1833; the residence of the prefect, the town hall, the theatre, a girls' school in the Chapelle des Ursulines, and the public library. The fortifications of Arras were the first to be constructed by the celebrated Vauban, according to his own system. It has been the seat of a bishop since 390 A.D., and two ecclesiastical councils have been held here—one in 1025, the other in 1490. The grain market of Arras is the most important in the north of France. Its principal manufactures include beet sugar, agricultural implements, hosiery, petroleum products, and leather. It has considerable trade in grain and flour, and there is commerce in oil, wine, brandy, and the industrial products of the city. It appears from the writings of Jerome that Arras was remarkable for its woollen manufactures in his time; afterward, during the Middle Ages, it was famed for its tapestry; indeed, the name of the town was transferred to this article of manufacture, and *arras* was the name given in England to any richly figured hangings. Pop., 1901, 25,813; 1906, 24,921; 1911, 26,080. The ancient name of Arras was *Nimetacum*, and the town was the capital of the tribe of the *Atrebates*. With Artois it was ceded by the States of the Netherlands to Louis XI of France in 1482; but, the inhabitants having revolted, the King laid siege to the town, stormed it, and slew or expelled the people, whom he replaced by others brought from all parts of his dominions, ordering the city to be thenceforward called *Franchise*, to obliterate the very name of Arras. Soon afterward (1493) it was ceded to Maximilian of Austria, and was retained by the Spanish branch of the house of Hapsburg till 1640, when Louis XIII of France took it after a long siege. By the Treaty of the Pyrenees it was finally ceded to France. Arras suffered much in the time of the first French Revolution, especially in the year 1793. Robespierre and his brother were natives of the town.

AR/RAS. A name for large tapestries used as wall hangings. They appear to have been first made in large numbers at Arras, at that time a city of Flanders, but now in France; hence their name, which in Italian is *arazzi*. The name was preserved even after Arras ceased to be the great centre of their manufacture, in the fifteenth century. Among the most famous

single series is that for which Raphael made designs.

ARRATE Y ACOSTA, ăr-ră'tă é à-kôs'tă, JOSÉ MARTÍN FÉLIX (1697-1766). A Cuban historian. He was born at Havana, studied law in Mexico and Havana, and was appointed alcalde of Havana in 1752. He wrote *La Habana Descripta* and a history of Cuba, under the title *Llave del Nuevo Mundo y antemural de las Indias Occidentales*, which was not published until 1830. A new edition appeared in 1876.

ARRAWAK, ăr-ră-wăk. See ARAWAK.

ARREBO, ăr-re-bô', ANDERS CHRISTENSEN (1587-1637). A Danish poet, born at Aroöskjöbing. He was appointed Bishop of Drontheim and was one of the promoters of the Renaissance poetry. He wrote some secular verse, but is best known for his *Hexameron*, a description of the six days of the Creation, and a metrical translation of the Psalms of David. For his life, consult the biography by Rördam (Copenhagen, 1857).

ARREST' (Low Lat. *arrestare*, from Lat. *ad*, to + *restare*, to stop behind). The taking of a person into custody in order to compel his attendance before a court of justice or to enforce the discharge of a legal obligation. In primitive law the arrest and detention of a debtor either to enforce payment of his debt or to subject him to the mercy of his creditor as a satisfaction thereof is a common procedure, but it is seldom employed in civilized communities to-day except as an incident of criminal proceedings. 1. *Civil arrest*.—By a fiction of the common law of England a person who did not pay a judgment against him was deemed guilty of a breach of the peace, "subjecting his body to imprisonment," says Blackstone, "by the writ of *capias ad respondendum*." The judges who established this fiction had no bowels of compassion for the insolvent debtor. Said Justice Hyde, in 1663: "If a man is taken in execution and lies in prison for debt, neither the plaintiff, at whose suit he is arrested, nor the sheriff who took him is bound to find him meat, drink, or clothes. He must live on his own, or on the charity of others, and if no man will relieve him, let him die in the name of God, says the law, and so say I." This inhuman policy worked badly; and a few years after Justice Hyde's declaration Parliament felt compelled to enter upon a course of mitigating legislation, which terminated during the last century in the abolition of imprisonment for debt, both in Britain and in this country. In some civil actions a party is still subject to arrest, either during its progress or upon its termination. As a rule these actions are of a quasi-criminal nature, e.g., to recover a fine or a penalty; or they are brought to redress wrongs to person or property. Ordinarily, a warrant of arrest in a civil suit will not justify the officer in breaking into a house to take the party; nor can it be lawfully executed on Sunday; nor are certain privileged persons, such as foreign representatives, members of Congress and Legislature in attendance upon their duties, and others liable to arrest in civil proceedings. 2. *Criminal arrest*.—Not only public officers, but private persons as well, may arrest an actual or suspected criminal. For a misdemeanor committed in his presence, or for a felony committed, although not in his presence, either a peace officer or a private person may arrest the offender without a warrant (q.v.), and a peace officer is authorized to arrest without a warrant, on reasonable suspicion that

the arrested party has committed a felony. This subject is regulated by statute in each jurisdiction, as is the mode of obtaining a warrant. A criminal arrest may be made on any day; a peace officer may break into a building to execute a criminal warrant, as well as call upon any person to assist him; and, as a rule, only foreign representatives, with their families, are privileged from criminal arrest. The liberty of the individual against unlawful interference with his freedom, whether exercised under the forms of law or otherwise, by an officer of the peace or a private citizen, is guarded by the action for false imprisonment (q.v.). Consult: Hawley, *Law of Arrest on Criminal Charges* (2d ed., Chicago, 1891); Freeman, *A Treatise on the Law of Executions in Civil Cases* (3d ed., San Francisco, 1900); and the works mentioned under the articles referred to above.

ARREST, ăr-rést', HEINRICH D'. See D'ARREST.

ARREST' OF JUDGMENT. In the practice of the English common-law courts, an expedient on the part of an unsuccessful defendant, after verdict rendered against him, to have the judgment stayed or arrested, on the ground that there was some error which vitiated the proceedings. If the objection succeeded, it was fatal to the prosecution of the plaintiff's cause of action, there being no opportunity for amendment after trial. The severity of this rule has been somewhat modified by legislation, so that, under modern applications of the remedy, the action or prosecution may in a proper case be renewed. At the present day, in the United States as well as in England, a defendant may have the judgment against him arrested only for good and sufficient reason appearing on the record of the case, as where the pleadings are not a sufficient basis for the action, or if there be a fatal variance between the pleadings or indictment and the proof upon which the verdict was rendered. But the existence of facts not in the record, as the discovery of new evidence, or a verdict reached by the jury against the weight of evidence, will not justify an arrest of judgment. In the former case the court must proceed to judgment, notwithstanding the new facts alleged to exist, and in the latter case the court can only set aside the verdict and order a retrial of the case. This is a very different result from that which attends an arrest of judgment, the effect of which is to set aside all proceedings in the case and dismiss the complaint or indictment. This relief is usually obtained upon the defendant's motion, made after verdict and before judgment, but the court has the power to grant it even if it be not demanded. Judgment once rendered is conclusive and cannot be arrested. It may, however, under proper circumstances—as where taken by the excusable default of the defendant—be reopened by the court in which it was obtained, or its execution may, for good cause, be stayed on application to a higher court. See JUDGMENT; STAY; and the works there referred to.

ARRETIVM, ăr-rě'sh-üm. An ancient Etruscan city, the modern Arezzo (q.v.).

AR/RHENAL. Soda methylarsenate. An arsenic derivative, intended to replace that drug, as a tonic and antiperiodic, especially in chronic malaria. Chemically it is disodic-methyl arsenate. See ARSENIC; CACODYL.

AR/RHENATHERUM (Gk. ἄρρην, *arrhēn*, male + ἀθήρ, *athēr*, the beard or spike of an ear

of corn). A genus of grasses embracing three species allied to *Holcus* (see *SOFT GRASS*) and *Avena* (see *OAT GRASS*). The species are tall perennial grasses, with flat leaf-blades and erect panicles, which are often one-sided. *Arrhenatherum elatior*, known also as *A. avenaceum*, *Avena elatior*, or *Holcus avenaceus*, is a common grass in Great Britain. It is sometimes called oat grass, from the resemblance to the coarser kinds of oats in the general appearance of the panicle. In France it is very much cultivated for fodder, and it is often called French rye grass. It has, however, no affinity to the true rye grass, *Lolium*. In the United States east of the Mississippi River this grass is grown to some extent as a hay grass. It does not form a good sward and consequently is not valuable for pastures except when mixed with other species. It is here known as tall meadow oat grass.

ARRHENIUS, är-rä'nī-us, SVANTE (1859—). A Swedish physical chemist. He was born near Upsala and studied physical science at the university of that city. After a brief period of teaching at his *alma mater* he spent several years abroad, carrying on original investigations in collaboration with some of the best European chemists and physicists of the day, and in 1891 was made professor in the University of Stockholm. Arrhenius' researches have resulted in one of the most important among the recent contributions to science. Confining his attention almost entirely to the relations between electrolytic phenomena and the chemical and physical properties of substances, he succeeded in establishing on a firm basis a general theory, which is now universally accepted by the scientific world, viz., the so-called theory of electrolytic dissociation. According to this theory, a substance whose aqueous solution is capable of conducting electricity is broken up in solution into parts charged, some with positive, others with negative electricity. Thus, ordinary brine contains, according to Arrhenius' theory, electro-positive "ions" of the metal sodium, and, separated from them, electro-negative ions of chlorine. The theory reminds one of the old dualistic view of the nature of chemical composition, advanced by Davy and Berzelius in the first part of the nineteenth century; and, in the opinion of many authorities, may lead to a revival of those views in some modified form. What is certain is that the theory of electrolytic dissociation furnishes an excellent explanation of a host of chemical phenomena which would otherwise remain entirely unintelligible, and that it correlates a number of different facts, between which no connection could otherwise be detected. Arrhenius' publications include *Sur la conductibilité galvanique des électrolytes* (1884), a work (in German) on electro-chemistry (1902), the *Lehrbuch der Kosmischen Physik* (1903), and a number of original monographs. In 1907 he published a series of lectures delivered at the University of California under the title of *Immuno-Chemistry: Applications of Methods of Physical Chemistry to the Theory of Toxins and Antitoxins*. In his *Worlds in the Making* (1908), he combats the theory that the universe is tending to destruction by loss of heat and motion. In 1903 he received a Nobel prize for achievements in the field of chemistry. For a fuller description of Arrhenius' theory and its value to the scientific world, see *DISSOCIATION*.

ARRHIDÆUS (Gk. Ἀρριδαῖος, *Arrhidaïos*). An illegitimate son of Philip of Macedon by

Philinna, a dancing girl of Larissa. He was at Babylon when Alexander died, in 323 B.C., and, though almost an imbecile, was elected King of Macedonia, under the name of Philip, with the understanding that, if a son were born to Roxana, the widow of Alexander, he should be associated with Arrhidaeus in the government. The next year Arrhidaeus married Adeia, called Eurydice, the granddaughter of Perdicas II. Two years later he and his wife were captured by Polysperchon, the leader of the cause of Alexander's son, born of Roxana, and both were put to death by the order of Olympias, the grandmother of the young King.

AR'RIA. The wife of the Roman Cæcina Pætus, who, for treason to the Emperor Claudius, was ordered to end his own life by suicide (in 42 A.D.). When Pætus hesitated, she seized the dagger, drove it to the hilt into her own breast, and then handed it to him, saying calmly, "Pætus, it does not pain me!" (*Non dolet, Pater!*) She fell dead, and the husband at once dispatched himself with the same weapon. (See Pliny the Younger, *Epistles*, iii, 16; Martial, i, 13.) Arria was mother of the Arria who was married to P. Clodius Thrasea Pætus.

ARRIAGA, är-rä-ä'gä, MANOEL DE (1842—). First President of the Republic of Portugal. He was born at Horta, in the Azores, and was educated at the University of Coimbra. He studied law and became one of the most distinguished practitioners in Lisbon. During the reign of Louis I (1861-89) he was for many years a deputy from the Republican party to the Chamber of Representatives. In that body he became known as a fluent speaker who was strongly identified with Republican ideals and movements and a bitter enemy of monarchic institutions. In order to hush his vehement assaults upon the monarchy, King Louis offered him the position of tutor to his sons, but this he refused. He took an active part in the establishment of the republic in 1911, and on August 24 of that year was elected its first President under the new constitution. He was the candidate of a coalition of the Conservative Republicans, who were opposed by the radicals under the leadership of Dr. Alfonso Costa, the Provisional Minister of Justice. Dr. Arriaga received 121 votes against 86 cast for Senhor Machado, the nominee of Dr. Costa. (See *PORTUGAL, History*.) Well known as a writer and scholar, Arriaga was given the degree of Doctor of Laws by the University of Coimbra.

ARRIAGA, är-rä-ä'gä, PABLO JOSÉ D' (1562-1622). A Spanish Jesuit and author. He was born at Vergara, was rector of the Jesuit college at Arequipa, and subsequently the first rector of that at Lima. He perished in a shipwreck in 1622. Among the many historical works that he left, the most important are *Directorio espiritual, Extirpacion de la idolatría de los indios del Perú*, and *Ejercicios espirituales*.

AR'RIANUS (Gk. Ἀρριανός, *Arrianos*) (?-c.180 A.D.). A distinguished historian and a native of Nicomedia, in Bithynia. He was born near the end of the first century A.D. of good family, and upon obtaining the Roman citizenship assumed the name Flavius. After completing his education he left home and lived for some time, in the reign of Trajan, at Nicopolis, where he was a devoted pupil of the Stoic philosopher Epictetus. He won early in life the friendship of Hadrian and was from time to time honored with marks of the Emperor's

favor. While in the public service he traveled much and became acquainted with a number of lands and peoples. In 130 A.D. he was *consul suffectus* and soon after was made *legatus Augusti pro praetore* of the province of Cappadocia, an office which he held for several years, successfully defending the province against an invasion of the Alani. Under Antoninus Pius he obtained the consulship. In 147-148 A.D. he appears at Athens, where he had obtained the citizenship, as Archon Eponymos. He was also at some period of his life priest of Demeter (Ceres) in his native town. During the latter half of his life he seems to have kept himself apart from public service and to have devoted himself to letters.

As a writer Arrianus was a close imitator, both in subject and in style, of Xenophon. His relation to Epictetus was, in his own regard, that of Xenophon to Socrates, and he was known at Athens as the "younger Xenophon." He wrote on philosophical, historical, and military subjects. His philosophical writings all related to Epictetus. *The Discourses of Epictetus* (Διατριβαί 'Επικτήτου), in eight books, the first four of which have been preserved, comprised notes taken by Arrianus of his master's lectures and put in form for publication. So far as possible, the original words of the master were preserved. A *Manual of Ethics* ('Εγχειρίδιον 'Επικτήτου), together with the commentary of Simplicius on the same, has also come down to us. *The Conversations of Epictetus* ('Ομιλῆαι 'Επικτήτου), in 12 books, is mentioned, though this work was possibly another form of the *Discourses*. The most important historical work of Arrianus is *The Anabasis of Alexander the Great*, in seven books, which, both in the number of its books and in its style, is a reminiscence of Xenophon. The *Anabasis* not only contains the campaigns of Alexander in Asia, but is a complete narrative of the life of the King from the beginning of his reign to the time of his death. It is an impartial and accurate narrative, based on the most trustworthy authorities and written in a plain and unadorned style. The two chief authorities used were Ptolemy, son of Lagus, and Aristobulus, both officers in Alexander's army. Besides these, the works of Eratosthenes, Megasthenes, Nearchus, and others, as well as the letters of Alexander, etc., were drawn upon. *The Indica* ('Ινδική) is a geographical work, containing a description of India, together with an account of the voyage of Nearchus from the Indus to the Euphrates, and is written in the Ionic dialect. The sources were principally Nearchus, Eratosthenes, and Megasthenes. It was appended to the *Anabasis*, of which it may be regarded as a continuation. *The Events after Alexander*, in 10 books; *The Bithyniaca*, in eight books (containing a history of Bithynia from mythical times to the abdication of the last King, Nicomedes III, in 75 B.C., and *The Parthica*, in 17 books (containing an account of the Parthian War under Trajan), have been lost. Of *The Alanica*, a history of the Alani, only a small extract, called "Εκράσις κατ' Ἀλανῶν, is preserved. *The Periplus of the Euxine Sea* is a description of a voyage around the Euxine Sea, undertaken by Arrianus in his official capacity as Governor of Cappadocia. It was a report made to the Emperor Hadrian, and dates from 130-131 A.D. A second *Periplus of the Euxine Sea* and a *Periplus of the Red Sea*, to which the name of Arrianus is attached, are later compositions.

A work on tactics, preserved, was based on a work of the same name by Ælian, which, again, was taken in its main features from Asclepiodotus's work. The *Cynegeticus* is a short treatise on hunting, written as a supplement to Xenophon's work on the same subject. Other works, not preserved, were biographies of Timoleon of Corinth and Dion of Syracuse, and a *Life of Tulliborus*, a famous robber of Asia Minor. Editions of the *Anabasis* are by Krüger (Berlin, 1848), Sintenis (Berlin, 1867), and Abicht (Leipzig, 1876). There is a translation by Chinnock (New York, 1893). The philosophical works are to be found in Schweighäuser's *Epictetæ Philosophæ Monumenta* (3 vols., Leipzig, 1799). They have been translated by Elizabeth Carter (London, 1758) and by Thomas Wentworth Higginson (Boston, 1891). The best critical edition of Arrianus is that of Dubner and Muller (Paris, 1846).

ARRIAZA Y SUPERVIELA, ár-rê-â'thâ ē sô'pêr-vyâ'lâ, JUAN BAUTISTA (1770-1837). A Spanish patriotic poet, born in Madrid. After serving for several years in the navy, he abandoned it for a diplomatic career and became Secretary of the Legation, first in London and afterward in Paris. Later he was transferred to an important post in the Department of State. He returned to Spain in 1807 and did important service for his country during the French occupation by kindling the national spirit with his stirring *Poesías patrióticas*, issued in 1810. Subsequently, having declared himself an unconditional supporter of absolute monarchy, he received an important appointment in Ferdinand VII's cabinet, in the Department of Foreign Affairs. His earliest poems, *Las primicias*, appeared in 1793; *Emilia*, a didactic poem on the influence of the fine arts, in 1803. Though a master of form, Arriaza lacked real depth of feeling, and his poems owed their temporary vogue to their adaptability as popular songs, his ode entitled *Profecía del Pireneo* rivaling even the *Marseillaise* in power and grandeur. A complete collection of his verse is to be found in the *Biblioteca de autores españoles*, vol. lxvii, and a selection in Wolf's *Floresta de rimas modernas castellanas* (Paris, 1837).

ARRIERE (â'ryâr') BAN. See BAN.

AR'RINGTON, LILLIE. See BURROUGHS, MARIE.

ARRIOLA, ár-rê-ô'lâ, PEPITO (1896—). A pianist, and one of the most remarkable cases of precocious genius. He was born in La Coruña, Spain, Dec. 14, 1896. When only four years of age, the boy showed such unmistakable musical talent that he received regular instruction. His parents removed to Berlin, where he was placed under Alberto Jonás. In 1901, when only five years old, he began a tour of Germany, and in the following year he also visited England. Everywhere his astounding performance called forth unqualified praise. He came to America in 1909, where he was generally spoken of as "the second Mozart." From 1902 to 1904 he studied with Nikisch in Leipzig.

ARRIVABENE, ár-rê-vâ-bên'â, GIOVANNI, COUNT (1787-1881). An Italian political economist, born in Mantua. He was arrested in 1820 as a revolutionary agitator, and was imprisoned for several months, but finally made his escape and took refuge in England. His political views had given the Austrian government such deep offense, however, that in 1824 he was sentenced to death *in contumaciam*, and his property was

appropriated by the State. While he was in London he devoted himself mainly to the study of political economy and published the work which first drew international attention to him, *Di varie società e istituzioni di beneficenza in Londra* (1828-32). He lived in Belgium from 1827 to 1859 and was one of the organizers and President of the Congress of Political Economy, held in Brussels in 1847. He was active in the founding of the Belgium Economic Society and subsequently became its President. In 1860 he returned to Italy, was appointed Senator, and became President of the Economic Society of Florence. He did much to improve economic conditions in Italy. Autobiographical are his *Intorno ad un' epoca della mia vita, 1820-22*; (1860; Ger. trans., 1861), and *Memorie della mia vita, 1795-1859* (2 vols., 1879). Arrivabene prepared also a translation in Italian of John Stuart Mill's *Principles of Political Economy* and of the more important writings of N. W. Senior. Under the title *Scritti morali ed economici*, his writings were collected in 1870.

ARRO'BA (Sp. and Portug. from Ar. *arrub*, a quarter, from *al*, the + *rub*, fourth part). A weight commonly used in Spain, Portugal, Brazil, and in the principal Spanish and Portuguese colonies, which varies with the locality. In Spain it is equivalent to the English quarter of a hundredweight, or 28 pounds. It is nearly the same in Portugal. In Spain, the arroba is also a measure of capacity, used for wine, brandy, etc., and contains four of our quarts.

ARROM, ä'r-röm', CECILIA DE. See CABALLERO, FERNAN.

ARRONDISSEMENT, ä'rôn'dês'män'. See FRANCE, *Government*.

ARROW, THE. A small northern constellation, between Aquila and the bill of the Swan.

AR'ROWHEAD. An aquatic plant of the genus *Sagittaria*, to which the name is sometimes applied. See AQUATIC PLANTS.

AR'ROW-HEADED CHAR'ACTERS. See CUNEIFORM INSCRIPTIONS.

AR'ROWPOINT, CATHERINE. A character in George Eliot's *Daniel Deronda*, a clever and very sensible young woman.

AR'ROWROOT. A variety of starch extracted from the roots of certain plants growing in tropical countries. It is a fine, starchy farina, valued as a delicacy for use in preparing puddings, desserts, etc., and as a food for children and invalids easy to assimilate without digestive disturbance. It is obtained from the tuberous roots, or, more correctly, the root-stocks (rhizomes), of different species of the genus *Maranta*, belonging to the family Marantaceæ, and is characterized by solitary ovules, a fleshy style curved downward, branching stems, and white flowers. The species chiefly yielding it is *Maranta arundinacea*, a native of tropical America, cultivated in the West Indies and Florida, and growing about 2 feet high, with ovato-lanceolate, somewhat hairy leaves, clusters of small flowers on two-flowered stalks, and globular fruit about the size of currants. The roots (or rhizomes) contain a large proportion of starch. They are often more than a foot long, of the thickness of a finger, jointed, and almost white, covered with rather large paper-like scales. They are dug when a year old, washed, and carefully peeled. By rasping or otherwise the roots are reduced to a pulp and the starch removed by washing with water. Great care should be taken to prevent the starch souring

and to insure cleanliness. The careful peeling of the roots is of great importance, as the skin contains a resinous matter, which imparts a disagreeable flavor to arrowroot, if allowed to mix with it. The West Indian arrowroot most esteemed in the market is grown in Bermuda; the next, and almost equal to it, in Jamaica. The East Indian arrowroot is not, in general, so highly valued, perhaps because substitutes for the genuine arrowroot more frequently receive that name. The *Maranta arundinacea* is now, however, cultivated both in the East Indies and in Africa. *Maranta indica*, which was supposed to be distinct from *Maranta arundinacea*, is now regarded as a mere variety of it, with perfectly smooth leaves. It is cultivated both in the East Indies and in Jamaica. Arrowroot is obtained also from *Calathea allouia* and *Clinogyne dichotoma*, plants closely related to *Maranta*.

The amount of starch present in the roots of the *Maranta* varies according to age, and runs from 8 per cent, in those of the young plant, to 26 per cent when full grown, at the age of 10 to 12 months. In Bermuda it is estimated that four barrels of peeled and cleaned rhizomes will yield in a good season 100 pounds of good arrowroot.

The prepared starch contains some 16 per cent water, 82 per cent nitrogen-free extract (mostly starch), 0.8 per cent protein, and very small amounts of fat and ash.

Arrowroot is a light, opaque, white powder, which, when rubbed between the fingers, produces a slight crackling noise. Through the microscope the particles are seen to be convex, elliptical or triangular. The dry starch is inodorous, but when dissolved in boiling water has a characteristic smell and swells up into a perfect jelly. Arrowroot is sometimes adulterated with rice starch, potato starch, sago starch, and with the common starch of wheat flour.

Large quantities of arrowroot are annually imported into the United States and Europe. As an article of diet, it is often prepared for invalids and children by merely dissolving it in boiling water and flavoring with sugar, lemon-juice, wine, etc. It is also often prepared with milk, made into puddings, etc. In the United States corn (maize) starch is very commonly used in general cookery for making puddings, etc., and arrowroot seems less common than was once the case.

A starch somewhat similar to arrowroot and partly known by the distinct name of *tous-les-mois*, is obtained from some species of the allied genus *Curcuma*. East Indian arrowroot is in part obtained from the tubers of *Curcuma angustifolia*. Other species of *Curcuma* (see TURMERIC), as *Curcuma zedoaria*, *Curcuma leucorrhiza*, and *Curcuma rubescens*, also yield a similar starch; the same tubers which, when young, yield a beautiful and pure starch, yielding turmeric when old. In Travancore this starch is the principal part of the food of the inhabitants. The young tubers of the galangal, *Altimia galanga*, another plant of the same family (Scitamineæ), are another source of this starch. A starch somewhat resembling arrowroot, and often sold under that name, is obtained from different species of the family Cycadaceæ, as from the dwarf, fleshy trunks of *Zamia tenuis*, *Zamia furfuracea*, and *Zamia pumila* in the West Indies, and from the large seeds of *Dion edule*, in the lowlands of Mexico. The Chinese prepare a similar starch from the

tubers of species of *Sagittaria*. The starch of the cassava, manihot, or manioc (see CASSAVA) is sometimes marketed under the name of Brazilian arrowroot. In England the name "Farina" or "English arrowroot" is applied to starch prepared from maize or from potatoes. Starch obtained from the roots of the *Arum maculatum* (see ARUM) is known as Portland arrowroot. Otaheite arrowroot is the starch of *Tacca pinnatifida*. All these as well as cornstarch are so nearly allied to true arrowroot as not to be certainly distinguishable by chemical tests; but the forms of the granules differ, so that they can be distinguished by the microscope. When of good quality and known purity, these starches are all wholesome, useful food-stuffs of practically the same nutritive value.

The name arrowroot is commonly said to have had its origin from the use of the fresh roots by the South American Indians as an application to wounds to counteract the effects of poisoned arrows; and the expressed juice has been recommended as an antidote to poisons and a cure for the stings and bites of venomous insects and reptiles. But it is not improbable that the name is really another form of *ara*, an Indian word.

ARROWSMITH, AARON (1750-1823). An English cartographer, born at Winston, in Durham. He went to London at the age of 20. His publications include numerous topographic and hydrographic maps and charts, executed with the greatest care. His map of Scotland appeared in 1807, his *General Atlas* in 1817. His work on the *Geometrical Projection of Maps* was published posthumously (London, 1825). His son Aaron and his nephew John also published a number of cartographic works, and John (1790-1873) was one of the founders of the Royal Geographical Society.

ARROW WOOD. See VIBURNUM and Plate of TANSY, ETC.

ARROYO, ár-rō'yō. A town in the department of Guayama, Porto Rico. It has a good harbor on the south coast of the island and is about 40 miles south by east of San Juan (Map: Porto Rico, E 4). The town is prettily situated, and, although somewhat isolated, has highway connection with important points. It is in a fertile region which produces much sugar, which, with rum and molasses, is widely exported. Some iron is mined in the district. The three caves of Aguas Buenas are here and are the principal noteworthy feature. A hurricane in 1899 wrought great havoc. Pop., 1899, 2137; 1910, 3220.

ARROYO MOLINOS, ár-rō'yō mō-lē'nōs (Sp. Mill Creek). A village in Estremadura, Spain. It is noted as the scene of the complete defeat of General Girard, one of Marshal Soult's lieutenants, by Lord Hill, Oct. 28, 1811. General Girard had been sent out by Soult on a plundering foray with 5000 men, when he was surprised early in the morning by Hill, who had camped a league off at Alcuéscar. The French colors, artillery, and 1300 prisoners were captured.

ARRU, arōō', ISLANDS. See ARU ISLANDS.

ARSACES, ár'sh-sēz. See ARSACIDÆ.

ARSACIDÆ, ár-sās't-dē, or **AR/SACIDS**. The name of the royal dynasty which ruled over the Parthian monarchy from its foundation in the middle of the third century B.C. until its destruction by the Persian Sassanidæ in 226 A.D. A branch of the dynasty was established on the throne of Armenia about 150 B.C., and outlived

the Parthian Arsacidæ. The accounts concerning the Arsacidæ which have been transmitted to us by the ancient historians are exceedingly vague, confused, and contradictory, and modern criticism has found itself unable to reconcile or simplify the conflicting statements. The most important members of the dynasty of the Parthian Arsacidæ were Arsaces I and Arsaces VI.—**ARSACES** (Gk. Ἀρσάκης, *Arsakēs*) I delivered Parthia from the dominion of the Seleucidæ, kings of Syria. He is said by some to have been a Scythian by blood. An atrocious insult offered to his brother Tiridates by Pherecles or Agathocles, the Macedonian satrap of the country, is said to have fired his spirit and driven him to rebel. The Macedonians were expelled in 256 B.C. Antiochus Theos, King of Syria, was at war with Egypt, and was unable to recover this portion of his dominions. Seleucus, the son of Antiochus, made two unsuccessful expeditions against Arsaces, in the last of which he was taken prisoner. Arsaces I now acquired regal power, built a city called Dara, on the mountain Zapaortenon, developed the internal resources of his new kingdom, and endeavored to organize it; and, after the conquest of several countries, died at a great age. Such, at least, is the account given by Posidonius and other writers. Arrian, however, states that Arsaces died after a reign of two years, and that his brother Tiridates succeeded him, under the name of Arsaces II, and ruled for 37 years. From this we should infer that many of the acts attributed to the founder of the Parthian kingdom were the work of his successor—**ARSACES VI**, or **MITHRIDATES I**, flourished about the middle of the second century B.C. He enlarged the territories of the Parthians by the conquest of Bactria and is even supposed to have penetrated into India and subdued the nations between the Hydaspes and Indus. In the year 138 B.C. he defeated and took prisoner Demetrius Nicator, King of Syria, whom, however, he treated generously, bestowing on him his daughter in marriage. He was a just and merciful prince.

ARS AMATORIA, ARS AMAN'DI, or **ARS AMO'RIS**. A famous work of Ovid, giving humorously a set of rules for the conduct of love affairs, how to gain and how to retain affection. Of the three books, two are addressed to men; the third, to women. The work has been characterized as "one of the supreme parodies in all literature." Consult a paper by E. K. Rand, entitled "Ovid and Metamorphosis," in *Harvard Essays on Classical Subjects* (Boston, 1912).

AR/SENAL (Fr., Sp., Portug. arsenal, dockyard; It. *arsenale*, *arzena*, *arzanale*, arsenal, dockyard; cf. It. *darsena*, Sp. *dársena*, Portug. *taracena*, dock, and Sp. *atarazana* (l), dock, all from Ar. *dār aṭṭinā'ah*, workshop, factory, from *dār*, house + *al*, the + *ṭinā'ah*, art, mechanical industry). An establishment for the manufacture, repair, and storage of arms, ships, or munitions of war. In the United States the term is commonly applied to an establishment designed for the manufacture and storage of arms and munitions of war for the land forces; there are several naval arsenals, but these are merely storehouses for ammunition. In England the term has nearly the same signification. On the continent of Europe the original meaning of the term is preserved, and, while there are many arsenals designed solely for the supply of the

land forces, the great naval arsenals of Brest, Cherbourg, Toulon, Naples, Spezia, Venice, etc., are establishments in which ships are built, repaired, and fitted out, and in which equipments and naval stores are manufactured. The manufacture of guns is now generally carried on in gun factories and small-arms factories. (See ORDNANCE ESTABLISHMENTS.) Some of the non-explosive parts of ammunition are manufactured at the general arsenals, but the work of preparing explosives and of filling cartridges and explosive shells is commonly done at special arsenals or establishments at safe distances from centres of industry and population; and large quantities of ammunition are no longer stored in arsenals chiefly devoted to general military or naval industries. In the United States and in England the term *navy yard* (q.v.) corresponds almost exactly to that of *naval arsenal* on the Continent, the same class of work being carried on in each. A very large proportion of the munitions of war are now made in private works; and this, together with the desirability of specializing manufactures, has led to a reduction of the scope of work carried on in arsenals.

The first regular manufacture of war materials in the United States was in 1776, when gunpowder was made for the Continental forces; and in 1777 Springfield, Mass., was chosen by General Washington as a suitable place for an arsenal. The manufacture of small arms commenced there in 1787 and has since continued. Harper's Ferry Arsenal dates from 1795, from which time other arsenals were gradually built, until the list of arsenals, armories, and ordnance depots under the control of the United States War Department in 1913 comprised the following establishments: Allegheny Arsenal, Pittsburgh, Pa.; Augusta Arsenal, Augusta, Ga.; Benicia Arsenal, Benicia, Cal.; Columbia Arsenal, Columbia, Tenn.; Fort Monroe Arsenal, Fort Monroe, Va.; Frankford Arsenal, Philadelphia, Pa.; Indianapolis Arsenal, Indianapolis, Ind.; Kennebec Arsenal, Augusta, Me.; New York Arsenal, Governor's Island, New York City; Rock Island Arsenal, Rock Island, Ill.; St. Louis Powder Depot, Jefferson Barracks, Mo.; Sandy Hook Proving Ground, Sandy Hook, N. J.; San Antonio Arsenal, San Antonio, Tex.; Springfield Armory, Springfield, Mass.; United States Powder Depot, Dover, N. J.; Watertown Arsenal, Watertown, Mass.; Watervliet Arsenal, Watervliet, N. Y.

The naval gun factory is located in the Washington Navy Yard and forms the principal part of this yard's activities. The naval proving ground and powder factory is at Indian Head, Md. In naval magazines powder and explosives are stored, and ammunition is received, overhauled, loaded, and prepared for issue to ships. The naval magazines are located at Iona Island, N. Y., Dover, N. J., Fort Lafayette, N. Y., Hingham, Mass., Mare Island, Cal., St. Julien's Creek, Va., Fort Mifflin, Pa., Ostrich Bay, Puget Sound, Wash., Bellevue, Md., and Olongapo, P. I.

ARSENIC (Gk. *ἀρσενικόν*, *arsenikon*, yellow orpiment from *ἀρσεν*, *arsēn*, male, masculine; alluding to its strong properties). A widely distributed element that was known to the ancients, being distinctly referred to as early as 1694 by Schröder. It is often found in the form of mammillated or kidney-shaped masses, but occurs also in well-crystallized form. It is found chiefly associated with other metallic minerals in the older rocks or in schists. The

principal European localities are: Andreasberg, in the Harz Mountains; Joachimsthal, in Bohemia, and Freiberg, in Saxony. It is also abundant in Chile, Mexico, and New Zealand. In the United States it is found in Haverhill and Jackson, N. H.; Greenwood, Me., and Leadville, Colo. In combination with sulphur, arsenic occurs as realgar and as orpiment, and with sulphur and iron as löllingite and as arsenopyrite or mispickel, called also arsenical pyrites. It is a common constituent of other minerals, but in small quantities only. The arsenopyrite is the usual commercial ore from which arsenic is obtained, and the process for its reduction is by heating the ore in earthenware retorts or tubes laid horizontally in a long furnace. As arsenic is quite volatile on heating, it condenses in the iron tube as a coherent crystalline mass, which may be still further purified by a second sublimation.

Arsenic (symbol As, at. wgt. 75.0) is a steel-gray, brittle metal, with a specific gravity of 5.23 to 5.76; it is a good conductor of electricity and is odorless and tasteless. It volatilizes above 100° C., with a garlic-like odor, and is rapidly vaporized at a dull-red heat. It is used as a constituent of alloys, as white alloy, as speculum metal, in bronzing brass, and in the manufacture of opal glass; also for hardening lead in the manufacture of shot. Arsenic and its soluble compounds are exceedingly poisonous.

Arsenic forms two oxides—the arsenic trioxide and the arsenic pentoxide. The former yields with basic radicals the salts called arsenites. It is commonly called *white arsenic*, arsenious acid, or flowers of arsenic, and is obtained in various metallurgical processes by roasting arsenic ores, during which the vapors of the oxide are volatilized and subsequently condensed in receptacles called poison chambers, or poison towers. The crude oxide is purified by one or more sublimations, yielding ultimately a white crystalline powder that is odorless, but has a weak, metallic, sweetish taste. This is the principal commercial compound of arsenic, and is used for the preparation of other arsenical compounds, in the production of green pigments, in the manufacture of glass, and as a poison for rats and vermin; also in medicine, in various compounds such as *Fowler's solution*, which is an arsenite of potassium. Arsenious oxide is used in medicine in treating many skin diseases, in anæmia, in chorea, in some forms of malarial fever, in cancer and other malignant growths, in neuralgia, in asthma, and in certain gastric conditions. It is an alterative and is frequently used in connection with other tissue builders or tonics during convalescence. Since small quantities produce poisoning, arsenic should be used only when prescribed by a physician. As this metal is much used in the arts, chronic poisoning by it is not infrequent, resulting in kidney disease and even paralysis. Yet it is asserted that in Styria the peasants consume arsenic daily—the women to improve their complexions, the men to increase their power of endurance. They are said to be strong and long-lived (see *Edinburgh Medical and Surgical Journal*, 1871, vol. xvi, p. 569). Freshly precipitated hydrated oxide of iron, and the freshly precipitated hydrated oxide of iron with magnesia, are regarded as the best and most efficient antidotes for arsenious acid; but immediate removal of the poison by vomiting or purging is desirable.

For the detection of arsenic, three methods are commonly employed. Of these, the first consists in the treatment of the material submitted for examination with a strong alkali, either potassium or sodium hydroxide, and passing through the filtered liquid a current of hydrogen disulphide, which, on acidulation if arsenic be present, produces a precipitate of the yellow sulphide. The precipitate may be further tested by dissolving in ammonia and evaporating until the residuary substance is reduced to metallic arsenic. Another method is the Reinsch process, in which, the preparation containing arsenic having been brought into solution, newly burnished pieces of copper foil are introduced into the liquid, and if arsenic be present it will at once be precipitated on the copper as a dark gray metallic film (Cu_3As_2). It is said that by this method one part of arsenic can be detected in 250,000 parts of solution. A third, and perhaps the most useful, method is that invented by Marsh, which consists in treating the material with dilute sulphuric acid and metallic zinc in a gas-generating apparatus. The arsenic combines with the hydrogen liberated by the zinc, and forms arsine (AsH_3) which is then passed through a glass tube; on heating, the gas decomposes, depositing metallic arsenic in the form of a "mirror" near the open end of the tube. In carrying out this operation, especially in criminal cases, the utmost precautions are necessary to insure the perfect freedom of the apparatus and reagents used from arsenic or similar substances capable of producing an arsenic-like "mirror." The nature of the mirror may be demonstrated by dissolving it and testing the solution obtained by one of the usual methods. With copper oxide, arsenious oxide forms a copper arsenite which is a pigment known as *Scheele's green*. With basic copper acetate it yields *Schweinfurth green*—called also emerald green, imperial green, and mitis green.

When acted upon by oxidizing agents, arsenious oxide yields arsenic oxide, which combines with basic radicals to form arsenates. Arsenic oxide, or arsenic acid, is sometimes used as an oxidizing agent in the preparation of aniline red.

Arsenic combines with sulphur, yielding an orange-yellow disulphide, which is found native as the mineral realgar and is used as a pigment and as a depilatory. A trisulphide also exists, which is found native as the mineral orpiment, used in pyrotechny and as a pigment for artists; also formerly in dyeing, and with quicklime as a depilatory under the name of *rusma*. Consult Valour, *Chimie et toxicologie de l'arsenic et de ses composés* (Paris, 1904).

ARSENIOUS ACID. See ARSENIC.

ARSENOBENZOL. "606."—Ehrlich's specific for syphilis. See SALVARSAN; also SYPHILIS.

ARSENOPYRITE (from *arsenic* + *pyrite*), or MISPICKEL. An iron sulpharsenide that crystallizes in the orthorhombic system, has a metallic lustre, and is silver-white in color. It is readily recognized by its odor of garlic when struck a glancing blow with a hammer. Under an oxidizing blow-pipe flame it gives a white coat on charcoal and the characteristic garlic-like odor of arsenic. In Canada it occurs with sulphide of iron containing gold, forming large ore bodies, but no process has been developed for the commercial extraction of this gold. As a vein mineral it occurs associated with various ores of gold, lead, silver, and tin, in igneous

crystalline rocks, and is recovered as a by-product, arsenious oxide, in the smelting of these ores.

ARSINOË, är-sin'ô-ë (Gk. Ἀρσινόη). A Greek feminine name which was especially popular in the Macedonian dynasty of Egypt, the family of the Ptolemies. The wife of Lagos and the mother of Ptolemy I was named Arsinoë. Other noteworthy princesses who bore the name were: 1. ARSINOË, who was the daughter of Lysimachus, the King of Thrace, and first wife of Ptolemy II Philadelphus. Her son Ptolemy, as Euergetes, later became King of Egypt. 2. ARSINOË II, born about 316 B.C., the daughter of Ptolemy I and Berenice. She was married in her sixteenth year to the aged Lysimachus, King of Thrace. The eldest son of this King, Agathocles, had previously married Lysandra, Arsinoë's half-sister. Arsinoë's brother, Ptolemy I Philadelphus, afterward wedded Arsinoë I (see above), the daughter of Lysimachus. Arsinoë II, wishing to secure the throne for her children, prevailed on her husband to put Agathocles to death. Lysandra, however, fled with her own children to Seleucus of Syria, and induced him to declare war against her father-in-law, who lost his life and kingdom. Arsinoë II sought refuge in Macedonia, which was also seized by Seleucus. After a few months Ptolemy Ceraunus, the half-brother of Arsinoë II, assassinated Seleucus; and in order to gain possession of Arsinoë's sons, whom he feared as rivals to his ambition, he offered marriage to his half-sister. She consented to the union and opened the gates of the town in which she had taken refuge, whereupon her suitor caused her sons to be killed before her eyes. Arsinoë fled to Egypt (279 B.C.). Her own brother, Ptolemy Philadelphus, banished his wife, Arsinoë I, to Coptos, and married Arsinoë II, beginning thus the series of sister-marriages which were in accordance with the Egyptian custom and exactly opposed to the Greek tradition. Arsinoë II had no children by her brother and adopted the three children of Arsinoë I. Her husband showed great affection for her. He named the capital of the Fayum (the Arsinoite nome) after her, and had a splendid tomb and memorial temple erected to her by the architect Dinochares, who is said to have roofed it with loadstones, so that her iron statue seemed to float in the air. She seems to have assisted Ptolemy in the government. 3. ARSINOË III was sister and wife of Ptolemy IV Philopator, who caused her to be murdered soon after the birth to her of an heir. 4. ARSINOË IV was daughter of Ptolemy XI. Auletes (80–51 B.C.). She fled from Alexandria when Julius Cæsar was besieged in it (48 B.C.) and was received as queen by the Egyptian troops so long as her brother, Ptolemy XII Dionysus, remained in the hands of Cæsar. Captured by the Romans, she was led in triumph through Rome; afterward she was liberated, and returned to Egypt. Her famous sister, Cleopatra VII, persuaded the Triumvir Antony to have her murdered at Ephesus (41 B.C.), although she had taken refuge in the temple of Diana.

AR/SIS and THE/SIS. See BEAT.

AR/SON (OF. from Lat. *ardere*, to burn, participle, *arsus*). In the laws of all civilized countries, a crime of the deepest atrocity. At common law, it consisted in the burning of the house of another, willfully and of malice aforethought, and was a felony punishable by death. In the long and painful history of the criminal

law it is said to have been the first offense in which the question of the *mens rea*, or criminal intent, of the act was taken into account. In essence the common law of arson remains substantially unchanged in the United States as well as in England, notwithstanding some statutory modifications and the general mitigation of the penalty incurred by the commission of the crime. Unless it results, directly or indirectly, in the death of some person—in which case it comes under modern definitions of the crime of murder—it is no longer punishable by death, but by imprisonment for periods varying with the degree or atrocity of the offense, sometimes for life. There must be an actual lighting and burning, in order to constitute the crime, and it must be deliberate, and not accidental, or the mere result of carelessness. The premises need not, however, be consumed, an actual blaze, ignition, or charring being enough. Generally speaking, it is not arson to burn one's own house, even with the intent to defraud an insurer, or to destroy the personal property of another on the premises; though this act, when done with such an illegal intent, was also a crime—usually a misdemeanor—at common law, and is now, in some of the United States, defined as a lower degree of the crime of arson. In New York it is arson, under the penal code, to set fire to any building, even though it be that of the accused, in which there is at the time a human being. For the particular treatment of this crime in this country, the reader is referred to the codes and statutes of the several States. Its early and later history has been fully told in Pollock and Maitland, *History of English Law* (Boston, 1899), and in Stephen, *History of the Criminal Law of England* (London, 1883). Consult also: Stephen, *Digest of the Criminal Law* (5th ed., London, 1894); Russell, *Treatise on Crimes and Misdemeanors* (6th ed., London, 1896); and the authorities referred to under CRIMINAL LAW.

ARS POETICA (The Poetic Art). A discussion of dramatic poetry by Horace, called also Epistle to the Pisos. In it Horace develops the laws of dramatic composition, and adds suggestions and comments from his own experience. See HORACE.

ART (Lat. *ars*). Broadly speaking, the word "art" stands for any object produced by the mind and hand of man; that which is not immediately a product of nature; that which is artificial, which is opposed to the natural, in the creation of which human skill has intervened. The shaft of a tree is natural; shaped as a ship's mast, and perhaps further ornamented, it has entered a low grade of art, the material grade, and has become useful. In the present discussion the word "art" is used in the sense of fine art, as opposed to the useful and industrial arts, and its end, unlike those, is to give pleasure. The kind of pleasure must, however, be somewhat closely defined, for its range and quality are not without certain limitations. For perhaps greater clearness it may be well to contrast the province of "fine art" with examples of other pleasure-giving activities of the human mind and of the lesser industrial arts. The appliances of science, light-producing, heat-producing, sound-transporting agencies, the results of mechanical or industrial arts, contribute to the pleasure, comfort, and sociability of life; but they are the result of applied and scientific principles and of the exact sciences, and for

their appreciation do not call for that particular quality of pleasurable mental effort which the contemplation and knowledge and enjoyment of pure beauty exact and afford. There are many pleasures of which our human economy is susceptible that may not be ranked among the pleasures of art (see *ÆSTHETICS*); for the word "art" under this head is confined more strictly to its expression in painting and sculpture.

Art is perhaps entitled to be deemed the highest factor in civilized life, because it is the most unselfish. Sight is the sense it appeals to chiefly, but it is only that through this sense it may reach the mind; so it is a mistake to think that sculpture and painting end with visual enjoyment merely. There are higher and less high emotions to which art appeals, and it is the perceptible exercise of rare judgment and of taste that stamps a so-called work of art "fine." There are pictures existing, and examples even of musical composition, betraying a mind of such puerile character that the fact that they have been produced in obedience to the technical exactions of these respective arts in no way warrants them in being called "fine." Fine art consists not merely in technical address; and yet there is a certain perfection of *virtuosity* so intelligent, displaying such a rectitude of taste and such a refined instinct for the fitness of things that it is pleasure-giving to the degree of becoming æsthetic. Through "the happy and dexterous way in which a thing slight in itself is handled" it may become an object of "fine art." Material subjects also may serve as acceptable themes for the fine arts, if treated with such fitness that they do not offend the æsthetic sense. Veronese apotheosized the subject of feasting, not in itself a lofty theme. His, or any painter's, success in problems of this kind is a sign of the artist. True artists perceive the limitations of their art and never overstep them; and, indeed, fine art has to-day become synonymous with the exercise of fine taste in many departments of mental effort and individual handicraft.

It is very evident that the production of a work of high art which requires great abstraction of mind could never have occurred in the early and savage period of the human race. That was a period of self-preservation and a fight for mere existence. As time went on and life became more complex, there was leisure for the mind to employ itself in other matters; and with the complete emancipation of the human intellect, such as exists to-day, there has come an imperative demand for expression in a language that is as potent as that of uttered speech—the beautiful and universal language of art. In painting, its vocabulary is form and color; but these, in fine art, must be so used as to express the ideas and emotions excited in the artist by things seen. Imitation merely will not do this, so the artist must make use of seen things to denote certain attitudes of mind and emotions of the soul. A work of art must not so far stray from truthful representation as to irritate the mind of the beholder by its offenses against structural truth, but, on the other hand, art is not achieved through strict imitation. Art is many-sided—the æsthetic sensibilities are touched in such a variety of ways that it is somewhat difficult to fix definitely the channels through which painting and sculpture may legitimately reach the human mind and still rest within the limitations that these mediums exact on the part of the producer. It is certain, however, that the beholder of a

painting or statue should receive the impression of a mind employing the materials of a particular craft with perfect control and judgment, of a mind dominated by such taste that the language—that is to say, the medium used—is made to voice ideas that are better expressed by such means than by any other. Hence the objection to so-called “literary” art, or “story-telling” art, in pigment and in clay. Subjects which are more effectively rendered through verbal form, and which, to be understood pictorially, require a page of explanatory notes, are not so pleasure-giving, in the graphic arts, as those which immediately strike the mind, through the eye, by their elevation of sentiment and the opportunity they afford the artist for noble lines and charming qualities of paint. Both these arts are, as has been said, *imitative*; but the true artist recognizes in the exercise of his craft to what point his imitation of nature may legitimately carry him. This knowledge may be revealed to him by the consideration of the class of emotions it is his intention to excite.

Bibliography. Some of the best books are: Harris, *Theory of the Arts* (London, 1869); Frothingham, in *American Journal of Archaeology*, vol. ix (1894); Taine, *Lectures on Art* (Eng. trans., New York, 1899); Leighton, *Addresses to the Students of the Royal Academy* (London, 1896); Conway, *The Domain of Art* (ib., 1901); Lange, *Das Wesen der Kunst* (Berlin, 1901); Von Kunowski, *Schöpferische Kunst* (Leipzig, 1902); Walter Crane, *Ideals in Art* (London, 1905); Clausen, *Aims and Ideals in Art* (New York, 1906); Delville, *The New Mission of Art* (London, 1910); Rodin, *L'Art* (Paris, 1911; Eng. trans., New York, 1912). Ruskin's works abound in art criticism, sometimes inspiring, often misleading. The most important passages have been collected by Street, *Ruskin's Principles of Art Criticism* (Chicago, 1901). See also the *Bibliography* under *ÆSTHETICS*.

History. The monuments produced by the artistic faculty represent in the most concrete form the different stages and kinds of human activity on its more ideal side, and are intimately connected with the two other main spheres of *science* and *industry*, to whose products art is often called upon to lend beauty and interest. Within the sphere of art itself the *social* arts of religion, philosophy, and government supply not only the *literary* arts, but also the *formative* arts of architecture, sculpture, and painting, with their themes and their inspiration, without which works of art would have little importance in the development of civilization. The fine arts, in order to attain a high standard, must therefore embody some higher idea. A Greek temple, a Gothic cathedral, a Mohammedan mosque, a Benedictine monastery, a triumphal arch, an amphitheatre, a Roman villa, a feudal castle, represent religious and social forces, above and beyond fine art, which mold these monuments so that they are part of the larger life. The form, arrangement, decoration, and purpose of such buildings are no part of “art for art's sake.” So it is with works of sculpture and painting—with a Phidian Zeus, a Byzantine Christ, a Cimabue Madonna borne in triumphant procession, an Immaculate Conception by Murillo. Greek mythology and Christian dogma are as much embodied in art as in literature; art has been regarded for as many millenniums a means of teaching as it has been for centuries a means of pleas-

ing, though produced under their own special organic laws, are governed by the general laws of the civilization to which they belong, it results that these works, like everything else in civilization, are a mixture of good and evil, true and false, and that the customary æsthetic opinion that beauty alone is the aim of art is contradicted by both theory and practice. Such a standard could not be applied to the novel or the drama in literature, as it would eliminate a majority of masterpieces; neither can it be applied in art. Any work with distinct significance and character is artistic, whether its theme is moral or immoral, its form beautiful or ugly, and whether it is inspired by a sentiment of the grotesque, the deformed, and the fearsome, or of the sublime and the beautiful.

A study of the history of art will show that through the 4000 or more years during which such works were produced before the fifth century B.C., the æsthetic pleasure they gave was practically independent of the human figure and was dependent on effects of color and material forms. Exquisite appreciation of color among the peoples of western Asia and grandiose combinations of architectural lines and masses among the Egyptians were the keynotes of this long period, of this lower and material stage, when the human figure was used as a higher species of hieroglyph, as a means, not an end. The long, painted processions in an Egyptian tomb; the friezes in relief of an Assyrian palace, were a part of ceremonial or contemporary history. In Greece of the sixth and fifth centuries, art enters upon a higher mission; this mission becomes both more definite and more ideal, centring around the human figure. It is the plastic stage of ancient art. Even in architecture questions of outline, proportion, and rhythm predominate, in place of the earlier material ideas of colossal mass. Color became subsidiary and remained crude, never attaining among the Greeks the harmony and subtlety of Asiatic art. The human form was for the first time idealized in plastic form and made to express types and thoughts besides mere external facts. The next change was heralded in the Alexandrine Age and fully embodied in Roman civilization. Art became pictorial and psychological; Greek simplicity became complex. Portraits replaced types; the variegated porphyries, serpentines, and other strong-colored marbles succeeded the white Parian; in place of the cameo-like Attic reliefs on a single plane without background we have first the picturesque scenery of the Alexandrine relief and then the two and three planes of the imperial Roman sculptures. Even architecture was fundamentally modified. The Hellenic Greeks had placed their buildings singly and with an unerring eye for beauty on the appropriate natural site; but each one was for itself. Under Rome, architectural composition is developed, and the grouping of coördinate structures, the planning of stupendous interiors, becomes a large part of the art, accompanied by wonderful richness of color in decoration. There is plastic loss and picturesque gain. In harmony with the new love of luxury, art is made to minister to private as well as to public life. Its bounds were thus immeasurably enlarged while its ideals were lowered. Philosophically speaking, the fit closing of an artistic era was now reached; all the changes had been rung.

When the Christian revolution set in, art was regenerated, as a consequence of the religious

and social regeneration. The second era began, of course, by a reconstruction in the higher spheres of religious and philosophic thought and the state; until their currents could reach and revivify the fine arts, until new artistic forms could be created to express suitably these new ideas, the result was necessarily inadequate, as it had been for example, in the centuries of Greek art before Phidias. As a natural reaction from the previous worship of beauty of form, Christian art went at first to the other extreme of caring merely for the content. The decay of skill went with a carelessness as to its acquisition. Like the Egyptians and Assyrians, the artists of the early Christian and Byzantine periods used figures largely as hieroglyphs, for purposes of instruction, but the things taught were fundamentally different; they were the things of the spirit. A true history of Christian sculpture and painting up to the Renaissance should deal but little with the technique and mainly with the theme, not with the æsthetic pleasure, but with the internal significance. Imperfection of form was regarded as immaterial. This point of view once secured, it becomes clear how we should study the frescoes of the Catacombs to reach the heart of Christianity before the stage of theological definitions; how the dogmas and beliefs of the Eastern church are set forth in illuminated Bibles and in the mosaics and frescoes of Byzantine churches, from St. Mark at Venice, and from Monreale to Mount Athos; how the encyclopædic learning and dominant thoughts of the Middle Ages can be grasped in the sculptures and glass windows of such French Gothic cathedrals as Chartres, Rheims, and Amiens. The intellectual quality of this art is shown in the supremacy of geometric law and constructive thought in an architecture which is the embodiment of the triumph of mind over matter—the antipodes of Egyptian architecture. During this pre-Renaissance period there was the greatest variety of stages; in the West the only time when the external expression was adequate to the ideas involved was the period of the Gothic cathedrals, which in many ways was the exact counterpart of the Hellenic development of the fifth and fourth centuries B.C. (Phidias to Lysippus), in the same way as the earlier Christian period had corresponded to the Oriental stage and the later Renaissance period was to mirror the Roman stage of ancient art. It is interesting to follow out this analogy; to see how portraiture, psychologic study, picturesqueness, and the supremacy of painting are characteristics of the Renaissance as of Roman art, but on another plane, in which the keynote was furnished, not by architecture, as with the Romans, but by sculpture.

The Renaissance is the last and pictorial stage of the second era in art history. Michelangelo was its supreme embodiment, the Sistine ceiling its clearest expression. Renaissance architecture was plastic, not constructive—a decorative system. The simple composition, the clear outlines of the painting of the fifteenth and sixteenth centuries have also a plastic underlying basis. At this moment we have hardly enough perspective to see clearly just where the Renaissance merges into modern art, but one thing is certain, modern art carries the standard of painting in the van. It has not yet created its own types of architecture or decorations; in these spheres it lives mainly on models of the past. We may, however, speak of a distinctly modern

sculpture, and present-day painting is truly original.

Plan of Art Articles in the New International Encyclopædia. The details illustrating the historic development of the fine arts are given in both general and special articles. The present article, and those on *ÆSTHETICS*, *PRIMITIVE ART*, and *ARCHÆOLOGY*, are designed as a general introduction. There follow three general historic sketches on *ARCHITECTURE*, *SCULPTURE*, and *PAINTING* and two of lesser length on *ENGRAVING* and *DECORATIVE ART*. They are all designed as distributive articles for the more detailed sub-headings and special articles, and are supplemented by two classes of general articles; those on great historic styles broader than nationalities, and those on national styles. To the former belong Byzantine, Mohammedan, Romanesque, Renaissance, and Baroque art, which spread over several countries. Within such styles there are, of course, the national subdivisions; but these are subordinate to certain general laws or characteristics of the style. Thus French Gothic and Renaissance are very distinct from Italian and German; Armenian and Coptic Byzantine from Hellenic; Persian and Spanish Mohammedan from Egyptian. The second class, of national arts, is especially important in ancient times before the Greeks had drawn the East and West so close together. So, Egyptian art and Assyro-Babylonian art possess distinctly national styles. Minor nationalities like the Hittites and Phœnicians are, it is true, strongly influenced in their art by elements borrowed from these two great civilizations; but not sufficiently so as to cast national traits into the shade.

The next group of articles gives classes of general subheads: (1) of *style*—as, for instance, of Doric, Ionic, and Corinthian under *ORDERS OF ARCHITECTURE*; of early English Decorated and Perpendicular under *DECORATED STYLE*; *PERPENDICULAR*; (2) of *branches of art* from the point of view of material; for instance, *CARPENTRY* and *MASONRY*, as branches of architecture; *BRONZE*, *CHRYSELEPHANTINE*, *TERRA-COTTA*, *IVORY*, *WOOD CARVING*, and *GOLDSMITH'S WORK*, as branches of sculpture; *Fresco*, *TEMPERA*, *OIL PAINTING*, *WATER COLOR*, *PASTEL*, *ILLUMINATED MANUSCRIPTS*, as branches of painting; *LINE ENGRAVING*, *ETCHING*, *WOOD ENGRAVING*, *DRY POINT*, *AQUATINT*, *MEZZOTINT*, as branches of engraving; *MOsaic*, *STAINED GLASS*, *POTTERY*, *VASES*, *ENAMEL*, *INLAYING*, *JEWELRY*, etc., as forms of decorative art; (3) of *classes of monuments* from the point of view of their use. Under *ARCHITECTURE*, the general headings of *religious*, *civil*, and *military*, where these themes are treated historically, are each subdivided: religious architecture into such heads as *TEMPLE*, *CHURCH*, *CATHEDRAL*, *MONASTERY*, *BAPTISTERY*; civil and domestic architecture into such as *MUNICIPAL ARCHITECTURE*, *FORUM*, *PALACE*, *FOUNTAIN*, *VILLA*, *MAUSOLEUM*, *THEATRE*, *AMPHITHEATRE*, *CIRCUS*, *BATH*, *TOWN HALL*, *ARCH TRIUMPHAL*, *AQUEDUCT*, *BRIDGE*; military architecture into such as *ACROPOLIS*, *CITADEL*, *CAMP*, *CASTLE*. Certain subtitles are somewhat more special than these; such as the names of structures confined to a certain style, like *OBELISK*, *MASTABA*, and *PYRAMID* in Egyptian art, or those confined to a religious sect and style, like *ALCAZAR*, *CARAVANSERAI*, *KHAN*, *MINARET*, and *MOSQUE* in Mohammedan art, or *CATACOMBS*, *BASILICA* in Early Christian art; such also are subordinate buildings or parts of buildings, like *CLOISTER*, *CHAPTER-HOUSE*, and *DORMITORY*, which

are parts of a monastery, or KEEP, BAILEY, TOWER, BASTION, and BARBICAN, which are parts of a castle; APSE, CHOIR, NAVE, TRANSEPT, CRYPT, CLEARSTORY, which are parts of a church. Similar classes of works obtain also under sculpture and painting. For example, in sculpture come PULPIT OF AMBO, TOMB, RELIQUARY, CHALICE, CROSS, HERM, etc.; in painting are such terms as MURAL PAINTING, TRIPTYCH, etc. Of great importance for painting is the classification (4) in accordance with the *general subject* represented under such headings as PORTRAITURE, LANDSCAPE, and STILL-LIFE PAINTING. The next class (5) includes *works of sculpture and painting* classified according to subject, the general rules of which are laid down in two general articles, one on MYTHOLOGY IN ART, for the ancient world, and one on Christian ICONOGRAPHY, for the period beginning with the Christian era. The history of the artistic treatment of each such important theme is given under separate heads, which are enumerated in these two articles. Such are the myths and types of the Olympian gods, the chief exploits of personages like HERCULES, THESEUS, and PERSEUS, and the heroes of the *Iliad* and of Greek tragic poets, not to mention great historic personalities. Similarly, for Christian art, the types and events of the life of Christ, the Virgin and the Apostles are described in such general articles as CHRIST IN ART and MADONNA, and in themes like ANNUNCIATION, NATIVITY, ADORATION OF THE KINGS, CRUCIFIXION, LAST SUPPER, ASCENSION, and LAST JUDGMENT.

Class (6) *technique of the arts*, comprises the greatest number of separate heads. The processes of sculpture are explained under CARVING, FOUNDING, RELIEF SCULPTURE, and in the introduction to SCULPTURE; those of painting under DRAWING, PERSPECTIVE, ENCAUSTIC PAINTING, TEMPERA, FRESCO, OIL PAINTING, etc. Other technical terms referring to the painter's craft are CANVAS, EASEL, GROUND, PAINTERS' COLORS, etc. Of the architectural titles several of the articles are of some length, such as COLUMN, DOME, ARCH, VAULT, MOLDING, including both definition and history, but the majority consist of definitions, as in the case of such architectural members as ARCHITRAVE, FRIEZE, and CORNICE, composing the classic entablature, as well as DENTIL, FASCIA, CORONA, MUTULES, details of this entablature, and CABLE MOLDING, PALMETTE, and its other moldings and ornaments. Reference to the comprehensive articles will secure complete references to the smaller units. The great majority of such technical terms belong to the field of architecture, and include all the building implements under such heads as AXE, DRILL, HAMMER, CRANE, DERRICK, DRESSING, STAGING, QUARRY.

Class (7) is concerned with the *appreciation and enjoyment* of the fine arts under such general titles as ARCHITECTURE, APPRECIATION OF; PAINTING, do., SCULPTURE, do., and in special articles like LINE, COLOR, COMPOSITION, CHIAROSCURO, PERSPECTIVE VALUES. Class (8) consists of articles illustrating *manners and customs* in which art and artistic forms of industry have at least an important part. Some are general, historic, and descriptive, as COSTUME, FURNITURE, BURIAL, BRICK, ARMOR, JEWELRY, and under such headings will be found references to the more specific headings; in this field especially it is impossible to distinguish between art and archæology. The next series, class (9), consists of a *topographical* treatment of monuments. In the case of every

city or town containing monuments of unusual importance and significance in art history, the conventional guide-book information, which is sufficient in ordinary cases, is abandoned for a systematic, scholarly treatment. Such is the case in cities like VENICE, ROME, ATHENS, CAIRO, FLORENCE. It is the same with places like POMPEII, which illustrate any period with great fullness. Ancient sites that are now mere ruins—like BAALBEK, PALMYRA, BABYLON, SELINUS, CARNUNTUM—are described. Even single works are picked out for separate description; ancient monuments, such as the PARTHENON and the PAN-
THEON; the Egyptian temples at EDFT, KARNAK, and PHILE; the mediæval monasteries of MONTE CASSINO, CERTOSA, CLUNY, MELROSE; the châteaux of CHAMBORD, CHENONCEAUX; the villas MEDICI, LANTE, GIULIA; the palaces of the DOGES, the PITTI, STROZZI, LOUVRE, LUXEMBOURG, TUILERIES; the churches ST. PETER, ST. PAUL; the ALHAMBRA, and many more. Finally, class (10) comprises the *biographies* of the most prominent personalities in art history, not merely the men who are popularly known, but all those who have contributed original work. The most important are enumerated in the general articles ARCHITECTURE, PAINTING, SCULPTURE, etc.; and in those on the great historic styles, such as GREEK, GOTHIC, and RENAISSANCE ART. Details have been in each case reserved for the biographies.

To recapitulate, access to the mass of articles can be had by simply passing systematically from the more general to the more special in each branch, each article having a list of references, and the whole series being arranged so as to secure a complete mosaic picture, which can be supplemented by the use of the bibliographical lists at the close of the general articles.

TABLE OF ART HISTORY

ORIENTAL	
Babylonian	(c 6000-500 B.C.)
Egyptian	(c.5000- 50 B.C.)
Assyrian	(c.1500-600 B.C.)
Hittite	(c.1500-700 B.C.)
Phœnician	(c.1500- 50 B.C.)
Jewish	(c 1000 B.C.- 70 A.D.)
Persian	(c ? B.C.-600 A.D.)
Chinese	(c.2000 B.C.-1800 A.D.)
Japanese	(beg. c.600 A.D.)
Indian	(beg. c.500 B.C.)
WESTERN	
Ægean	(c.2500-800 B.C.)
Greek	(c 1000-100 B.C.)
Etruscan	(c 1000-200 B.C.)
Roman	(c.300 B.C.-400 A.D.)
CHRISTIAN	
Early Christian	(c 100- 800 A.D.)
Byzantine	(c 400-1450 A.D.)
Romanesque	(c 800-1200 A.D.)
Gothic	(c.1150-1450 A.D.)
Renaissance	(c.1400-1700 A.D.)
Modern	(c.1700-present)

History of Art. The output of literature on this subject during recent years perhaps equals in volume all that has been heretofore done. The best brief manuals of a popular character are those by Goodyear (New York, 1889); Lübke (2 vols., Stuttgart, 1873; latest Eng. trans., New York, 1904); Turner (London, 1903); Rosenhagen (Bielefeld, 1908); and Reinach, *Apollo* (Paris, 1904; Eng. trans., New York, 1907), the clearest and most practical of all. More extensive and scholarly are the works by Schnasse, *Geschichte der bildenden Künste* (8 vols., Dusseldorf, 1866-79); Knackfuss

and Zimmermann, *Allgemeine Kunstgeschichte* (2 vols., Bielefeld, 1900); Carrotti, *History of Art* (2 vols., Eng. trans., London, 1908—). The best and most modern productions, each volume or section written by the highest authorities, are: Woermann, *Geschichte der Kunst aller Zeiten und aller Völker* (3 vols., Leipzig, 1900–11); Springer, *Handbuch der Kunstgeschichte* (5 vols., Leipzig, 1904–07); and André Michel, *Histoire de l'art*, thus far five volumes, each in two parts (Paris, 1905—). Histories of art based upon reproductions are those of Winter and Dehio (5 vols., Leipzig, 1900–02), Neuwirth (Munich, 1910—), and especially the series edited by Ludwig Justi (3 vols. thus far, Berlin, 1910—), with introduction and commentaries by specialists.

The history of art has also been treated in its principal divisions, as in the *Collegé Histories of Art*, edited by J. C. Van Dyke; architecture, by Hamlin (New York, 1909); painting by Van Dyke (ib., 1904); sculpture by Marquand and Frothingham (ib., 1911). The titles of such works, as well as those composing the series of national arts, such as the *Geschichte der deutschen Kunst*, edited by Dohme, the *History of American Art*, edited by Van Dyke, will be found in the bibliographies of ARCHITECTURE, PAINTING, SCULPTURE, ENGRAVING, ETC. Works on the principal chronological divisions of art, ancient, mediæval, and modern, are those of Reber, *History of Ancient Art and History of Mediæval Art* (Eng. trans., New York, 1887) and (best) Perrot and Chézeaux, *Histoire de l'art ancien* (7 vols., Paris, 1881—).

Artist Biographies. These may be best consulted in the dictionaries. The briefest for ready reference is Spelman, *Kunstlexicon* (Berlin, 1905); somewhat longer are Muller and Singer, *Allgemeines Künstlerlexicon* (6 vols. and supplement, Frankfurt, 1895–1906), and Bénézit, *Dictionnaire des peintres, sculpteurs, dessinateurs et graveurs* (2 vols., Paris, 1911—). By far the most scholarly and comprehensive of such works is Thieme and Becker, *Allgemeines Lexicon der bildenden Künstler* (Leipzig, 1907—). The work as planned will have about 150,000 titles. Artist biographies are published in many separate volumes and usually popularly written; such as *Great Masters in Painting and Sculpture*, edited by Williamson (London, 1900—), *Les maîtres d'art* (Paris); *Künstler Monographien*, ed. Knackfuss (Bielefeld, 1895—), and *Klassiker der Kunst* (Stuttgart), the last two having excellent reproductions. This is also the principal feature of the periodical publication, *Great Masters in Art* (Boston), the text of which is composed of selections from standard works. For biographical dictionaries of special divisions of art, such as Painting, Sculpture, Engraving, consult the bibliographies under these titles.

Art Periodicals. Besides giving all kinds of artistic news, these publications often contain important articles of research. The principal in English are: *Art Journal* (London, 1839—); *Studio* (London, 1893—), published also in New York as the *International Studio*, with important American additions; the *Connoisseur* (London, 1901); the *Burlington Magazine* (ib., 1903—), and *Art* (New York, 1913—). Among those in German are *Zeitschrift für bildende Kunst* (Leipzig, 1866—); *Repertorium für Kunstwissenschaft* (Stuttgart and Berlin, 1876—); *Jahrbuch der königlich preussischen Kunstsamm-*

lungen (Berlin, 1880—); *Jahrbuch der Kunstsammlungen des allerhöchsten Kaiserhauses* (Vienna, 1883—). The French periodicals include *Gazette des Beaux-Arts* (Paris, 1859), with its supplement *Chronique des Arts* (ib., 1875) and the *Revue de l'Art* (ib., 1897). The chief Italian are *L'Arte* (Rome, 1898—), *Rassegna d'Arte* (Milan, 1901—), and *Bollettino d'Arte* (Rome, 1907—).

ART, PRIMITIVE. The motives which lead to the production of works of art and the capacity for æsthetic enjoyment seem to be common to men at all levels of culture. We cannot speak, then, of the origin of art in an absolute sense, but only of the first stages of development both in artistic production and in æsthetic appreciation. It is difficult to tell just what primitive peoples themselves regarded as beautiful. Even when we have laid before us articles which seem to involve appreciation of the beautiful—as, for example, carved figures on weapons and cooking utensils—and even when we read of the wardance or the corroboree, or of the practices of tattooing or scarring, it is not easy to tell what emotions were aroused in the primitive mind by the contemplation of these things. A symmetrical spear was more useful than a crude asymmetrical one; a dance may have been intended to appease some god or to bring luck in hunting, as the buffalo dance of some Indian tribes; a series of figures on a bone knife may have been a kind of picture writing, it may have been a mark of individual or tribal ownership; or the figures on a bit of pottery may have simply copied the woven pattern of a more primitive utensil. So that we must distinguish what was done from utilitarian, or religious, or social motives, or for communication, or from simple habit, from what was the result of æsthetic impulses. As a matter of fact, it is highly probable that for a long time purely æsthetic impulses and purely æsthetic productions were rare—that a thing was at once useful and artistic, or religious and artistic, or social and artistic. It is, then, one of the chief problems which artistic origins furnish, to disentangle the æsthetic from the non-æsthetic. For this two things are required. The investigator must know the essential ingredients of the æsthetic consciousness, both on its productive and on its contemplative side, and he must know where the most primitive conditions are to be found. The first requirement is psychological. It takes into consideration the elementary æsthetic feelings (see *ÆSTHETICS, EXPERIMENTAL*), other feelings, emotions, and organic sensations, and the general and special associative factors (brought from the experiences of the individual and of the social group to which he belongs) in the more complex judgments of taste. The second requirement is anthropological. It asks: "What is a 'primitive people'? What is 'primitive culture'?"—assuming that the most primitive art is to be found on the lowest level of civilization. Perhaps the best guide to the primitiveness of a tribe or race is to be found in its means of livelihood. Hunting and fishing evidently take lower rank than agriculture or cattle raising. They imply simpler social conditions and a lower grade of mental development. Fortunately, some of the hunting tribes are still in existence and offer object-lessons in primitive culture. Among them there is almost no social organization, and life is reduced to extremely simple conditions. Even here, how-

ever, evidences of artistic appreciation are by no means rare.

The chief modes in which primitive man expressed his love for beauty are by ornament and in the dance. Painting, plastic art, literature, and music were not, however, entirely lacking. A passion for bodily adornment is characteristic of primitive man. He smeared his body with red, yellow, black, and white cosmetics, tattooed and scarred himself, loaded himself with nose, lip, and ear rings, necklaces of shell and bone, bracelets and anklets, and arranged his hair in the most fantastic fashions; clothing, even, was worn more for adornment than as a covering to the body. As civilization advanced, ornament migrated from the body to the implements and utensils and to the clothes, displaying itself in rich and variegated garments such as are to be seen to-day in the royal attire of Oriental monarchs and in the holiday dress of peasants. From clothing it passed to the decoration of the home, to places of worship, and to public buildings. This is a natural sequence of the widening of the individual's interests in the development of a highly organized society.

An expression of the primitive artistic impulses, which has a greater social significance than ornament, is to be seen in the dance, which was more truly a matter of aesthetics than it is in civilized communities. The essential element in it was energetic and rhythmic movement. It was either simply gymnastic, giving free play to muscular activities, or mimetic, reproducing the actions of beasts and birds and portraying the emotions of love and war. The paintings, drawings, and carvings of primitive tribes furnish a less important means of expression. They are represented by the rock pictures of the Australians, the bone carvings of the Eskimos, and the drawings of the Bushmen. They are remarkable for their careful and faithful representations of natural objects—largely animals—with which the artist was familiar. Their excellence is to be attributed to the careful observation and the manual dexterity which distinguishes the hunter from the agriculturist. Even the drama and the art of poetry are represented among primitive peoples. A limited number of poems have been collected which are real expressions of emotion and which attempt metrical form. Love and nature are seldom employed as themes. The poet sings, by preference, of himself. But the form, rather than the matter, seems to be the essential æsthetic element; since meaningless syllables, in many instances, take the place of words, while the rhythmical movement of the verse has been carefully preserved and retains its original emotive value. The drama grew naturally out of the dance and song. Pantomimic dramas came very early. They have been found among the Australians, the Eskimos, and the Tierra del Fuegians. With the drama comes the song, which is likewise related very intimately to the dance. It has even been said of some primitive peoples that they never dance without song and never sing except in the dance. Thus we see that music, too, has a prominent place in their lives. It is without doubt true that the voice was the first musical instrument, and that the cadences of emotional utterance, the sounds of nature, and the construction of crude musical instruments—the drum, the flute, and the trumpet—all conduced to the development of music. Primitive music is characterized by melody in which the

rhythmic element (made precise by the dance) is far in advance of the harmonic element. The intervals are fewer in number than with us and not so sharply defined, while polyphony is practically unknown. See MUSIC.

Consult: Grosse, *The Beginnings of Art* (New York, 1897); Tylor, *Anthropology* (New York, 1889); Hirt, *The Origins of Art* (London, 1900); Wundt, *Die Kunst* (Leipzig, 1908).

ART, SCHOOLS OF. See DESIGN, SCHOOLS OF.

ARTA, *ār'tā* (the ancient *Ambracia*). An episcopal city of upper Epirus (Map: Greece, C 2), situated 10 miles from the northern coast of the gulf to which it gives its name and 39 miles south of Janina. It stands on the left bank of the river Arta, the ancient *Arachthus*, whence the modern name, which was first used in the eleventh century. It is surrounded by groves of orange trees, gardens, and vineyards; has a considerable trade in wine, agricultural products, tobacco, and fruit, and manufactures cloths and leather. The ancient Ambracia (Ambrakia) was settled by the Corinthians about 640 B.C. and later became an independent republic. It was the capital of Epirus under Pyrrhus; its decline was begun by its seizure in 189 B.C. by the Romans, and its importance was utterly destroyed when Nicopolis was settled (31 B.C.). The city received a new lease of life under the Byzantine emperors, and in the thirteenth century was the capital of the Despot of Epirus. After various changes of rulers Arta became in 1449 a Turkish possession and remained such. It was ceded to Greece as a result of the Treaty of Berlin in 1878. Pop., 1896, 7582; 1907, 8000.

ARTA, GULF OF (anciently, Lat. *Sinus Ambracius*). An arm of the Ionian Sea, 25 miles long and 10 miles wide, penetrating into the western coast of Greece and nearly bisected by 39° N. lat. A bar at its entrance detracts from its usefulness. It is noted as the landing place of Philip V of Macedonia (218 B.C.), during the war with the Achaean League, and for the naval battle of Actium fought at its mouth 31 B.C.

AR'TABA'NUS (Gk. *Ἀρτάβανος*, *Artabanos*) (?-226 A.D.). The last King of Parthia. After his kingdom had been devastated by the army of Caracalla Artabanus gave battle to Macrinus, near Nisibis (217). After two days of desperate fighting the Romans were defeated and peace was concluded. During the war Artabanus lost his best troops, and the Persians seized the opportunity of recovering their independence. Led by Artaxerxes (Ardashir), the founder of the dynasty of the Sassanids, they defeated the Parthians in three great battles, in the last of which Artabanus was taken prisoner and killed (226). This ended the kingdom of the Aracids, which had existed about 475 years. Consult Gutschmid, *Geschichte Irans*.

AR'TABA'ZUS (Gk. *Ἀρτάβαζος*, *Artabazos*). The name of several distinguished Persians in the times of the Achæmenids. When Xerxes advanced against Greece, it was an Artabazus who led the Parthians and Chorasians. He later warned Mardonius against engaging in battle at Plataea, and on the first indications of defeat he withdrew his own division, amounting to 40,000, from the field, and succeeded, though with great difficulty, in forcing his way through the wilds of Thessaly, Macedonia, and Thrace to Byzantium, where he crossed to Asia. Subsequently he acted as negotiator between the Spartan Pausanias and Xerxes. Another Ar-

tabazus was general under the Persian King, Artaxerxes Mnemon, and revolted against Artaxerxes Ochus in 356 B.C. For this offense he appears to have been forgiven, and subsequently we find him accompanying Darius Codomannus after the battle of Arbela. On the murder of the King Artabazus attached himself to Alexander, who rewarded his fidelity by appointing him satrap of Bactria.

ARTAGNAN, D', dār'tā'nyān'. The hero of Dumas's *Trois mousquetaires*, *Vingt ans après*, and *Le Vicomte de Bragelonne*. He is chiefly known in modern times as a well-drawn character in these novels; and the Gascon adventurer who goes to Paris to seek his fortune, winning his way by his sword, his genius for intrigue, and the aid of his three friends, Athos, Porthos, and Aramis, is among the most popular heroes of fiction, both on and off the stage. But he was also an actual historical personage of note. Charles de Baatz de Castelmor, Count d'Artagnan, was born in 1611 or 1612. By 1654 he had risen to be captain in the Guards. When the musketeers were reestablished in 1657, he was made *sous-lieutenant*; but as the nominal head of the corps, the Duke de Nevers, paid no heed to his duties, he was practically its commander-in-chief, becoming actual *capitaine-lieutenant* in 1667. His most noteworthy official act was the arrest of the all-powerful minister, Fouquet, in 1661. He was made *maréchal-de-camp* (brigadier-general) in 1672, and fell in June of the following year at the siege of Maastricht.

ARTAN'THE. See MATICO.

AR/TAPHRE'NES, or **AR/TAPHRE'NES** (Gk. Ἀρταφέρνης, Ἀρταφέρνης). A Persian general, who, with Datis, commanded the Persian army that invaded Greece (490 B.C.) and was defeated at Marathon. He led the Lydians and the Mysians in the expedition of Xerxes against Greece in 480 B.C.

ARTAX'ATA (Gk. Ἀρτάτα, Armen. Artasat). The ancient capital of Armenia, on the Araxes, where Hannibal took refuge when Antiochus could no longer protect him. The Carthaginian is said to have superintended the building of the city, which was named from the King Artaxais I about 180 B.C., on the site of an older city, Armavir. It was destroyed by the Romans (58 A.D.), rebuilt by Tiridates, and called Neronia, in honor of Nero, who had granted the kingdom to Tiridates. It was taken and partly destroyed by the Persians in 370, and in 450 it was the seat of an ecclesiastical council, over which Joseph, the patriarch, presided. The ruins of the city are now called Ardashir.

ARTAXERX'ES (Gk. Ἀρταξέρξης, OPers. Artaxšātra, 'whose kingdom (xšātra) is right (arta)'). The name of three of the ancient Persian kings of the Achaemenian dynasty. (See ACHÆMENES.) The same title, under its later and changed form of Artakshatar, or Ardashir, reappears as the name of three sovereigns of the Sassanian dynasty. (See SASSANIDE.)—The first of the ancient monarchs of the name is ARTAXERXES I, surnamed Longimanus, or Μακρόχειρ, from the Persian Dirāzdašt, 'the long-handed.' Whether this designation referred to an actual physical peculiarity or to the extent of his empire is uncertain. He was the son of Xerxes I, and he ruled over Persia, 465–424 B.C. The Egyptian revolt which broke out in the first part of his reign was suppressed about 455. The hostilities which existed between Persia and Greece were checked by the

victory which the Hellenic arms gained over the Persian forces in Cyprus (449), and a truce was arranged on the initiative of Artaxerxes. During his reign the Peloponnesian War in Greece broke out (431). Artaxerxes died at the close of the year 425, or in the beginning of the year 424, on the same day as his wife Damaspiā. His name is preserved on a tablet which he caused to be inscribed in the palace at Persepolis, and it has been found also on a porphyry vase.—ARTAXERXES II, surnamed Mnemon, from his tenacious memory, was a grandson of the preceding, and son of Darius II, whom he succeeded as King of Persia 404–358 B.C. He is the most important of the three kings of the name; and he is best known to history because of the revolt of his brother, Cyrus the Younger, which resulted in the battle of Cunaxa (401) in which the latter was killed, as described by Xenophon in the *Anabasis*. Artaxerxes rebuilt the royal palace at Susa, and his inscriptions mention the Zoroastrian divinities Anāhitā (see ANAÏTIS) and Mithras, which fact is of interest in regard to the question of his faith. His life is included among Plutarch's biographies.—ARTAXERXES III, or Ochus (OPers. Vahuka), son of the preceding, and King of Persia 359–338 B.C. He was the contemporary of Philip of Macedon. Ochus was a weak and despotic ruler, enough proof of which was given by his behavior when he subdued Egypt, about 345. His policy throughout was largely guided by his shrewd and influential eunuch Bagoas, at whose hands, through poison, he ultimately lost his life.

ARTEDI, ār-tā'dē, PETER (1705–35). A Swedish naturalist. He was born at Anund, Sweden, Feb. 22, 1705, and studied at Upsala, where he and Linnæus became youthful friends. Resolving to reform the existing systems of classification, Artedi gave his attention to fishes and Linnæus to plants. He was drowned at Leyden, Sept. 21, 1735. At the time of his death he left materials for his *Ichthyologia*, which Linnæus edited and published, together with a life of the author, in 1738. A new edition appeared in 1788, and a part of it was expanded and reissued, edited by Schneider, in 1789, under the title *Synonymia Piscium*. According to Cuvier, the great work of Artedi is the first named, which gave a truly scientific character to the study of fishes. The only error of any magnitude which occurs in it is the inclusion of the Cetacea among fishes. Artedi was also a distinguished botanist. He was the first to indicate, as a special characteristic, the presence or absence of involucre in the umbelliferous plants, whose species are so difficult to distinguish from each other. Linnæus named a genus of these, in memory of his friend, *Artedia*.

AR/TEGAL. The personification of justice in the *Fæerie Queene*. The character is also supposed to represent Lord Grey, Spenser's patron.

ARTEL, ār-tyél'. The Russian name for a gang. It refers especially to associations of independent laborers working collectively on a job and dividing the profits. It is a primitive form of coöperative production, which sometimes resembles the old trade guild and is still in existence among the fishermen of Archangel. Among the peasants in agricultural labor the artel has been largely displaced by the contract system, though they are still organized on the coöperative basis sometimes for the purchase of provisions. See GANGS, AGRICULTURAL.

ARTEMIDORUS (Gk. 'Αρτεμίδωρος, *Artemidōros*). A geographer and native of Ephesus, who lived about 100 B.C. On one occasion he was sent to Rome to recover certain temple treasures which had been wrongfully appropriated by the Roman officials. In recognition of his success on this embassy, his townsmen erected a golden statue to him. His travels extended through the lands bordering on the Mediterranean Sea and the less distant parts of the Atlantic Ocean and the Red Sea. The *Γεωγραφούμενα*, *Geographoumena*, in 11 books, was a comprehensive work on the geographical, physical, historical, and political features of the most important countries of Europe, Asia, and Africa, and was based on the author's own investigations and a study of the works of Timosthenes, Eratosthenes, Polybius, Agatharchides, and others. It was much used by later authors, but only fragments, fortunately numerous, have come down to us. An epitome of the work was made by Marcianus of Heraclea, which, too, has been lost. Artemidorus wrote another book called 'Ιωνικά 'Υπομνήματα, *Ionika Hypomnēmata*. He seems to have been much influenced by Polybius.

ARTEMIS. See **DIANA**.

ARTEMISA, är'tā-mē'sā, or **ARTAMISA**, är'tā-mē'sā. A town of Cuba, in the province of Pinar del Rio, situated about 45 miles by rail southwest by west of Havana (Map: Cuba, C 4). It carries on a considerable trade in sugar and tobacco. Pop. (latest report), 1899, 4179.

ARTEMISIA, är'tē-mish'i-ā (Gk. 'Αρτεμίσια). The name given to festivals of the Greek goddess Artemis (see **DIANA**), held in all quarters of the Greek world. One of the most important of such festivals was held at Ephesus. There the statue of the goddess, equipped with bow and arrows and draped with the skin of a wild beast, was carried in procession: young women, representing nymphs, danced, and contests of various sorts were held.

ARTEMISIA (Lat., Gk. 'Αρτεμίσια, probably from being dedicated to Artemis). A genus of plants of the family Compositæ, in which the flowers of the disk have stamens and styles and are either fertile or abortive, those of the ray pistillate and fertile. The heads of the flowers are numerous and small; the leaves are generally much divided. There are many species, herbaceous plants and shrubs, natives chiefly of the more temperate regions of the Eastern Hemisphere and the western United States. They have generally an aromatic smell, more or less agreeable, and a warm, sometimes rather acrid and bitterish taste. To this genus belongs wormwood (*Artemisia absinthium*), the *apsinthion* of the ancient Greeks, to whom its medicinal properties were well known. It is a native of Great Britain, the continent of Europe, and the northern parts of Asia, growing in waste places, by waysides, etc. It is a perennial, 2 to 4 feet high; its leaves are bipinnatifid and clothed with a silky down, and its small, hemispherical drooping heads of flowers are of a dingy yellow color and are produced in axillary panicles. It is aromatic and bitter, containing a bitter principle and an essential oil, on account of which it was formerly used in medicine in various forms (oil, extract, tincture, etc.), as a stomachic and anthelmintic or vermifuge, and as a febrifuge. Sea wormwood (*Artemisia maritima*, including a variety which has been called *Artemisia gallica*), a native of salt-marshes in Great Britain and other parts of Europe, pos-

sesses similar properties; as also Roman wormwood (*Artemisia pontica*), a native of the middle and south of Europe, but not of Great Britain; Tartarian wormwood (*Artemisia santonica*), a native of Tartary, Persia, and other parts of the East; and Indian wormwood (*Artemisia vulgaris*), a native of the Himalayas, abounding at elevations of 2000 to 6000 feet. Indian wormwood grows to the height of 12 feet. It is considered in India a powerful deobstruent and antispasmodic. Tree wormwood (*Artemisia arborescens*), a native of the south of Europe and the Levant, is also larger and more shrubby than the common wormwood. The dried flower-buds of a number of species of *artemisia* are sold under the names of wormseed and have long been in much repute as anthelmintics. *Artemisia pauciflora*, known as Levant wormseed, contains the crystalline principle santonin employed in medicine as a vermifuge. *Artemisia absinthium*, from which the bitter aromatic liquor called *extrait, eau, or crème d'absinthe* is prepared, is a small, low-growing species, as are *Artemisia mutellina*, *Artemisia glacialis*, *Artemisia rupestris*, *Artemisia spicata*, etc., found on the Alps, and known to the inhabitants by the name of *genipi*. Mugwort (*Artemisia vulgaris*), a common native of Great Britain and of the continent of Europe, often found about ruins and in waste places, grows to the height of 3 or 4 feet, has pinnatifid leaves and panicles of small yellow flowers. It emits, when rubbed, an agreeable smell and has a bitter taste. In Germany the young shoots and leaves are used in cookery for seasoning. It is used also for the same medicinal purposes as wormwood, but is weaker. Its leaves, and those of some of the other species, are used as fomentations for cleansing and healing wounds. Southernwood (*Artemisia abrotanum*) is a shrubby plant with long, straight stems 3 to 4 feet high, the lower leaves bipinnate, upper leaves pinnate. It is a native of the south of Europe and middle parts of Asia and has long been a favorite plant in cottage gardens in Great Britain. It has an aromatic and pleasant odor. The leaves are used to drive away moths from linen, and in some parts of the Continent as an ingredient in the manufacture of beer. The smell of this plant appears to be peculiarly disagreeable to bees, which retreat from it; and a little branch of southernwood is sometimes used when they are swarming, to promote their ascent into the new hive. Tarragon (*Artemisia dracunculus*) is a perennial plant, a native of Siberia, and long cultivated in gardens in Great Britain. It has a branching stem 1 to 1½ feet high, with narrow leaves. It is fragrant and has an aromatic smell and taste. The leaves and tender tips are a favorite ingredient in pickles. An infusion of the plant in vinegar is used as a fish sauce. The leaves of *Artemisia maderuspatana* or *Grangea maderuspatana* are regarded in India as a valuable stomachic and are also used in anodyne fomentations. Moxa (q.v.) is prepared by the Chinese from the leaves of *Artemisia moxa* and other species. In the western United States many shrubby species exist and are known as sagebrush. One of the most common is *Artemisia tridentata*, with small, wedge-shaped leaves, 3- to 7-notched. *Artemisia cana*, silvery sage, *Artemisia mexicana*, white sage, and *Artemisia ludoviciana*, prairie sagebrush, are other important range species. Certain varieties of the

sagebrush are important winter forage for sheep, and are occasionally eaten by cattle under the spur of starvation. The so-called "black sage," which occasionally reaches 10 feet in height, is, in many of the more isolated portions of the western United States, the only fuel of the settlers. See Plate of DESERT PLANTS.

ARTEMISIA (Gk. *Ἀρτεμισία*). 1. A queen of Halicarnassus in Caria, and a vassal of the Persian King, who joined the fleet of Xerxes in the expedition against Greece, and distinguished herself by bravery and skill at the battle of Salamis (480 B.C.). The Athenians, indignant that a woman should appear in arms against them, offered a reward of 10,000 drachmæ for her capture, but she escaped. According to a doubtful tradition, Artemisia afterward jumped from the Leucadian Rock, in consequence of a disappointment in love. 2. A daughter of Hecatomnos and wife of Mausolus, of Mylasa, her own brother. She followed Mausolus, in 353 B.C., as a ruler of the satrapy of Caria, and with energy and skill thwarted an effort of the Rhodians to free themselves and surprise Halicarnassus, the capital of the satrapy. She completed the famous Mausoleum, and died in 351, according to tradition, of grief at the death of her husband.

ARTEMISIUM, är'té-mish'ŭ-ŭm (Gk. *Ἀρτεμισιον*, *Artemision*). 1. The stretch of coast at the northern extremity of Eubœa, opposite the Thessalian Magnesia. It belonged to the town of Histiaea, and was named from the temple of Artemis, which stood here. Off this point occurred the first naval conflict between the Greeks and the Persians at the time of the invasion of Xerxes. 2. A mountain 5400 feet high between Argolis and Arcadia, between Mantinea and Argos, now called Malewo. On the summit was a temple of Artemis. 3. A promontory and temple of Artemis in Caria. 4. A small city in Sicily, near Myla, in which was a famous temple of Artemis Phakelitis.

ARTERIOSCLEROSIS (Gk. *ἀρτηρία*, *arteria*, artery + *σκληρώσις*, *sklērōsis*, induration). A disease of the arteries beginning in the internal coat (*intima*) as a chronic inflammatory process and finally resulting in hardening of the muscular elastic coat. The connective tissue of the walls is increased in quantity. This produces a contraction, by pressure, on the blood vessels supplying the artery, which in turn causes weakening and degeneration of the walls of the vessel. It loses its elasticity, becomes hard and rigid, and is easily ruptured. If the degeneration takes place in spots or mainly involves one of the arterial coats, with the production of fatty degeneration and subsequent deposit of lime salts in the walls of the vessel, it is termed *atheromatous*, from *atheroma* (Greek *athērē*, meal), the name of the fatty or chalky substance. At times the increase in the amount of connective tissue is so great that the lumen of the blood vessels is obliterated. The causes of arteriosclerosis are chronic alcoholism, gout, lead poisoning, syphilis, deficient metabolism from habitual overeating, overwork of the heart, and kidney diseases. Vital statistics show a steadily increasing proportion of deaths from heart and kidney diseases, associated with arteriosclerosis, in modern city dwellers, a state of affairs believed to be dependent on sedentary existence, combined with overeating and drinking, and the worries incident to the complicated economic problems of modern life. Experimental

injection of bacterial cultures and toxins into the wall of the aorta have resulted in the production of aortitis, the most marked changes being in the middle coat, where calcareous deposits occurred. The close resemblance of these results to natural pathologic conditions suggests infection as a possible cause. See ARTERY.

ARTERY (Lat. *arteria*, Gk. *ἀρτηρία*, *artēria*, wind-pipe, artery). In anatomy any vessel through which the blood passes from the left side of the heart to the tissues, from the old idea that these tubes were air-carriers because they are empty after death. In its structure an artery may be roughly subdivided into three layers, called coats: an external, elastic and distensible, the *tunica adventitia*; a middle, muscular coat, the *tunica media*; an internal, smooth and transparent, lined with endothelium, the *tunica intima*. The tube is also enveloped in a layer of cellular tissue, termed the *sheath*. When an artery is wounded by a sharp instrument, the effect varies with the direction of the cut. If longitudinal, the edges may not separate, and the wound may heal without much bleeding; if oblique or transverse the edges gape, and a nearly circular orifice allows of a profuse hemorrhage. If the artery be completely divided, its walls do not collapse like those of a vein; the cut orifice contracts, and also retracts into its sheath; this checks the flow of blood, a clot of which shortly forms on the outer side; then another forms inside the vessel, and together they stem the flow till the cut edges of the artery have time to throw out lymph (see ADHESION), and heal as other wounded tissues. When an artery is compressed by a ligature, the brittle inner and middle coats crack, curl inward, and unite. See BLEEDING.

SUBDIVISIONS OF ARTERIAL WALL.

- | | |
|-------------------------|----------------------------|
| 1. Endothelial layer. | 4. Elastic layer. |
| 2. Penetrated membrane. | 5. Fibro-connective layer. |
| 3. Muscular layer. | 6. Areolar sheath. |

The arteries of the human body are all offshoots of the aorta. As each main trunk passes into a portion of the body, it divides into superficial and deep branches which anastomose freely, so that the tissues are not dependent for their supply on a single arterial trunk.

Diseases of the Arteries. The diseased conditions affecting the arteries consist of (1) degeneration of the arterial walls (either fatty, calcareous, or hyaline); (2) arteriosclerosis; and (3) aneurism. *Fatty degeneration of the intima* (inner coat) is very common. It occurs as yellowish spots in the aorta and larger vessels. *Calcareous degeneration* succeeds the fatty change, and occurs as flakes or plates of chalky deposit in the *intima*. It is the terminal stage of arteriosclerosis. *Hyaline degeneration* is a

change usually found at the beginning of arteriosclerosis. It occurs as a smooth, homogeneous substance replacing the *tunica intima*, generally distributed throughout the smaller arteries and capillaries, especially in the kidney. The substance which replaces the normal tissue of the arterial coat is called *atheroma* (from Greek *athērō*, meal), whether hyaline, fatty, or calcareous; it consists of a pulpy or hardened mass of cholesterine, oil, albuminous and chalky material. In some arteries, such as those over the temples and at the wrists, chalky deposits or atheromatous thickening may be felt easily. Atheromatous deposit is at first attended with a narrowing of the calibre of the vessel, varying with the thickness of the deposit, and most marked at the points of bifurcation. Smaller arteries may be completely obliterated, while the larger arteries may be very much contracted. A later consequence is dilatation of the vessel, and this again may terminate in aneurism. The arteries sometimes become abnormally lengthened and consequently not only dilated but tortuous. Another condition involving much danger is this: a calcified artery loses the smoothness which the interior of the vessel ought to present, rough projections form, upon which the fibrin of the blood may be deposited in small clots; these, becoming detached, may be carried with the blood till they become arrested and plug up an artery, giving rise to embolism or thrombosis. A blow may crush a diseased artery, when a healthy elastic vessel might have escaped injury. A ligature applied to a calcified artery is apt to cause it to break, and the difficulty of securing such vessels is often very great. It is to this form of disease that most of the failures of operations for aneurism are due. The heart's action in pumping blood through stiff, unyielding arteries whose calibre is diminished causes a permanent rise in the blood pressure, resulting in hypertrophy of the heart, disease of the kidneys, cerebral hemorrhage, aneurism, gangrene, or sclerosis of the coronary arteries. *Arteritis*, or *inflammation of the arteries*, is no longer recognized as a distinct disease. See ARTERIOSCLEROSIS; HEART; KIDNEYS; APOPLEXY; ANEURISM; GANGRENE.

ARTESIAN (ār-tē'zhan) **WELLS** (from the old county of Artois, Lat. *Artesia*, now part of France, where the oldest well in Europe was bored in 1126). Vertical borings into the ground, to a depth of 100 feet or more for the purpose of obtaining water from some deeply buried porous stratum, such as sandstone or gravel. In the true artesian well the water should flow to the surface, but at present the term "artesian" is applied to any deep well, even where the water is obtained by pumping.

The presence of an artesian water supply in any region depends upon the existence beneath that region of a tilted porous layer, inclosed between two impervious beds. The outcropping edge of the porous bed must, moreover, be of sufficiently open texture to soak up the rain which falls upon it, and furthermore there must be no escape of the contained water from the lower portions of the bed. It is therefore evident that when such a porous stratum is saturated with water, the latter will be under pressure, the pressure at any one point amounting to that of a column of water whose height is the difference between the altitude of that point and the altitude of the outcrop of the water-bearing layer. If now from a point on the surface, at a level

lower than that of the outcrop of the porous stratum, a drill hole be sunk to the water-bearing bed, a flow of water will be obtained, but the water will seldom rise to the same level as the point of intake owing to the friction which has to be overcome in flowing through the porous bed. The most favorable conditions are when the rocks form a basin, or when the inclined porous layer passes into an impervious one. The collecting area, or region drained by the porous stratum may be in the immediate vicinity of the well (a common case in shallow wells) or it may be at a distance of several hundred miles. In boring for artesian water a knowledge of the geological structure of the region is of highest importance. The work of the United States Geological Survey, aided by data obtained from wells already bored, has demonstrated the existence of several extensive and well-marked artesian water-yielding areas. Thus a large part of Nebraska, South Dakota, eastern Colorado, and northwestern Kansas obtains its artesian water from the Dakota sandstone, the collecting area of which is around the base of the Black Hills in South Dakota and along the eastern foothills of the Rocky Mountains. The Iowa wells derive their water from the St. Peters sandstone, whose collecting area is in Wisconsin. Along the Atlantic coast many wells obtain a supply of pure water from the southeasterly dipping Tertiary and Cretaceous beds underlying that area.

Artesian wells in all parts of the country yield a supply of water for domestic use, which in many instances is much purer than surface water. In the arid regions of the West they also serve the purpose of supplying water for irrigation, thus rendering fertile the soil of many districts otherwise non-productive.

The Chinese were acquainted with artesian wells, and in Europe they have been used for centuries—in France, England, Austria, and Germany; indeed, the basin-shaped structure of the Paris and London areas, with their alternating beds of clay and sand, has yielded the type structures for artesian water supply. Portions of the Sahara Desert have been reclaimed by artesian water derived from wells sunk by the French government. The effect of these wells has been materially to benefit the country and also to change the character and habits of its nomadic Arab inhabitants. Several tribes are said to have settled down around these artificial springs, and to have constructed villages, planted palms, and entirely renounced their previous wandering existence.

Many artesian wells have been driven to a great depth, their diameters varying from 3 to 6 inches, several such deep borings having been made in the United States; e.g., at St. Louis, Mo. (3843.5 feet); Columbus, Ohio (2775½ feet); Louisville, Ky. (2086 feet); West Chicago, Ill. (3081 feet); Galveston, Tex. (3071 feet); Pittsburgh, Pa. (4625 feet). At Wheeling, W. Va., there is a dry well 4500 feet in depth, which has furnished valuable records of temperature changes in the earth's crust. Among the noted foreign wells is one at Passy, near Paris, 1923 feet deep; Sperenberg, near Berlin, 4194 feet; Schladenbach, near Leipzig, 5735 feet.

The temperature of artesian well waters is commonly about 40° to 50° F., except in the case of deeper wells, whose waters may reach a temperature of 70° to 80°. The water from a well at Charleston, S. C., registers 87°. In

some places these hot waters are used for heating buildings, as at Grenelle, Paris. The Grenelle well-water has a surface temperature of 81.70° F.

Cases are not infrequent where artesian waters are charged with gases such as carbon dioxide or hydrogen sulphide; or they may contain mineral substances in solution, thus at times serving as medicinal waters.

The methods adopted for boring artesian wells are similar to those employed in drilling oil wells. (See WELL SINKING.) The cost is commonly from \$2 to \$3 per foot for the first 1000 feet, and 50 cents greater per foot for each additional 500 feet. Artesian wells commonly show a gradual decrease in flow, due either to partial filling of the tube, or to reduction of pressure because of the boring of new wells in the same vicinity, or to exhaustion of the basin. More precise information regarding the distribution and characteristics of the artesian waters of different portions of the United States may be found in the bulletins and annual reports of the United States Geological Survey and of the geological surveys of various States, particularly those of Iowa, New Jersey, Mississippi, and Missouri.

ARTEVELDE, är'te-vël'de, JACOB or JAMES VAN (c.1290-1345). A popular leader of the Flemings. The war between England and France having threatened the cloth industry of Flanders, Artevelde was persuaded to lead the Flemings against the encroachments of Count Louis of Flanders, the vassal of the French King. In December, 1337, he assumed the leadership, and, with the aid of the men of Ghent, freed the town from the nobles and adherents of the Count. Afterward Artevelde was elected captain-general of the town of Ghent. In 1338 he made a commercial treaty with England, but maintained the policy of armed neutrality. Edward III of England, wishing to gain him as an ally, landed at Sluys, but was resisted. Edward's first campaign proving successful, Philip of Flanders refused to recognize the neutrality of the Flemings, thus forcing them to declare for the English. Artevelde now urged Edward to assume the title of "King of France," and the Flemings, in 1340, accepted Edward as their liege lord. The chief power remained in the hands of Artevelde. On July 24, 1345, he was slain in a popular tumult at Ghent, presumably because he intended to recognize the Black Prince as Count of Flanders.

ARTEVELDE, PHILIP VAN, son of Jacob, born about 1340, entered public life in January, 1382. Differences had again arisen between the Flemings and Count Louis. Under Yoens, the former burned the Count's favorite castle and set up the standard of revolt. Yoens dying the same year, Peter van den Bossche became leader; but, as affairs seemed to be going badly for the revolt, Artevelde was chosen chief captain. By severe discipline and skillful tactics he defeated the Count's forces and entered Bruges; but, in November, Charles VI brought a great army from France. Artevelde took his stand at Roosebeke, but was defeated and slain, Nov. 27, 1382.

Sir Henry Taylor published a drama entitled *Philip van Artevelde* (London, 1834). Consult Ashley, *James and Philip van Artevelde* (London, 1883), and Hutton, *James van Artevelde* (London, 1882).

ARTFUL DODGER, THE. The nickname of John Dawkins, one of the band of youthful pick-pockets maintained by Fagin the Jew, in Dickens's *Oliver Twist*.

ARTHOIS, är'twä', JACQUES D' (1613-86). A Flemish landscape painter. He was born at Brussels and modeled his art upon that of the pupils of Rubens. His pictures, the subjects of which are derived principally from the forests and environs of Brussels, are characterized by great facility of execution, but lack fidelity to nature. The figures in his landscapes are often painted by such able artists as Teniers, Pierre Bout, and Van der Meulen. His paintings are numerous in the galleries at Madrid, Brussels, and Vienna, and in various French and German museums.

ARTHRITIS (Gk. *ἀρθρίτις*, joint disease, gout, from *ἄρθρον*, *arthron*, joint). An inflammation of the joints, arising from wounds, bruises, or surgical operations, and sometimes without apparent cause. It frequently follows a bacterial infection. All, or a part, of the joint may be involved. The main symptoms are swelling, pain, heat, and redness. The diseases with which arthritis is commonly associated are gout, rheumatism, gonorrhoea, tuberculosis, syphilis, pyæmia, and typhoid fever. Acute and chronic forms are recognized. The usual treatment in acute cases is compression by cloths wet with cold water, rest, cooling diet, and sedatives. Counter-irritation by means of iodine, turpentine, or mustard, may be of service in chronic or sub-acute cases. Sometimes cupping or leeching may be indicated. See GOUT; SYNOVITIS.

ARTHROPODA (Gk. *ἄρθρον*, *arthron*, joint + *πούς*, *pous*, foot). One of the phyla of animals. They are bilaterally symmetrical, and the body is divided into segments, of which each typically carries a pair of jointed appendages. The brain lies dorsal to the food canal and is connected with a ventral chain of ganglia. The body is covered with a fine chitinous cuticle, periodically molted. The Arthropoda are descended from the Annulata, from which they differ chiefly in the jointed appendages, which are used largely as walking, instead of merely swimming, appendages, and they have advanced beyond the annelids in the specialization of the segments and appendages, so that in general, head, thorax, and abdomen may be distinguished. The head always bears a pair of jaws and at least one pair of antennæ, except when, as in spiders, these are rudimentary or altogether gone. The abdomen is usually devoid of developed appendages; when present, these have other functions than locomotion. Sense organs are usually well developed, except in the parasitic forms. The eyes are either simple and placed directly above the brain, or compound, and are sometimes placed on movable stalks. The mouth is usually provided with one or more pairs of appendages; the intestine may be coiled, and excretory organs occur chiefly either as specialized tracts or as diverticula of the midgut, or as tubular special glands. An incomplete blood system is present, but veins are often lacking, and the blood returns through the general body spaces. The dorsal vessel functions as a heart and may become very short and specialized. Reproduction is usually bisexual, but parthenogenesis occurs. During development repeated moltings (ecdyses) occur, often associated with profound changes in form; from molt to molt constitutes a larval "stage."

Classification. Class I. *Crustacea*, divided into *Entomostraca*, of small size and a variable number of segments, and *Malacostraca*, usually of large size, with 20 segments in the trunk (ex-

cepting one small and rare group, Nebalia). Orders of Entomostraca: Phyllopoda (fairy-shrimps), Trilobita (fossil), Ostracoda, Copepoda (water-fleas), Cirripedia (barnacles). Chief orders of Malacostraca: Isopoda (sow-bugs), Amphipoda (beach-fleas), Cumacea, Stomatopoda (mantis shrimps), Schizopoda (shrimps and prawns), Decapoda (lobsters, crayfish, crabs).

Class II. *Arachnida*—Orders: Scorpionida (scorpions); Pseudoscorpionida (book scorpions); Pedipalpida (scorpion spiders); Solpugida (Galeodes); Phalangida (harvestmen); Araneida (spiders); Acarida (ticks and mites); Xiphosura (king crab).

Class III. *Onychophora*, containing only Peripatus.

Class IV. *Myriapoda* (Centipeds, etc.).

Class V. *Insecta*—Orders: Aptera (spring-tails and silver-fish); Orthoptera (cockroaches, grass-hoppers, etc.); Neuroptera (dragon-flies, May-flies, caddis-flies, etc.); Hemiptera (bugs); Diptera (gnats and flies); Lepidoptera (butterflies and moths); Coleoptera (beetles); Hymenoptera (bees, wasps, etc.).

Bibliography. References to books will be found under various articles describing groups or species of Arthropoda. Consult, as general works, particularly the series "Cambridge Natural History," and Parker and Haswell, *Text-book of Zoology* (London and New York, 1897); Lankester, Hutton, and others, "Are the Arthropoda a Natural Group?" in *Natural Science*, vol. xi (London, 1897); Kingsley, "Classification of the Arthropoda," in *American Naturalist*, vol. xxviii (Philadelphia, 1894).

ARTHROSPORES (Gk. *ἄρθρον*, *arthron*, joint + *σπόρος*, seed). A name applied to the resting cells of certain of Blue-green Algæ. In *Nostoc* the ordinary working cells form a filament that resembles a string of beads. When the conditions for work begin to be unfavorable, certain cells enlarge, accumulate reserve food, and become thick-walled. These cells (the arthros-pores) are able to endure cold or drought; and upon the return of favorable conditions the heavy wall is broken through, and work is resumed. These "arthrosphores," therefore, are not real spores, but are simply protected working cells.

ARTHUR. A half-legendary king of the Britons, supposed to have reigned in the sixth century. He was the great national hero of the British Celts and became the central figure of one of the principal cycles of mediæval romance. Nothing is absolutely known of his history, and his existence has sometimes been denied altogether. The more usual view, however, recognizes at least an historic starting point for the great body of tradition that centres in his name. In accordance with a favorite theory of modern mythologists, Arthur is often regarded as a combination of an actual British hero with one or more ancient Celtic gods. Thus, Professor Rhys, who connects Arthur's name with an Aryan root which means 'to plow,' thinks that some elements in his legend belonged originally to a culture-god described on Continental inscriptions as Mercurius Artaois, or Mercurius Cultor, while perhaps other elements were derived from an old sky-god, a kind of Celtic Zeus.

The usual account of Arthur, as given by Geoffrey of Monmouth, is briefly as follows: He was the son of Uther Pendragon, King of Britain, and Igerne, the wife of the Duke of Cornwall, whose union was effected by a device of

Merlin the Wizard. After the death of the Duke, Uther made Igerne his queen, and in due time Arthur succeeded to the throne. Upon becoming King, Arthur at once took the lead of his people in their wars with the Saxons and defeated the invaders on every hand. Encouraged by victory, he extended his conquests to Ireland, the Orkneys, and even to Norway and Gaul. Meanwhile he established a great court at Caerleon-on-Usk, where, with his Queen Guinevere (or Guanhumara), he was surrounded by a grand assemblage of knights and kings. After a time a message came from the Emperor of Rome demanding tribute, and Arthur, ably supported by Gawain, conducted a successful expedition against the forces of the Empire. In the midst of his victories on the Continent Arthur was recalled to defend his kingdom and Queen from the traitorous Modred, who had seized upon both in his absence. Arthur undertook to put down the rebellion, and in the first battle his forces were victorious, but Gawain was slain. Then, in the battle at the river Camel, Modred was defeated and killed, but Arthur himself was grievously wounded and carried off to the island of Avalon to be healed. The hope was long cherished by the British people that Arthur would some day return and restore them to power.

Much of this narrative is obviously unhistoric, and very little of it can be traced with certainty to sources older than the ninth century. The first recorded mention of Arthur is in the *Historia Britonum* of Nennius, who lived about the year 800. He is there described as a *dux bellorum*, who, along with other leaders of the Britons, fought 12 battles against the Saxons. The *Annales Cambriae* (contained in a MS. of the tenth century) also mention him, giving the year 537 as the date of his death. The *Vita Gildæ* (preserved in a twelfth century MS.) speaks of him as a king of all Britain. But not till we come to the *Historia Regum Britanniae* of Geoffrey of Monmouth (which already existed, in some form, as early as 1139) do we find the more fully developed story of which an outline has just been given. The question with regard to Geoffrey's sources is very difficult and may never be fully settled. The later chroniclers—Wace, Layamon, Robert of Gloucester, and the rest—for the most part repeat the same account with minor modifications. Thus Wace (who wrote in 1155) first mentions the Round Table, an element which he surely did not invent, but must have derived from current Celtic traditions.

It was not in the chronicles, however, that the material about Arthur found its fullest and best expression. The fame of his court was most widely celebrated in the romances of chivalry. Of this class of literature one of the earliest and greatest representatives was the French poet, Chrestien de Troyes, who wrote in the latter half of the twelfth century. He had many followers in France, and the French romances were widely translated and imitated in the other European languages. The relation between the romances and the chronicles is not entirely clear, but the latter cannot be looked upon as the source of any considerable part of the material in the former. In the romances less attention is paid to Arthur and his conquests, and far more to the lives and exploits of his several knights; so that the King, while remaining the central figure of all the poems, is the hero of hardly any. Gawain, Ywain, Lancelot, and Perceval are cele-

brated in turn, until they, too, give place to new knights, the favorites of new poets. Most of the earlier romances (like those of Chrestien) were metrical; but the stories soon began to be worked over in prose, and finally great prose cycles were written, in which the scattered episodes were woven together with as much consistency as could be obtained. The great example in English of this stage of development is the *Morte d'Arthur* of Sir Thomas Malory, which has been the source of Arthurian lore most consulted by English readers and writers since the fifteenth century.

The origin of the material in the romances and the manner of its transmission have long been the subject of voluminous discussion. Some scholars have maintained that there is nothing distinctively Celtic in the cycle beyond the names, the geographical setting, and an occasional incident. Others, holding the stories to have been in large part the property of the Celtic races, have discussed whether they were transmitted to the French poets in England or on the Continent, whether through the Armorians or through the Welsh. Each of these theories of transmission has at present its adherents among scholars; but in the course of recent investigations the Celtic character and origin of the great body of the material has been steadily made clearer. The "matter of Britain" has not been misnamed. Unfortunately the remains of early Welsh literature are scanty, and little or nothing can be learned from them of the direct sources of the Arthurian stories. But the national hero tales of the Irish have been preserved in large quantities from very early times, and a comparison of this saga material with the mediæval romances has developed many striking parallelisms which cannot be explained except by some theory of common origin. The pursuit of this line of investigation has yielded most important results in the last few years.

The story of Arthur and his Round Table has been less treated in modern than in early English literature. Still, it has engaged the attention of great poets. Spenser introduced Arthur into the *Faerie Queene*, but preserved very little of the substance of the old romances. Milton and Dryden both planned Arthurian epics and then gave them up for other subjects. The romantic revival of the nineteenth century brought the "matter of Britain," along with other mediæval subjects, once more to the front. A number of episodes from the cycle were treated by the lesser poets of the period, and Tennyson produced in the *Idylls of the King* what is now without doubt the best-known version of these ancient tales.

See AVALON; MARINOGION; PERCEVAL; TRISTRAM.

ARTHUR (1187-1203). Duke of Brittany, grandson of Henry II of England and nephew of Richard I, Cœur-de-Lion. In 1194 he was proclaimed Duke of Brittany. On Richard's death in 1199 the nobles of Anjou, Touraine, and Maine refused to recognize John and became the vassals of Arthur. He was knighted by Philip II of France and invested with Brittany and other French possessions appertaining to the English crown. In the same year John landed in Normandy. In support of Arthur Philip took the field against him. Soon, however, Philip's unscrupulous conduct gave offense to the Angevin friends of Arthur, and in 1200 a peace was concluded between John and Philip. In 1202 war again broke out. Poitou rose in insurrection against England, and Arthur, who had marched to besiege the castle of Mirabeau, was taken prisoner. He was removed in 1203 to Rouen, where he mysteriously disappeared—drowned, some said, by John's own hands. The story of Arthur appears in Holinshed. Shakespeare, in *King John*, used Holinshed as a basis, but supplemented the old chronicle with imaginative details of his own. See JOHN.

ARTHUR, CHESTER ALAN (1830-86). The twenty-first President of the United States. He was born at Fairfield, Vt., Oct. 5, 1830, of Scotch-Irish parentage. He graduated from Union College in 1848, began the practice of law in 1853 and soon became conspicuous at the bar of New York. In the decade before the Civil War his professional reputation was assured by his share in the famous Lemmon Case, involving the validity, under certain conditions, of the Fugitive Slave Law, and by his management of the case, which resulted in securing a verdict from the highest court of the State that a slave brought into New York while in transit from one slave State to another was, ipso facto, free. In the period of the war he served at different times as inspector-general and as quartermaster-general of the State of New York, and gained wide recognition for his particularly effective work in preparing the New York troops for the field. Having identified himself with the Republican party in its early days, he obtained from President Grant in 1871 the highly desirable office of Collector of the Port of New York, and four years later his administration of the office was indorsed by a reappointment. His relations with practical

politics and his attitude toward civil-service reform not tending long to maintain harmony between himself and the incoming administration, he was removed from office by President Hayes. The power of his friends, however, was such that in 1880, partly as a concession to the unsuccessful supporters of Grant, he was nominated for the vice-presidency, and upon his election to that office manifested an activity in senatorial politics quite unusual with vice-presidents. In the factional fight for the control of the New York patronage, he continued in alliance with Roscoe Conkling, the leader of the "Stalwart" faction, against the "Half Breeds." This bitter controversy culminated in the resignations of Senators Conkling and Platt; but the situation seemed altered a few months later, when, upon the death of Garfield, Arthur succeeded to the presidency. His administration of that office, however, was marked by a realization of its responsibilities, and by principles of procedure different from those which had earlier controlled his actions as a politician.

Those who anticipated the introduction of partisan motives into the executive policy were shown clearly to be in error, and the administration, although not brilliant, was in many respects creditable. The tariff formed the chief object of party legislation, and important congressional action was taken with reference to the problems of polygamy in Utah, of the Chinese, of the development of the navy, and of civil-service reform. On the other hand, the "Star-Route" frauds had not disappeared from notice, and the prevalent dissatisfaction with the methods and accomplishments of the Republican party was typified in the defeat of Arthur's Secretary of the Treasury, Mr. Folger, by Grover Cleveland in the gubernatorial contest in New York. President Arthur was avowedly a candidate for the nomination in 1884, but was defeated by James G. Blaine. He died Nov. 18, 1886. Consult Smalley, *Life of C. A. Arthur* (New York, 1880); and see UNITED STATES, *Administration of Arthur*.

ARTHUR, SIR GEORGE (1784-1854). An English colonial governor, born at Plymouth. He entered the army in 1804, served with marked distinction in several campaigns, and in 1814 was appointed Lieutenant-Governor of British Honduras. From 1823 to 1837 he was Lieutenant-Governor of Tasmania, and in the latter year was appointed Lieutenant-Governor of Upper Canada. During part of 1841 he acted as Deputy-Governor. From 1842 to 1846 he was Governor of the Presidency of Bombay, India, in which capacity he carried on the Deccan survey, quelled the Kolapur insurrection, and did much firmly to establish British sovereignty.

ARTHUR, JOSEPH CHARLES (1850—). An American botanist. He was born at Lowville, N. Y., studied at the Iowa State College and Johns Hopkins, Harvard, and Bonn universities, served as instructor in the universities of Wisconsin and Minnesota from 1879 to 1882, and from 1884 to 1887 was botanist to the New York Agricultural Experiment Station. He was appointed professor of vegetable physiology and pathology at Purdue University and botanist of the Indiana Experiment Station in 1887. With Dr. Coulter and Dr. Barnes he edited a *Handbook of Plant Dissection* (1886) and (with D. J. McDougal) wrote *Living Plants and their Properties* (1898). In *North American Flora*

(1907) the article on *Uredinales* is his. He was one of the editors of the *Botanical Gazette* from 1882 to 1900, and published numerous papers, including *History and Biology of Pear-Blight*.

ARTHUR, JULIA (1869—). The stage name of Ida Lewis, an American actress. She was born at Hamilton, Ont., May 3, 1869. At the age of 14 she appeared on the professional stage, and then, after three seasons, went to England to study music and drama. Having returned to New York, she met with success in *The Black Masque*, and in A. M. Palmer's company as Mercedes, etc. In 1895 she appeared in London with Irving at the Lyceum, playing Rosamund in *Becket*, and other parts. Next year she accompanied Irving and Terry to America. In 1897 she brought out in New York *A Lady of Quality* on an elaborate scale; the following season she appeared as Rosalind in *As You Like It*, at Wallack's Theatre. Oct. 24, 1899, she produced, at the Broadway Theatre, *More than Queen*, from the French of Emile Bergerat, taking the part of Josephine Bonaparte, which obtained a great success. In March, 1900, an illness in Philadelphia caused her to leave the stage temporarily. She is the wife of B. P. Cheney, Jr. Consult J. B. Clapp and E. F. Edgett, *Players of the Present* (New York, 1899), and L. C. Strang, *Famous Actresses of the Day in America* (Boston, 1899).

ARTHUR, PRINCE, DUKE OF CONNAUGHT. See CONNAUGHT, ARTHUR WILLIAM PATRICK ALBERT, DUKE OF.

ARTHUR, TIMOTHY SHAY (1809-85). An American story-writer, born near Newburgh, N. Y. He wrote a great number of moral and domestic tales and sketches which once had much popularity and was one of the authors of a series of histories of various States. One of the most popular of his stories was *Ten Nights in a Bar-Room*, especially as dramatized. He founded *Arthur's Home Magazine* in 1852. He died in Philadelphia.

ARTHUR, WILLIAM (1819-1901). A British author and clergyman, born in Ireland. He was in India for three years as a missionary; afterward secretary of Wesleyan Church Missionary Society, and president of the British Conference, and was principal of the Wesleyan College in Belfast from 1868 to 1871. He is the author of *Personal Reminiscences of a Mission to the Mysore* (London, 1847); *The Tongue of Fire, or True Power of Christianity* (1856; 40th ed. in 1885, and many reprints); *The People's Day* (1855; 11th ed., 1856); *Italy in Transition* (1860); *The Pope, the Kings, and the People* (1903).

ARTHUR'S SEAT. The hill 822 feet high in the immediate vicinity of Edinburgh, Scotland, supposed to have derived its name from the British King Arthur, who is reputed to have watched from its summit the defeat of the Picts by his army. It is a basaltic mass, analogous to those of the Palisades of the Hudson, though of less extent, which during Mesozoic time flowed out as lava from a fissure in Carboniferous rocks. Erosion through long time subsequent to the period of outflow has resulted in the present form of the hill, which presents on its western and southern sides steep precipices. The hill was selected in 1855 as a base for observations with a view to determining the density of the earth.

ARTICHOKE (It. *arcicciocco*, dial. *carciocco*,

carcioffo; Sp. *alca[r]chofa*, from Ar. *al-harshaf*, *al-kharshūf*). The true French or globe artichoke, *Cynara scolymus*, is a thistle-like perennial plant of the family Compositæ, now growing wild in the south of Europe, but probably a native of Asia. *Cynara scolymus* has the radical leaves 3 to 4 feet long and somewhat spiny. The stem is 2 or 3 feet high, branched, with large heads of violet-colored (sometimes white) thistle-like flowers at the summits of the branches. The globe artichoke is prized as a vegetable, especially in Europe. Though long known in the United States, it has not become common. It can be found in season in large city markets, fresh and canned, and its use is increasing. The thickened receptacle and fleshy bases of the scales of the involucre of the immature flower is the portion eaten. A favorite method of cooking is to boil in salted water and serve with melted butter or a white sauce. In Europe it is also eaten raw as a salad. Several varieties are in cultivation, differing in the more or less spiny leaves and the more or less globose form of the head. Artichokes are generally propagated by rooted slips or suckers in spring. These are planted in rows about 4 feet apart, and 2 feet apart in the row. The artichoke bed continues productive for several years. Seaweed is an excellent manure. Consult: "Bur or Globe Artichoke," *United States Department of Agriculture Year Book*, 1899; L. H. Bailey, *Cyclopædia of American Horticulture* (New York, 1900-02); G. Nicholson, *The Illustrated History of Gardening* (London, 1888). The Jerusalem artichoke is a different plant. See ARTICHOKE, JERUSALEM. For illustration, see ARAUCARIA.

ARTICHOKE, JERUSALEM (*Helianthus tuberosus*). A tuberous-rooted perennial sunflower, with annual stems 6 to 10 feet high, and closely resembling the common sunflower. The name Jerusalem is a corruption of the Italian *girasole*, sunflower; and the name "artichoke" comes from the supposed similarity of flavor of the tubers to the true globe artichoke. (See preceding article.) The tuber is the edible portion of the plant. The tubers are produced in clusters of 30 to 50, close about the thick, fleshy root. They are irregularly pear-shaped and similar to potatoes in appearance, but not so smooth. There are white, yellow, red, and purple varieties. The plant is propagated, as are potatoes, by means of tubers planted in rows 2½ to 3 feet apart, and 12 to 14 inches distant in the row. It grows on almost any well-drained soil and is oftentimes planted on gravelly knolls or mounds that would be too dry and poor for many other crops. The crop matures in about five months, and the tubers may be left in the ground over winter without harm; but if allowed to freeze out of the ground they spoil rapidly. Yields of 200 to 500 bushels per acre are common, and as high as 1000 or more bushels per acre have been recorded. The tubers of Jerusalem artichokes are frequently grown as a feeding stuff. Though useful for all kinds of stock, they are generally fed to pigs, which are turned in to gather the crop themselves. Like most roots, Jerusalem artichoke tubers are succulent, i.e., have a high water content—some 78 per cent on an average. In composition they resemble potatoes closely. Their principal nutrients are various sugars and inulin, these comprising some 17 per cent. The tubers are somewhat used as human food. A favorite method of cooking them is to boil in salted water until

tender and serve with a white sauce. They are also eaten raw, pickled in vinegar. The flavor is mild and distinct. In Europe alcohol has been manufactured from the tubers. The leaves and stalks of the plant have been somewhat used as coarse fodder, especially for cattle. The dry stalks are useful as fuel.

ARTICLE (Lat. *articulus*, a little joint). A word which signifies in general a component part of a whole, complete, however, in itself. Thus, we speak of the several articles of a confession; the articles of war; a leading article, etc.

The use of "article" as a grammatical term arose as follows: In such a sentence as, "He found *that* (or *the*) man *that* he was looking for," the Greeks considered the defining particle as connecting the two parts of the sentence and called it joint (Gk. *ἄρθρον*, *arthron*, Lat. *articulus*); the name was subsequently confined to the first of the two, the other being called the relative. By some grammarians the articles are included among the adjectives.

In English there are two articles—the definite *the*, and the indefinite *a* or *an*; and other modern languages have corresponding words. But articles are not essential to language. The Latin had no articles, and the Greek, as well as the oldest Germanic language, e.g., the Mæso-Gothic, had only the definite article. The Slavic languages have no article, with the exception of the Bulgarian.

The definite articles originate uniformly in demonstrative pronouns. Eng. *the* is only a weakened form of the Anglo-Saxon demonstrative *se*, neut. *that* (with the base *the* occurring in all the oblique forms). The same is the case with the Ger. *der*; and Fr. *le*, *il* and *lo*, and Sp. *el*, are all from the Lat. *ille*, 'that.' In like manner, *an* or *a* is from the old form of *one* (*ān*); Ger. *ein* means both *one* and *a*; and so are Fr. *un*, It. and Sp. *uno*, both from Lat. *unus* = *one*.

In the Scandinavian tongues the definite article is attached to the end of the word; the Danish, for example, writes *kong-en*, the king; *hus-et*, the house. It is likewise appended to the noun in the Rumanian, Bulgarian, and Albanian languages.

ARTICLES, THE SIX. Articles often mentioned in the ecclesiastical history of England in the sixteenth century, and imposed by act of Parliament in 1539, when, Henry VIII being displeased with some of the bishops most favorable to the Reformation, their opponents for a time regained the ascendancy. These articles asserted the doctrine of transubstantiation, declared communion in both kinds not to be necessary, condemned the marriage of priests, enjoined the continued observance of vows of chastity, and sanctioned private masses and auricular confession. Severe penalties were appointed for writing or speaking against them, and for abstaining from confession or the sacrament at the accustomed times, for priests failing to put away their wives, and for persons writing or speaking against the doctrine of transubstantiation. Archbishop Cranmer vainly opposed the act in the House of Lords; the King was resolute to have it passed. Its severity was mitigated by a subsequent act of his reign (1544), and it was transgressed with impunity even by ecclesiastical dignitaries, until it was repealed in the first year of Edward VI. The text of The Six Articles Act is given in Gee, *Documents Illustrative of the History of the English Church* (London, 1896).

ARTICLES, THE THIRTY-NINE. The articles of religion agreed upon by the archbishops and bishops of both provinces and the whole clergy of the Church of England, in the convocation held at London in the fourth year of Elizabeth, 1562, under Archbishop Parker. To have a clear view of the history of these important articles, we must go back to the promulgation of the original ones, 42 in number, in the reign of Edward VI. The council appointed by the will of Henry VIII to conduct the government during the King's minority, was for the most part favorably disposed toward the reformed opinions, and the management of Church affairs devolved almost entirely upon Archbishop Cranmer. In the year 1549 an Act of Parliament was passed, empowering the King to appoint a commission of 32 persons to revise the ecclesiastical laws. Under this act a commission of 8 bishops, 8 divines, 8 civilians, and 8 lawyers (among whom were Cranmer, Ridley, Hooper, Coverdale, Seory, Peter Martyr, and Justice Hales) was appointed in 1551, and one of its first acts was to draw up a code of articles of faith. These were 42 in number and were set forth by the King's authority in 1553. Strype and Burnet make it appear that these 42 articles were agreed upon in the convocation that was sitting in 1552, but this was not the case. To these articles was prefixed the catechism, and there is no doubt of Cranmer having had the principal hand in their composition; for he owned before Queen Mary's commission that they were his doing. But immediately after their publication Edward died, and one of the first acts of the convocation summoned with the Parliament in the first year of Queen Mary was to declare that these 42 articles had not been set forth by the agreement of that house, and that they did not agree thereto. In 1558 Elizabeth succeeded her sister. In 1559 Parker was installed in the see of Canterbury, and immediately the other vacant sees were filled. And now came a fresh opportunity of drawing up some articles of faith which might serve as a test of orthodoxy in the Reformed church. Parker applied himself to this work, and, for the purpose, revised the 42 articles of King Edward, rejecting 4 of them entirely, and introducing 4 new ones, viz., the 5th, 12th, 29th, and 30th as they now stand, and altering more or less 17 others.

This draft Parker laid before the convocation which met in 1562, where further alterations were made; and the 39th, 40th, and 42d of King Edward's, which treated of the resurrection, the intermediate state, and the doctrine of the final salvation of all men, were finally rejected. The 41st of King Edward's, which condemned the Millenarians, was one of the four which Parker omitted. Thus the articles were reduced to 39. They were drawn up and ratified in Latin, but when they were printed, as was done both in Latin and English, the 29th was omitted, and so the number was further reduced to 38. From these 38 there was a further omission. viz., of the first half of the 20th article, which declares that "the Church hath power to decree rites and ceremonies, and hath authority in controversies of faith." As all the records of convocation perished in the great fire of 1666, it is very difficult to ascertain how these omissions arose. However, in 1571, the articles once more underwent revision. Archbishop Parker and Bishop Jewell made a few trifling alterations; and the 29th being restored, the convocation,

which was then sitting, ratified them both in Latin and in English, and an Act of Parliament was passed in that year compelling the clergy to subscribe "such of them as only concern the confession of the true Christian faith, and the doctrine of the Sacraments." There still, however, remained some difficulty as to which was the authorized copy, some of the copies being printed with, and others without, the disputed clause of the 20th; but this was finally settled by the canons passed in the convocation of 1604, which left the articles as they now stand. "His Majesty's declaration," which precedes them, and directs that they shall be interpreted "in their literal and grammatical sense," was prefixed by Charles I in 1628.

It may be interesting to know from what other sources the Thirty-nine Articles are derived. Some of them, as the 1st, 2d, 25th, and 31st, agree not only in their doctrine, but in most of their wording with the Confession of Augsburg. The 9th and 16th are clearly due to the same source. And others, such as the 19th, 20th, 25th, and 34th, resemble, both in doctrine and verbally, certain articles drawn up by a commission appointed by Henry VIII and annotated by the King's own hand. The 11th article, on justification, is ascribed to Cranmer, but the latter part of it existed only in the articles of 1552. The 17th, on predestination, may be traced to the writings of Luther and Melancthon. The fact is that they bear every mark of being a compromise, designed to be agreeable to the contending parties, Lutheran as well as Calvinist, in the Church of England at the time, and it is well to remember that they are not a creed, but a formula intended to test the sufficient loyalty of the clergy and other officeholders. Each party in the Church of England, even to the most advanced high churchmen of the present day, has been able to prove its agreement with the teaching of the articles—to its own satisfaction, at least. Controversy as to the sense in which subscription is made to them was vigorous all through the nineteenth century, the acute dialectic minds of Newman on one side and Jowett on the other having been exercised in proving that they might be signed in a sense other than the *animus imponentis*, or the mind of the authority which requires subscription. It was felt that subscription to a body of doctrinal statements was an excessive obligation, if it were meant to imply literal agreement with every sentence. To avoid further ambiguities, and to relieve clerical consciences on this point, the Clerical Subscription Act of 1866 did away with subscription in the case of the clergy, and substituted a declaration of assent to the articles and Prayer Book. The University Test Act of 1871 released members of Oxford, Cambridge, and Durham universities (except divinity students) from the obligation of signing them, and threw open the doors of these institutions to persons of varying religious beliefs.

They were adopted by the Convocation of the Irish church in 1635, and by the Scottish Episcopal church in 1804. After the organization of the American Episcopal church they were adopted by the General Convention of 1801, with a few slight changes covering references to civil affairs, to the Athanasian Creed, which that body dropped from the Prayer Book, and to the Book of Homilies. That they are not, in their

original form, satisfactory to extreme Protestants is shown by the fact that the Reformed Episcopal church modified a number of them into a more unmistakably anti-Roman sense in 1875, and that Wesley modified and shortened them into 25 for the Methodist Episcopal church in America in 1784. Consult: Browne, *Exposition of the Thirty-nine Articles* (London, 1850); Forbes, *An Explanation of the Thirty-nine Articles* (London, 1867); a comparative text is published in vol. iii and a discussion of its history in vol. i of Schaff, *Creeds of Christendom* (New York, 1884).

ARTICLES OF ASSO'CIATION. A written instrument, setting forth the purposes, terms, and conditions of the association of several persons for the prosecution of a joint enterprise. It is primarily a contract, binding the parties thereto, severally, to one another for its performance; but it may, when duly executed and filed, have by law the force and effect of a charter of incorporation. Such is the usual mode of incorporating companies under the general corporation laws of the United States. See COMPANY; CORPORATION; INCORPORATION.

In England the term is employed to describe the printed regulations for the conduct of the business of a joint-stock company, organized and registered under the Companies Act of 1862. See JOINT-STOCK COMPANY.

ARTICLES OF CONFEDERATION. See UNITED STATES, *History*.

ARTICLES OF FAITH. The summarized statements of the views held and taught by a religious body as the essential doctrine of its system. They have been divided, by Protestant writers, into articles that are fundamental and those that are non-fundamental. The best-known articles of faith are the Apostles' Creed; the Nicene Creed, established by the Council of Nice (325 A.D.), the Athanasian Creed; the statements of faith promulgated by the Council of Constantinople (381 A.D.), and by the Council of Ephesus (431 A.D.); the Thirty-nine Articles (see ARTICLES, THE THIRTY-NINE) of the Church of England, drawn up by Cranmer and Ridley, the Augsburg Confession, the Helvetic Confession, the Thirty-seven Articles of the Church of the Netherlands, the Westminster Confession, and the Articles of the Methodist Episcopal Church. No definite articles of faith were drawn up by the primitive Church until the spread of Christianity, the geographical separation of its different branches, and the growth of heresy, made some brief formularies necessary as a basis of union. See CREEDS AND CONFESSIONS.

ARTICLES OF WAR, UNITED STATES. The discipline and disciplinary procedure code of the United States army. The articles, or rules, were originally copied from the English Mutiny Act, July 30, 1775, and then enlarged, Sept. 20, 1776. The present articles, which are substantially the same as the former, were enacted April 10, 1806, and form Section 1342, United States Revised Statutes, being printed in full in the United States Army Regulations. They commence by a statement declaring that the armies of the United States shall be governed by these rules and articles; that the word "officer," as used therein, shall be understood to designate commissioned officers; and the word "soldier"—all non-commissioned officers, musicians, artificers, privates, and other enlisted men; and the convictions mentioned therein shall be understood to be

convictions by courts-martial. There are 125 articles altogether, to which all commissioned officers must subscribe on appointment. Under these articles expressions or conduct implying disrespect or disobedience toward the President, or those placed in authority, are prohibited; but provision is made for appeal against the decision or conduct of a superior. Mutiny, sedition, quarrels, frays, and other disorders; dueling, and all that pertains to it; drunkenness on duty; sleeping on duty; desertion; and neglect of duty, as well as all other forms of misconduct during war, come under distinct clauses. The sixty-second article, generally called "the general article," provides for the punishment of all crimes not capital and all disorders and neglects not mentioned in the other articles. It is the authority under which statutory and common-law crimes and misdemeanors are punished by military courts. The authority and order of procedure for every description of courts-martial or courts of inquiry is explicitly stated, as well as the law to be observed in the discharge or dismissal of officers; the disposal of the effects of deceased officers or men; and the treatment of spies. Subordination to civil authority is enjoined, attendance at divine service encouraged, and punishment ordered in instances of profanity or abuse. Soldiers are also forbidden to hire other soldiers to perform any of their duties. The concluding article ordains that the articles shall be read and published once in every six months to every garrison, regiment, troop, or company in the services of the United States, and shall be duly observed and obeyed by all officers and soldiers. See MILITARY LAW; COURTS, MILITARY.

ARTICULATA (Lat. nom. neut. pl. of *articulatus*, jointed, from *articulus*, joint), or ARTICULATED ANIMALS. One of the primary divisions of the animal kingdom, according to the system of Cuvier, now divided into several. See ANNULATA; ARTHROPODA; COLECIDA.

ARTIFICER (from Lat. *artifex*, a master in the liberal arts, an artist). A soldier who is a mechanic, blacksmith, farrier, wheelwright, carpenter, harness-maker, or machinist, and who is carried on the rolls as an artificer. In the United States army such a soldier is enlisted as a private and is appointed artificer by the company commander. He receives the pay of a corporal. In England he would be assigned to the ordnance store corps and work at his particular trade. Each regiment has also its corps of pioneers, who are mechanics and receive extra pay for their work. Similar branches are a part of the organization of all other European armies.

ARTIFICIAL BUTTER. See OLEOMARGARINE

ARTIFICIAL COTTON. See COTTON, ARTIFICIAL.

ARTIFICIAL FLOWERS. See FLOWERS, ARTIFICIAL.

ARTIFICIAL HORIZON. A reflecting surface, usually of mercury, used with the sextant (q.v.) or reflecting circle in measuring altitude when the natural horizon is indefinable, and in determining the zero for all instruments by which altitude is measured.

ARTIFICIAL LIMBS. The art of replacing lost limbs by artificial ones made of some appropriate material is very old. In the museum of the Royal College of Surgeons, in London, there is an artificial leg of bronze, wood, and iron, exhumed from a tomb at Capua, Italy, in which,

together with the skeleton of the wearer, were found three vases assigned to the year 300 B.C. Herodotus relates the tale of an Elean, captured by the Spartans and confined with one foot in the stocks, who secured his release by amputating his own foot, and who afterward wore a wooden foot. Pliny declares that M. Sergius, about 167 B.C., made and wore an artificial hand, with which he fought in battle. The celebrated artificial hand of the German knight, Götz von Berlichingen (1480-1562), "the Iron-handed," weighed three pounds and was so constructed as to grasp a sword or lance. It was invented by a mechanic of Nuremberg and is preserved at Jaxthausen, near Heilbronn, a duplicate being in the castle at Erbach, in the Odenwald. According to Scott's *Border Antiquities*, the family of Clephane, of Carslogie, "have been in possession from time immemorial of a hand made in the exact representation of that of a man, curiously formed of steel," and that it was given by one of the kings of Scotland to a laird of Carslogie, who had lost a hand in the service of his country. Ambroise Paré described, in 1564, an iron arm constructed for a Huguenot captain, with which he could hold his shield as well as his bridle-rein. Lorrain, a French locksmith, manufactured artificial limbs, under Paré's suggestions, with much success. Father Sebastian, a Carmelite monk, is credited with being the next to construct such limbs, with less success. Verduin, a surgeon of Holland, invented an artificial leg in 1696, which bore his name and which was amended in later years by Serré. It is claimed that, early in the nineteenth century, Baillif, of Berlin, constructed a hand which did not exceed a pound in weight, and in which the fingers, without the aid of the natural hand, not only exercised the movements of flexion and extension, but could be closed upon and retain light objects, such as a hat and even a pen. In 1790 and 1810 patents were taken out by Thomas Mann, and in 1800 by James Potts, both of England, for artificial legs of wood. Potts's leg was used by the Marquis of Anglesea (who lost a leg at Waterloo) and was hence called the "Anglesea Leg." In 1818 Von Gräfe invented a mechanical appliance for artificial legs, which is largely used with modifications, by European makers. William Selpho, who worked with Potts in England, introduced the "Anglesea Leg" in America. It was superseded by the "Palmer Leg," a lighter and more adaptable invention by B. F. Palmer, an American cripple. Palmer's leg was patented in 1846, 1849, and 1852. Other American makers have been George W. Yerger, W. C. Stone, J. Russell, O. D. Wilcox, J. S. Drake, and A. A. Marks. Marks was the first to suggest rubber feet and hands, and his artificial limbs are now the most commonly used of any in America. His first patents were issued in 1856 and 1860. In 1845 a Dutch mechanic, Van Peeterssen, invented a hand which could be used by an actor, M. Roger, to pick up a pen or hold a leaf of paper, draw a sword from the scabbard, etc. Van Peeterssen's conceptions were extended and improved by the Messrs. Charrière, the celebrated surgical mechanics of Paris, aided by M. Huguier, the well-known surgeon. A very ingenious arm was also constructed by M. Béchard. The utility of an artificial arm depends much on the nature of the stump. A stump above the elbow is best suited for an arm when it gradually tapers to its lowest end, and terminates in a rounded surface.

When an arm is removed at the shoulder joint, and there is no stump, an artificial arm can still be fixed in its proper place by means of a corset. In amputation below the elbow joint, the best stump is one which includes about two-thirds of the forearm; while a stump formed by amputation at the wrist is very unsatisfactory. The simplest form of artificial arm intended to be attached to a stump terminating above the elbow "consists of a leathern sheath accurately fitted to the upper part of the stump. The lower end of the sheath is furnished with a wooden block and metal screw-plate, to which can be attached a fork for holding meat, a knife for cutting food, or a hook for carrying a weight" (Heather Bigg). The arm should be so carried as to represent the position of the natural arm when at rest. It is retained in its position by shoulder and breast straps, and forms a light, useful, and inexpensive substitute for the lost member. More complicated and therefore more expensive pieces of apparatus are made, in which motion is given to the fingers, a lateral action of the thumb is obtained, and the wrist movements are partially imitated; and a degree of natural softness is given to the hand by a covering of gutta-percha and india-rubber. Artificial rubber hands are now made in America that will write with a pen, manipulate the lever of a locomotive, row with an oar, cancel tickets, hold papers, work telegraphic keys, hold reins in driving, as well as use a pickaxe, carry a heavy weight, etc.

Artificial legs, having fewer requirements to perform than artificial arms, are comparatively simple in structure. A simple and inexpensive artificial leg which answers all ordinary purposes consists of a hollow sheath or bucket, accurately conformed to the shape of the stump, and having a "pin" placed at its lower end to insure connection between it and the ground. Artificial legs are made in America, provided with rubber feet so that the wearer can dance, skate, ride a bicycle, ride a horse, walk in pedestrian contests, climb ladders, and live the usual life of an active laborer or mechanic. There are many men in the service of railroads as conductors, brakemen, switchmen, etc., who wear an artificial leg, and are able completely to perform their duties. In cases of arrested development of the lower limbs, short-legged persons may be made of the ordinary height by the use of artificial feet placed below the true feet, and attached to the legs by means of metallic rods, jointed at the knee and ankle, or by long-topped shoes.

Other parts, not entitled to be called limbs, can also be replaced by mechanical art—such as the nose, lips, ears, palate, cheek, and eye. In the present advanced state of plastic surgery deficiencies of the nose, lips, and palate can usually be remedied by an operation; cases, however, may occur where an artificial organ is required. Artificial ears are molded of silver or of wax, painted the natural color, and fixed in place by a spring over the vertex of the head. Artificial eyes are made which are adapted to fit almost any socket left after enucleation, and which can be detected with difficulty. The color of the iris of the remaining eye is perfectly copied, and blood vessels traversing visible portions are imitated exactly.

ARTIFICIAL SILK. See SILK, ARTIFICIAL.
ARTIFICIAL STONE. See STONE, ARTIFICIAL.

ARTIGAS, ür-té'gás, FERNANDO JOSÉ (1755-1851). A South American soldier and dictator, born at Montevideo. At an early age he became captain of a corps in the Spanish provincial service, in which he continued loyal for some time after the outbreak of the insurrection in Buenos Aires. In 1811, however, as a result of ill-treatment by his superior officers, he joined the Revolutionary forces and won a number of victories. He afterward joined the Republican army besieging the Portuguese troops from Brazil, and then occupying Montevideo, but he acted so independently that the commander-in-chief, Sarratea, outlawed him. He then organized an independent force of *gauchos* (cattle-drivers), defeated the troops sent against him, and forced the Junta at Buenos Aires to give him the whole of Uruguay (1814) and recognize him as an independent chief. He drove the Portuguese out of Montevideo, became dictator, and in 1815 made an unsuccessful effort to take Buenos Aires. Repeated efforts to effect a reconciliation between the parties were rendered futile by personal animosities, and eventually General Artigas was defeated and in 1820 fled to Paraguay; but the Dictator Francia sent him to Candelaria, where he passed the remainder of his life in peace as a political exile.

ARTILLERY ("from OF. *artiller*, Sp. *artilero*, It. *artigliero*, OF. *articulier*, explained in a Latin-French glossary as = *artifex*, a master in the liberal arts, an artist; as if from Lat. *articularius*, apparently from *articulum*, dimin. of *ars*, art"). For the development of the meaning, cf. Eng. *engine*, from Lat. *ingenium*, natural capacity, talent, genius.

HISTORY

Early Artillery Machines. Before the introduction of gunpowder, the word "artillery" referred to machines for throwing heavy missiles, in which the projecting force was obtained by a spring or weight suddenly released. These included the catapult, bow, crossbow, sling, ballista, onager, springal, etc. The ballista and onager projected their missiles, usually stones, from a bag or bucket, using the spring as a source of energy. The catapult is described as a machine for throwing stones and darts of great size, and the springal as resembling the ballista. There is much confusion attending the description of these old machines, and the various terms are used indiscriminately by different writers. It is reported in some ancient accounts that stones weighing several hundred pounds were thrown over half a mile. The projectiles used included large beams or logs, heavy arrows and stones, and also inflammable material which was projected over the walls of a town, castle, or other fortified place, to set fire to the interior. The machines above mentioned, having little mobility, were restricted almost entirely to use in the attack and defense of fortified places during the progress of a siege. In modern use the word "artillery" is applied, first, to all projectile arms using gas as a propelling force which are supported by carriages (excepting machine guns) in contradistinction to arms which are discharged from the hand or shoulder; second, to the troops serving such arms; third, to the science which treats of the service of the guns and the organization and administration of the personnel.

Earliest Records. Cannon made its appearance almost immediately following the discovery

of the process of the granulation of gunpowder by the German, Schwartz, in 1320. There is no doubt that gunpowder was known before this date. The English friar, Roger Bacon, who died in 1292, wrote of it, and he is supposed to have obtained his knowledge from the Chinese, who are said to have been acquainted with this explosive for many centuries before that time. There is little doubt, however, that its use as a propelling force dates from the discovery of Schwartz, for shortly following that event artillery began to appear in the different armies of Europe. It is said that Edward III employed *crakeys of war*, by which name artillery was first known, in 1327, in his campaign against the Scots. Froissart (1337-1410) is authority for the statement that at the siege of Quesnoy (1340) the French were repulsed, "their horses being frightened by weapons which made a great noise and shot pieces of iron." This appears to be the most authentic account of the first use of firearms in warfare. Villani, a contemporaneous historian, mentions the appearance of three pieces of cannon at Crecy (1346). The development of this weapon was slow, for, a century later, at the siege of Constantinople, we see the old mechanical engines of war and the new cannon employed side by side. Here appeared the greatest park of artillery yet seen in warfare, gathered for Mohammed by the Hungarian engineer, Urban, who had lately left the service of the Greeks for the more remunerative employment of the Turkish monarch.

Probably the most famous piece of ordnance mentioned in history is the great gun of Mohammed II (1453). It was of brass, weighed 18¾ tons, was 17 feet long, and discharged a stone ball 25 inches in diameter, weighing approximately 600 pounds. No firing carriage was provided, the gun being laid by means of blocks and wedges, and sinking the breech end in the ground. Low charges and high elevations were used, the effect being secured largely from the steep angle of fall of the projectile. Its range according to Gibbon was one mile. A traveling carriage consisting of a train of trucks was provided, and the efforts of 200 men and 60 oxen were employed nearly two months in transporting this great gun about 100 miles. Even larger pieces of this class were to be seen at the Dardanelles only a few years ago.

The artillery of this period consisted generally of huge, cumbersome weapons mounted upon crude carriages (limbers had not yet appeared), which were moved by horses or oxen hitched in tandem, by man power, or sometimes by both. Animals and drivers were employed or impressed as required, and were often dismissed and replaced by others similarly obtained at different points along the line of march. Cannoneers were secured from some neighboring fortress, or maybe hired with the gun, often the personal property of the gun captain. Mobility was of the lowest order. The first employment of the new weapon was in siege warfare, and it was not until the end of the fifteenth century that guns began to be used as field artillery in the sense that we understand the term to-day. The earliest cannon were of the simplest construction, being merely tubes closed at one end, and were fired by means of a hot iron applied to a train of powder passing through the touch-hole to the charge within. These guns were known as "vases" and "bombards," and were bell-shaped rather than cylindrical. They were

supported on rough wooden horses or carrying platforms, the latter sometimes consisting of two wheels in front and a trail attached to the axle. At first the material used was iron bars held together with hoops, sometimes hammered iron or copper, laboriously fashioned by hand; later, guns were cast from bronze and other composition metals.

First Half of Sixteenth Century—Wars of Charles V (1521-44). In the wars of Francis I of France and the Emperor Charles V artillery began to establish a reputation as a weapon. The *matériel*, *personnel*, and draft were still very crude, but guns began to be used effectively on the field of battle. The conical-shaped bombards and vases gradually disappeared during this period and were replaced, in the siege-train, by culverins (18-pounders) drawn by oxen, and in field artillery by cannon (2-, 4-, 6-, and 8-pounders, from the weight of the projectiles thrown) called "falcons," "falconets," and "sakers." It took many years to devise a carriage which would serve both for transportation and for firing. This was gradually developed during the progress of the Franco-Spanish wars. The loss of guns in battle was common because of their immobility. A temporary retirement meant the capture of the guns, and an advance made them useless, as they were then masked by the infantry. The first battle in which artillery played an important part in the general result was at Marignano (1515), where the French had about 350 guns. The Swiss infantry, at that time considered the best in Europe, were unable to stand the fire of this artillery, which covered an important crossing and otherwise distinguished itself by its mobility and timely appearance at critical points. The result was a French victory. At Pavia (1525) the French would have probably won another victory, had their artillery not been masked by their own troops at a critical juncture of the battle.

Latter Half of Sixteenth Century—Religious Wars of France. In the religious wars of France the use of artillery was greatly developed and improved both by the Catholics and by the Huguenots. It was a period during which field artillery began to be used in accordance with the principles of tactics, i.e., it was massed or deployed with reference to the other arms of the service, to attain a common end; so that we may consider this an epoch in the general development of battle tactics for field artillery. It was about this time that the numerous kinds and calibres of field artillery were reduced to four (6-, 12-, 24-, and 48-pounders) in the Dutch artillery. This was another important step in the development and improvement of a system of field artillery. During these wars there was a proportion of one gun to about 1000 men of the other arms of the service. Some idea of the ordnance of this period is gained from the table below showing the artillery train sent to Flanders in 1588:

Classification	Weight*	Diameter of bore	Weight of shot
Demi-cannon . .	6000 lb.	6½"	30 lb.
Culverin	4000 "	5½"	18 "
Demi-culverin . .	3000 "	4½"	9 "
Saker	1500 "	3½"	5 "
Minion	1100 "	3¼"	4½ "
Falcon	800 "	2½"	2½ "

* Exclusive of carriage.

The Thirty Years' War (1618-48). It is, however, to Gustavus Adolphus that we owe one of the most important improvements in field artillery, viz., mobility. He soon recognized the defects of artillery in this respect, and that the efficiency of artillery was in exact proportion to its accuracy, rapidity of fire, and quickness of movement on the battlefield. A curious field-piece, sometimes called the "Kalter," sometimes the "leather" gun, consisting essentially of a cylinder of beaten copper, strengthened with iron bands and tangentially supported by coiled rope, the whole being covered with leather, was introduced by him in the Polish War. It was drawn and served by two men only, but of course, had little power. Later it was replaced by iron 4-pounders, drawn by two horses. So many were the improvements made by this remarkable military genius, that his field guns could be fired three times as rapidly as the infantry musket. Gustavus Adolphus considered six field guns to 1000 men of other arms as the most efficient proportion, double that of any other nation of this period. He first introduced the "battalion" system of guns by attaching two to each regiment of infantry and placing them under the orders of the colonel; but he always kept a large number of guns in reserve for critical moments in a battle. He separated the field and garrison artillery, inaugurated the practice of loading the powder in cartridges instead of the old method of using a ladle, and adopted both solid shot and grape for his field guns. It may be said, in passing, that the result of many of the battles of Gustavus Adolphus might have been different but for his improvements in the construction and use of field artillery.

Latter Part of the Seventeenth Century—The Wars of Louis XIV. The French artillery was greatly improved during the time of Louis XIV. The material was both bronze and iron; calibres were limited to 4-, 6-, 8-, 12-, 18-, 24-, and 32-pounders; canvas cartridges and grape-shot were employed. Howitzers and mortars came into use, and explosive shells were introduced into the field artillery by the English and Dutch. Louis XIV was the first (1671) to establish a permanent organization for artillery, but it was not until 1732 that rank was conferred upon French artillery officers. The present Royal Regiment of Artillery of the British army was established in 1716. William III (1689-1702) reorganized the *personnel* and formed the first regimental establishment. Formerly men were detailed from other arms for duty with the artillery when needed. Louis XIV also established schools for the instruction of officers in the science of gunnery, introduced platform wagons, wrought-iron field and mortar carriages, and a new and efficient carriage for sea-coast guns. The English artillery at this time was considerably inferior, in mobility, at least. The largest gun used by them during this period was a demi-cannon, weighing about 6000 pounds, exclusive of the carriage. The famous laboratory at Woolwich, England, was established in 1672. In the War of the Spanish Succession the proportion was four guns to every 1000 men of other arms. The guns were used with great effect and skill. The mobility of the artillery increased in all the armies except the English, and it is in this respect that Marlborough differed most radically from Gustavus Adolphus, as the former never attempted to im-

The Eighteenth Century—The Wars of Frederick the Great. It is remarkable that Frederick the Great should have neglected his artillery as he did in the early battles of his career. It was not until later that its true value as a weapon was learned by him; and, like most military lessons, it was learned by costly experience. The defect of Frederick's artillery was its immobility. The field artillery was divided into batteries of position and battalion guns. The former, consisting of heavy guns, were assembled in large batteries in front of the centre or in the wings; the battalion guns, which were 3- or 4-pounders, were assigned one pair to each battalion, each pair commanded by a corporal. Their instructions were always to precede the battalion by 50 paces, to unlimber at 500 paces, and not to fire grape until within 350 paces. Worst of all, when the battalion was beaten, the loss of the pieces was almost inevitable for want of time to limber up. After the battles of Rossbach, Leuthen, and Hochkirch, Frederick, appreciating at last the valuable service rendered by his artillery during these three important battles, improved and increased the number of guns to five for every 1000 men of other arms. He also created a horse artillery system of 10 light 6-pounders, which was able to accompany his cavalry. His field artillery was also improved as his infantry decreased in number, and consisted of 3-, 6-, and 12-pounder guns and 7-, 10-, and 25-pounder howitzers. The Austrian artillery opposed to Frederick's was much superior. The tactics of this period consisted in massing the guns, but the fire itself was not concentrated, the range of the guns being so inferior that it was impossible to concentrate the fire of separated batteries on the same distant object. The general result of these wars, so far as artillery is concerned, was the formation and organization of position gun batteries, which were assigned to brigades of infantry, thus establishing the brigade system, the formation of howitzer batteries, and the creation of horse artillery.

Gribeauval Epoch (commencing 1765). Gribeauval, sometimes called the "father of modern artillery," undertook to reconstruct the French system of artillery in 1765. He separated the arm into the four classes now generally recognized by artillerists—namely, field, siege, garrison, and seacoast, and provided for each a distinct *matériel*. He at once recognized the advantage of decreasing the number of calibres for each kind of service. The guns for field batteries were limited to 3 calibres (4-, 8-, and 12-pounders) and 6-inch howitzers. For siege and garrison artillery he adopted 12- and 16-pounders, 8-inch howitzers, and 10- and 12-inch mortars. By decreasing the length and weight of the pieces, omitting ornamentation and strengthening the carriage, decreasing the windage (clearance between projectile and bore), and the charge, he greatly improved the mobility of the system. Uniformity, lightness, and strength were the ends sought. The introduction of tangent sights and elevating screws greatly increased the accuracy and rapidity of fire. The organization was also improved. Two field guns were assigned to each battalion of infantry, and the men for the service of these pieces were drawn from the company of artillery assigns to each infantry brigade. In addition

to this there were eight pieces assigned to the centre and each wing of the army. Eight pieces constituted a "division" to which a company of artillery was assigned. Gribeauval was the first to develop the use of the prolonge, the rope used to unite the trail with the limber, when retiring firing. Horses were hitched in pairs instead of in file. A new ammunition wagon was provided, and canister (a tin case containing a number of balls) was introduced as a projectile. In Gribeauval's system, however, drivers were still hired, as formerly, and the dispersion of the guns among battalions was a serious defect. Horse artillery was established in the French army in 1791 and in the British army in 1793. Gribeauval's improvements in garrison and seacoast carriages resulted in a type, similar in essential principles, to those used in England and America up to the middle of the nineteenth century.

Beginning of Nineteenth Century—Artillery under Napoleon. Napoleon created a divisional artillery by withdrawing the guns from the battalions, forming them into batteries, and assigning the batteries to infantry divisions. This added to their efficiency and relieved the infantry battalion of an impediment. He made many important improvements, both in organization (among others reducing the number of guns in the battery from 8 to 6), administration, and the tactical employment of artillery in the field. He reduced the calibres for the field batteries to 6-pounder guns and 24-pounder howitzers, and to 4-pounders for the horse batteries. He used military drivers for horse batteries, and did away with the general custom previous to this advance of hiring teamsters by contract. They now formed a part of the military establishment. Napoleon always held in reserve a large number of guns for use at the decisive moment of the battle, and effectually employed the modern system of concentration of fire from separated masses of guns. His artillery played a most important part at Friedland, Wagram, Borodino, Lutzen, and Waterloo. As Napoleon lost his infantry, he increased the number of guns per 1000 men. At Austerlitz the proportion was $2\frac{1}{2}$ guns, at Wagram nearly 4, to each 1000 men of other arms. A study of his campaigns is of the utmost importance, as it gives, perhaps as no other series of campaigns, a detailed account of the possibilities of field artillery.

British Artillery. Just before the English wars on the Continent, which began in 1793, the British artillery consisted of a train composed of both field and siege guns, organized in brigades of 12 pieces each. Two guns were assigned to each infantry battalion. Draft was by three horses in single file, the drivers being carters on foot. The necessity for reorganization and improvement was soon made apparent. The driver corps for the guns was established in 1794. The dispersion of the guns among the infantry battalions was abolished in 1802, the guns being formed into field batteries or brigades of 6 guns each. Prior to this time field and siege guns had been gathered, almost haphazard, into batteries of 12 pieces. Shrapnel was invented by Major Shrapnel in 1803, and Congreve rockets by Sir W. Congreve in 1806. Horses were harnessed in pairs. There were 6 horses to each gun and 4 to each caisson. The armament for each battery was 5 guns and 1 howitzer, uniform in each field battery, either 6-, 9-, or 12-pounders. The how-

itzers were 5½-inch brass pieces. At first the horse batteries contained two 9- and three 6-pounders, but later all five guns were 9-pounders. Congreve rockets were unique reversions to earlier artillery weapons, but seem to have been effective. The rocket consisted of a sheet-iron case inclosing the explosive and was fired from a tube. They were first used at Leipzig (1813) and with great success; also in the Peninsular War at the passage of the lower Adour (1814), and at Bladensburg, against American troops. Notwithstanding the above improvements, the British artillery still lacked mobility. Improvement in this direction was steady up to the time of the Crimean War.

First Half of Nineteenth Century. In 1822 the corps of drivers in the British Artillery was abolished, and men were enlisted to serve either as drivers or cannoneers. This practice was followed by the French in 1829. The field batteries consisted of 4 guns and 2 howitzers each, the guns being 8- and 12-pounders, and the howitzers 24- and 32-pounders. Weights were reduced, and the ammunition was carried in chests on the limber. Seats were provided for the cannoneers on the limber-chests and the caissons, and the 2 flasks in the trail were replaced by a single "stock." To Napoleon III is due the establishment of a field battery consisting of a single calibre. The gun was known as the 12-pounder Napoleon. The French artillery at this time was divided into horse artillery (the cannoneers being mounted), line artillery, commonly known as "field artillery" (the cannoneers on the chests), and reserve or siege artillery, in which all the men marched on foot. This was the organization at the time of the Crimean War. The British artillery was organized as "position, heavy field, field, horse, and mountain batteries, armed respectively with 18-, 12-, 9-, 6-, and 3-pounder guns, and 8-inch, 32-, 24-, and 12-pounders, and 4-inch howitzers. A rocket section was attached to each battery of field and horse artillery." (See Wagner, *Organization and Tactics*.) The Crimean War consisted principally of siege operations, and there was therefore little opportunity for the tactical use of fieldpieces. At Inkerman (Nov. 5, 1854), however, both sides employed artillery with some effect. The maximum effective range obtained by the guns of this period was only about one mile, and it became evident during the war that the power of the field gun had to be increased and its fire made more accurate if it was to become effective in a contest with infantry. Rifling, though first practically applied in 1846, was not developed until after the Crimean War. Rifled siege guns were first used by the British at the siege of Sebastopol, but with little effect, on account of poor construction. In reference to the question of rifling and breechloaders, Lloyd and Hadeock, in their *Artillery: Its Progress and Present Position*, state that as early as 1547 the principles of rifling and breech-loading had been experimented with in England. A few years after Sebastopol, the Armstrong breech-loading rifled gun, which was first used in the China Campaign of 1860, was introduced into the British artillery.

Italian War (1859). Rifled field guns first appeared on the field of battle in the Italian War of 1859, being one of the many improvements made practical by the French. The smooth-bore 12-pounder Napoleon gun and the 4- and 12-pounder rifled muzzle-loader familiar to

the Union service during the Civil War, played a prominent part in this war. The Austrian artillery at this time consisted entirely of 6- and 12-pounder guns, and 32-pounder howitzers, all smoothbore. By rifling, the effective range of the French field gun was increased to about 2500 yards. The Austrian smoothbore, with an effective range of only 1450 yards, was therefore at a great disadvantage.

Civil War in the United States. *Field Artillery.*—At the beginning of the Civil War in the United States, the field artillery consisted of eight batteries. Most of the seacoast artillery was promptly converted into light batteries. One additional regular regiment and many volunteer batteries were organized. The armament consisted of 3-inch wrought-iron muzzle-loading rifled field guns, 6- and 12-pounder bronze smoothbores, 12-pounder bronze mountain howitzers, and 12-, 24-, and 32-pounder bronze field howitzers. The Napoleon gun was used throughout the Civil War, and with great effect at the shorter ranges. The range of the Ordnance Department 3-inch gun was 2800 yards, and that of the 12-pounder Napoleon about 1500. The objection to the Napoleon, as to all smoothbore arms, was its inaccuracy at long range. The projectiles of this period were shot, shell, grape, and canister. In the Eastern armies the battery contained at first six pieces, later four. There were four batteries to each division. When the divisions were organized into corps, about half of the divisional batteries formed the corps reserve. In 1863 division artillery was abolished, and the batteries of each corps were formed into an "artillery brigade." This system obtained until the close of the war. A brigade contained from 4 to 12 batteries. In the Western armies a battery of artillery was assigned to each infantry brigade, and this organization was retained until 1863. Subsequent changes all tended toward the concentration of batteries. In the Confederate Army of Northern Virginia the artillery was formed into battalions of four batteries each, and a battalion was assigned to each infantry division. To each army corps were assigned two battalions of "corps artillery." This organization of field artillery, with minor changes, has since been adopted by most of the powers. "The War of Secession gave the tactics of artillery a long stride forward. The increased range of the infantry weapon denied to the artillery the ability to manoeuvre close to the enemy, as was done in the Napoleonic wars, and greatly restricted the use of grape and canister, which were suitable for short ranges only. The ranges ordinarily employed varied from one-half to one mile, although on occasions batteries sought positions considerably short of these distances. It developed the use of masses of guns to an extent unknown since the days of Napoleon. It infused into the handling of that arm a degree of audacity foreshadowing the tactics of 1870; and if its offensive use in masses had not been all that could be wished, it was due to causes beyond the control of the arm itself." (Wagner, *Organization and Tactics*.)

Siege and Seacoast Artillery.—Up to about 1890 the United States had for seacoast defense and siege trains only the guns left over from the Civil War. These were principally Rodman smoothbores and Parrot rifles, both cast iron and muzzle-loaders. They were supplemented in 1872 by the addition of 8-inch

muzzle-loading converted rifles, the old 10-inch Rodmans being utilized for this purpose. The leading position of American artillery in 1861 was largely due to Lieutenant Rodman, of the United States army. His principle consisted essentially in casting guns by cooling from the interior. The system of artillery in the United States at the beginning of the Civil War embraced the following: "Siege and garrison: Cast-iron 4½-inch rifle, 12-, 18-, and 24-pounder guns, 24-pounder and 8-inch howitzers, and 8-inch and 10-inch mortars; Cohorn mortars (bronze). Seacoast: 32-pounder gun, 8-, 10-, and 15-inch Columbiads, 10- and 13-inch mortars. The total embraced seven different calibres of guns, three of Columbiads, four of howitzers, and four of mortars, or 18 altogether—the same as in 1850. In 1861 the smoothbore system of the United States was certainly excellent. In quality of cast-iron used, and its manipulation during manufacture, it has been claimed, and with good reason, that the Ordnance Department of the United States army led all other countries. If not the first upon the ground, the department was among the pioneers in heavy modern armaments, as was shown by the casting, successfully in that year, of what at the time was the most powerful weapon known—a 15-inch Rodman gun, followed, in 1864, by a similar but 20-inch smoothbore, throwing a shot weighing 1080 pounds. This was a grand stride, and placed the American artillery in no secondary position in the array of national armaments at that time developing." (Birkhimer, *Historical Sketch of the Artillery, United States Army*.)

Austro-Prussian War (1866). During this war nothing of importance in *matériel*, organization, or tactics, was developed by either the Austrians or Prussians. The field battery of the Prussians consisted of six guns, steel breech-loading rifles and smoothbores in the proportion of 10 to 6. They were called 6- and 4-pounders, the first class using a 15-pound oblong shell, and the latter a similar 9-pound shell. Shell fire, using percussion fuze, was used almost exclusively. Muzzle-loading rifles and smoothbores were used in the proportion of 10 to 6 (8- and 4-pounders), each battery containing eight pieces. The Austrians still retained the system of "brigade" artillery and used rocket batteries. In this war "brigade" artillery and rocket batteries appeared for the last time, and breech-loading rifled field guns first came into general use, although some had been used by the Confederates during the Civil War. The Prussians handled their artillery ineffectively during the entire war, their principal fault being failure to use the batteries at hand. The Austrians were far superior in initiative and dash in the handling of their artillery.

Franco-German War. The Prussian artillery officers were bitterly chagrined because of the ineffectiveness of their arm in 1866, and their use of artillery in 1870 was one of the most important military lessons of that war. Reserve artillery disappeared, and divisional and corps artillery alone were employed. To each cavalry division two batteries of horse artillery were attached. The guns employed were steel breech-loading rifles, 6- and 4-pounders. The proportion of artillery was 3.7 guns to 1000 men. The French used muzzle-loading rifles (8- and 4-pounders). A few 12-pounder Napoleon guns seem still to have been in service. The mitrailleuse used by them was a machine gun.

Their proportion of artillery was three guns to 1000 men. "The characteristic features of the artillery tactics of the Franco-German War may be summed up as follows: On the march the German artillery was no longer kept in rear of columns of infantry, but was pushed well to the front, being preceded only by enough infantry to protect it from surprise. It was brought into action at the very first opportunity, and almost invariably in large masses, which concentrated their fire upon the objective of the infantry attacks, and the mastery of the hostile artillery was deemed necessary before the infantry advance. Its fire, in almost every case, was deliberate and accurate, and was employed at ranges varying from 3300 to 650 yards, while the French wasted their ammunition in a rapid fire at ranges too long for the best effect. The French committed the further fault of retaining their batteries too long in reserve, and employing them, too often, singly instead of in masses. In this war shrapnel, although first used in 1808, was still in its infancy, and both sides depended mostly upon shell fire. The French time fuze had only two graduations, equivalent to ranges of about 1 and 1½ miles. The Germans used percussion fuzes. The mitrailleuse did not meet the high expectations that had been formed of it, though its effect was sufficient to foreshadow the extensive use of machine guns in future wars. Borbstaedt acknowledges that these guns did produce a considerable effect, partly from the strange, rattling noise they made, partly from the rapidity with which an immense number of projectiles were fired; and he says: 'It cannot be denied that the French mitrailleuses caused heavy losses to the attacking German troops, especially in positions where it was possible to keep them concealed till the decisive moment had arrived.' The mistake of pitting these guns against the German field artillery was frequently and disastrously made by the French. They were good only in the defense of positions." (Wagner, *Organization and Tactics*.)

Russo-Turkish War. The guns used by the Russians in this war were inferior to those used by Prussia seven years before. They were bronze breech-loading rifles, the heavy being 9-, and the light, 6-pounders. The *matériel* of the Turkish artillery was superior to that of the Russians, being composed of Krupp's steel breech-loading rifle guns, 8 and 9 centimeters calibre (3.2 and 3.5 inches). The Russians had 3.9 guns to 1000 men, the Turks only 2.2. During this war nothing new was developed either in organization or *matériel*. It was proved, however, in the actions around Plevna that the fire of field guns was ineffective against troops sheltered in intrenchments, and that no previous bombardment, no matter how severe, will justify the artillery in withholding its fire during the advance of the infantry. On this occasion the Russians had furiously bombarded the Turkish trenches preparatory to assaulting with their infantry. When the guns ceased, the Russian infantry advanced to the attack, and was greeted by a murderous fire from the Turkish riflemen who during the bombardment by the Russian guns had remained quiet and unharmed in their intrenchments.

Spanish-American War. The artillery played little part in the Spanish-American War of 1898. At Santiago the Americans employed four batteries of 3.2-inch breech-loading rifled

steel field guns. Unfortunately these were supplied with black powder, which immediately drew the fire of the Spanish guns. Major Herbert H. Sargent, in *The Campaign of Santiago*, states that, with the exception of one platoon of mountain guns, the Spanish artillery was composed only of the immobile guns placed for the defense of the city, and most of these were of an obsolete type. The United States organized a siege train composed of 3.6- and 5-inch rifles and 7-inch howitzers, but this equipment was never employed. The 3.2-inch field gun and a 2.95-inch mountain howitzer, purchased in England, were used in the Philippines. One battery of 3.2-inch field guns accompanied the American troops to China in 1900 and was used at Peking.

Boer War. In the South African War the British employed a 3-inch breech-loading field gun firing a 15-pound projectile, a horse artillery gun of the same calibre firing a 12½-pound projectile, a 5-inch siege rifle firing 50-pound lyddite shells, several types of howitzers, 2.5-inch mountain guns, and 4.7-inch naval guns. The last mentioned were handled by the naval battalion, and were hauled by horses or oxen, as the occasion required. The fuses of the field and horse artillery guns were graduated up to 3360 and 3960 yards, respectively. According to the comment of the German general staff in their *History of the Boer War*, the shooting and manoeuvring of the British artillery were good, but it was not sufficiently trained in fire tactics and working with the infantry. The brigade divisions (battalions) which had not existed in time of peace, were handled with the dash and boldness that had marked the employment of the batteries against savage tribes, and this resulted in the loss of two batteries at Colenso. The Boer equipment consisted of 6-inch Creusot breech-loading siege rifles whose range was 8750 yards, 4.7-inch Krupp howitzers, 3-inch field guns, and 1.45 Vickers-Maxim machine guns (the pom-poms), but much of this armament was old and obsolete. Only in the first part of the war did the Boers employ their artillery by batteries, for after the battle of *Talana Hill* the guns were fought singly, and generally withdrawn before the crisis of the action.

The Russo-Japanese War (1904-05). Both sides used artillery to a very large extent, each being armed with modern rapid-fire guns, although not of the latest type, on long recoil carriages. The Russian weapon was superior to that of the Japanese, but the latter were brilliantly successful in the early stages of the war because of the thorough instruction of their *personnel* and the use of "indirect" fire, here employed for the first time in actual war, although originating with the French in their drill regulations of 1897. In this system the guns are concealed as long as possible, the fire being directed by the observer, who is stationed in a commanding position from which he can see the field of fire. Having telephonic or signal communication with the batteries, the observer is a more important man than the gunner. This method was adopted by the Russians later in the war. The artillery prepares for the attack by firing over the heads of the advancing infantry, instead of by the preliminary artillery duel of former days. Mobility is not so important as ballistic qualities, long range, and rapidity of fire. The Japanese field artillery was organized into 19 regiments of 2 battalions of 3 batteries of 6 guns each. One such regiment was attached to

each of the 13 infantry divisions composing the army, the remaining 6 regiments forming an artillery reserve which remained at the disposition of the commander-in-chief. In addition, there was the heavy or siege *matériel* manned by the foot-artillery troops. The Japanese gun, although employed according to modern tactics, was not a true rapid-fire gun. It was not equipped with an hydraulic recoil buffer, and this necessitated relaying after each shot. Its calibre was 2.95 inches, and it fired a shrapnel weighing 11 pounds. High explosive shell were also used. The Russian artillery had no regimental formation, but was grouped into battalions of 3 or 4 batteries of 8 guns each. One or two such battalions were assigned to each infantry division (24 to 48 guns). The gun fired a 14½-pound shrapnel (no shell were carried), and was too heavy for the rough Manchurian terrain. Two types were employed, the later and better model being of such recent issue that the troops were entirely unacquainted with its use, and it was not until late in the war that it was handled in such manner as to bring out the real possibilities of the weapon. Prior to that time there had been a tendency to hold a large part of the artillery in reserve, in marked contrast to the Japanese, who early in the action assigned tasks to by far the greater part of their guns. The greatly superior ballistic properties of the Russian gun (it outranged its Japanese rival by 1000 meters or 1093.61 yards) were thus offset by the superior tactics of the Japanese and the presence with the latter of high explosive shell, the lack of which was a great handicap to the Russians. Neither gun was provided with shields, but both sides improvised this protection as the war progressed. Both belligerents used heavy artillery and mortars, but, if we except Port Arthur and the crossing of the Yalu and Tai-tzu, there is little evidence of their effect. Field mortars are described by Colonel Neznamov as without sufficient range and accuracy, and they may therefore be regarded as obsolete. The lessons brought out by this war were the employment of artillery at long ranges and from concealed positions, the danger of exposing the guns during the early stages of the action, the great rapidity of fire and its consequent drain upon the ammunition supply, the negligible effect of artillery fire against earthworks and hidden targets, and, finally, the urgent necessity for coöperation between the artillery and the infantry which it must support with its fire up to the moment of the final assault. For a full account, see **RUSSO-JAPANESE WAR**.

Balkan Wars. In the Balkan wars all reports make mention of the terrible effect of artillery fire. General Herr of the French artillery visited the theatre of operations while the war between Turkey and the Allies was still in progress, and as a result of his investigations concluded that artillery must seek the destruction of the hostile guns, therefore the artillery duel is necessary; that oblique fire so manifested its superiority that every effort should be made to gain positions from which it can be delivered; that a frontal attack is only possible after the mastery of the hostile artillery; that the employment of heavy guns at long range, both for the purpose of hastening the hostile deployment and the destruction of the hostile artillery, is necessary; that excessive ranges are uncertain; that field observatories are abso-

lutely necessary; that mountain batteries are preferable to field artillery as accompanying batteries; that aëroplanes under the control of the artillery are necessary; and finally that drag ropes and man harness should be provided.

The Allies were mostly armed with Schneider-Canet field guns, and their employment was generally similar to the French tactics. The Turks were armed with Krupp guns, but the demoralization which seemed to prevail in the Turkish army mitigated against their proper use.

The scientific development of coast artillery in which the United States has taken a prominent part, was commenced only during the last years of the nineteenth century. The modern weapons of artillery are now such complicated and complete pieces of mechanism that the various groups can best be considered when treated by themselves, and the reader is referred to the articles COAST ARTILLERY; FIELD ARTILLERY; GUNS, NAVAL; HORSE ARTILLERY; HOWITZERS; MACHINE GUNS; MORTARS, MOUNTAIN ARTILLERY; ORDNANCE; SIEGE GUNS, in which will be found illustrated descriptions of most forms of modern ordnance.

Bibliography. Wagner, *Organization and Tactics* (Kansas City, 1906); Grosse, *Military Antiquities* (London, 1801); Owen, *Modern Artillery* (London, 1873); Lloyd and Hadeock, *Artillery: Its Progress and Present Position* (Portsmouth, 1893); Birkhimer, *Historical Sketch of the Artillery, United States Army* (Washington, 1884); Birnie, "Gun-Making in the United States," in *Journal of Military Service Institution* (Governor's Island, 1891); Jeram, *The Armies of the World* (London, 1889); Bethel, *Modern Guns and Gunnery* (Woolwich, 1910); Bethel, *Modern Artillery in the Field* (London, 1911); Spaulding, *Notes on Field Artillery* (Fort Leavenworth, 1908); May, *Field Artillery with the other Arms* (London, 1898); Roquerol, *The Tactical Employment of Quick-Firing Field Artillery*, trans. by Radcliffe (London, 1903); Hohenlowe, *Letters on Artillery*, trans. by Walford (London, 1898); *The Field Artillery Journal*, Washington, D. C.; the *Journal of the U. S. Artillery*, Fort Monroe, Va.; *Royal Artillery Journal*, Woolwich, England; official publications of the Ordnance Department, U. S. A. There is a vast literature upon this subject in French and German, reference to which can be found in encyclopædias in those languages. For the organization of artillery, and its relation to the other arms of a modern army, see ARMY ORGANIZATION, and for a description of the tactics governing artillery, see TACTICS, MILITARY; SIEGE AND SIEGE WORKS; FORTIFICATION; COAST DEFENSE; for a discussion of the theory of various artillery weapons, see BALLISTICS AND GUNNERY; for the construction and the mechanical details of different forms of cannon, see ORDNANCE. See also PROJECTILES; FUZE; PRIMER; AMMUNITION; RANGE AND RANGE-FINDER; EXPLOSIVES; GUNPOWDER.

ARTILLERY, PARK OF. A name applied to a collection of guns and accessories in camp or barracks. In action or siege, the guns are parked out of reach of the enemy's fire when not in use themselves. The equipment of a gun park consists of reserve guns and carriages, ammunition wagons and caissons, implements, and material necessary for repairing and completing equipments, and harness stores, field forges, etc. The *personnel* consists of the officers and men of the batteries, smiths, wheelwrights, sad-

dlers, armorers, drivers, and other artificers and laborers.

ARTILLERY CARRIAGES. Artillery carriages are of two classes: First, gun carriages, designed so as to enable cannon to be transported thereon or fired therefrom. Of this class those for the seacoast guns are fixed in position. Second, carriages designed for the transportation of ammunition or material necessary for use of the artillery in the field. Artillery carriages and gun mounts will be found discussed at considerable length in ORDNANCE; GUNS, NAVAL. See also ARTILLERY; COAST ARTILLERY; FIELD ARTILLERY; MACHINE GUNS; SIEGE GUNS; HORSE ARTILLERY.

ARTILLERY COMPANY, ANCIENT AND HONORABLE, of Boston. The oldest regularly organized military company in America, dating from 1637, and formed on the model of the Honorable Artillery Company of London. In the early days of the Colony it was a purely military organization, composed of the leading citizens of Boston and adjacent towns, and always ready for service. The military organization is still preserved, but the functions of the corps are now more or less social, though regular drills are still held at its armory, in Faneuil Hall.

ARTILLERY COMPANY, HONORABLE. The oldest existing volunteer corps in Great Britain, and the model on which the Boston organization of similar name (see ARTILLERY COMPANY, ANCIENT AND HONORABLE) was formed. It had its origin in 1537, in the days of the Tudor sovereigns of England, and is closely rivaled in point of antiquity by the Yeomen of the Guard, the Sergeant-at-Arms, and the corps of Gentlemen Pensioners. The beginnings of the modern artillery school may clearly be seen in the patent forming the company, which, in 1537, Henry VIII granted to three persons, appointing them overseers of the "Science of Artillery" for longbows, crossbows, and hand guns. The city of London has always taken great pride in the organization, which, curiously enough, is the only body of British troops, not regulars, permitted to parade in London streets with bayonets fixed. Until 1849 the members elected their own officers. Since then they have been crown appointments, made on the nomination of the lieutenantancy of the city of London.

ARTILLERY SCHOOLS. The United States Artillery School, established at Fort Monroe, Va., constitutes an independent command, from which all reports and returns are made to the headquarters of the army. It is governed by special regulations, modified from time to time, as may be necessary. The school consists of a commandant, adjutant, officers detailed as instructors, and of the troops and enlisted men assigned for duty or instruction. The commandant and the heads of the departments, in addition to forming the faculty, constitute a board of coast artillery for the general service, to which questions of professional interest can be submitted. The instructors and the student-officers have no duties other than those of the school. Practically all coast-artillery officers pass through this school. The first artillery school for practice was established at Fort Monroe in 1824, but was discontinued six years later. A second attempt was made in 1858, but was stopped by the Civil War. The school was again started in 1867, but it was temporarily discontinued in 1898, owing to the officers being needed in the field, etc., during the Spanish-American

War. It was reestablished in 1900, the course being for one year, commencing September 1, and under the plan then adopted was intended chiefly for the recently appointed lieutenants of artillery not graduates of the Military Academy, a considerable number of whom were admitted to the army during and after the Spanish-American War. Instruction is both theoretical and practical, and the course is closed by an examination before a board of officers especially appointed for the purpose. The curriculum includes the subjects of ballistics and seacoast engineering, electricity, mines and mechanisms, artillery, coast defense, and explosives, special courses including customs and usages of service, property returns, correspondence, regulations, etc. A limited number of graduates are retained for the advanced course which occupies the second year. A branch of this same institution is the school for master gunners, under the management of the officer in charge of the artillery school.

A school of fire for field artillery was established at Fort Sill, Okla., in 1911. In this school the course for captains and lieutenants of the regular army lasts three months; for field officers it is one month. There is also a special course of one month for officers of the organized militia. The work consists mostly in the actual fire of field artillery projectiles and a study of the results obtained.

Foreign Artillery Schools. France, Germany, England, and Italy have artillery schools, some of which have been established for over 200 years. An artillery school was established in Venice as early as 1515. Louis XIV established a school of application for the artillery at Douai in 1679. This was in 1802 transferred to Metz, where it remained till the war of 1870. It is now at Fontainebleau. The artillery and engineering school of Prussia is at Berlin. The artillery and engineering school of England is at Woolwich. In some of the countries the artillery and engineers' schools are combined, but in most of the European states a separation of the two arms is made. In addition, many countries maintain schools of fire. That of Germany is at Jüterbog, Italy's is at Natturmo, and Austria's is at Hajmasker.

ARTILLERY TRAIN. A certain number of cannon mounted on carriages, with all their furniture, fit for marching. See **FIELD ARTILLERY**; **ARMY ORGANIZATION**; **ARTILLERY**; **SIEGE GUNS**; **TACTICS, MILITARY**.

ARTOCARPUS. See **BREAD-FRUIT TREE**.

ART OF POETRY. See **ARS POETICA**.

ARTOIS, är'twä' (from *Atrebates*, Lat. name of a Gallic tribe). A former province of France, bounded by Flanders and Picardy, almost corresponding to the modern department of Pas-de-Calais. The capital of Artois was Arras. Louis IX, in 1237, made Artois a county, and gave it to his brother Robert, who was succeeded by his son, Robert II, who died in 1302. Afterward it passed into the control of Flanders and Burgundy, but was ceded to France by treaties in 1659 and 1678. It is a fertile district, yielding grain and hops and vegetables, with abundant pasture.

ARTOIS, COMTE D'. The title borne by Charles X (q.v.) before his accession to the throne of France.

ARTOIS, JACQUES. See **ARTHOIS, JACQUES**.

ARTOT, är'tô', **MARGUERITE-JOSÉPHINE-DÉSTRÉE MONTAGNEY** (1835-1907). A Belgian mezzo-soprano. She was born at Paris, July 21,

1835, studied under Pauline Viardot-Garcia, and made her début at Brussels in 1857. The next year she appeared at the Opera House in Paris, but left there to make a tour of France, Belgium, and Holland. Her success was immediate, and after 1860 she appeared in opera in London, St. Petersburg, and the capitals of the Continent, her repertory including parts in operas by Mozart, Rossini, Verdi, Gounod, etc. In 1869 she was married to the Spanish barytone, Padilla.

ARTOTYPE. See **PHOTOGRAPHY**.

ARTS, LIBERAL, or SEVEN LIBERAL. The distinction between the liberal arts and the practical arts on the one hand, and philosophy on the other, originates in Greek education and philosophy. In the *Republic* (bk. xi) of Plato and the *Politics* (viii, 1) of Aristotle, the "liberal arts" are those subjects that are suitable for the development of intellectual and moral excellence, as distinguished from those that are merely useful or practical. The distinction was always made, by the Greek theorists, between music, literature in the form of grammar and rhetoric, and the mathematical studies, and that higher aspect of the liberal discipline termed philosophy. Philosophy was sometimes called the liberal art par excellence. Philo of Judæa, in his attempt to harmonize Hebrew religious literature and Greek philosophy by allegorical interpretation, takes this relationship of the arts and philosophy as the meaning of the union of Abraham with Hagar and Sarah—the former typifying the liberal arts, the latter typifying philosophy. No definite number was ever assigned to the liberal arts by the Greeks, though the distinction later indicated by the terms *trivium* and *quadrivium* is clearly made in the *Republic* of Plato. Varro (116-28 B.C.) reproduces the distinction and the substance of the various "liberal arts" for the Romans, though he includes medicine and architecture, both practical subjects, excluded alike by Greek and by Mediæval thought. Quintilian (35-95 A.D.) discusses five arts—grammar, rhetoric, music, geometry, and astronomy; but, with the subdivision of the first and fourth, there would be added dialectic and arithmetic. By the fifth century the number of arts is definitely recognized as seven, both by the churchman Augustine and the pagan Martianus Capella. Cassiodorus, in the sixth century, applies the term *quadrivium* to arithmetic, geometry, music, and astronomy. Probably before that time the term *trivium* had been applied to grammar, rhetoric, and dialectic, to indicate the trinity of the subject rather than simply their elementary character. By the time of Alcuin, in the eighth century, a sacred significance is attached to the number seven, and the Church appropriates this organization of human or pagan learning, to which at first it had been extremely hostile. Throughout the Middle Ages the "seven arts," as combined into the *trivium* and *quadrivium*, represent the sum of human learning. Dante, in his *Il convito* (bk. ii), identifies them with the seven planetary circles of the heavens, discovering in each planet the characteristic excellence of the corresponding study. The "Seven Liberal Arts" formed the curriculum of the early universities, and their mastery entitled one to the degree of *bachelor*, or *master* "in arts." For the greater portion of the Middle Ages philosophy had simply been the inclusive term, but with the development of the universities, it came to be regarded as a higher discipline. The Renais-

sance broke down even this limitation, and hereafter knowledge was no longer confined to these definite and narrow limits. For a survey of the significance of the term "liberal arts," consult: Abelson, *The Seven Liberal Arts* (New York, 1906), containing full bibliography; Parton, *The Arts Course at Medieval Universities* (Urbana, Ill., 1910). See DEGREE; DIPLOMA; UNIVERSITY; PHILOSOPHY.

ART STUDENTS' LEAGUE OF NEW YORK. One of the most prominent schools of art in America, located in New York City. It was founded in 1875 by certain students from the National Academy of Design, who felt the need of study from life and a broader field of work than the more conservative institution could give them; was incorporated in 1878, and has since then risen steadily in importance. The annual membership is now over 1500, and the average daily attendance in its classes is 500. Its alumni include many of the most prominent artists in this country. The quarters of the League is the American Fine Arts Building at 215 West 57th Street. The League is self-supporting, the student's fees being from \$30 to \$70. It is governed by a board of control elected from the members, who in turn are elected from the advanced students. There are classes in drawing and painting from life, antique drawing, portrait, still life and miniature painting, composition, illustration, modeling, and lectures on anatomy, construction and history of art. There are, in general, no entrance requirements. The school year includes night classes for men and women, and a summer term in the American Fine Arts Building, also a summer school of landscape painting at Woodstock, Ulster Co., N. Y. Besides scholarships to some of the small art schools in other cities, the League gives prizes and scholarships in all of its own classes for the best work done. Among the prizes are the One Hundred Dollar Prize for the best painting, the Saltus Prize of \$50 for antique drawing, the Saint-Gaudens Prize of \$75 for figure modeling, the Saint-Gaudens Prize of \$25 for composition modeling, and the Evans Prize of \$50 for the encouragement of the practical side of art.

ARTSYBASHEV, MIKHAIL PETROVITCH (1878—). A Russian writer of the same school as Gorki and Andréev (qq.v.). He was born in South Russia and claims to have Tatar blood in his veins. He is undoubtedly of mixed descent. The famous Polish humanitarian, Kosciusko, was his maternal great-grandfather. Left a sickly orphan at the age of three, the boy struggled for an education. Painting engaged his attention in his early years, but the indigence of his father deprived him of means enough to master it. Then he turned to writing, and when, years later, a story of his happened to be printed, he determined to become a writer. Subsequent short stories, of which a great number have been published within a few years, showed the wisdom of his determination. At 25 he wrote a novel, *Sanin*, which at once placed him in the front rank of contemporary Russian writers. It took four years, however, to find a publisher for it; but when it was published (in 1907) its success was phenomenal. Favored by the reaction following the hopeful revolutionary days of 1906, this novel created more discussion in Russia than anything else published within a decade. For his frank realism and revolutionary heresies Artsybashev has already (in 1912)

served a two months' sentence in a Russian prison. His popularity is very great, however, and he continues writing in the same realistic vein. His method and style are as simple as those of Maupassant, while his psychological analysis is as penetrating as that of Andréev. He treats of present-day Russia in so masterly a manner that his personal leanings are often indeterminable—resembling the great Turgenev in this respect. He writes of all sorts of men with equal frankness and sympathy. Indeed, Artsybashev is to-day the most promising Russian writer. His works, both long and short, have already been translated into German and Yiddish. *Sanin*, so far his only novel, has been dramatized and put on the Jewish stage.

ARTUSI, ăr-tōō'sé, GIOVANNI MARIA (c.1550–1613). An Italian musician, composer, and writer on musical theory. He was born at Bologna, was a canon of San Salvatore, Venice, and staunchly defended the musical traditions and views of his time against the innovations of Monteverde and Gabrieli. He published a *Canzonette*, for four voices, and a *Cantate Domino* (Vincenti collection). His theoretical works include the *L'arte del contrappunto ridotto in tavole* (1586 and 1589), *Delle imperfezioni della musica moderna* (1600 and 1603).

ARUBA, ăr-rōō'bá, or ORUBA. An island of the Dutch West Indies, situated at the entrance to the Gulf of Venezuela, west of Curaçao, of which it is a dependency (Map: West Indies, E 4). Area, 69 square miles. The population in 1902 was 9105, and estimates in 1911 returned about 10,000. The surface is elevated and scantily watered. Gold is mined, and there are large phosphate deposits. Both of these commodities are important articles of export. Aruba was occupied by the Dutch West India Company in 1634. The capital is Oranjestadt, which contains the bulk of the population.

ARU, ăr-rōō, or ABBU, ăr-rōō', ISLANDS. A group of islands in the Arafura Sea, situated between lat. 5° 10' and 6° 20' S. and long. 134° and 135° E., southwest of New Guinea (Map: Australasia, F 3). It consists of one large island, divided into the five parts of Kola, Wokan, Kobrur, Tragan, and Maikor, and a number of small islands, all of which are generally low and inaccessible. The chief commercial centre is Dobbo, on the island of Womma, and is a resort for traders. The population is estimated at 22,000 and is made up chiefly of Papuans. The group belongs to the Dutch and forms an administrative dependency of the Moluccas.

ARUM (Lat. Gk. *ἀρον*, *aron*, wake-robin, cuckoo-pint). A genus of monocotyledonous plants of the family Araceæ. Most of the species are tropical or semi-tropical. They are characterized by a convolute spathe inclosing the spadix, which is naked at top and bears the pistillate flowers at its base. The staminate flowers are placed just above the base. In some of the species the spathes are highly colored and beautiful. These flowers are well known under the name "callas." The calla or calla lily of the greenhouse and gardens is *Richardia* or *Zantedeschia æthiopica*, a native of Africa. A common species in Europe is *Arum maculatum*, where it is known as cuckoo-pint, wake-robin, etc. In the United States there are a number of closely related genera, of which may be mentioned the Indian turnip (*Arisæma triphyllum*), the water arum (*Calla palustris*), and the skunk cabbage (*Symplocarpus foetidus*). The

latter is well known for its fetid odor. An allied form, *Anthurum andreanum*, from Colombia, South America, with a large, brilliant, orange-red spathe, is often cultivated. Consult A. L. P. and C. Decandolle, *Monographiae Phanerogamarum*, vol. ii (Paris, 1878-79). For illustration, see ANEMONE; CALLA.

ARUNDEL, ăr'ün-del, or colloquially, ăr'n'del. A small municipal borough of Sussex, England, situated on the navigable river of Arun, about 5 miles from the coast (Map: England, F 6). It has an old parish church, dating from the end of the fourteenth century; but its chief interest centres in Arundel Castle, the former seat of the earls of Arundel, which consists of an old Norman keep and a Gothic building restored late in the nineteenth century. It was besieged twice during the twelfth century and utterly ruined during the civil war of Charles I. It is now the residence of the dukes of Norfolk. Pop., 1891, 2644; 1901, 3059; 1911, 2842.

ARUNDEL, THOMAS (1353-1414). Archbishop of Canterbury in the reigns of Richard II, Henry IV, and Henry V. He was born in Arundel Castle, Sussex, the present seat of the dukes of Norfolk, and was the third son of Robert Fitz-Alan, Earl of Arundel and Warren. He became Archdeacon of Taunton (1373) by the Pope's appointment, and Bishop of Ely in August of the same year. In 1388 he was transferred to the archiepiscopal see of York. He was Lord High Chancellor of England from 1386 to 1389 and from 1391 to 1396. In 1396 he was promoted by a papal bull to the archiepiscopal see of Canterbury. Having been banished the kingdom (1397) for taking a leading part in the first attempt which was made to deliver the nation from the oppression of Richard II, he was honorably received at Rome, and at first favored by the Pope, Boniface IX (1389-1404), who later, prejudiced by the representations of Richard II, deprived him of his see and transferred him to St. Andrews in Scotland. He did not return till 1399 and then was reinstated at Canterbury. He crowned Henry IV, October, 1399, and served as his Lord Chancellor for a few days, again in 1407 and 1412. He was conscientiously a bitter persecutor of the Lollards, the followers of Wiclif, and a chief instrument in procuring the horrible act for the burning of heretics (*de heretico comburendo*), passed in the reign of Henry IV (1401). He even carried his bigotry so far as to solicit from the Pope a bull for digging up Wiclif's bones, which, however, was wisely refused him. He also procured a synodal constitution which forbade the translation of the Scriptures into the vulgar tongue. He died at Canterbury, Feb. 19, 1414.

ARUNDEL, THOMAS HOWARD, second EARL OF (1586-1646). An English art collector, the first to make any large assemblage of works of art in England. He was born at Finchingfield (Essex), was educated at Westminster School and at Trinity College, Cambridge, in 1616 was appointed a Privy Councillor, and in 1621 Earl Marshal of England. In 1636 he executed an important diplomatic mission at the court of Vienna. See ARUNDEL MARBLES; ARUNDEL SOCIETY.

ARUNDEL HOUSE. 1. The famous London house of Lord Arundel, situated where Arundel, Howard, Norfolk, and Surrey streets now unite at the Strand. Here the Arundel

marbles were placed when first exported by their new owner from Italy. During the turbulent times of Charles I and Cromwell it was often deserted, and the splendid statuary in its gardens was partially destroyed. 2. The house of Lord Arundel, in which Lord Bacon died in 1626. It stood near Highgate.

ARUNDEL MARBLES. The inscribed marbles in the collection of ancient sculptures and antiquities formed about 1627 by Thomas Howard, second Earl of Arundel. Of the original collection of 250 pieces, 136 were presented in 1667 to the University of Oxford, by his grandson, Henry Howard, afterward Duke of Norfolk. The collection was formed for the Earl largely through the purchases of Mr. (afterward Sir) William Petty, who traveled in Italy, Greece, and Asia Minor for this purpose. The most important inscription is the "Parian Chronicle," a slab of marble containing a large part of a chronicle of events in Greek (chiefly Athenian) history. It originally extended from the reign of Cærops, here reckoned as 1582, to 263-262 B.C., the year of its composition, but the Arundel copy breaks off at 355 B.C. In 1897 another fragment, covering the period from 336 to 299 B.C., was found on Paros. The unknown writer not only gives the Athenian archon in whose term the events recorded took place, but also the number of years before 264 B.C. This inscription, with others of the collection, was first published in *Marmora Arundelliana*, by John Selden (1628), later in *Marmora Oxoniensia* by Prideaux (Oxford, 1676), Chandler (Oxford, 1763), and Roberts (Oxford, 1791). The best edition is that of Boeckh, with full Latin commentary, in *Corpus Inscriptionum Græcarum* (Berlin, 1828-77). The new fragment is published in *Mitteilungen des kaiserlich deutschen archaologischen Instituts, Athenische Abteilung*, vol. xxiv (Berlin, 1897). Consult Sandys, *A History of Classical Scholarship*, vol. ii, pp. 342-343 (Cambridge, 1908).

The nobleman whose name is associated with these ancient marbles is worthy of remembrance, independently of his general merits, as the first of his order in England who liberally encouraged the fine arts and communicated the influence of his own taste and enthusiasm in their cultivation to a wide circle of imitators and successors.

ARUNDEL SOCIETY. A society founded at London in 1849 and named after the Earl of Arundel, the famous collector of the Arundel Marbles and one of the first great English patrons and lovers of the arts. It was discontinued in 1897.

ARUNDEL CLUB. A society founded at London in 1904 for the purpose of continuing more effectively the work of the Arundel Society. The Arundel Society encouraged the study of art by reproducing the best works of the old masters; but the Arundel Club goes further by copying and publishing important works in private collections previously inaccessible.

ARUN'DO. See REED.

ARUWIMI, ăr'wō-wēmē. An important right tributary of the Congo, rising from many sources on the slopes of the Blue Mountains west of Albert Nyanza, East Africa (Map: Belgian Congo, E 2). It flows westward through a densely wooded region to the Congo, forming numerous rapids and receiving the Nepoko from the right. It enters the Congo in lat. 1° 30' N., after a course of nearly 800 miles. It is navigable to Yambuya. Natives give to parts of

its course the names Ituri, Novelle, Suhali, and Bijerre. Stanley, who discovered the river in 1883, ascended it in 1887 on his expedition in search of Emin Pasha.

ARVAD, ár'vād. An ancient Phœnician city. The Greek form of the name *Ἀρφαδος*, *Arwadōs*, became Arados when the digamma was dropped; hence the Latinized *Aradus*. Arvad, or more correctly Arwad, was originally the designation of a town on a little island in the Mediterranean about a mile off the coast of Syria, 30 miles north of Tripoli. This island, as well as the small modern village upon it, still bears the name Ruad, or Arwad. But already in the beginning of the fifteenth century B.C. Arvad seems to have had colonies on the mainland. The early Egyptian form of the name, Aratutu or Arudot, corresponding to Arwadoth, is a plural and, as W. Max Müller has suggested, probably designates a city of which the colonies on the mainland were regarded as a part. Thothmes III (1501-1447) conquered the city and after a rebellion punished it severely. It was the home of Abdashirta, and Aziru and his Amoritic dynasty, known to us through the Boghaz Keui tablets, held possession of the city. Tiglath-pileser I (c.1140-1100) embarked in Arvadite ships; Arvad paid tribute to Asurnazirpal III (885-860); Matan Baal of Arvad sent 200 men to the battle of Qarpar against Shalmaneser III in 854; a Matan Baal of Arvad also paid tribute to Tiglath-pileser IV (745-728); Esarhaddon (681-668) demanded tribute of another Matan Baal of Arvad. During the Persian period Arvad formed with Tyre and Sidon a league whose capital was Tripolis. King Strato seems to have held considerable territory in Phœnicia on the advance of Alexander. When attacked by him, the city secured water from springs at the bottom of the sea. The colony Antaradus on the mainland gradually became more important. It is mentioned by Ptolemy. This city was rebuilt by Constantine in 346 A.D. and called Constantina: at the time of the Crusades it had the name Tortosa. The town itself and one of the castles were taken by Saladin, but it returned to the hands of the Christians and was the last possession of the Crusaders in Syria captured from the Templars by Malik al Ashraf in 1291. The walls of Tortosa, now Tartus, are still standing, and there are remains of a castle built by the Crusaders. On the island there are also remains of walls and castles. The latter are of Moslem origin, built since the destruction of the city in 638. The town has now about 3000 inhabitants. Consult: Pietschmann, *Geschichte der Phönizier*, pp. 36 ff. (1889); William Allan, "On the Island of Ruad," in *Journal of the Royal Geographical Society*, vol. xxiii, pp. 154 f. (1853); Renan, *Mission de Phénice*, pp. 19 ff. (1874); W. Max Müller, *Asien und Europa*, pp. 186 f. (1893); and for Assyriological references, Rogers, *Cuneiform Parallels to the Old Testament* (1912).

ARVAK, ár'vāk (early awake). In Norse mythology, one of the horses of the sun. The other was called Alsvið (all-knowing).

AR'VAL BROTHERS (Lat. *Fratres Arvales*, from *arvum*, a field, arable land). A Roman priesthood of 12 members, whose duty it was to offer public sacrifices to insure the fertility of the fields. The place of their annual meeting was discovered near Rome in 1570, and since then large portions of their records, originally

inscribed on slabs inside the temple of Dea Dia, have been recovered, including a list of magistrates from 2 B.C. to 27 A.D. The records end in 241 A.D. and may begin as early as 21 B.C. The college does not seem to have been of importance during the later Republic, but to have been raised to importance by the Emperor Augustus, who was a member, as were his successors, until Gordian III. The members were elected for life by the college, usually on nomination of the Emperor. The officers were a *magister* (master) and a *flamen*; and among the attendants were four boys, who were required to be the sons of senators and to have living parents. Each officer wore a wreath of green, a white fillet, and a white toga bordered with purple. The great annual festival under their charge was in honor of Dea Dia, an otherwise unknown goddess, who must have originally resembled Tellus and Ceres, indeed, W. W. Fowler, in his *Roman Festivals*, p. 74 (London, 1899), identifies her with Ceres. It occupied three days between the middle and end of May and was celebrated with an elaborate ritual. On the first day was the ceremony of "touching" samples of old and young grain; on the second the sacrifice of two white pigs, a cow, and a fat sheep, in a sacred grove beyond the city, followed by blessing or "touching" samples of grain, and after that the dance and song of brotherhood in the temple, and the election of officers for the coming year. On the third day there was a sacrifice in the city. The Arval Brothers celebrated also a festival called *Ambarvalia* (q.v.). Other important duties of the brothers were to offer sacrifice on the birthday of an emperor, or at the beginning of a consulate, or for escape from danger, or at the starting or ending of a journey, or on occasion of any important event touching the imperial family. On the 3d or 4th of January they recited a particular form of prayer for the ruling Emperor and made sacrifice to the Capitoline deities. Consult Henzen, *Acta Fratrum Arvalium* (Berlin, 1874), and *Ephemeris Epigraphica* (Rome, 1872-99).

ARVE, ár'v. A tributary of the Rhône, 62 miles long, situated in the department of Haute-Savoie, France (Map: Switzerland, A 2). It rises on the Col-de-Balme (over 7000 feet high), in the canton of Valais, Switzerland, and flows southwest through the Val-des-Bagnes and the celebrated valley of Chamonix, emptying into the Rhône some distance below Geneva through a picturesque gorge at an elevation of over 1100 feet above the sea. The Arve is very swift and turbulent; and, as it is fed by glaciers, it often overflows its banks and is even the chief cause of the rises in the river Rhône itself. At flood, it is superior in volume to the Rhône itself. The district watered by the Arve contains many pleasure resorts and much fine scenery. The chief towns of interest are Servoz, Saint-Gervais-les-Bains, which has sulphur baths, and Sallanches.

ARVERNE. A borough in Queens Co., N. Y., comprising the fifth ward of New York City, 3 miles southwest of Far Rockaway on the Long Island Railroad, and on the Atlantic Ocean and Jamaica Bay (Map: New York City, Greater New York, G 8). It is a purely residential borough and is a popular summer resort for New Yorkers because of its accessibility and excellent bathing facilities. Pop. (est.), permanent, 2000; summer, 8000.

ARVEYRON, ár'vá'rôn'. A tributary of the Arve in the department of Haute-Savoie, France, rising in the Alps, 4400 feet above sea level, as the outlet of the Mer-de-Glace in Chamonix. Other tributaries of the Arve bear the name "Arveyron," and are further distinguished by the addition of the names of the glaciers from which they take their source.

ARWIDSSON, ár'véd-son, ADOLF IVAR (1791-1858). A Swedish poet, born at Padasjoki, Finland. In 1817 he was appointed *docent* in history at the University of Åbo; but his outspoken criticism of the acts of the authorities, in an essay contributed to a journal, the *Mnemosyne*, resulted in his banishment from Finland in 1822 and his removal to Stockholm, where he became director of the Royal Library (1843-58). His publications include a collection of poems, *Ungdoms Rymfrost* (1832); a collection of Swedish folk songs, entitled *Svenska Fornsånger* (3 vols., 1834-42); and a translation of the Icelandic *Prithjof's Saga* (2d ed., 1841).

ARYABHATA, ár'ya-b'hāt'ā (end of fifth century A.D.). A Hindu astronomer, born at Pataliputra (mod. Patna, on the upper Ganges). He was known to the Arabs as Arjehir, and his writings had considerable influence on Arabic science. His only work known to us is the *Āryabhatīga*, a series of rules and propositions written in verse and so called after his own name. This was published in Sanskrit, and edited by Kern at Leyden in 1874. It is divided into four parts, entitled respectively, "Celestial Harmonies," "Elements of Calculation," "On Time and its Measures," and "Spheres." Of the second part, Rodet has published a translation (Paris, 1879). Aryabhata held that the earth rotates upon its axis, and he gave the correct explanation of eclipses of the sun and the moon. In mathematics he could solve the quadratic equation, but many of his geometric formulas were incorrect.

ARYAN, ár'yan or ár'ī-an. The name commonly employed to designate that group of languages and that branch of the human family to which formerly the appellation "Caucasian" or "Japhetic," as opposed to "Semitic," was popularly but inaccurately given. It is synonymous in general with the terms "Indo-Germanic," "Indo-European," or "Indo-Celtic." German philologists commonly employ the term "Indo-Germanic" in its stead, and on good grounds they restrict the name "Aryan" to the sense of "Indo-Iranian," that is, to the Indian and Iranian branches of the great Indo-European family of languages and the early national communities which these languages represent. It can be proved, for example, that in ancient times the inhabitants of India and Persia proudly styled themselves Aryans, and there is no doubt that the term was a national designation in their case. In the oldest hymns of India, the Rīg-Veda, Aryan (*ārya*) is employed as a national epithet of the members of the ruling people of northern India, as opposed to the Dasyus, the Gentile or subject races, and especially the darker-skinned inhabitants of the south. The Avesta divides countries into Aryan and non-Aryan (*airya*, *anairya*), and from *airya* comes the later form of the name *Erān* or *Irān*, and also the classical *Ariana* (see IRANIANS). In the old Persian inscriptions Darius boasts of being "an Aryan and of Aryan descent" (*ariya ariya cidra*, Naqsh-i Rostam, Inscription a 14).

The etymology of the word *ārya*, *airya*, *ariya*, is obscure, and the real meaning of "Aryan" is uncertain. In the older Sanskrit *āryá*, *ārya* seems to denote 'true,' 'loyal,' and 'good'—in reference, perhaps, to those of the true stock, the real people, the loyal. In later Sanskrit *ārya* means 'noble.' Such explanations as 'plowmen,' 'tillers of the soil' (cf. Lat. *ārare*, to plow), taken to denote an agricultural population in contradistinction to a nomadic tribe, have little to recommend them. Moreover, while Aryan, in the sense of Indo-Iranian, is well authenticated in antiquity, little success has followed the attempt to prove that "Aryan" was used in primitive times by the people themselves as a broad and general designation, in the sense in which philologists and anthropologists have employed it. At present the name is given to a family composed of eight great groups of European and Asiatic peoples, whose languages are as follows: (1) Indian and Iranian; (2) Armenian; (3) Greek; (4) Albanian; (5) Italic; (6) Celtic; (7) Germanic; (8) Balto-Slavonic. (See these titles.) A recently discovered Aryan language, Tocharish, has not yet received a definite classification, though it is believed to be more akin to the western groups of the Aryan languages than to the Indo-Iranian. This subject is treated in Sieg and Siegling, "Tocharisch, die Sprache der Indoskythen," in *Sitzungsberichte der Berl. Akad.* (1908). As a linguistic and ethnologic term, "Aryan," both in Europe and in the United States, is beginning to give place to the preferable term "Indo-European" or "Indo-Germanic." "Indo-Celtic," as a designation instead of "Aryan," has not had much vogue; but it is sometimes employed as a substitute for "Indo-Germanic," especially by the French, who use also "Indo-European." As a convenient term, however, for general usage, "Aryan" has much in its favor, and it will doubtless survive as an alternate to the more precise designations.

That the Aryan peoples had their primitive home in the Pamirian region of the Hindu-Kush was formerly the commonly accepted theory; but of late years the evidence is more in favor of the location of their home somewhere between the Caspian and the North Sea, or rather in the steppe land of southern Russia (O. Schrader, 1890, 1901). Brinton (1890) made the Aryans a West European development of the white race (primitively from northern Africa); Keane (1896) placed the Aryan cradle land somewhere in the Eurasian steppe area, while Much (1904) seeks it in northwestern Europe. Others, like Deniker (1900) and Sergi (1895-1901), prefer to speak of the Aryanization of prehistoric dwellers in Europe (from Asia?). The Aryan is a very ancient dweller in both Asia Minor and Central Asia, and the Aryan element in the culture of the south Asiatic peoples is both old and far-reaching. Consult: Schrader, *Reallexikon der indogermanischen Altertumskunde* (Strassburg, 1901), as well as his *Die Indogermanen* (Leipzig, 1911); E. de Michelis, *L'Origine degli Indo-Europei* (Turin, 1903); Taylor, *Origin of the Aryans* (New York, 1890); Reinach, *L'Origine des Aryens* (Paris, 1892); Ripley, *Races of Europe* (New York, 1899); Sergi, *Mediterranean Races* (1901); Much, *Heimat der Indogermanen* (2d ed., Berlin, 1904); Hirt, *Die Indogermanen* (Strassburg, 1905); "Untersuchungen zur indogermanischen Altertumskunde," in *Indogerm.*

Forsch., vol. xxii (1907): Ehrlich, *Zur indogermanischen Sprachgeschichte* (Königsberg, 1910). See INDO-GERMANIC LANGUAGES; INDO-EUROPEANS.

ARZAMAS, är'zä-mäs'. The capital of the district of the same name, in the government of Nizhni Novgorod, Russia (Map: Russia, F 3). It is situated on the high right bank of the Teshia River at its juncture with the Arsha, an affluent of the Volga, 75 miles by rail from Nizhni Novgorod and 340 miles east of Moscow. Arzamas has tanneries, brickyards, and manufactures iron, flour, soap, and tallow. The town is a commercial centre, trading in cloth and knitted goods. Pop. (latest report), 1897, 10,600. Arzamas was noted in the first half of the nineteenth century for its school of painting, whose products supplied a great part of Russia with holy pictures.

AS (Lat.). The designation both of a Roman weight (called also *libra*), corresponding very nearly to an English *pound*, twelve ounces, and of a coin made of the mixed metal *as*, or bronze. The *as* (coin) originally no doubt weighed a (Roman) pound, but it was gradually reduced to 1-36 of a pound, and even less. It is therefore difficult to assign any fixed value to the *as*. About 270 B.C. the *denarius* (= 17c.) contained 10 asses; so that the value of the *as* was a little less than 1¾ cents. When the denarius was made equivalent to 16 asses instead of 10, the value of the *as* was about 1 cent. It was by the *sestertius* that money was reckoned at Rome. The oldest form of *as* usually bore the figure of an ox, a sheep, or other domestic animal (*pecus*); from which it is usually supposed that the Latin word for money, *pecunia*, is derived. Consult G. F. Hill, *A Handbook of Greek and Roman Coins* (London, 1899). See Plate II of NUMISMATICS.

A'SA, son of Abijah (1 Kings xv. 7-9) and the third King of Judah. According to the author of Chronicles he began his reign as a religious reformer by removing the idolatrous altars and breaking the images (2 Chron. xiv. 3). He next turned his attention to the fortifications of the land, building walls and towers (2 Chron. xiv. 6). With an army of 580,000 men he defeated Zerah, the Ethiopian King (2 Chron. xiv. 8-12). On his return from this glorious victory he was met by Azariah, the son of Oded, who preached a new religious reform. Azariah's preaching strengthened Asa in his work, and he removed the traces of idolatry from Judah and Benjamin. He even removed his mother, Maachah, from power because she had made an idol to Asherah (1 Kings xv. 13; 2 Chron. xv. 16). Many scholars question the historical character of this Ethiopian invasion, not mentioned in Kings, and these thoroughgoing religious reforms. For a time Asa had peace in the country, but war broke out between him and Baasha, King of Israel. Against this King Asa asked and secured the help of Bar Hadad, King of Damascus. For this step he was severely rebuked by Hanani, the seer. The King, in anger, imprisoned the prophet (2 Chron. xvi. 7-10). For the last two years of his reign Asa was afflicted with a disease of the foot. He died and was buried in the city of David (1 Kings xv. 23-24) with great solemnity. The duration of his reign may be fixed approximately at 934-877 B.C.

ASABA, ä-sä'bä. A town of southern Nivola. II.—15

geria, Africa, situated on the Niger about 150 miles from the coast (Map: Africa, E 4). It was the administrative headquarters of the Royal Niger Company and is the seat of the Supreme Court. In a mineral survey of southern Nigeria important deposits of lignite were discovered near Asaba within a dozen miles of the river. Since 1910 the town has grown rapidly in commercial importance.

A'SA DUL'CIS (Neo-Lat. *asa*; cf. Pers. *azā*, mastic, Ar. *asā*, healing, and Lat. *dulcis*, sweet). A drug in high repute among the ancients as an antispasmodic and diuretic; also for supposed virtues of the most extraordinary kind, such as neutralizing the effects of poison, curing envenomed wounds, restoring sight to the blind, youth to the aged, etc. Its value was estimated by its weight in gold. The princes of Cyrene caused a figure of the plant producing it to be struck on the reverse of their coins, and it was sometimes called *Laser cyrenaicum*. The plant is of the genus *Thapsia* (of the natural order Umbelliferae). It is a native of the south of Europe and of Barbary.

AS'AFETIDA, or **ASSAFETIDA** (Lat. *fetida asa* or *assa*). A gum resin, which has been supposed to be identical with the exuded juice of the *Siphon* of Dioscorides, so highly esteemed among the Greek physicians; but this, perhaps, was rather the *Asa dulcis* (q.v.). This drug is brought from Persia, Turkestan, and Afghanistan, and is procured by drying the milky juice which flows from the root of the *Ferula fetida* of the order Umbelliferae. The root is long, and generally undivided; white inside, but having a black covering; and contains in its interior a quantity of juice of an overpowering odor, which much resembles that of garlic. About April the root leaves are taken away, and the root itself is more or less exposed by removal of the soil from about it. After a lapse of six weeks a slice is cut horizontally from its summit and a thick white juice exudes, the smell of which even exceeds in strength that of the drug when dry. The drug is sometimes met with in the market in the form of tears, but more frequently in lumps, which are made up of irregularly shaped tears, agglutinated together by a softer substance. Asafetida is used in medicine and possesses stimulant, carminative, and antispasmodic properties. It is most useful in minor hysteria, and, from its carminative action, in tympanitis or distension of the intestines with gas. When taken internally, it may be detected in almost every secretion of the body, in the saliva, breath, and urine. It is composed mainly of resin and gum, with oil of garlic and a small amount of ferulic acid. In many parts of the East asafetida is employed as a condiment.

ASAKAWA, ä'sä-kä'wä, KWAN-ICHI (1873—). A Japanese-American anthropologist and educator. He was born at Ninomatsu, Japan, and received his earlier collegiate education at Waseda University in Tokio. He then came to the United States to study at Dartmouth College and at Yale. From the former he received the degree of B.Litt. in 1899 and from the latter, three years later, that of Ph.D. In 1906, after several years as lecturer on the history and civilization of East Asia at Dartmouth College, he went back to Japan to occupy the chair of English at Waseda University. A year later, however, he accepted an appointment as instructor at Yale in the history of Japanese civilization and in 1910

was made assistant professor in this department. Besides numerous articles in Japanese and American periodicals, his published writings include: *The Early Institutional Life of Japan* (1903); *The Russo-Japanese Conflict: Its Causes and Issues* (1904); *Notes on Village Government in Japan after 1600* (1910). He also contributed the concluding chapters to the new edition of *Japan*, edited by Capt. F. Brinkley (1904), and edited "Japan" in the *History of Nations Series* (1907).

ASAM, ā'sām. A family of Bavarian artists. —HANS GEORG (c.1649–1711) prepared several oil paintings and frescoes for the churches at Benediktbeuren and Tegernsee. He later gave instruction in architecture at Prague.—His sons, COSMAS DAMIAN (1680–1742), painter, and ÆGIDIUS QUIRINUS (d. c.1746), sculptor and worker in stucco, studied at Rome, and settled at Munich about 1715. They completely remodeled the cathedral of Freising and decorated the monasteries of Maria-Einsiedeln and Metten and the church of St. Emmeram at Ratisbon. They built the so-called Congregational Hall at Ingolstadt, and at their own expense constructed the church of St. John, besides their dwelling in Munich, which building, with its numerous fantastic features, is in some respects one of the most striking specimens of the Baroque style of architecture in Germany.

ASAMA-YAMA, ā-sā'mā-yā'mā. The largest active volcano in Japan (8280 feet high), situated in the province of Shinshu, in about 138° 30' E. long. and 36° 25' N. lat. (Map: Japan, F 5). The earliest-recorded eruption occurred in 1650. There was a very severe eruption in 1783, which caused the destruction of several villages and of a primeval forest. Since then its activity has been manifested largely in showers of ashes and stones. Its crater is circular in shape and measures about three-fourths of a mile in circumference.

A'SAPH. The eponym of a guild of singers in the Second Temple, who may have superintended the musical part of the worship as early as the time of Nehemiah (Neh. vii. 44). Afterward they shared this work with the "Sons of Korah." When the Korahites became porters and doorkeepers, the Asaphites were supplemented by the guilds of Heman and Ethan. The Chronicler, deeming it essential that the musical organizations of the temple should consist of Levites, represents Asaph, Heman, and Ethan as descendants of Gershon, Kohath, and Merari (1 Chron. vi. 33–47). Ps. l, lxxiii–lxxxiii, are attributed to Asaph and consequently belonged to a hymn book used by this choir.

AS'APHUS (Gk. *ἀ, α, priv.* + *σαφής, saphēs*, clear, distinct). An Ordovician genus of smooth trilobites, often of large size, among the members of which there is manifested a tendency to lose that longitudinal lobation which is so peculiarly characteristic of the trilobites as a group. The large head shield has the central portion or glabella indistinctly limited and is provided with two reniform compound eyes, which in some species are placed upon immovable stalks that, rising far above the general surface of the head, enabled the animal to command a view of the entire horizon. This latter arrangement is of interest when considered in connection with the nature of the joint that connected the head with the thorax, this joint having in all trilobites been so constructed as to prevent any lateral motion of the head shield, a

slight vertical motion only having been possible. The thorax has eight segments, and the tail shield, of a size somewhat less than that of the head, is generally quite smooth and non-segmented.

The allied genus *Megalaspis* has a head of elongated triangular form, with the anterior and lateral angles produced into sharp spines. Another allied genus, *Niobe*, which appeared at a somewhat earlier age than did *Asaphus*, has the longitudinal lobation quite well marked, and seems to indicate the form of the stock from which *Asaphus* was evolved through a gradual loss of the trilobation and segmentation of the carapace. These three genera, together with four others of less importance and over 150 species, comprise the family Asaphida, which is found abundantly in all portions of the Ordovician system in Europe and North America. See ORDOVICIAN; TRILOBITA; and for illustration see Plate accompanying TRILOBITA.

ASAR, ā'sār, **OSAR**, ō'sār, or **OESAR**, ē'sār. Variations on the Swedish *asar*. The same as Esker (q.v.).

AS'ARABAC'CA (Lat. *asarum*, Gk. *ἀσάρον, asaron*, *asarabacca* + Lat. *bacca*, berry), *Asarum europæum*. A plant of the family Aristolochiaceæ, a native of Europe, growing in woods; rare, and perhaps not truly indigenous, in Great Britain. The whole plant has acrid properties; the roots and leaves are aromatic, purgative, and emetic. The use of *asarabacca*, however, as an emetic has been much superseded by that of *ipecaeuana*, which is milder and safer. The powdered roots and leaves enter into the composition of cephalic snuffs, which cause sneezing, and are employed as a counter-irritant in cases of headache, ophthalmia, toothache, etc. The plant contains a volatile oil and a crystalline substance called *asarin*, to which it seems to owe its active properties. The genus *Asarum* is distinguished by 12 pointed stamens, distinct from each other and from the style, and by a bell-shaped three-lobed perianth. *Asarum europæum* has a very short stem, with two shining kidney-shaped leaves on long stalks, from the axil of which springs a single drooping greenish-purple flower. A nearly allied species, *Asarum canadense*, a native of the United States, is stimulant and diaphoretic and is used under the name of Canada snakeroot, instead of *Aristolochia serpentaria*. It is also called wild ginger and used as a spice, being of a warm aromatic quality, and not acrid like its European congener.

AS'ARUM. See ASARABACCA.

ASBEN, ās-bén. See AIR.

ASBES'TIC. A name given to a mixture of second-grade asbestos and serpentine, obtained as a by-product in asbestos mining. The material is crushed and mixed with lime to form a light, strong, fireproof wall plaster, which can be given an excellent finish.

ASBES'TOLITH is a somewhat similar material, made from short-fibred asbestos, used for flooring and fireproofing. See ASBESTOS.

ASBESTOS (Gk. *ἀσβεστος*, inextinguishable, incombustible, from *ἀ, α, negat.* + *σβέννυαι, sbennynai*, to extinguish). In mineralogy, antophyllite, amphibole, and serpentine, three minerals of fibrous, crystalline structure, are classified under asbestos. Chemically the two first-mentioned minerals resemble each other; being silicates of lime and magnesia, and alumina; the third being a hydrated silicate of magnesia.

The asbestos of commerce is the fibrous varieties of tremolite, actinolite, and other varieties of amphiboli, of which *chrysotile* is the silky kind. The Italian variety is true asbestos, while most of the output from Canada is chrysotile. *Mountain leather* and *mountain cork* are also varieties of asbestos, amphibole group, which occur as flexible sheets containing little or no alumina and distinguished by their thickness; they cannot be separated into fibre. The mountain cork is elastic, brown in color, and has a specific gravity of .68 to .99. Mountain wood is a variety resembling dried wood, but has no vegetable cells. *Crocidolite*, a beautiful fibrous mineral occurring in south Africa and western Australia, containing 34 to 38 per cent of oxide of iron, has no commercial fire-proofing value, as it disintegrates under heat.

Commercially asbestos has been used since ancient times, and its discovery is attributed to the Romans, who obtained their supply from the Italian Alps and the Urals. The Alps variety was known as *amianthus* (Gk. unpollutable). Amianthus cloth was indestructible by fire, and was used by the ancients to enwrap dead bodies placed on the funeral pile, in order to preserve the ashes of the body. Pliny refers to it as a rare and costly cloth, the funeral dress of kings. Marco Polo in the thirteenth century, while traveling in Siberia, was shown cloth made from fibrous mineral, called amianthus, which withstood the action of fire. Plutarch also refers to his perpetual lampwick made from Carpathian linen. In the Middle Ages it was rarely referred to. In 1720 it was discovered in the Urals, and 40 years later a factory was established for its manufacture. About 1860 interest was revived in Europe, and the first modern attempts were made by a London syndicate to exploit asbestos deposits. Mining operations began about 1878 in Quebec, and a sensation was created in London on the arrival of shipments of the better grades of mineral. The development was very rapid between 1878 and 1890, but was followed by a setback from overproduction and fall in price. This resulted in the introduction of mechanical means for the preparation of the mineral. In 1909 15 quarries were operating over an area 20 miles in length, and 19 mills having a daily capacity of 8520 tons. In 1911 Canada produced 85 per cent of the world's output, Russia 10 per cent, the United States 3 per cent, and Africa and other countries 2 per cent. Deposits are reported in several of the States, but little prospecting has been done. The output from the United States in 1912 came from Georgia, Vermont, and Wyoming. Deposits are known as cross fibre, slip fibre, or mass fibre, according as the fibre crosses the vein or is parallel to it. Veins vary from a mere thread in width up to from 4 to 6 inches and are very irregular; the width is no criterion of the length of the fibre. Development in Quebec has reached 400 feet, where the quality is found to be the same as on the surface. The commercial requirements are length, fineness of fibre, infusibility, tensile strength, and flexibility. Temperatures of from 2000° to 3000° F. are easily withstood, while some varieties will withstand 5000° F.

Up to 1898 the dressing of asbestos rock was entirely by hand. Overproduction, resulting in a reduction in price, necessitated the introduction of mechanical means for cheaper produc-

tion and a much wider market. The first mill in Canada was erected in 1889, followed quickly by many new mills of improved type. The general milling practice to-day consists of hand sorting in the quarry, sending the better grades to cobbling houses, the waste rock to the dump, and the mill rock together with the fines to the mill. In the mill the rock goes to breakers, dryers, rotary crushers, fiberizers, and screens. The fibre is separated by fans. The mill rock from a quarry amounts to from 20 to 80 per cent of the output and the fibre from 6 to 12 per cent of the mill rock. The value of the product varies from \$10 to \$300 per ton.

The use of asbestos has increased and is increasing very rapidly. It is employed in the manufacture of woven fabrics, such as fire-proof theatre curtains, cloth for theatre wall linings and scenery, firemen's clothing, and fire-proof rope; roof shingles or asbestos slate, stucco plaster, lumber, mill board, asbestos paper, and insulating; coverings for pipes, furnaces, and locomotives to prevent radiation of heat; and as a filler for high-grade paints. Consult: Jones, *Asbestos: Its Properties and Uses* (London, 1890); "Asbestos" in *Mineral Industry*, vol. vi (New York, 1897); Fritz Circle, *Chrysotile—Asbestos, Occurrence, Exploitation, Milling and Uses*, Canadian Department of Mines (Ottawa, 1905); U. S. Geological Survey, *The Production of Asbestos* (1912). See AMPHIBOLE; SERPENTINE; ASBESTIC.

ASBESTOS. A village of Richmond Co. in the province of Quebec, Canada, 85 miles southwest of the city of Quebec, and 4 miles east of Danville (Map: Quebec, G 5). It is situated on the Danville and Atlantic and Grand Trunk railways. The town contains mills and factories, but the rich deposits of asbestos in Richmond and the adjacent counties of Wolfe and Megantic are the chief sources of its prosperity. Pop., 1901, 783; 1911, 2224.

ASBJÖRNSSEN, äs-byörn'sen, PETER CHRISTEN (1812-85). A distinguished Norwegian student of folklore and zoölogy, born at Christiania. He studied at Christiania University and taught for several years. He made long journeys on foot for scientific purposes, in the course of which he collected popular tales and legends, which, in coöperation with his friend Jørgen Moe, the future Bishop of Christiansand (1838), he published, and later several times supplemented, as *Norske Folkeeventyr* (*Norwegian Folk Tales*, 1842-43). A *New Collection* appeared in 1871. It was followed by another, *Norske Huldre-eventyr og Folkesagn* (*Norwegian Fairy Tales and Folk Legends*, 1845-48). His scientific researches earned him traveling stipends at intervals from 1846 to 1853. He then studied forestry and held various official positions in connection with the forest and turf industries from 1860 to 1876, when he was pensioned. He made several important discoveries in deep-sea soundings and wrote on zoölogy and other scientific subjects; but this side of his work is quite overshadowed by work in folklore, which shows literary talent and much originality. He did not, like the Grimms and Arnason, aim merely at reproduction, but retold the stories in settings that illustrated the life and mental horizon of the people, with exquisite bits of natural description that found immediate and wide recognition. Many of Asbjörnsen's tales have been translated into English: *Popular Tales from the Norse*, tr. by Sir George

Dasent (London, 1859); *Tales from the Fjeld*, by the same (ib., 1874); *Fairy Tales from the Far North*, tr. by Braekstad (New York, 1897).

ASBOTH, ăsh'bôt, SÁNDOR (ALEXANDER) (1811-68). A Hungarian-American soldier. After fighting under Kossuth (1848-49), he accompanied him to America in 1851 and became a citizen of the United States. During the Civil War he commanded divisions under Frémont and Curtis, as brigadier-general and was seriously wounded at the battles of Pea Ridge (March 7-8, 1862) and Marianna (Sept. 27, 1864). He resigned with the brevet rank of major-general (August, 1865), and was United States Minister to the Argentine Republic (1866-68), where he died of his wounds.

ASBURY, ăz'bēr-I, FRANCIS (1745-1816). The first bishop of the Methodist Episcopal church ordained in the United States. He was born at Hamstead Bridge, 4 miles northwest of Birmingham, Eng., Aug. 20 or 21, 1745. He obtained rudimentary education in a village school; at 18 became a local preacher; at 21 was received by Wesley into the itinerant ministry; and on Oct. 27, 1771, landed in Philadelphia as a missionary in America. It was but three years after the building of the first Methodist church in the country, and the conference of that year gave but 316 Methodists in America, chiefly in Philadelphia and New York. When the Revolution began, Asbury sympathized with the people, and while Mr. Rankin, who was the ecclesiastical superior, returned to England, Asbury remained; though, like many other non-jurors, he was subjected to suspicion and at one time to imprisonment. After about two years of surveillance the authorities concluded that the scruples of Asbury were not political, but religious, and he was permitted to go free. He improved his opportunity, and when the war closed there were 83 Methodist ministers at work, and the membership reached 14,000. In 1784 the several societies were organized into an Episcopal church, and Asbury and Thomas Coke were elected, by the conference in Baltimore, Md., 1784, joint superintendents. The title "bishop" was substituted later, which called out a rebuke from Wesley, who, however, approved of Asbury's superintendence. Thenceforward his life was devoted to preaching and the supervision and extension of churches. His labors were incessant, and his biography is itself a good history of the growth of Methodism in America. He never married, lest a wife should distract attention from his great work. He was always poor and always generous. In 1785 he laid the foundation for the first Methodist college, and afterward formed an educational plan for the whole country, by making districts with at least one classical academy in each. He was rather stout, of medium height, with a fresh countenance and a penetrating eye. Wesley alone was his superior as a practical worker and organizer, and the two were alike in zeal and spirit. During his ministry it is estimated that Asbury traveled more than 270,000 miles, visiting every part of the country; preached more than 16,000 sermons; ordained over 4000 ministers, and presided at 224 conferences. It is largely due to the labors of this indefatigable apostle that Methodism in America owes its excellent organization and wonderful growth. He died at Spottsylvania, Va., March 31, 1816. His only written works were his journals (New York, 1852), which are personally and his-

torically of great value. For his biography, consult W. P. Strickland (New York, 1858), and Smith (Nashville, 1896); Du Bose, *Francis Asbury* (Nashville, Tenn., 1909); Mains, *Francis Asbury* (New York, 1909). Consult also Tipple, *Heart of Asbury's Journal* (New York, 1904).

ASBURY (ăz'bēr-I) **PARK**. A city in Monmouth Co., N. J., 51 miles, by rail, south of New York City, on the Atlantic Ocean, and on the Central of New Jersey and the Pennsylvania railroads (Map: New Jersey, D 3). Asbury Park is one of the most popular watering places on the Atlantic coast. A board walk extends for almost two miles along a fine beach which is owned by the taxpayers. The city contains a large number of good hotels and cottages, a public library, several theatres, lecture halls and pavilions, parks, hospitals and dispensaries, and an aviation field. Among the notable events of the summer season are the big Baby Parade, at which \$4000 is awarded in prizes, the lake carnival, the masque fête, and the fireworks displays. At Ocean Grove, which is separated from Asbury Park by Wesley Lake, is one of the largest musical auditoriums in the country, having a seating capacity of almost 10,000. The city has manufactories of sleeping garments and automobiles.

Asbury Park was founded in 1869, incorporated in 1874, and chartered as a city in 1897. The beach front, the water works, and sewage system are owned by the municipality. Pop., 1900, 4148; 1910, 10,150. The summer population is estimated at about 100,000.

ASCAGNE, ăskăn'y'. A character in Molière's comedy, *Le dépit amoureux*, who is substituted for her dead brother of the same name and habited in his garments, but who later falls in love with Valère and marries him secretly.

ASCALON. A city of Palestine. See ASUKELON.

ASCALON. The sword of St. George, mentioned in Richard Johnston's *Seven Champions of Christendom*, a romance printed in 1596.

ASCA'NIUS, called also Iulus, the son of Æneas, and mythical founder of the family of the Cæsars. He founded also the city of Lavinium. It is in the disguise of Ascanius that Cupid, in Vergil's *Æneid*, implants the flame of love for Æneas in Dido's breast.

ASCAPART. The name of a giant, 30 feet high, often referred to by Elizabethan writers. He appears in the romance *Bevis of Hampton*, where he is conquered by the hero.

ASCARIS (Gk. *ăskapls*, *askaris*, a worm in the intestines). A genus of intestinal nematode or round worms, which are of comparatively large size. The body is long and cylindrical, and the mouth is usually surrounded with three lips or cephalic valves, one in a dorsal position and the other two ventral. Species of *Ascaris* are found parasitic in man, pigs, sheep, calves, horses, dogs, cats, etc. In addition to their irritation of the intestinal mucosa, narrowing or stoppage of the intestinal lumen, and possibly rupture, they excrete toxins which may cause nervous disturbances and inflammatory changes. These worms are not attached by means of hooks or otherwise to the walls of the intestines, and may be expelled by the administration of cathartics and vermifuges. The best-known species is the round-worm of man, the pin-worm being placed in a closely allied genus. Another species (*Ascaris megalo-*

cephala), larger than the preceding, is found in the intestine of the horse. It is sometimes as large around as a lead pencil, and has a noticeably large head. It is of special interest to biologists, because it was upon the eggs of this species that the German scientist Boveri made his notable observations regarding cell division and the behavior of the chromosomes.

ASCENDANT (Lat. *ad*, to + *scandere*, to climb). In astrology, the easternmost or rising star in a horoscope is in the ascendant, or "house of life." It was deemed to have the most influence on destiny, or to give the strongest indication of the future; so it is said when one's prospects improve, "his star is in the ascendant."

ASCENSION (for origin of name, see below). An isolated volcanic island in the Atlantic, in lat. 7° 55' S., and long. 14° 23' W., about 700 miles northwest of St. Helena (Map: Africa, C 5). It has an area of 34 square miles, little of which is under cultivation, and rises to an elevation of 2870 feet in Green Mountain, on which a sanitarium for sailors has been erected. The island, which belongs to Great Britain, is fortified, is under the direct control of the Admiralty, and is used as a coaling and supply station for the British navy. The population in 1912 was estimated to be about 200. It consists principally of officers and their families, seamen, and a few natives. Vegetables and fruit are grown, and small game is abundant. The island was discovered by the Portuguese in 1501 and named Conception Island. It was revisited on Ascension Day, 1508, when it received its present name. It was settled by the British in 1815, during Napoleon's stay on St. Helena. Principal settlement, Georgetown.

ASCENSION, RIGHT (Lat. *ascensio*, an arising; Ger. *gerade Aufsteigung*). The name given in astronomy to one of the two factors which determine the position of a heavenly body in the sky with reference to the celestial equator, the other being the declination. Right ascension and declination are quite analogous to longitude and latitude on the earth. The initial point for measuring right ascension is one of the points of the celestial equator where it is intersected by the ecliptic, and this point is called the vernal equinox, or the first point of Aries. The right ascension of a heavenly body is then defined as the angular distance measured on the celestial equator from the vernal equinox to the foot of a perpendicular circle let fall on the equator from the heavenly body. The right ascension is ascertained by means of the transit instrument and clock. The transit instrument enables us to observe its meridian passage, and the transit clock gives the time at which this takes place. This clock is set so that when the first point of Aries is in the meridian it stands at 0 hours, 0 minutes, and 0 seconds, and it is so arranged as to indicate 24 sidereal hours, the time that elapses between two successive passages of that point. The reading of the clock at the passage of any heavenly body then enables us to calculate that body's right ascension. The right ascensions of all the fixed stars down to about the ninth magnitude have been thus determined and are published in printed star catalogues. With the completion of the International Star Catalogue now in progress, the right ascensions of all stars down to the eleventh magnitude, to the number of about 2,000,000, will become available.

ASCENSION DAY, or **HOLY THURSDAY**. One of the great religious festivals of the Episcopal and also of the Roman Catholic church. It is held on the fortieth day after Easter, and is intended to commemorate the ascension of Christ into heaven. It is one of the six days occurring in the year for which the Church of England appoints special psalms, and the same church also particularly recommends it as a fitting day for the receiving of communion. No mention of its celebration occurs before the fourth century, though St. Augustine believed it to have been instituted either by the apostles themselves, or the primitive bishops succeeding them. Connected with its religious observances were certain civic ones, which in some parts of England and Scotland are still continued, viz., *beating the bounds*, or *riding the marches*, though their religious connection is apparently forgotten. See **ROGATION DAYS**; **PERAMBULATION OF PARISHES**.

ASCETICISM. Among the Greeks, *ἀσκησις*, *askēsis*, denoted the exercise and discipline practiced by the athletes or wrestlers, who had to harden their bodies by exertion, and to avoid all sensual and effeminating indulgences. In the schools of the philosophers, especially of the Stoics, the same word signified the practice of mastering the desires and passions, or of severe virtue. In these senses it passed into the language of the early Christians. The essence of asceticism is to hold self-denial and suffering to be meritorious in the sight of God, as a means to perfect the moral nature and to rise to spiritual heights not otherwise attainable. Aside from asceticism for training, which the meaning of the word suggests, there is an asceticism which rests upon a dualistic philosophy. It holds that the material world is evil; redemption of the soul is found only by withdrawing from the world. Though complete separation from matter can take place only at death, yet the soul may, by asceticism, proclaim independence of the material world and so work toward its redemption. This dualistic asceticism is Oriental (Indian) in origin, but before the beginning of the Christian era had penetrated into the Greek world. Asceticism in the Christian Church is derived from both types. Judaism was not originally ascetic, but regarded the world as the good gift of God, to be used and enjoyed to his glory. Protestantism has in general taken the same attitude. Even in the Greek and Roman churches asceticism has been much modified in modern times. The reasons for asceticism have largely vanished in the belief that evil and good reside, not in matter, but in the moral life; and that normal living furnishes a sufficient training for spiritual life. Consult Hastings, *Encyclopædia of Religion and Ethics*, "Asceticism," and Moore, *Greek and Roman Ascetic Tendencies* (Boston, 1912). See **MONASTICISM**.

ASCH, äsh. A town of the Austrian crown-land of Bohemia. It is situated at the foot of the Hainberg, about 2100 feet above the sea level, 13 miles northwest of Eger, and near the Bavarian and Saxon frontiers (Map: Austria, C 1). It manufactures woolen and mixed silk and woolen goods, particularly stockings, and there are machine shops and bleaching and dyeing establishments. Pop., 1890, 15,557; 1900, 18,700; 1910, 21,583.

ASCHAFFENBURG, ä-shäff'en-burk. The capital of the Bavarian district of lower Franconia, on the right bank of the Main, at its

junction with the Aschaff (lat. 50° 1' N., long. 9° 7' E.), about 23 miles east-southeast of Frankfort (Map: German Empire, C 4). It is built upon an eminence and has a healthful and attractive situation. Among its buildings is the castle of Johannsburg, built between 1605 and 1614 by Johann Schweikard, of Kronberg, Elector of Mainz, containing a collection of paintings and engravings and a fine library. Besides a cathedral, military barracks, and town hospitals, Aschaffenburg possesses a Roman villa, built by King Louis I, in imitation of the Castor and Pollux edifice discovered at Pompeii. Among its educational and charitable institutions are a gymnasium, a *real-schule*, two seminaries, a music school, and two orphan asylums. It is the burial place of the poets W. Heinse and K. Brentano. The town manufactures clothing, varnishes, glue, cigars, beer, and colored papers, for the latter of which it has long been famous. It carries on a considerable trade in cattle, wood, building stone, tobacco, wine, etc. Pop., 1890, 13,275; 1900, 18,091; 1910, 29,892. Aschaffenburg existed as early as the invasion of Germany by the Romans, who built a castle here. In 974 it came into the possession of the archbishops of Mainz and remained with them until the dissolution of the Germanic Empire. The Concordat between the Pope and the German nation was prepared at Aschaffenburg in 1447. In 1814, along with the principality of which it is the capital, it was ceded to Bavaria by Austria.

ASCHAM, äs'kam, ROGER (1515-68). A distinguished English writer, humanist, and classical scholar, born at Kirby Wiske, in Yorkshire. He received his early education at home under the direction of his father and in the family of Sir Anthony Wingfield, and in 1530 entered St. John's College, Cambridge, where he took his degree of M.A. in 1537. The study of the classics, especially Greek, had recently been revived at Cambridge, and Ascham's bent impelled him with ardor to these studies. His reputation as a classical scholar soon brought him numerous pupils, and, there being at that time no Greek chair, he was appointed by the university to read Greek lectures. At first he opposed the newly introduced (Erasmian) method of pronunciation, which is still used in England, but afterward adopted and defended it. His leisure was devoted to music, penmanship, in which he excelled, and archery. In defense of the latter art he published, in 1545, a treatise, entitled *Toxophilus*, the pure English style of which, independently of its other merits, ranks it among the classical pieces of English literature. For this treatise, which was dedicated to Henry VIII, he was rewarded with an annual pension of £10, equivalent to about \$500 of our present money. In 1546 he was appointed university orator; and in 1548, on the death of his former pupil, Grindal, he was called to supply his place as master of languages to the Princess (afterward Queen) Elizabeth. In this office he gave the highest satisfaction, but at the end of two years abruptly resigned it because of a quarrel with the steward of the household. That he did not lose favor at court, however, is manifest from his having soon after been appointed secretary to serve Richard Morysin, Ambassador to the court of Charles V. He spent three years in Germany and in Italy, and on his return published the diary he had kept during his travels. The interest of Gardiner, Bishop

of Winchester, secured his appointment as Latin secretary to Queen Mary; his pension also was doubled. His prudence and moderation preserved him from offending by his Protestantism. After the death of Mary, Queen Elizabeth retained him at court as secretary and tutor, posts which he held until his death, in 1568. His second important work, *The Scholemaster*, a treatise on classical education, was published in 1570 by his widow. An English version of Ascham's letters appeared in 1777, ed. by Kennedy, with a *Life* by Dr. Samuel Johnson (reprint, 1815). Consult: *The Collected Works of Ascham*, ed. J. A. Giles (London, 1864-65); *Toxophilus*, ed. Arber (ib., 1868, and reprinted, 1902); *The Scholemaster*, ed. Mayor (ib., 1863); and the reprint by Arber (1878); Katterfeld, *Roger Ascham, sein Leben und seine Werke* (Strassburg, 1880); English Works, ed. Wright (New York, 1905).

ASCHBACH, äsh'bag, JOSEPH (1801-82). A German historian, born at Höchst, near Frankfort-on-the-Main. He held the professorship of history at Bonn (1842-53) and at the University of Vienna (1853-72). In 1870 he was ennobled. Among his works are *Geschichte der Westgothen* (1827); *Geschichte der Omajjaden in Spanien* (2 vols., 1829-30); *Geschichte Kaiser Sigismunds* (4 vols., 1838-45); *Geschichte der Wiener Universität* (1865); and *Roswitha und Konrad Celtes* (1867), in which he maintained that the panegyric of the Emperor Otho the Great, which was ascribed to the nun Roswitha, had been written by Konrad Celtes during the sixteenth century. This assertion was disproved by Waitz and by Köpke. Consult R. Köpke, *Ottotonische Studien* (1869).

ASCHERSLEBEN, ä'shërs-lä'ben. A town in the Prussian province of Saxony. It is situated on the river Eine, 32 miles south-southwest of Magdeburg (Map: German Empire, D 3). It has considerable manufactures of beet sugar, woolens, linens, earthenware, tinware, chemicals, etc., and breweries, iron foundries, tanneries, etc. There are also coal and salt mines, and extensive beet gardens. Pop., 1890, 22,893; 1905, 27,876; 1910, 28,968. Aschersleben is mentioned in the twelfth century and was probably founded in the eleventh. It became Prussian in 1813.

ASCHERSON, ä'shër-zön, PAUL FRIEDRICH AUGUST (1834-1913). A German botanist, born in Berlin. He studied medicine and natural science and in 1873 was appointed professor of botany at the university there. In 1873-74 he accompanied Rohlfs in his expedition to the Libyan Desert, which he again visited alone two years later. In 1884 he was made custodian of the Botanical Museum at Berlin. His principal contributions are on the subject of the flora of Europe and of Africa. His published works include *Flora der Provinz Brandenburg* (1864), and a *Synopsis der mitteleuropäischen Flora* (2d ed., 1912).

ASCIANS, äsh'yanz, or ASCII, äsh'i-i (Gk. *ἀσκιαν*, *askian*, priv. + *σκιά*, *skia*, shadow). People near the equator, who have the sun over their heads and who, consequently, have no visible shadow twice a year.

ASCIDIAN (Gk. *ἀσκιδιον*, *askidion*, dim. of *ἀσκός*, *askos*, a skinbag, a bladder), or TUNICATE (Lat. *tunicatus*, clothed with a tunic). One of the small marine animals, constituting the class Urochorda of the phylum Chordata, and popularly known as sea-squirts. They are of two kinds: (1) fixed and individual ones, to which

ASCIDIANS AND BALANOGLOSSUS

For explanation of details, see articles "Ascidian" and "Balanoglossus."

the name "ascidian" is more properly applied; and (2) compound free-swimming ones, more properly designated as tunicates. Their principal interest is the evidence they show of affinity with the vertebrates by the presence in their larval conditions of a notochord and other fundamental characteristics of the chordata. See PLATE OF ASCIDIANS AND BALANOGLOSSUS.

The larvæ at first are free-swimming, and resemble a tadpole. The tail is fringed with a delicate transversely striated fin; in the axis of the tail is the notochord, and above it the central nerve-cord, which anteriorly is dilated, and still farther forward again expands into a vesicle, which is a true sense-organ—a primitive eye. The enteric canal exhibits a mouth, a pharynx, œsophagus, stomach, and intestine; and there is a heart and blood circulation. After a few hours of existence in this stage, so suggestive of an embryo vertebrate, it becomes fixed by adhesive papillæ upon its "head"; its "tail," including the notochord, disappears, the nervous system diminishes to a single ganglion, the body takes the form of a dilated sac, with an incurrent and excurrent orifice side by side at the outer end, the reproductive organs develop, and a purely vegetative existence within such protection as is given by a leathery, contractile tunic, takes the place of the promising condition of early youth. Appendicularia, a minute animal swimming on the surface of the sea, is like an ascidian larva and preserves its chordate condition throughout life.

These simple, solitary ascidians are bi-sexual and increase only by spawning; but the composite tunicates form colonies by budding, as well as emit eggs, and the economy of some of these communities is very complicated. See BALANOGLOSSUS; CHORDATA; ALIMENTARY SYSTEM, EVOLUTION OF; NERVOUS SYSTEM, EVOLUTION OF; ETC. Consult Parker and Haswell, *Text-Book of Zoology* (New York, 1898).

EXPLANATION OF PLATE OF ASCIDIANS, ETC.

2. A CREEPING FORM (*Clavellina*), showing stolons.
3. SAME AS No. 2 *a*, mouth; *b*, branchia; *c*, nervous centre, *d*, stomach; *e*, genital gland; *f*, exhalent pore; *g*, anus, *h*, stolons
4. PORTION OF BRANCHIÆ, enlarged
5. AN ENCRUSTING COMPOUND ASCIDIAN (*Botrylloides*).
6. DIAGRAM OF PART OF 5, showing structure; the arrows indicate inward and outward water currents
7. COLONY OF FREE LUMINOUS ASCIDIANS (*Pyrosoma*).
8. ASCIDIAN EMBRYOS (tadpole stage), showing changes of form with growth, and disappearance of notochord (*noto*); *a*, youngest full-swimming tailed stage; *b*, larva recently fixed, *c*, older fixed stage, *d*, section of tail of *a*, showing relation of fins to notochord
9. BALANOGLOSSUS; *br*, branchial region; *co*, collar; *gen*, genital ridges; *hep*, prominences formed by hepatic cæca, *pr*, proboscis.
10. Enlarged section of upper part of 9, *prob*, proboscis; *div*, supposed notochord (diverticulum); *mo*, mouth; *dors*, dorsal vessel.

ASCITES, ἄσις/ῥιζ. A collection of serous fluid in the peritoneal cavity. It occurs as a symptom of nephritis, chronic peritonitis, tuberculosis, heart disease, abdominal tumors, and especially of cirrhosis of the liver. The fluid is pale yellow, clear, with a specific gravity of 1.010 to 1.016, albuminous and coagulable. If bloody, cancer should be suspected. When it occurs in large quantity and breathing is difficult, the fluid must be drawn off repeatedly with aspirator or trochar, by the surgeon. Many cases, however, can be held in check by the administration of saline

cathartics and diuretics, in conjunction with appropriate treatment directed to the particular organ at fault. In the case of cirrhosis of the liver an ingenious operation, devised by Talma, has proved effective when undertaken fairly early in the disease. *Omentopexy*, as it is called, consists in the suture of the peritoneum and omentum to the liver, thus establishing a collateral circulation and relieving the obstructed portal system.

ASCLEPIADA'CEÆ (named after *Asclepias*). The milkweed family. A family of dicotyledonous plants, including herbs or shrubs, often with twining stems and mostly with a milky juice. The leaves are entire and without stipules. The flowers, commonly produced in umbels, are peculiar in structure, but perfectly symmetrical and regular; ovary of two carpels, styles short and united by their disk-shaped stigma; fruit of two foliicles or pods; seed usually flattened and provided with long, fine hairs, embryo about as long as the seed; cotyledons flat.

This family, closely related to Apocynaceæ, embraces over 200 genera, and nearly 2000 species, which are widely distributed throughout the warmer portions of the globe, being especially numerous in Africa. The principal representative in the United States is the well-known *Asclepias*, or milkweed. The main sections of the family are Periplocoideæ represented by the genera *Periploca* and *Streptocaulon*; Asclepiadeæ, which includes *Asclepias* and *Cynanchum*, including *Vincetoxicum*; Tylophoreæ, of which the chief genera are *Marsdenia*, *Stephanotis*, *Cereopogia*, *Stapelia*, and *Hoya*; and Gonolobeæ, represented by *Gonolobus*. These plants vary widely in characteristics and uses. Many are cultivated for their perfume, as *Stephanotis floribunda*, etc.; others, such as some species of *Stapelia* and *Hoya*, are known as carrion flowers, from their repellent odor. Flies are attracted by them, and eggs are often deposited upon the flowers. Some species of *Asclepias* yield fibre from their stems, and the silky fibre of their pods has many uses. Among them are species of *Marsdenia*, *Periploca*, and *Orphanthera*. For the economic uses of others, see INDIAN SASSAPARILLA; MUDAR; ARGEL; CYNANCHUM.

ASCLEPIADÆ (Gk. Ἀσκληπιάδαι, *Asklēpiādai*). Originally an association, claiming descent from the god of healing, Asclepius, or Æsculapius, in which the practice of medicine was hereditary. Later those not connected by blood were admitted, and the organization, which existed in various parts of Greece, became a training school for physicians. After the time of Hippocrates the Asclepiadæ seem to have required a comprehensive course of study of their candidates, and the Hippocratic Oath (q.v.) shows the ethical standard they maintained.

ASCLEPIADE'AN METRE, ASCLEPIADEAN VERSE. The name given to two kinds of Greek and Latin logaædic verse, named, probably, after Asclepiades of Samos. 1. The Lesser Asclepiadean consisted of an irrational trochee, cyclic dactyl, syncopated foot, cyclic dactyl, trochee, syllaba anceps, thus:

— | — | — | — | — | — | — | — |
Mæce | nas ata | vis | edito | regi | bus

2. The Greater Asclepiadean consisted of an irrational trochee, a cyclic dactyl, a syncopated

ascus. Although there are usually eight ascospores, a larger number may appear by further division of the original eight; or there may be a smaller number through failure of ascospore formation in connection with some of the eight nuclei.

The asci appear in groups, generally forming a more or less extended layer (hymenium), and usually the hymenium is invested by a sterile jacket, the whole structure then being called an "ascocarp." Intermixed with the asci there are usually sterile, filamentous structures (paraphyses), so that an ascocarp consists of three elements—asci, paraphyses, and sterile jacket. Sex organs have been observed among the Ascomycetes sufficiently to indicate that ascocarps arise as a result of the sex act, although in many cases the sex act may have been eliminated.

The production of ascocarps is one phase in the life history of Ascomycetes. The other phase,

been called "Discomycetes," or "cup Fungi." The hymenium lining the cups of these Fungi is often brightly colored, a very common illustration being the so-called "scarlet cup." Most of

PEZIZA, A CUP FUNGUS.

the Lichens belong here, for Lichens are chiefly cup Fungi that are parasitic upon certain Algae. The common "morel," usually thought of as a mushroom, is also related to this assemblage, for although its ascocarp (the "morel" which is eaten) is not cup-shaped, the hymenium is freely exposed in depressions upon the surface of the mushroom-like ascocarp.

In the third group the ascocarp is a completely closed structure (cleistothecium). To this group belong the "truffles," whose fleshy ascocarps are subterranean; the various blue and green "molds," such as appear on bread, preserves, herbarium specimens, etc.; and the "powdery mildews," so very common on flowering plants, and always to be seen upon the leaves of lilac, covering them with its whitish growth.

In the fourth group the ascocarp is flask-shaped (perithecium), being neither widely open nor completely closed. This is far the largest assemblage of Ascomycetes, and contains most of those that cause destructive diseases of plants. In general they are called the "black Fungi" (Pyrenomycetes), because frequently they produce dark, wart-like excrescences on twigs that look like charred spots. Among the destructive diseases induced by this group is the "black knot," so common on plum and cherry trees; and also the "ergot fungus," which is parasitic in the young grains of grasses, especially rye, and from which the medicinal ergot is obtained. Since many of the "imperfect Fungi" probably belong here, some of the diseases they induce may be mentioned as follows: "cankers" (especially destructive in forest plantations), "wilts" (wilts of cotton, cowpea, and watermelon being notable diseases in the southern States), "scabs" (a very common disease in apple orchards), "bitter rot" of apples and other fruits, etc.

ASCONIUS PEDIANUS, QUINTUS (c.3-c.88 A.D.). A Roman critic and historian. He was born probably at Patavium, but lived mainly at Rome. During the reigns of Claudius and Nero he made a careful study of state papers then extant, and wrote his valuable historical commentaries on Cicero's Orations, of which only those on the five orations, "In Pisonem," "Pro Scauro," "Pro Milone," "Pro Cornelio," and "In Toga Candida," are preserved. These, too, are in a fragmentary condition, but the fragments are of great value, because Asconius' work rested on a careful study of Cicero's writings and those of his contemporaries and on an examination of official documents. The commentaries, written in pure Latin, refer chiefly to points of history and antiquities, and contain interesting accounts of those constitutional forms of the senate, popular assemblies, and the courts of justice, which under the Empire were

(1) Macrosporium; a, section of perithecium showing asci and paraphyses; b, a single ascus with 8 ascospores, and a paraphysis; (2) *Lachneo-hemispherica*; a, apothecia; b, an ascus with paraphyses.

which is usually much more conspicuous, is that in which characteristic spores (conidia) are produced. There are thousands of Ascomycetes whose conidium stage and ascocarp stage have not been connected; and these conidia-bearing forms, whose ascocarps are unknown, are called "imperfect Fungi" (*Fungi imperfecti*). It is this conidium stage that is of special economic importance, for it is the cause of many destructive diseases of useful plants.

Although usually eight orders of Ascomycetes are recognized, they may all be considered in four groups, dependent on the character of the ascocarp. In one group there is no ascocarp, the asci (hymenium) appearing without any investment by a jacket. To this group belong such forms as the "yeasts" (somewhat doubtful Ascomycetes) and the parasites that induce the diseases known as "peach-leaf curl," "plum pockets," and certain of the "witch brooms."

In the second group the ascocarp has the form of a flat disk, a cup, or a funnel, in each case lined with the hymenium (the layer of asci and paraphyses). These widely open ascocarps are called "apothecia" (singular, "apothecium"), and the Ascomycetes with such ascocarps have long

rapidly disappearing. The notes on the Ver-rine Orations are of a much more grammatical cast and exhibit traces of a declining Latinity, so that, though originally ascribed to Asconius, they are probably to be attributed to a grammarian of a later date. Consult Madvig, *De Asconii Pediani Commentariis* (Copenhagen, 1828). Asconius is known to have written also a life of Sallust and a treatise against Vergil's critics, but these have been lost. For the text of Asconius' extant writings, consult C. G. Schultze's and Orelli-Baiter's editions of Cicero, and the edition of Asconius himself by A. C. Clark (Oxford, 1906). Consult also Thomas Stangl, *Ciceronis Oratorum Scholiastæ*, vol. ii (Leipzig, 1912).

ASCOT HEATH. A famous English race-course (of almost exactly 2 miles) in the parish of the same name, in Berkshire, about 29 miles southwest of London. It was laid out in 1711 by order of Queen Anne, who attended the first meeting that year. The Ascot Gold Cup race was founded in 1771, and in 1807 a gold cup was first awarded. The track was improved in 1902. The meetings are held in June. Consult Cawthorne and Herod, *The Royal Ascot; Its History and its Associations* (London, 1902), and Rice, *History of the British Turf* (2 vols., London, 1879).

ASCOT RACES. One of the most fashionable horse-races in England, held at Ascot Heath in Berkshire.

ASCUTNEY (Ind. 'Three Brothers'). A mountain rising 3329 feet above the level of the sea near the Connecticut River in Windsor Co., Vt. It presents a fine example of a *monadnock* (q.v.). From its summit a beautiful view of the Connecticut valley may be obtained. There are granite and olive-green syenite quarries.

ASELLI, á-sel'la, **ASELLIO**, á-sel'yó, or **ASELIUS**, GASPARO (c.1581-1626). A celebrated Italian physician, professor of anatomy and surgery at Pavia. In 1623 he discovered the lacteal vessels. Before his time anatomists had supposed that the chyle was carried from the intestines into the liver by the mesenteric veins. While dissecting a living dog, he noticed for the first time the multitude of little vessels which suck up the nutritive portion of the food. At first he mistook them for nerves and did not pay particular attention to them; but on pricking one with the point of his scalpel, a white liquid spurted out, and the discovery flashed on him. He seems, however, never to have understood or described them with complete accuracy. In the year following his death a treatise on the subject of his discovery was published, entitled *De Lactibus, sive Lacteis Venis*.

ASEN, á'sen. The name of some of the Mediaeval Bulgarian czars—JOHN ASEN I (1186-95) freed his country from the domination of Byzantium, added Sophia to his dominions, and made Tirnova the Bulgarian capital. JOHN ASEN II (1218-41), son of the preceding, was forced to flee to Russia when his uncle usurped the throne. His return to Bulgaria opened a new era for the nation. Theodore of Epirus, "Emperor of the East," was overthrown, and Albania and Macedonia conquered. Asen was thus afforded an opening on the Adriatic, which he used for the commercial advancement of Bulgaria.

AS'ENATH. The daughter of Potipherah, priest of On, wife of Joseph (Gen. xli. 45, 50; xlv. 20). The name seems to be the Hebraized form of the Egyptian *'ws-n-nt*, 'she belongs to

Neith.' Names of this type occur in the XXI Dynasty, and become frequent in the XXVI or Saite Dynasty. Consult Spiegelberg, *Ägyptologische Randglossen zum alten Testament*, p. 184 (1906).

ASENATH, LIFE OF. See APOCRYPHA.

ASEP'SIS. See ANTISEPTICS.

AS'ES. See ÆSIR.

ASGARD, ás'gård (Old Norse *áss*, god + *garðr*, garth, inclosure, home). The home of the Norse gods, or the Scandinavian Olympus. It was said to stand in the middle and highest part of Ida's Plain, which is the centre of the universe. There the Æsir ('gods') built a hall, *Gladsheim* ('home of joy'), with seats for 12, and one high-seat for Odin, the All-father; and also a lofty abode called Vingolf, for the goddesses. The gods worked diligently, played at games, were rich in precious things, and happy until three maidens from Jotunheim, 'giants' world,' crossed the plain and entered Asaheim, when corruption began to spread among the inmates. Asgard had many mansions, the largest and noblest of which was Gladsheim, while another, not so large, but fairer and brighter than the sun, was called Gimle, i.e., the house of the jeweled roof. The latter mansion will stand when heaven and earth shall have been destroyed by fire and will be the dwelling place of brave and upright men. There is an historical explanation of this myth: that Asaheim was a country east of the Don in Asia, where there was a city of Asgard, in which ruled a chief named Odin, or Wodan; that Odin, fearing subjection by the Romans, led his people across Russia to Sweden and settled at Sigtuna (Upsala); that his priests or chief men founded other settlements and established the worship of their ancestors; that in lapse of time the man Odin and his chiefs came to be looked upon as gods. No date can be settled for such a migration; but from 120 to 80 B.C. has been thought probable, for then Mithridates Eupator was defying the armies of Rome. This theory is based on the account in *Heimskringla*, which is, however, of doubtful value. See ÆSIR; SCANDINAVIAN AND TEUTONIC MYTHOLOGY.

ASGILL, ás'gil, JOHN (1659-1738). An eccentric English writer. He was born at Hanley Castle, Worcestershire, and studied for the bar. At intervals during the whole of his checkered life he practiced his profession in some form or other; but he was continually involved in financial and other difficulties. Fortunately for him, Parliament had just passed an act (1700) for the resumption of forfeited estates in Ireland, and commissioners were appointed to settle claims. Seeing his opportunity, he went to Ireland and found the whole country wrangling in lawsuits. His talents, and the favor of the commissioners, secured to him a lucrative practice; and he even acquired sufficient influence to obtain a seat in the Irish Parliament. Some time, however, before taking his seat, Asgill had published a most extraordinary pamphlet, entitled *An Argument Proving that, According to the Covenant of Eternal Life, Revealed in the Scriptures, Man May Be Translated Hence into the Eternal Life Without Passing Through Death, Although the Humane Nature of Christ Himself Could not thus be Translated till He had Passed Through Death* (1700). The Irish Parliament voted the treatise a libel and expelled the author. Asgill returned to England and entered the English Parliament in 1705 as a member for

Bramber, in Susséx. But the fame of his unlucky pamphlet at last proved a Nemesis; for the English House, resolving to be not less virtuous than the Irish one, took up the treatise, condemned it to be burned by the common hangman, as profane and blasphemous, and expelled Asgill (1707). After this, his circumstances rapidly grew worse, until he finally found something like peace in two prisons, the King's Bench and the Fleet, between which his excursions were confined for the remainder of his life. The famous pamphlet by which Asgill is remembered, was much praised by Coleridge for its irony. The case for man was, indeed, capitally argued in terms of the English law. Asgill professed to believe that he was to be translated without dying. Consult the Gregg edition of the argument (New York, 1875), and Coleridge, *Table Talk*, April 30, 1832, reprint (London, 1883).

ASH (AS. *æsc*, MHG. *asch*, Ger. *Esche*), *Fraxinus*. A genus of trees belonging to the family Oleaceæ. The leaves are deciduous and

ASH-TREE LEAF AND FRUITAGE.

are pinnate with a terminal leaflet. There are about 50 species, mostly natives of Europe, eastern Asia, and North America. The common ash (*Fraxinus excelsior*) grows wild in the middle and south of Europe and in the north of Asia. It is an undoubted native of Great Britain. The flowers are naked; the leaves have five or six pairs of leaflets. The flowers appear before the leaves in spring; indeed, the tree is not covered with leaves until the season is far advanced and loses them again early in autumn. It is, however, a most beautiful and umbrageous tree, highly ornamental in parks; but in parks or hedgerows, it is injurious to the grass or crops immediately around it. It rises to the

height of 100 to 150 feet, generally with a smooth stem. The wood is white, tough, and hard, much valued by wheelwrights, cartwrights, coach-makers, joiners, and turners. It is also excellent for fuel. Sometimes it becomes irregular in the disposition of its fibres and finely veined, and is then prized by cabinet-makers. The wood of the young trees is almost as valuable as that of the old. Indeed, the value of the timber is greatest in trees of which the growth has been rapid, as it exhibits the characteristic toughness in the highest degree. The ash prefers a loamy soil, but grows in almost any, and flourishes in situations too elevated or too exposed for most other trees. It has been extensively planted in elevated situations in some parts of the north of Scotland, and there, in the more sheltered glens, it grows to a large size. Cultivation has produced and perpetuated a number of varieties, of which the most remarkable are the *weeping* ash, with boughs bent almost straight down to the ground; the *curl-leaved* ash, with dark-green wrinkled or curled leaves; and the *entire-leaved* ash, a very curious variety, with many or all of the leaves simple (not pinnate), which has been erroneously regarded by some botanists as a distinct species, and named *Fraxinus simplicifolia*, *Fraxinus heterophylla*, etc. The small-leaved ash (*Fraxinus parvifolia*) and the lentisk ash (*Fraxinus lentiscifolia*) are both natives of the shores of the Mediterranean and are very graceful and ornamental trees. The American ash, or white ash (*Fraxinus americana*), is readily distinguished from the common European ash by its lighter bark and paler green leaves. The leaves have a rachis, and the leaflets are shortly stalked and entire (those of the common ash are sessile and serrated). It is abundant in New Brunswick and Canada, but is less common south of New Jersey and west of Minnesota and Kansas. The trunk often rises more than 40 feet undivided. The wood is used for the same purposes as that of the common ash. The red ash (*Fraxinus pubescens* or *Fraxinus pennsylvanica*) is very similar, but of smaller size, and has a deep-brown bark. It is most abundant in Pennsylvania, Maryland, and Virginia, especially in swampy ground. The black ash or water ash of the New England States, New Brunswick, etc. (*Fraxinus sambucifolia* or *Fraxinus nigra*), is a large tree, with buds of a deep-blue color. This tree is more commonly found in wet places than the other species. Its wood is soft, tough, and easily separable into thin layers, on which account it is commonly used for barrel hoops, staves, and for splint baskets, etc. The blue ash of Ohio, Kentucky, Tennessee, etc. (*Fraxinus quadrangulata*), is also a large tree. The inner bark of this species gives a blue color to water, hence the name. The branches are quadrangular, the young shoots having on the angles four membranes which extend their whole length. The green ash (*Fraxinus viridis* or *Fraxinus lanceolata*), readily recognized by the brilliant green of its young shoots, is chiefly found in the Middle States; on account of its hardness, the green ash is extensively planted for wind-breaks, and as an ornamental in Minnesota and the Dakotas. It is easily propagated from seed and is of very rapid growth. The wood is less valuable than that of the white ash. The Carolina ash (*Fraxinus caroliniana*), remarkable for the great size of its leaflets, is found chiefly in the southern States. Besides these, North America produces about a

dozen other species or varieties. The wood of all of them is used for somewhat similar purposes to that of the common ash. In the south of Europe grows the manna ash or flowering ash (*Fraxinus ornus*, called *Ornus europæa* by some botanists), whose flowers have a four-partite calyx and four small yellowish-white petals. The tree has much resemblance to the common ash. From it the substance called manna (q.v.) is obtained by means of transverse incisions in the bark; but in very favorable situations it flows spontaneously during the greatest heat of summer. Manna is chiefly collected in Calabria and Sicily. A nearly allied species, *Fraxinus rotundifolia*, a native of Greece and the Ionian Islands, yields it also in perhaps equal quantity. The common ash is said sometimes to produce the same exudation in the same warm climates.

The mountain ash or rowan tree belongs to a different family, its resemblance to the ash being chiefly in its leaves. Fossil forms of the ash (*Fraxinus*) are known in all the Tertiary beds above the Eocene, in Europe, but have not been found in beds of equivalent age in North America. Consult G. Nicholson, *Illustrated Dictionary of Gardening* (London, 1884-89), L. H. Bailey, *Cyclopædia of American Horticulture* (New York, 1900-01), and C. S. Sargent, *Manual of the Trees of North America* (Boston, 1905).

ASHANTI, ā-shānt'ē, or **ASHANTEE**. A British possession (formerly a negro kingdom) in west Africa, separated from the Gulf of Guinea by the British Gold Coast colony (q.v.), of which it has practically been a part since 1896 (Map: Africa, D 4). Its boundaries were defined by an order of the King in council dated Sept. 26, 1901, and by a subsequent order dated Oct. 22, 1906. The area is estimated at about 20,000 square miles. It is a fertile and well-watered region. Dense tropical forests, rich in cabinet woods and rubber and resinous plants, cover an area estimated at 12,000 square miles. Increased attention is being paid to the cultivation of the soil by the natives, especially in the planting and care of the kola-nut tree. Cacao plantations are extending. Other agricultural products are yams, grains, fruits, vegetables, tobacco, gum copal, rubber and dyewoods. Gold is found in quartz and alluvial deposits; the output in 1905 was 68,259 ounces (£254,790) and in 1911, 124,878 ounces (£530,853). The natives have several well-developed industries and are skilled workers in metals and in the weaving of fabrics as well as in the production of earthenware. The ornaments of gold and silver found in the palace at Kumasi in 1874 bore evidence of much artistic skill. The railway line from Sekondi, on the coast, to Kumasi, the capital of Ashanti, is 168 miles long. The population of Ashanti, according to the census of 1911, was 287,814. The natives are negroes and are divided into numerous tribes, each governed by its own headman, and all, previous to the deposition of Prempeh, in 1896, subject to the King of Kumasi as king paramount. Among these tribes are the Bekwais, Kokofus, Kumasis, Daniassias, and Mampons. Physically the inhabitants of Ashanti are strong and well developed. Their speech belongs to the Tshi group. They practice polygamy and their religion is a mixture of ancestor worship and animism or nature worship. The capital is Kumasi, with a population, 1911, of 18,853. Obuassi, Wam, Nkoranza, Atabubu,

and Kintampo are other towns; Kintampo, an old slave mart, is now a station for the kola-nut trade.

The beginnings of the Ashanti kingdom are obscure, but traditions point to an immigration from the north of negro tribes fleeing from oppression at the hands of the Niger Moors, whose capital was Timbuktu. Our first positive glimpse of it is in the year 1700, when Kumasi was made the capital by Osai Tutu I, who conquered Akim, Assin, Gaman, Denkira, and other neighboring states. His successors continued the campaign of conquest; and about 1807 the Ashantis invaded the Fanti domains, thereby reaching the coast, where they became involved in a war with the British. Treaties were concluded and broken. From 1824 to 1826 the British met with heavy reverses, but at Dodowah the Ashantis were entirely routed. In 1831 they were driven from the seacoast, and the river Prah was fixed as the southern boundary of their kingdom. In 1873-74, in consequence of disputes arising in connection with the cession of the Dutch fort of Elmina to Britain, war broke out again, and an army under Sir Garnet Wolseley forced its way to the centre of the kingdom. After a severe battle at Amoafu and several days' fighting, Kumasi was taken Feb. 4, 1874, and burned on the 6th; and though the rainy season had set in, the British army returned in safety to the coast. The King submitted and promised to pay tribute and end the slave traffic. In 1895 the King of Ashanti (Prempeh), having molested the English settlers on the coast and raided the natives in numerous slave-hunting expeditions, a strong British force was sent again to Kumasi, which it reached with little resistance. The kingdom was then made a British protectorate (1896). In the spring of 1900 the Ashantis rose in sudden rebellion. The British governor of the Gold Coast colony and some 700 troops were pent up in Kumasi by 15,000 Ashanti warriors. On June 23 Governor Hodgson, with part of the garrison, succeeded in getting away to the coast, and on July 15 a relief expedition entered the town. The siege had lasted nearly four months. The country was definitively annexed to Great Britain Sept. 26, 1901. It is separately administered by a chief commissioner under the control of the governor of the Gold Coast, but the laws of the latter colony do not apply to it. Consult: H. C. J. Biss, *The Relief of Kumasi* (London, 1901); H. A. Freeman, *Travel and Life in Ashanti and Jaman* (London, 1898); C. C. Reinhardt, *History of the Gold Coast and Ashanti* (Basel, 1895).

ASHBOURNE, EDWARD GIBSON, BARON (1837-1913). An Irish barrister and politician. After studying at Trinity College, Dublin, he became a barrister in 1860 and Queen's counsel in 1872. Having served as a member of Parliament (1875-85), and as Attorney-General for Ireland (1877-80), he was made Lord Chancellor of Ireland in 1885. In this latter office he was continued, with a seat in the cabinet, until 1892, and he again held it from 1895 to 1906. He was created first Baron Ashbourne in 1885.

ASHBURNER, CHARLES ALBERT (1854-89). An American geologist, born in Philadelphia, where he received his collegiate education. He became engaged in the geological survey of Pennsylvania, in the capacity of assistant, and afterward was made head geologist, and carried on valuable investigations in connection with the

ASH AND ARAUCARIA

ARAUCARIA EXCELSA, as a house plant

ASH (*Fraxinus americana*)

survey of the coal fields of Pennsylvania. He was a member of many scientific societies. His name is well known among geologists, both in this country and abroad, and is intimately associated with the history of coal stratigraphy. His writings include a large number of papers, especially on the subjects of coal, petroleum, and natural gas, contributed to various scientific and technical journals and to the reports of the Pennsylvania Geological Survey.

ASH/BURTON, BARON. See **BARING, ALEXANDER.**

ASHBURTON RIVER. A river of Western Australia, rising in the mountains west of the Great Sandy Desert and flowing 400 miles northward into the Indian Ocean, north of Exmouth Gulf. The Tropic of Capricorn crosses its middle course and here, and to some extent below, grass lands and trees border the river. It reaches the sea, however, through the desert coastal strip of Western Australia (Map: Western Australia, B 6).

ASHBURTON TREATY. See **BARING, ALEXANDER; WEBSTER-ASHBURTON TREATY.**

ASH/RY, TURNER (1824-62). A Confederate general. Early in 1861 he raised a regiment of cavalry, and by successive promotions attained the rank of brigadier-general in 1862. In May, 1861, he commanded at Point of Rocks, near Harper's Ferry, and in the spring of 1862 covered General Jackson's retreat before General Banks, earning the highest praise for his ability and gallantry. In June, 1862, he was killed in a skirmish at Harrisonburg, Va., two days before the battle of Cross Keys. Consult J. B. Avirett, *The Memoirs of General Turner Ashby and his Compeers* (Baltimore, 1867).

ASHBY-DE-LA-ZOUCH, äsh'bi-de-lä-zoosh' or -zoöch' (after the Norman family La Zouch). A small town of Leicestershire, England, about 17 miles northwest of Leicester (Map: England, E 4). The town was once celebrated for its manufacture of stockings, hats, and fire-brick, but these industries have greatly declined. In the neighborhood there are saline springs; while coal, limestone, and fine clay are also found. The church of St. Helen is a rather handsome building; and the castle to the south of the town, now in ruins, known from Scott's *Ivanhoe*, was once the prison of Mary, Queen of Scots. Pop., 1891, 4500; 1901, 4700; 1911, 4927. Consult E. Mammatt, *History and Description of Ashby-de-la-Zouch* (London, 1852).

ASH/RY-STERRY, JOSEPH. An English critic. He was born in London and was educated as a painter, but soon turned to journalism. He has written some brilliant verses, sketches, and novels, such as *Nutshell Novels* (1890); *Lazy Munstrel* (1892), which has run through many editions; *Naughty Girl: A Story of 1893* (1893); *A Tale of the Thames in Verse* (1896); and *The Bystander; or, Leaves for the Lazy* (1900); *Sketches in Song* (1903); and *River Poems* (1909).

ASH/DOD (Heb. stronghold). One of the five confederated Philistine cities, the modern village of Esdud, 3 miles from the Mediterranean coast, between Gaza and Joppa. It had a commanding situation and possessed a famous Dagon temple, in which the captured Yahwe ark was placed (1 Sam. v.). Sargon sent his general against this city in 711 B.C. Azuri had been superseded by his brother Ahimiti, and he had been overthrown by Yamani (or Yawani). Yamani was forced to flee to Muzri. Ahi-milki,

King of Ashdod, is mentioned by Esarhaddon. According to Herodotus, the city was besieged 29 years by Psammeticus I (663-610 B.C.). In the time of Nehemiah an Ashdodite dialect was spoken by the children in Jerusalem whose mothers were Philistines. Whether this was a Canaanitish or Aramaic dialect cannot be determined. Jonathan took the city in 147 B.C. and burned the Dagon temple. Pompey enfranchised the city. As Azotus, it became a centre of Greek civilization, and was also the seat of a Christian bishop.

ASHE, äsh, JOHN (1720-81). An American soldier. He was born in North Carolina; was a representative in the Colonial Assembly, and its presiding officer (1762-65), and was a member of the first Provincial Congress. Early in 1775 he recruited a force of 500, with which he took Fort Johnson, and in the following year he became brigadier-general of the North Carolina State troops. He was with General Lincoln in 1779, and while commanding an expedition sent to relieve Augusta, Ga., was surprised and defeated by General Prevost (March 3), at Brier Creek. In 1781 he was made a prisoner at the capture of Wilmington (February 1), and after being treated with the utmost cruelty, died of smallpox, October 24. Asheville, N. C., was named in his honor.

ASH/ER (Heb. blessed). The name given in Gen. xxxv. 26, to the eighth son of Jacob, being the second born to him by his concubine Zilpah, the handmaid of Leah. Asher is thus merely the customary eponymous hero of the tribe of Asher, which formed part of the confederation known as the Bene Israel. The genealogy of Asher, indicating merely the subdivisions of the clan, is furnished in Gen. xlv. 17, and Num. xxvi. 44 (cf. 1 Chron. vii. 30). But little is known of the clan, which plays scarcely any part in Hebrew history. Asher takes no part in the uprising against Sisera (Judg. v. 17), while the statement (Judg. vi. 35 and vii. 23) that Asher participated in the conflict with Midian is open to question. The position of the tribe is also difficult to ascertain, since but few of the places mentioned (Josh. xix. 24-31) as belonging to Asher have been identified. There are indications that the tribe was originally settled in southern Palestine, where it became mixed with non-Hebrew clans, and subsequently moved northward toward the seacoast, though neither Acccho, Achzib, nor Sidon (mentioned Josh. xix, as cities of Asher) could ever have belonged to it. The popular etymology as 'happy' (Gen. xxx. 13) may furnish the real meaning, and it is also possible that Asher may have originally been the name of a deity. In that case it may ultimately prove to be identical with Assur (q.v.) since the name of this god was written in early times Ashir, or Asir, both in Assyria and in Cappadocia. Ashera would then be the consort of this deity. A district or state of Aser in northwestern Galilee is mentioned in Egyptian inscriptions of the time of Seti I (c.1331-10 B.C.) and Rameses II (c.1310-1244 B.C.). See Max Müller, *Asien und Europa*, pp. 236 ff. (1893).

ASH/ERA. 1. A wooden post used in worship at the sanctuaries of Palestine in ancient times. It was employed not only by the Canaanites, but also by the Israelites at Samaria, Bethel, and Jerusalem (2 Kings xxiii. 6), in connection with the worship of Yahwe. It probably had phallic shape, represented a god or goddess of

fertility, and stood at the boundary of a field and especially a sacred inclosure. In Assyrian, *Asirtu* also has the meaning of 'sacred precincts,' and this is its manifest sense in the Phœnician Masud inscription. There was a strong prophetic opposition to this cultus-object, and many *asheras* were hewed down by Josiah after 620 B.C. 2. *Ashera* was also the name of a goddess. She was in all probability the wife of Assur (q.v.), or Asir, as the name of the chief Assyrian deity is written in early inscriptions found at Kalat Sherkat and at Kara Eyük. *Asirtu*, or *Asratu*, also seems to have been identified with *Ishtar* (q.v.), and is sometimes represented as the consort of *Amurru*. (See AMORITES.) An *Abdashirta*, 'servant of *Ashera*,' flourished in Syria in the days of Amenhotep III (1411-1375 B.C.). Katabanian inscriptions show that this goddess was worshiped in south Arabia. *Athurat* is the consort of *Wadd*, the god of love. It is natural to infer that there was some connection between the goddess *Ashera* and the sacred pole. Consult Sayce, "Cappadocian Cuneiform Tablets from Kara Eyük" in *Babylonica*, vol. vi, p. 68 (1911).

ASH'ES. The substance of all plants and animals contains as an indispensable ingredient a certain amount of mineral matter which remains behind as ash when the organic portion of the substance is burned.

According to Warington, the proportion of ash varies from 0.2 to 0.4 per cent in the dry matter of the wood of trees, from 2 to 5 per cent in seeds, from 4 to 7 per cent in the straw of cereals, from 4 to 8 per cent in roots and tubers, from 5 to 9 per cent in hay, and from 10 to 25 per cent in leaves of root crops. Lawes and Gilbert found that the proportion of ash varied from 4 to 5 per cent in cattle, from 2.8 to 3.5 per cent in sheep, and from 1.8 to 3 per cent in swine.

Uses. The ashes of sea plants were formerly a common source of bromine and iodine, and the ashes of animal bodies form a source of phosphorus. But the commercial value of ashes depends mainly on their use (1) as a source of alkali (pearl-ash, potashes, etc.), and (2) as a fertilizer. The fertilizing value of ashes is due to the fact that they contain all of the mineral constituents required by plants, especially potash, and that largely in one of the most desirable forms—viz., as carbonate. The following are the most important classes of ashes for agricultural purposes: (1) wood ashes from household fires, furnaces, etc.; (2) cotton-hull ashes, resulting from the use of cotton hulls as fuel under boilers, etc.; and (3) lime-kiln ashes, which are a mixture of more or less lime with the ashes of the fuel used in the kilns.

Wood Ashes. Wood ashes were formerly the almost exclusive source of potash for fertilizing and other purposes. They have, however, been very largely replaced by the German potash salts. The supply of wood ashes is limited on account of the general substitution of coal for wood as fuel. Canada is the main commercial source of supply in America. There the ashes are collected from house to house and stored in so-called "asheries." When first collected, they are said to weigh from 34 to 40 pounds per bushel; but when stored they undergo a heating and sweating process which causes them to shrink about one-fifth in bulk, the weight per bushel increasing from 40 to 48 pounds. It requires about 30 cords of hard wood to make one ton of ashes.

The composition of wood ashes is very variable. The hard woods yield ashes richer in potash than the soft woods. Pure ashes carefully prepared from hard woods have been found to contain more than 17 per cent of potash; those from soft woods almost 10 per cent, besides about 2 per cent of phosphoric acid. No such ashes are found on the market. Unleached ashes contain, on an average, about 5 per cent of potash, 1.5 per cent of phosphoric acid, and 30-35 per cent of lime. The fertilizing action of ashes is mainly but not entirely due to the potash. The small amount of phosphoric acid which they contain is not without fertilizing value, and the lime, which is present to the extent of 600 to 700 pounds per ton (of 2000 pounds), is of great value in improving the texture and in correcting the acidity of soils, besides supplying an element which is deficient in many soils.

Ashes which have been subjected to leaching show a reduced percentage of potash and an increased percentage of moisture. The average composition of such ashes is as follows: Moisture, 30 per cent; potash, 1.3 per cent; phosphoric acid, 1.5 per cent; lime, 28 per cent. The fertilizing action of leached ashes is due very largely to their favorable physical effects on the soil, which are brought about mainly by the lime present.

Cotton-Hull Ashes. Cotton-hull ashes are much richer in fertilizing constituents than wood ashes and are highly esteemed, especially in New England, as a fertilizer for tobacco. They contain on an average about 23 per cent of potash, 9 per cent of phosphoric acid, and 8.8 per cent of lime, although their quality varies greatly. The potash has been found to vary from 10 to 42 per cent, the phosphoric acid from 3 to 13 per cent. The high percentage of phosphoric acid which these ashes contain makes them a valuable source of this fertilizing constituent. The percentage of lime is too small to exert any marked influence on the fertilizing effect.

Lime-Kiln Ashes. These are obtained in the burning of lime with wood and usually contain less than 1.5 per cent of potash, about 1 per cent of phosphoric acid, and 45 to 50 per cent of lime. The low percentage of potash and phosphoric acid, and high percentage of lime, are due to admixture of lime from the kiln. Such ashes are valuable mainly for their lime.

Other Kinds of Ashes. Among other kinds of ashes which occasionally attain some agricultural importance are tan-bark ashes, which, according to Voorhees, seldom contain more than 2 per cent of potash, 1.5 per cent of phosphoric acid, and 33 per cent of lime; coal ashes, which contain only traces of phosphoric acid and soluble potash and are useful only for improving the physical condition of heavy soils, and seaweed ashes, which are very variable in composition on account of imperfect incineration or admixture of impurities, but are often quite rich in potash, as has been shown especially in the case of the kelps of the Pacific coast of the United States.

ASHEVILLE, ash'vil. A city and the county-seat of Buncombe Co., N. C., 129 miles by rail southeast of Knoxville, Tenn.; at the junction of the Swannanoa and the French Broad rivers, and on the Southern Railway (Map: North Carolina, B 4). It is finely situated, at an elevation of 2300 feet in a mountainous region, and is a celebrated health resort, both summer and winter. The city contains a public

library, Asheville Normal and Collegiate Institute, Bingham Military School, Asheville School for Boys, Home Industrial School, and other educational institutions. The post office, United States government building, county courthouse, city hall, public library, auditorium, Kenilworth Inn, The Manor, Battery Park Hotel, and Win-yah Sanitarium are notable features, and additional places of interest are Overlook Park, Richmond Hill, Beaumont (grounds), Connally's View, and Swannanoa Drive along the river bank. Adjoining the city is the great Vanderbilt estate, Biltmore, which, with its forest preserve, covers about 132,000 acres. Asheville is in a region which has considerable mineral wealth and valuable timber, and is especially adapted to stock raising, dairying, and general agriculture, as well as truck gardening, poultry raising, and fruit growing. Its apples are of a particularly fine variety. The manufactured articles include caskets, wood novelties, brick, wagons, cars, agricultural implements, cotton goods, mattresses, harness, cereals, furniture, mica products, building material, and tanned leather. Water is supplied from the slopes of Mount Mitchell, developing 10,000 hydro-electric horse power. Settled in 1792, Asheville was first incorporated about 1835. The government, under a revised charter of 1901, is vested in a mayor, biennially elected; a city council, chosen by wards and on a general ticket; and subordinate officials, who are nominated and elected by the council. The water works are owned and operated by the municipality. Pop., 1890, 10,235; 1900, 14,694; 1910, 18,762.

ASH FLY. A gall fly of the oak (*Cynips quercifolia*). See GALL INSECTS.

ASHFORD. A market town of Kent, England, situated on the Stour, 56 miles by rail southeast of London (Map: England, G 5). It is well built and lighted and has an excellent water supply. The town maintains public baths, a park, hospital, and technical schools. It manufactures linen goods, agricultural implements, beer, and pianos, and has a large workshop of the Southeastern Railway. Pop., 1891, 10,700; 1901, 12,800; 1911, 13,668. Ashford was the home of Jack Cade.

ASHFORD, BAILEY KELLY (1873—). An American surgeon, born in Washington, D. C. His general education was obtained at the public schools and at Columbian (now George Washington) University. In 1896 he graduated from the Georgetown University Medical School and in 1898 from the Army Medical School, during this period serving also as resident physician in several hospitals. Having accompanied the military expedition to Porto Rico in 1898, he made during the next year an exhaustive study of anemia in that island, and determined that the hookworm responsible for this disease caused as many as 12,000 deaths a year. The governmental campaign against the plague, organized by him and prosecuted in 1903-04, resulted in the treatment and cure of some 300,000 persons out of a total population of a million, and in a reduction of 90 per cent in the death rate from anemia. Ashford founded the Porto Rico Anemia Commission and by special authority of the Secretary of War served on it in 1904-06. He was also made chairman of the consulting staff of the Presbyterian Hospital in San Juan, Porto Rico, and was chosen to membership in many American and foreign medical societies. His writings include *Anemia in Porto Rico*

(1904); *Uncinariasis in Porto Rico: A Medical and Economic Problem* (1911).

ASH/HURST, JOHN, JR. (1839-1900). An American surgeon. He was born at Philadelphia, graduated in 1857 at the University of Pennsylvania; studied medicine, and from 1862 to 1865 was assistant surgeon in the United States army. He was appointed professor of clinical surgery in the University of Pennsylvania in 1877, Barton professor of surgery in 1883, and president of the Philadelphia College of Physicians in 1898. He was a member of several scientific societies and edited Erichsen's *Science and Art of Surgery* (1869) and the *International Encyclopedia of Surgery* (6 vols., rev. ed., 1888). His original publications include *Injuries of the Spine* (1867) and *Principles and Practice of Surgery* (1871; 6th ed., 1901).

ASHI, āsh'ī, RABBI (352-427 A.D.). A son of Simai and member of a well-known family. Nothing is known of his childhood or education, but at an early age he became the head of the Rabbinical school at Surā in Babylonia. He is said to have rebuilt the schoolhouse at that place, and such was the distinction which he gained among his contemporaries that he was accorded the honorable title "Rabbana," i.e., 'our teacher.' His chief claim to fame rests upon the attempt that he made to gather the discussions of the Rabbis on the Mishnah into a compilation known as the "Gemara," which, together with the Mishnah, constitutes the Talmud. He worked at this task for more than 50 years, but it was left for his successors to complete it. See TALMUD.

ASHIKAGA, ā'shē-kā'gā. A town of Japan in the prefecture of Tochigi, situated in the southern part of Honshū, 71 miles by the Riomō Railway north-northwest of Tokio (Map: Japan, F 5). The town was famous for its academy of Chinese learning said to have been founded in the ninth century. It contained an extensive library of Chinese works and was one of the most famous centres of Chinese culture and Confucianism. With the establishment of the Seido at Yōto, at the end of the seventeenth century, it lost its former importance and at present retains only a fraction of its library and an image of Confucius. Commercially Ashikaga is important for its extensive trade in cotton and silk goods. Pop. (latest report), 1898, 21,348.

ASHIKAGA. A dynasty of Shoguns or military lieutenants of the Mikado, who ruled Japan from 1336 to 1574, the last being overthrown by Ōta Nobunaga. See SHOGUN.

ASHIO, ā-shē'ō. A town of Japan, situated in the southern part of Honshū, 10½ miles southwest of Nikkō. Silver is mined in the vicinity, and it is famous for the two copper mines of Ashio and Kotaki, 2 miles distant, considered the most productive in Japan. In 1910 the output of copper ore was about 300,000 tons. In the vicinity of the town are situated extensive smelting works run by electricity generated by water power. Pop., about 6000.

ASH/KELON (Gk. Ἀσκάλων, *Askalōn*; Heb. *Ashkelon*; Ass. *Askaluna*; modern *Ashdōd*). An important Syrian city in ancient times, now in ruins. It is situated on the shores of the Mediterranean, north of Gaza, and about 40 miles west-southwest of Jerusalem. Before the Philistine invasion it was occupied by the Avvites (Deut. ii. 23). In the beginning of the

fourteenth century B.C. the city was ruled by an Egyptian governor, Yitia, from whom we have three letters to Amenhotep IV in the Amarna correspondence. Ashkelon rebelled against Egypt in the reigns of Rameses II (1310-1244) and Merenptah (1244-1234). The latter refers to Ashkelon in his famous inscription mentioning Israel. (See ISRAEL.) The city passed into the hands of the Philistines when these invaders from Crete were driven from Egypt into Syria by Rameses III (c.1200 B.C.). It is mentioned as a Philistine city in the story of Samson (Judg. xiv. 19); it is one of the cities in which the captured ark of Yahwe was kept (1 Sam. vi. 17); and it is referred to by David in his elegy over Saul and Jonathan (2 Sam. i. 20). In the second half of the eighth century there were two parties in Ashkelon, as in other city kingdoms in Syria—one favorable to the Assyrians, and another striving for independence. Tiglath-pileser IV seems to have made Mitinti a vassal in 738; this King died in 733, and his son, Rukipti, was placed upon the throne by the Assyrian monarch. Sar-ludari, the son of Rukipti, was faithful to Assyria, but was driven away by Sidka. Sennacherib, in 701, brought him captive to Assyria and restored Sar-ludari. It became a part of the Achaemenian Empire and was conquered by Alexander. Under Ptolemaic and Seleucid rule it became a thoroughly Hellenistic city. The worship of its goddess Atargatis-Derketo continued, however, though temporarily checked by the Hasmonaean rulers, Jonathan and Alexander Jannaeus, who held possession of the city (1 Maccabees x. 86; xi. 60). Its regained independence was marked by the city era of 104 B.C. Herod's family probably came from Ashkelon, and he embellished the city with baths, palaces, and fountains. All through the Hellenistic period it seems to have enjoyed great prosperity and was a centre of learning. It was the birthplace of philosophers like Antiochus and Eubius, grammarians like Ptolemy and Dorotheus, and historians like Apollonius and Artemidorus. The citizens were strongly opposed to Christianity down to a late period. After being captured by the Moslems, Ashkelon remained in their possession until it was taken by the Crusaders. Under the walls of the city the Christians won a brilliant victory on Aug. 12, 1099; but the city did not fall into their hands until 1154 after a siege by sea and land of five months. It was taken by Saladin in 1187 and dismantled in the beginning of the third Crusade. The attempt by Richard Cœur de Lion in 1191 to rebuild the walls had to be abandoned, and it was agreed that the city should remain unfortified. The final destruction came in 1270 through Sultan Bibars, who had the harbor filled with rocks. The ruins of the massive city walls still stand, and to the east between them and Mejdol some remains of the temple of Derketo. Consult: Guérin, *Judée*, vol. i, pp. 153 ff. (1869); Winckler, *Geschichte Israels*, pp. 221 ff. (1895); Strack, *Gaza und die philistäische Küste* (1852); Schürer, *Geschichte des jüdischen Volkes* (4th ed., 1901).

ASH'KENA'ZIM. Already in the writings of Saadia (892-942) Ashkenaz seems to be used as a name of Germany. This interpretation may indeed be earlier, as Ashkenaz, Riphath, and Togarmah are explained as *Germaniye*, or Germans, in *Beresith Rabba*, xxxvii, 1. Since the twelfth century, at any rate, the Jews of Germany have been called Ashkenazim,

and they as well as the Jews of other regions in which German Jews have settled are designated as Ashkenazim, as against the Sephardim—the so-called Portuguese Jews, the descendants of the Jews of Spain and Portugal. The difference between the two consists merely in a different pronunciation of the Hebrew, and slight divergences in the ritual. Doctrinally there is no difference. At times, however, social distinctions have been very great and intermarriage almost impossible.

ASHLAND. A city in Boyd Co., Ky., 146 miles east by south of Cincinnati, Ohio, on the Chesapeake and Ohio and the Norfolk and Western railroads, and on the Ohio and Big Sandy rivers (Map: Kentucky, H 2). The principal features of interest are Central Park, a public preserve of about 50 acres in the centre of the city, and Clyffeside Park, a summer resort with various attractions, maintained by a corporation, just outside the city limits. Ashland is important chiefly as a manufacturing city, though it carries on an extensive trade in coke, iron ore, and the varied products of its industrial plants, which include pig iron, cut and wire nails, wire rods, steel billets, sheet steel, fire brick, leather, cement, coke ovens, flour, ice, furniture stock, and oak and poplar lumber. Settled in 1854, Ashland was chartered as a city in 1870. Under a revised charter of 1894 the government is vested in a mayor, elected every four years, and a city council which chooses all municipal officials except the board of education and chief of police. Pop., 1900, 6800; 1910, 8688.

ASHLAND. A city and the county-seat of Ashland Co., Ohio, 55 miles (direct) southwest of Cleveland, on the Erie and the Loraine, Ashland, and Southern railroads, and the Cleveland, Southwestern and Columbus electric line (Map: Ohio, F 4). It has a public library, the Samaritan Hospital, and manufactures stock and poultry foods, pumps, hay, tools, rubber goods, etc. The water works are owned by the municipality. Pop., 1900, 4087; 1910, 6795.

ASHLAND. A city in Jackson Co., Ore., 341 miles south of Portland, on the Southern Pacific Railroad (Map: Oregon, C 5). Ashland is the seat of a State normal school, a polytechnic and business college, the southern Oregon Chautauqua, and has a Carnegie library and a hospital. Because of its pleasant location in the Rogue River valley, and on account of the existence of hot and cold sulphur and other mineral springs, it is popular as a health resort. There are important fruit-growing, granite-quarrying, and lumber interests, and rich deposits of gold, copper, iron, and coal. The city also contains railroad shops, planing mills, a broom factory, iron foundry, and a creamery. The water works and electric light plant are owned by the municipality. Pop., 1890, 1784; 1900, 2634; 1910, 5020.

ASHLAND. A borough of Schuylkill Co., Pa., 12 miles (direct) northwest of Pottsville, on the Philadelphia and Reading, and Lehigh Valley railroads (Map: Pennsylvania, J 5). Coal mining is the chief industry, but there are also important foundries, machine shops, etc. Ashland owns and operates its water works. Settled in 1850, Ashland was incorporated in 1857. Its charter of that date provides for a mayor elected every three years and a city council of 15 members. Pop., 1900, 6438; 1910, 6855.

ASHLAND. A residential town in Hanover

Co., Va., 17 miles by rail north of Richmond, on the Richmond, Fredericksburg, and Potomac Railroad (Map: Virginia, G 4). It is the seat of Randolph-Macon College (Methodist Episcopal, South), founded in 1832, in Mecklenburg County, and removed to Ashland in 1866. Settled in 1845, Ashland was incorporated in 1856. The town suffered from a number of raids during the Civil War, and the locality was the scene of several battles. The town carries on a considerable trade in garden produce. Henry Clay was born about 7 miles from Ashland. Pop., 1890, 948; 1900, 1147; 1910, 1324.

ASHLAND. A city and the county-seat of Ashland Co., Wis., 70 miles east of Superior, on Chequamegon Bay, and one of the finest harbors on Lake Superior (Map: Wisconsin, C 2). Steamers connect it with lake ports, and it is on the Minneapolis, St. Paul, and Sault Ste. Marie, the Northern Pacific, and the Chicago and Northwestern railroads. Ashland is the seat of Northland College, the Sacred Heart Convent, and contains a hospital, the Vaughn Public Library, North Wisconsin Academy, an opera house, a fine United States government building and post office, and Knight Hotel. The Apostle Islands, in Chequamegon Bay, are of historic and scenic interest. Industrial and commercial interests are represented by several lumber mills, charcoal blast furnaces, steel plant, foundries and machine shops (including railroad shops of the Chicago and Northwestern), pulp works, creameries, flour mill, brownstone quarries, large wholesale houses, and extensive ore and merchandise docks. An extensive industry in dairying and fruit growing has been developed. Ashland is one of the most important ports on the Great Lakes, the place from which the product of the iron mines of the Gogebic Range is shipped. Settled in 1854, Ashland was incorporated in 1863, and since 1876 has grown rapidly. It was chartered as a city in 1887 and adopted the commission form of government in 1913. Pop., 1900, 13,074; 1910, 11,594.

ASH'LAR. See MASONRY.

ASH-LEAVED MAPLE. See BOX ELDER.

ASHLEY. A borough in Luzerne Co., Pa., 1 mile from Wilkes-Barre, on the Central of New Jersey and the Wilkes-Barre and Hazleton railroads. It is in a productive coal-mining region and has railroad shops. Pop., 1900, 4046; 1910, 5601.

ASHLEY, ANTHONY EVELYN MELBOURNE (1836-1907). An English statesman of the Liberal party, fourth son of the seventh Earl of Shaftesbury. After his graduation at Trinity College, Cambridge, he was called to the bar at Lincoln's Inn and joined the Oxford Circuit. He was private secretary to Lord Palmerston from 1858 to 1865, barrister of the Oxford Circuit from 1865 to 1874, and Parliamentary Secretary to the Board of Trade from 1880 to 1882. Mr. Gladstone selected him (in 1882) to succeed Mr. Courtney as Under Secretary of State for the Colonies. He was also member of Parliament from 1874 to 1885, when he was defeated in the Isle of Wight contest. In 1891 he was made a Privy Councillor. He wrote *The Life of Henry John Temple, Viscount Palmerston* (London, 1879).

ASHLEY, WILLIAM JAMES (1860—). An Anglo-American educator. He was born in London, England, graduated at Balliol College, Oxford, in 1881, was a lecturer in history at Lincoln and Corpus Christi in 1885-88, pro-

fessor of constitutional history and political economy at the University of Toronto in 1888-92, and professor of economic history at Harvard in 1892-1901, when he became professor of commerce and finance, and then dean of the faculty of commerce, in the University of Birmingham, England. He translated for the "Economic Classics" series, of which he was editor, Schmoller's *Mercantile System* (1896) and Turgot's *Reflections* (1898), and wrote *James and Philip van Artevelde* (1883); *An Introduction to English Economic History and Theory* (1888-93); *Surveys, Historic and Economic* (1900); *The Tariff Problem* (3d ed., 1911) and *The Adjustment of Wages* (1903), and *Progress of the German Working Classes* (1904). He edited *British Industries* (1907), *British Dominions: Their Present Commercial and Industrial Condition* (1911), *Birmingham Studies in Social Economics* (1912), and wrote *Gold and Prices* (1912).

ASHLEY COOPER, ANTHONY. See SHAFTESBURY, EARLS OF.

ASHMEAD-BARTLETT, Sir ELLIS (1849-1902). An English statesman. He was born in Brooklyn, N. Y., the eldest son of Ellis Bartlett, a minister of Plymouth, Mass., and of Sophia, daughter of J. K. Ashmead, of Philadelphia. He received his education at Torquay and at Christ Church, Oxford, where he was president of the Oxford Union. He graduated with high honors and was called to the bar at the Inner Temple in 1877. He was member of Parliament from 1880 to 1885, in 1886, 1892, and 1895, and Civil Lord of the Admiralty from 1885 to 1886 and from 1886 to 1892. He served in South Africa in 1900 and in the Græco-Turkish War of 1897, when he was taken prisoner by a Greek warship, the commander of which mistook him for a spy. He was knighted in 1892. He was a frequent speaker in the House, especially on foreign questions, and published: *The Battlefields of Thessaly* (1897); *The Passing of the Shereefan Empire* (new ed., 1910); *With the Turks in Thrace* (new ed., 1913).

ASH'MOLE, ELIAS (1617-92). An English antiquary, founder of the Ashmolean Museum, at Oxford University. He was born at Lichfield and became a lawyer. In the Civil War he favored the royalist side and held a commission in the army. About this time he became interested in the study of astrology and alchemy and entered Brasenose College, Oxford, to study these subjects, together with physics and mathematics. He was one of the earliest of English Freemasons, having been initiated about 1646. With the Restoration Ashmole received many court offices and honors. His later interests were almost entirely in antiquarian subjects. He received by bequest the collection of curiosities of John Tradescant, and with his own additions it was turned over to Oxford University in 1682. He was the author of *Theatrum Chemicum* (1652), a collection of ancient metrical treatises on alchemy; *Institution, Laws, and Ceremonies of the Order of the Garter* (1672); *The Antiquities of Berkshire* (3 vols., 1719), and his *Diary* (1717).

ASHMOLEAN MUSE'UM. A museum of antiquities at Oxford, founded by Elias Ashmole, and contained in a building erected by Christopher Wren in 1682. In the floor are some of the Arundel Marbles.

ASH'MUN, GEORGE (1804-70). An American lawyer and politician, born in Blandford, Mass.

He graduated at Yale in 1823 and was admitted to the bar in 1828; served for four terms in the Lower House of the Massachusetts Legislature, and for one term in the State Senate, and was an influential member of Congress from 1845 to 1851. In 1860 he presided over the convention at Chicago which nominated Lincoln for President.

ASHMUN, JEHUDI (1794-1828). An American missionary. He was born at Champlain, N. Y., graduated at the University of Vermont in 1816, and was elected a professor in Bangor Theological Seminary (Congregational). He soon resigned, joined the Episcopal church, and became editor at Washington of *The Theological Repertory*. In this periodical he advocated the views of the African Colonization Society for founding a colony of liberated negroes on the west coast of Africa. Soon he was appointed an agent of the Society, and in 1822 conducted a body of liberated negroes from Baltimore to Liberia. He devoted the next six years to the task of putting the colony on a solid basis, but was obliged to return to the United States and soon died. See his *Life*, by R. R. Gurley (New York, 1835).

ASHOKAN RESERVOIR. An artificial lake, about 14 miles west of Kingston, N. Y., formed by the Olive Bridge dam across Esopus Creek and the Beaver Kill and Hurley dikes across smaller streams and gaps between the hills. It has a water surface of 12.8 square miles and a capacity of 132,000,000,000 gallons. It is situated about 90 miles north of the city of New York and forms an important part of the Catskill water system, impounding the water of the Esopus watershed, which aggregates some 255 square miles. It is on the route of the Ulster and Delaware Railroad, which had to be re-located on account of the construction of the dams and reservoir. See **AQUEDUCTS**; **DAMS AND RESERVOIRS**.

ASHRAF, á-shráf'. A town of Persia in the province of Mazanderan, situated near the coast of the Caspian, 50 miles west of Astrabad (Map: Persia, E 3). It was the favorite residence of Shah Abbas the Great, and the ruins of the palaces and gardens bear evidence of their former splendor. The proximity to the Caspian coast gives the town some commercial importance, and Ashraf carries on a considerable trade with Russia in cotton and silk goods. In its flourishing days it is supposed to have contained as many as 2000 families which have dwindled to about 800.

ASH'TABU'LA. A city in Ashtabula Co., Ohio, 55 miles east by north of Cleveland; on Ashtabula River; on Lake Erie; and on the Lake Shore and Michigan Southern, the New York, Chicago, and St. Louis, and the Pittsburgh, Youngstown, and Ashtabula railroads (Map: Ohio, J 2). It contains a public library and a hospital, and has bow socket, box, and hardware factories, tanneries, worsted mills, and manufactures of farm implements, carriages and automobiles, shale paving bricks, etc.; it does a large business in the shipment of coal and transshipment of iron ore, through the fine harbor at the river's mouth; and it has also a large dry dock and shipbuilding plant, and one of the largest areas of winter vegetables under glass of any city in the United States. The river has been straightened and dredged by the city, greatly improving manufacturing and transporting facilities of Ashtabula and country adjacent

to the upper river. Ashtabula was first settled in 1803, and in 1808 was organized as a township, including within its limits what are now Kingsville, Sheffield, and Plymouth, separately incorporated in 1810, 1820, and 1838, respectively. The electric light plant is owned by the city. Pop., 1890, 8338; 1900, 12,949; 1910, 18,266.

ASH'TAROTH. See **ASTARTE**.

ASHTAROTH KAR'NAIM. A city mentioned in Gen. xiv. 5. The name should probably be read Ashtart Karnaim, and means 'Ashtart of the two-peaked [mountain].' It is possibly the modern Tell-Ashtarath, on the Bashan Plateau, 21 miles east of the Lake of Galilee, though places named after the great goddess must have been quite numerous. Consult Moore, in *Journal of Biblical Literature*, vol. xv, pp. 155 ff. (1896).

ASHTAR'TE. See **ASTARTE**.

ASH'TON, ALGERNON BENNET LANGTON (1859—). A distinguished English composer. He was born at Durham, but received his musical education at the Conservatory at Leipzig from 1875 to 1879. After his graduation he took a special course in composition with Raff. In 1881 he returned to his native country and settled as a teacher in London. In 1885 he became professor of piano at the Royal College of Music. As a composer he cultivated with evident predilection the field of chamber music. His works include four symphonies, three overtures, two string quartets, a quintet for wind instruments, compositions for organ, choruses, songs, and numerous sonatas for piano solo, piano and violin, piano and 'cello, and also one sonata for piano and viola.

ASHTON, JOHN (1834—). An English literary antiquarian, born in London. His many publications include: *Social Life in the Reign of Queen Anne* (1882); *History of the Chapbooks of the Eighteenth Century* (1882); *English Caricature and Satire on Napoleon I* (1884); *A Century of Ballads* (1887); *Social England under the Regency* (1890); *Real Sailor Songs* (1891); *The Devil in Britain and America* (1896); *When William IV was King* (1896); *Gambling in England* (1898); *Florizel's Folly*; *Gossip in the First Decade of Victoria's Reign* (1903); *The History of Bread: From Prehistoric to Modern Times* (1904); *Dawn of the Nineteenth Century in England: A Social Sketch of the Times* (5th ed., 1906).

ASHTON, LUCY. The daughter of Lord and Lady Ashton, in Scott's *Bride of Lammermoor*, and the heroine of the novel. Forbidden by her parents to marry her lover, Ravenswood, she goes mad on her wedding night and dies.

ASH'TON IN MAKERFIELD, -mák'ér-feld. A town in Lancashire, England, on the Central Railway, about 15 miles west of Manchester. Its chief industries are the manufacture of iron goods, cotton, and pottery, and there are numerous collieries. Pop., 1891, 13,400; 1901, 18,700; 1911, 21,543.

ASH'TON-UNDER-LYNE. A busy manufacturing town of Lancashire, England, on the Tame, about 6 miles east of Manchester (Map: England, D 3). It is a parliamentary borough, returning one member to Parliament. The town is of Saxon origin and came into the possession of the Assheton family in 1336. It was incorporated in 1847. Its change from comparative insignificance to an important manufacturing centre dates from the introduction of the

cotton industry in 1769. Bleaching, dyeing, and calico printing, coal mining, and the manufacture of machines, hats, etc., furnish considerable employment to the people. Its facilities for communication are excellent, as it is situated on three railway lines, and connected by a canal with Manchester and other important towns. Ashton possesses several hospitals, a technical school, a library, and a fine park. Pop., 1891, 40,500; 1901, 43,900; 1911, 45,172.

ASH'TORETH. See **ASTARTE**.

ASHUAPMOUCHOUAN, āsh-wāp'mū-chwān'. See **CHAMOUCHOUAN**.

ASHURADA, ā'shu-rā'dā. A small island in the southeastern part of the Caspian Sea, northwest of Astrabad (Map: Persia, E 3). The Russian government maintains here a naval station.

ASHURST, HENRY FOUNTAIN (1875—). An American public official and legislator, born at Winnemucca, Nev. His earlier education was obtained in the public schools of Flagstaff, Ariz., and at the Stockton (Cal.) Business College. A special course in law and political economy he took in 1903-04 at the University of Michigan. In 1896, shortly after his admission to the bar at Williams, Ariz., he was appointed a justice of the peace, and in the same year he was chosen a member of the Arizona Territorial House of Representatives. To this body he was reelected in 1898 and by it was chosen Speaker. Following a term in the Territorial Senate he was made district attorney of Coconino County, serving from 1905 to 1908. In the latter year he was admitted to practice before the Supreme Court of the United States. On March 27, 1913, he was elected United States Senator by the unanimous vote of the first Legislative Assembly of the new State of Arizona, for the term ending 1917. See **ARIZONA, History**.

ASH-WEDNESDAY. The first day of Lent, so called from the Roman Catholic ceremony of strewing ashes on the head as a sign of penitence. This custom was sanctioned by Pope Celestin III in 1191, but dates from at least as early as the tenth century. The present custom in the Church of Rome on this day is this: After an introit and four collects, the priest puts the ashes, which are those made by burning the palms consecrated on the preceding Palm Sunday, on the head of each penitent kneeling at the altar rails, while he says in Latin: "Remember, man, that thou art dust, and shalt return to dust." The Protestant church in Germany does not celebrate Ash-Wednesday. In the Church of England and in the Protestant Episcopal church in the United States, it is observed, but without anything of the ceremony from which it derives its name; and the *commination*—a series of denunciations against impenitent offenders—along with penitential prayers, is appointed to be read in the service for this day in the English church; but in the American church only the penitential prayers.

ASIA, ā'shā or ā'zhā. The largest and most easterly part of the Old World. Europe extends west from the northwestern part of Asia, something like a great peninsula. With an area of 17,250,000 square miles, Asia covers more than one-eleventh of the entire surface of the globe and more than a third of the entire land surface. A straight line from its most western point at *Baba Kalesi*, on the *Ægean Sea*, to its most eastern point at *Cape Deshnev* (East Cape), *Bering Sea*, has a length of 6820 miles. Its

greatest breadth is measured from Cape Chelyuskin, on the Arctic Ocean, to Cape Buru, at the south end of the Malay Peninsula, 5270 miles. Among the three northern continents, Asia extends farthest to the north and to the south, and the extreme northern and southern points lie almost under the same meridian. The time distance between the most western and eastern points is 11 hours. The ninetieth meridian of east longitude may be regarded as the central meridian, and the fortieth parallel of north latitude as the central parallel of the continent. These lines of orientation cut one another near Lob Nor, in eastern Turkestan. This enormous continental mass, with the exception of a territory in the extreme northeast, about as large as the area of England, lies in the northern division of the Eastern Hemisphere, while its islands extend on the southeast across the Equator. On three sides it is surrounded by the ocean, but on the west it joins Europe, the line of separation between them being accepted as the Ural Mountains, an irregular line from their south end to the north end of the Caspian Sea, thence the Caucasus Range to the Black Sea. The population of Asia was estimated (1908) at 918,324,000.

By the Isthmus of Suez Asia has a connection with Africa, from which it is separated by the narrow Red Sea, occupying a rift valley of comparatively recent formation. The continent has an average elevation above the sea of over 3000 feet. The coast line is about 33,000 miles in length, and on the south and east is greatly diversified by seas, bays, and gulfs, affording advantages to navigation and commerce far superior to those of Africa and South America, but inferior to those possessed by Europe and North America. The indented and broken northern coast is, to some extent, available for navigation in the summer months from Waigat Strait, south of Nova Zembla, to the Obi and Yenisei rivers; and in 1912 and 1913 Russian survey vessels steamed along the northern coast from Bering Strait to Cape Chelyuskin; but the whole north coast is icebound most of the year.

Asia is bounded northward by the Arctic Ocean, into which its continental shelf, covered to depths of only 600 feet, penetrates far to the north, eastward by the Pacific Ocean, southward by the Indian Ocean, and westward by Europe, the Caspian Sea, the Black Sea, the Mediterranean, and the Red Sea. On the extreme northeast it is separated from North America only by the narrow Bering Strait, about 40 miles wide. On the southeast the vast eastern archipelago, comprising numerous great islands, Luzon and Mindanao in the Philippines, Sumatra, Borneo, Java, Celebes, New Guinea, and hundreds of smaller ones, extends almost to Australia. The body of the continent may be regarded as a trapezium, of which the projections, consisting of several large peninsulas, bear some resemblance to those of Europe, though in Asia everything is on a greater scale. On the west is the peninsula of Asia Minor, or Anatolia, separated from Europe by the Bosphorus, the Sea of Marmora, and the Dardanelles, with the Black Sea on the north, the *Ægean Sea* on the west, and the Levant (the easternmost part of the Mediterranean) on the south. On the south of Asia Arabia may be considered as a counterpart of the Iberian Peninsula; Italy, with its neighboring island, Sicily, is rep-

resented by India and Ceylon; and as the broken Grecian Peninsula in Europe has numerous islands extending toward Asia on the southeast, so in Asia the Malay Peninsula has an island connection with Australia on the southeast by means of the Eastern Archipelago. The eastern coast of Asia is characterized by the deep indentations made by the Pacific Ocean, forming the South China Sea on the southeast, and the Yellow, East China, Japan, Okhotsk, and Bering seas on the east, all island-bound, and separated from the Pacific respectively by the Philippines, the Liu-Kiu Islands, Korea, Japan, and Kamchatka. On the north the Siberian coasts are also deeply indented, but rather by the embouchures of large rivers than by arms of the sea.

Topography. The relief features of this continent are characterized by great extremes and by an unparalleled variety; it has the most extensive lowlands, the greatest tablelands, the highest chains of mountains, and the most elevated summits in the world. Tracts doomed to everlasting snow and scorching sterility, salubrious valleys of continual verdure, and noisome jungles of the rankest growth are found within its limits.

Where India, Turkestan, and Afghanistan meet is an elevated region known as the Pamir, and to its inhabitants as the "roof of the world." It is of great height, even the valleys exceeding 11,000 feet in altitude above the sea, while the mountains are several thousand feet higher. From this region as a centre, mountain systems and ranges radiate in various directions, but mainly eastward and westward, inclosing between them elevated plateau-like areas. These mountain systems, with the inclosed plateaus, form the broad backbone of Asia, running with a widely differing breadth, nearly east and west across the continent. It is widest in the east, where it stretches from the Indo-China Peninsula across western China and Manchuria to southeastern Siberia, extending from lat. 20° to 50° N.; it narrows in the Pamir, and broadens again westward to include most of Afghanistan and much of Baluchistan, Persia, and Asia Minor. From the mountain knot of the Pamir stretches a mountain system, bordering the northern margin of the main plateau. The ranges comprising the system are somewhat broken and disconnected, and many of them arranged *en échelon*. They extend, under various names, to the coast of the Sea of Okhotsk and thence along the coast to Bering Strait. North of them lies Siberia, a great plain with a breadth of 130° of longitude, sloping gently over 25° of latitude to the Arctic Ocean.

East of the Pamir the great plateau is limited on the south by the Himalayas, while between this great range and the northern system are many other ranges traversing it. This tableland contains the plateau of Tibet and the vast elevated expanse of Han-hai, which includes the desert of Gobi or Shamo, and the Takla Makan Desert. The plateau of Tibet lies directly north of the Himalayas, and is limited on the north by the Kuenlun, Altyn Tagh, and Nanshan ranges, and on the east by the broken mountainous country in the west of China. Its surface is a plain, diversified by many mountain ranges, trending generally east and west. It is the most elevated plateau on earth, its western part ranging in height from 14,000 to 17,000 feet, sloping eastward down to 9000 feet. It is

a bleak, arid region, and its few inhabitants are occupied mainly in pastoral pursuits. The great plateau of Han-hai, which lies north and northeast of Tibet, is limited on the north by the succession of ranges which commence with the Tian Shan and are followed by the Ala-tau, Altai, Tan-nu, Sayan, Yablonoi, and Stanovoi ranges, and extend northeastward to the Sea of Okhotsk and Bering Strait; and on the east by the Khingan Mountains, mainly comprised in Mongolia. Its otherwise level surface is intersected by many mountain groups and has an elevation of 3000 to 4000 feet.

On the south the plateau region is separated from the plains of Hindustan by the Himalaya Mountains, many of whose summits rise from 25,000 to 29,000 feet above the level of the sea. Even the passes over this enormous range are almost as high as the summit of Mont Blanc. Here Dhaulagiri, in Nepal, long supposed to be the Mont Blanc of the Himalayas, rises to 26,800 feet, leaving all the peaks of the Andes far below, while K² rises to 28,250 feet, Kinchinjunga reaches nearly that altitude, and Mount Everest, now believed to be the loftiest summit on earth, attains the height of 29,000 feet.

From the Pamir stretches westward a great succession of mountain ranges, which, beginning with the Hindu Kush (which attains a height of 25,000 feet), and prolonged westward by the Paropamisus in Afghanistan, by the Elburz in northern Persia, with Demavend (about 18,500 feet), by the mountains of Armenia (culminating in Mount Ararat), and by the Taurus Range and other mountains of Asia Minor, forms a fairly continuous line of ranges to the shore of the Aegean Sea. North of it, in Russian Central Asia, is a depressed area, in some places below sea level, which is drained into the Aral and Caspian seas. The great plateau of which these ranges form the backbone consists of three sections. To the south of the Elburz Range and the Paropamisus, is the great plateau of Iran, in Persia, Afghanistan, and Baluchistan. West of this is the Median-Armenian Alpine region, some of whose plateaus are at elevations of over 6000 feet. Beyond this the plateau formation extends westward in the Anatolian tableland. The western plateau of Asia, thus divided into three sections, is full of diversities of soil and scenery. A great part of the tableland of Iran is extremely barren and arid, which serves to explain the enthusiastic terms in which the Persian poets have spoken of the beautiful valleys found here and there among the mountains. The coasts of the Persian Gulf are sandy wastes. A great part of Baluchistan also is an arid plain, covered with red sand.

Besides these central elevated land masses, there are many detached mountain chains and plateaus. The Ural Mountains, forming in part the land boundary between Europe and Asia, are divided into three sections—the northern, central, and southern Ural. The second of these divisions is rich in minerals, gold, platinum, magnetic iron, and copper. On the isthmus between the Black Sea and the Caspian the Alpine ridges of the Caucasus reach a height of 10,000 to 11,000 feet, while individual peaks tower up to 17,000 and 18,000 feet, as in the still faintly volcanic peak of Elbruz, 18,500 feet, and Kasbek, 16,500 feet; both of these peaks are, however, on the northern or European side of the main mass of the Caucasus. The highlands of Syria rise gradually from the neighboring deserts in the

PHYSICAL MAP OF ASIA

ELEVATIONS

ranges known as the Lebanon and Anti-Lebanon to heights respectively of over 10,000 and 9000 feet, and slope steeply in terraces down to the narrow coast lands of Phœnicia and Palestine. The peninsula of Arabia is a tableland of moderate height, continuous with the Syrian Desert and bordered by low mountain ranges. In the extreme south the mountains attain an elevation of nearly 8000 feet. Arabia is separated from the Armenian Plateau on the north by the valleys of the Tigris and Euphrates. Most of its area is desert, but in the interior the plateau reaches an elevation sufficient to induce enough rainfall for the cultivation of crops; this is, therefore, the populated region.

South of the Himalayas, at the head of the peninsula of India, is a depression drained on the east by the Ganges and on the west by the Indus. The Ganges valley is the densely populated region of India. East of the lower Indus is the desert of Sindh. Farther south on the peninsula is the plateau of the Deccan, which rises to an average height of from 1500 to 2000 feet. It is separated on the west from the narrow coast level of Malabar by the Western Ghats; on the east, from the broad level coast of Coromandel, by the Eastern Ghats; on the north it is separated from the low plains of Hindustan by the Vindhya Range and Malwa Plateau; and on the south the Ghats unite at the sources of the Kaveri forming the Nilgiri, or Blue Mountains, 8760 feet high, the loftiest chain in the peninsular portion of India. Burma and Assam are crossed by numerous mountain groups, which extend in broken lines from the interior of Tibet to the extremity of the Malay Peninsula. China Proper and French Indo-China have mountainous interiors, while the whole eastern coast line of Asia from Korea northward is paralleled by lines of highlands. The Japanese Archipelago may be regarded as a submerged mountain chain rising from the immense depths of the Pacific and reaching with the Kurile Islands northward to Kamchatka. The chain is crowned by numerous volcanic cones, and throughout its extent earthquakes and seismic disturbances are frequent phenomena.

Hydrography. The hydrography of Asia displays as striking a variety as does the structure of its land surface. The Asiatic Alpine regions send down, in some directions, torrents of water, which form rivers almost rivaling in magnificence those of America, and flowing for hundreds of miles through plains of unsurpassed fertility. On the other hand, there are wide-stretching tracts similar to the deserts of northern Africa and of equal sterility.

The seven great river systems of Asia are: the Mesopotamian, that of northwest India, that of northeast India and Tibet, the Indo-Chinese, the Chinese, the Siberian, and that of the Kirghiz steppe and Russian Turkestan. The first comprises the two famous streams, the Tigris and Euphrates, flowing into the Persian Gulf; the second comprises the Indus with its tributaries; the third system comprises the Brahmaputra and Ganges; the fourth comprises the rivers of the Indo-Chinese Peninsula, the chief of which are the Irawadi, the Salween, the Menam, and the Mekong; the fifth system is the Chinese, comprising four great streams, all of which flow in a general easterly direction into the Pacific—the Si-kiang, the Yang-tzi-kiang, the Hoang-ho, and the Amur; the sixth system comprises the large rivers of Siberia, the prin-

cipal of which are the Obi, the Yenisei, and the Lena—all have their source in the ranges bordering Siberia on the south and flow northward, traversing the great plain for 800 or 900 miles before their sluggish waters reach the Frozen Sea; the seventh system comprises the Ural, which flows into the Caspian Sea, and several other inland rivers, including the Amu-Darya and the Syr-Darya, flowing into the Aral Sea, the Ili, which flows into Lake Balkash, and the Tchui.

Asia is deficient in lakes. At the base of the ranges limiting Siberia on the south, are, however, several of magnitude, among them Baikal, believed to be the deepest fresh-water lake in the world, Balkash, and Issyk-kul. Farther west, in the depression east of the Caucasus, are the Aral and Caspian seas, which have no outlet; the Caspian Sea is 85 feet below the level of the sea. In Syria is the Dead Sea, occupying with its valley a deep depression, the surface of the lake being about 1300 feet below sea level. In the Armenian Mountains are lakes Van and Uramia, lying at great elevations and having no outlets. In Tibet and the desert of Gobi lakes without outlets are numerous, since, owing to arid conditions, drainage systems are not yet developed. A large part of Asia, comprising Tibet, Mongolia, Turkestan, and most of Baluchistan, Persia, and Arabia, i.e., nearly all the central and southwestern parts of the continent, the region in which the rainfall is deficient, has no drainage to the sea.

Geology. Little is known of the geology of the greater part of Asia. Certain limited regions, such as India, have been studied in detail, but our knowledge of the greater part of the continent has been derived from piecing together the reports of explorers. The great mountain systems consist principally of granites, gneisses, schists, and allied rocks, with, in many cases, the older stratified rocks lying on their flanks. This is the case with the Himalayas, whose uplift is believed to have occurred as late as Tertiary times and with the Tian-shan, Altai, Stanovoi, and the Kuenlun ranges. It has been found in two areas of the Kara-koram Mountains that elevations of igneous origin are fronted on the other side of glaciers by elevations of sedimentary formation. The Ural Mountains, also, have a metamorphic nucleus. In the Caucasus, in Armenia, the Vindhya Range of India, and in Persia, are extinct volcanoes, which have contributed lava and ashes to the building of the mountains, while in the peninsula of Kamchatka, the Japanese Islands, and the East Indies are many active cones. Indeed, this region on the east and southeast of Asia is one of the largest and most active volcanic regions on the earth.

The vast plain of Siberia is floored in succession from east to west with stratified beds, ranging from the oldest to the youngest, with large areas of eruptive and metamorphic rocks. The desert of Gobi and the plateau of Tibet are, except for the mountain ranges, floored with Tertiary and Quaternary beds. In North China are enormously deep beds of loess, which, especially in the region of the Hoang-Ho, has occasioned both remarkable topography and great fertility. Farther south in China the rocks are much older, consisting of Carboniferous and Jurassic beds, and also of Paleozoic rocks and Mesozoic deposits. The western plateaus in Afghanistan, Baluchistan, Persia, and Asia

Minor are in the main covered with Tertiary and Quaternary rocks, but in Arabia a large part of the plateau is floored with Jurassic beds. The great depression of northern India, south of the Himalayas, is a Tertiary deposit and a part of a large land area that once extended across the Indian Ocean to South Africa. The peninsula itself is composed of metamorphic and igneous rocks, with here and there areas of Paleozoic beds. Glaciers are found chiefly in the high mountain regions of the Tian-shan, Kuenlun, and Himalaya ranges, in the Tibetan highland, and in the Caucasus. No glaciers are found near the Arctic coast, owing to the deficient precipitation. See *Geology*, under INDIA; CHINESE EMPIRE.

Climate. Asia has a great variety of climate, owing to its range of latitude, altitude, and its relations to the bordering seas. It is in the main a continental climate, with light rainfall, a dry atmosphere, and great extremes of temperature. Near the coasts the climate is modified by the proximity of the sea, but this influence extends but a short distance inland, as the prevailing winds are off the land, except in the south, and even there the contrary is the case only during the prevalence of the monsoons. The whole of northern Asia lies within the range of the prevailing westerly winds of the Northern Hemisphere, in which are found the extensive cyclones and anti-cyclones which give variability to the weather in temperate latitudes. On the eastern and southeastern coasts cyclones of the hurricane type originate in the region of the tropical islands, and, pursuing a course at first westerly, under the influence of the trades, gradually turn toward the north and east, often ravaging the coast to some distance inland. In the extreme southern part of Asia occur general storms of hurricane character and local storms of the tornado form.

Temperature. The mean annual temperature in Asia, reduced to sea level, decreases uninterruptedly from about 90° F. at the south to 0° at the north. On the eastern coast the decrease in temperature, with increase in latitude, is somewhat slower than in the interior, but on the whole the isotherms follow the parallels quite closely, especially in the southern half of Asia. The isotherm of 32° crosses eastward from Archangel with a slightly southerly bend, to the mouth of the Amur. On the western side of Asia the temperatures decrease from 72° at Suez to 14° at the northern end of the Ural Mountains. On the eastern coast there is a decrease from 78° in Siam to 10° at Bering Strait. The region of greatest cold is near Verkhoyansk, in Siberia, on the Yana River, but a short distance north of the Arctic Circle, between the meridians of 130° and 140° E.

The average temperatures for January decrease from about 80° at the south of the continent to -60° in the neighborhood of Verkhoyansk, whence there is an increase to -40° on the coast. From Verkhoyansk, the centre of cold, the temperature rises in all directions; westward along the Arctic coast to -4° at the northern end of the Urals, and eastward to -13° at Bering Strait. On the western side of the continent the temperature decreases from 57° at Suez to -4° in the northern Urals. On the eastern coast the temperature decreases from about 80° at the south to -13° at Bering Strait. The isotherms in the northern part of the continent swing far to the south in the

interior, showing much lower temperatures there than on the coasts in winter. The isotherm of 32 runs nearly due east from the middle of the Caspian Sea to the middle of the Yellow Sea, showing in this latitude little difference in winter temperatures between the coast and the interior. Throughout the greater part of northern Asia the January temperatures are more than 18° below the normal for those latitudes, and at Verkhoyansk it is 47° below normal, owing to the distance from the sea and its influences.

In July the highest temperature is on the Arabian and Persian plateaus, where the average is 93°; from this section there is a fall to 82° in southern India, southern Siam, and southern China, and toward the north and east, to 39° throughout most of the Arctic coast. The maximum temperature of the whole continent ranges from 120° in Persia and Arabia to 75° on the northern coast, and in the northern interior it reaches 100°. The minimum ranges from about 65° in the extreme south to -58° on the northern coast, but in the neighborhood of Verkhoyansk, in the interior of northeastern Asia, a temperature of 92° below zero has been observed.

Rainfall. In most regions of Asia, except near the Pacific coast and south of the Himalayas, the rainfall is scanty. On the immediate coast of the Arctic Ocean in Siberia the annual precipitation is under 10 inches. Elsewhere in Siberia it is between 10 and 20 inches. In the great desert regions of Gobi, the Caspian and Aral Sea regions, and in Persia, it is below 10 inches. The explorations of Stein, Huntington and others, in the southern part of east Turkistan and especially in the dreaded Takla Makan Desert, have revealed the ruins of many large centres of population, showing that this region must once have had abundant rain. In most of Arabia the rainfall is below 10 inches, except in the higher plateau of the interior, where it reaches 20 inches. In Manchuria the rainfall increases to 30 inches, and in China it increases southward from 30 inches in the north to 40 inches at the mouth of the Hoang, to 70 inches in the southern part, and is 80 inches in Japan. The Malay Peninsula has an excessive rainfall. In the Himalaya region the rainfall on the southern slopes sometimes amounts to over 160 inches, in one limited region to 475 inches, and for much of the southeastern coast region of India it reaches from 120 to 160 inches, but it decreases very rapidly west of Calcutta, and on most of the Deccan Plateau it is only 20 inches, increasing again on the western coast to from 40 to 160 inches. The heaviest annual rainfall in the world occurs in Assam, to the south of the eastern Himalayas, where a precipitation of 800 inches is on record. While the normal rainfall for southern Asia may be estimated at from 40 to 60 inches, yet wherever a mountain range intercepts the moist winds blowing from the Indian Ocean, a rainfall of from 140 to 160 inches occurs on the windward side of the mountains, and usually of from 20 to 40 inches on the leeward side. Northern Asia has rain at all seasons, except in the deserts, where rain seldom falls. Southern Asia, including India and the Malay Peninsula, is subjected to periodic rains, the maximum occurring in summer, the period of the southwest monsoons.

Winds. While southern Asia is in the region of normal winds, the trades, yet these winds are very much, sometimes totally, changed by the monsoons. During the summer season the in-

terior of the continent becomes intensely heated, and the surface winds blow inward from the south, forming the southwest monsoon; the air thus brought inland is saturated with moisture, which it discharges freely on being cooled in passing over hills or mountain ranges. This monsoon character of the winds has a very marked effect on the rainfall of southern Asia, and it is due to the summer monsoon that the great precipitation occurs on the windward side of the Asiatic highlands bordering the coast.

Flora. Along the Arctic coast there is a barren region from 150 to 500 miles wide, the tundra, where only dwarf Arctic plants and mosses grow. South of this is an extensive region of forests, mostly coniferous in the north and deciduous trees in the south. To the southward of these are great areas of pasture land which extend to the borders of the deserts. In the greater part of Central and western Asia the vegetation is of desert-like character, but wherever the rainfall is sufficient there is the vegetation common to the moister temperate climates. South of the Himalayas the flora is essentially tropical, and mostly occurs with the luxuriance belonging to the well-watered hot zone. The northern part of the continent differs little in the general character of its productions from the corresponding parts of Europe and America. Pines, birches, and willows form, as in the other continents, the last forests of the north, but on account of the more severe climate, they do not reach a limit so far northward as in Europe, though a little farther north than in America. Some of the common plants of Europe are abundant as far east as Kamchatka; the crowberry (*Empetrum nigrum*), so plentiful on the moors of Scotland, is still more plentiful throughout Siberia; the same bilberries (*Vaccinium*) and brambles (*Rubus*) abound in Kamchatka as in Scandinavia. There are, however, interesting differences. Heather is comparatively rare in Asia, its flora agreeing in this respect with that of America rather than with that of Europe. The larch extends far northward, to the mouth of the Obi, to the utmost limits of arborescent vegetation. In Kamchatka a different kind of birch replaces the common birch of Europe as a forest tree, and the Siberian stone pine is different from that of the south of Europe. Siberia in its less frigid and dry regions produces a rich vegetation, of which herbaceous plants, of a size unusually large for a cold or temperate climate, are a characteristic feature; among these may be mentioned species of rhubarb, angelica, and cow-parsnip. In the abundance of currants the warmer parts of Siberia resemble North America, although most of the species are different.

To the south of the Altai Mountains in the desert of Gobi and the plateau of Tibet the flora is very poor and scanty, owing to the severe climate and the scarcity of rain. The flora of Asia Minor and of the watered parts of Syria has a general resemblance to that of the south of Europe, although exhibiting also features which belong rather to that of India or of Africa. Shrubby members of the mint family are particularly characteristic of this region. The tropical flora of Arabia abounds in trees which yield fragrant balsams and resins, particularly those of the order Amyridaceæ. Indeed, both the warmer temperate and the tropical regions of Asia excel other parts of the world in the number and variety of the odoriferous

drugs which they produce, from myrrh and frankincense to asafetida. Arabia has long been noted for the production of coffee, which is now also extensively cultivated in other warm parts of Asia. The date palm is as characteristic of Arabia as it is of Egypt. Acacias and mimosas also abound. The flora of Persia in part resembles that of Arabia, although it is less tropical in character and the altitude of its mountains gives to it in some places a different character. The abundance of Scitamineæ is regarded as particularly characteristic of India; the plants of this order yield ginger, galangal, cardamoms, turmeric, and other articles of commerce, among which not the least important is a kind of arrowroot. Members of the pea family are also very numerous, both herbaceous and shrubby or arborescent; many of them exhibiting great beauty of foliage and splendor of flowers, and some producing useful kinds of pulse; others, timber, gum, medicines, etc. The number of valuable medicinal plants which belong to the Indian flora is very great, as is also that of dyewoods; and fine fruits, of which the mango and mango-steen may be particularly noticed. Cucurbitaceæ (gourds) are very numerous; as are also trees of the genus *Ficus* (fig), some of which produce caoutchouc, and among which are the sacred peepul and the banian tree, so remarkable for the roots which descend from its branches to become new stems, and for the extent of ground which it canopies.

Palms are numerous in the tropical parts of Asia, and particularly in its southeastern regions, but are less numerous than in the tropical parts of South America. The coconut is one of the most common palms in the vicinity of the sea. Some of the Asiatic palms are valuable for the sago which they yield. The natural order Dipteracæ is one of those peculiar to India and southeastern Asia, and includes some of the noblest timber trees, including teak, so valuable for shipbuilding. The flora of the Indo-Chinese Peninsula, and of the southeastern part of Asia generally, differs from that of India, and exhibits, if possible, a richer variety. The change from the Indian flora is still greater in the islands, and a resemblance to that of Polynesia and of Australia begins to appear. The breadfruit takes the place of its congener, the jack of India. These regions produce nutmegs, cloves, and other spices. The Lauracæ are abundant, yielding cinnamon, cassia, and camphor. China and Japan have many plants peculiar to themselves and are remarkable for the prevalence of the Ternstræmiacæ, the natural order to which the tea plant and the camellia belong. The Himalaya Mountains possess a flora very different from that of the Indian plains, and in some of its most characteristic features, particularly in the prevalence of large rhododendrons and magnolias, it has been found to agree remarkably with the flora of the southern parts of the United States; while at still greater altitudes there is a strong resemblance to that of more northern regions; forests of pine appear, and along with them the deodar, a cedar resembling the cedar of Lebanon. The mountains of Java also produce oaks and other trees resembling those of the temperate zone, although the species are peculiar. An important element in the flora of the lowlands of southern and eastern Asia is the bamboo, which often attains gigantic proportions.

Many of the cultivated plants of Europe are

known to be natives of Asia, and others are supposed to be so. Among the economic plants are rice, wheat, barley, oats, rye, maize (introduced), potato (introduced), beans, peas, buckwheat, millet; and in the south banana, plantain, yam, cacao, sugar cane, tobacco, spices, cotton, poppy, hemp, flax, and corchorus.

Fauna. Selater and Wallace divide Asia into two great regions. North of the Himalaya Range lies the great Palearctic region, while to the south of it is the Oriental zone. The climatic extremes of the former, with its long and intensely cold winters and its warm, short summers, are not favorable to animal life. Mammals, of which there are 41 families, are found throughout the region. Birds, of which there are 58 families, are common, and most of the genera of northern and central Europe are found here. Partridges and grouse are plentiful; the most northern birds are the Alpine ptarmigan, the snow bunting, the raven, the gyrfalcon, and the snowy owl. Reptiles (25 families) and amphibia (10 families) are comparatively scarce, especially in the northern section. Of fresh-water fishes there are 13 families. The insects as a whole are of European character, butterflies being especially numerous. The Oriental region, while it is comparatively limited in extent, has an exceedingly rich fauna, which is isolated from the Ethiopian fauna on the west by oceanic and desert barriers, and from the Palearctic on the north by the mountainous and desert barriers. In this region are found 35 families of mammalia, 71 of birds, 35 of reptiles, 9 of amphibia, and 13 of fresh-water fishes. The warm climate of this region is especially conducive to the sustenance of animal life in great numbers. This is especially noticeable as regards birds, reptilia, and insects, which are found in great numbers.

Among domesticated animals belonging to Asia, the most important are the ox, reindeer, and buffalo, the sheep, the goat, the horse, the ass, the camel, and the elephant. A number of species of ox and buffalo are natives of Asia. Very distinct from all the others is the yak of Tibet, which is to the inhabitants almost what the reindeer is to the Laplander. The sheep and goat, the horse and ass, are natives of the mountainous parts of central Asia. The camel is almost indispensable as a beast of burden and of food in the deserts. It is used principally in Central and southwestern Asia. The elephant is a native of the tropical parts of Asia and is of a different species from that of Africa.

Under the titles INDIA, PERSIA, HIMALAYAS, SIBERIA, ETC., the local faunal characteristics will be treated in detail.

ETHNOLOGY

Within the limits of the Asiatic continent are included all the five great races of man. The number, however, of Amerinds, or Red Men, is so inconsiderable, and the absolute proportion of the negroid peoples so small, that, roughly speaking, the entire population of Asia and its islands may be said to consist of the three great races, the white, the yellow, and the brown, or, as they are commonly known, the Caucasian, the Mongolian, and the Malay.

The White Race. The white inhabitants indigenous to Asia, as opposed to white Europeans who have but recently entered the continent, constitute about one-tenth of the total

population, and are found in Arabia, Asia Minor, the region of the Caucasus and Siberia, Persia, Afghanistan, Baluchistan, the great Indian peninsula. Though it is possible that the Semite branch of the great white race came originally from northern Africa and probable that the Aryan branch came from Europe, it nevertheless is true that from remote antiquity these families have been found on Asiatic soil, and that it was in Asia they acquired those physical characteristics and developed the peculiar form of genius which mark them to the present day. This race presents within itself a wonderful diversity of type, both mental and physical; in color of skin, in shape of the head, and in the general structure of the body, there is a great difference between the Arabians, for instance, and the inhabitants of the Caucasus region. So, too, the race embraces peoples in various stages of civilization, ranging from the agricultural Hindus, with their great cities and highly developed political institutions, down to the nomad tribes of the Arabian deserts or the mountain-dwellers of Afghanistan. Of the three subdivisions of the white race, the Aryans, the Caucasians in the narrow sense, and the Semites, the two former seem to have been the original occupants of Asia Minor, and of the two, the Aryans seem by far the more important. Indeed, the influence of the *Caucasian* population, comprising the Georgians, and the Mingrelians, with their related tribes, the Lesghians and the Circassians, upon the Aryan-Semitic culture of Asia Minor, must have been exerted in prehistoric times. Both Aryan and Caucasian yielded before the *Semite* peoples, who advanced from the interior of the Arabian Peninsula and spread over the region from Mesopotamia to the Mediterranean. The Semitic tribes became differentiated into three groups—the Aramaic, including the ancient Babylonians, Assyrians, and Chaldeans; the Canaanite, including the Philistines, the Hebrews, and the original inhabitants of Palestine; and the pure Arabian group, which comprised those who remained in the Southern Peninsula. Of the three stocks, only the Jews, as representatives of the second, and the Arabs, have survived. Farther to the east, on the plateau of Iran, the highlands of Pamir, and in the plains of India, lived and still lives the third branch of the white race—the *Aryan* or Indo-Germanic, which may be subdivided into the two great groups of Indians and Iranians. The former will include the ancient peoples whose tongue still survives in literature as the Pāli and Prākṛit, and the modern Indian stocks of the Bengali, Sindhi, Hindustani, Marathi, Gujarati, Punjabi, and Nepali. The Iranian group would comprise the old and new Persians with their related stems, the Kurds and the Baluchis, the peoples of Afghanistan, and, lastly, the Armenians. In addition to the definitely determined members of the white race some ethnologists are inclined to find Caucasian elements in such peoples as the Khmers of Cambodia, the Miao-tse of southern China, and the Aino of Japan; these, however, for lack of authoritative information must be relegated to the category of unclassified breeds. Finally, there has undoubtedly been a considerable infusion of Aryan blood into the Mongolian hordes in some parts of Tibet, China, Farther India, and perhaps some of the neighboring islands.

In the history of civilization the part played by the white race of Asia is of surpassing im-

portance. The great empires of antiquity arose among the Semites of Mesopotamia and the Aryans of Iran and Hindustan. The art of writing, literature, the sciences, political institutions, were developed here to a higher degree of perfection than even in ancient Egypt. Above all, the white race in Asia has been the promulgator of the world's great religions. From the Asiatic Semites came Judaism, Christianity, and Mohammedanism—three faiths which embrace the whole western world. From the Asiatic Aryans came Zoroastrianism with its great principle of the conflict between good and evil, destined subsequently to influence the Jew and the Christian. Brahmanism, which is the ritualistic and sacerdotal expression of the Aryan nature; and Buddhism, which may be considered as the Aryan anticipation of Christianity. From the last developed Jainism and Lamaism. The spread of Aryan Buddhism in eastern Asia, with its influence on the social life of the people, corresponds to the expansion of Semitic religions in the West.

The Yellow Race. The yellow race is the most typically Asiatic of all. It numbers seventenths of the population of the continent and covers practically all its extent outside of the domains of the Aryo-Semites—into which, indeed, it has not failed to intrude, first in prehistoric ages and again in modern times, with the result that there is a large Mongolian element in the Caucasians of Asia Minor, Afghanistan, Baluchistan, and India. The race may be divided into two great geographical groups—one in the north, embracing all the tribes of Siberia and Turkestan, with their centre somewhere near the Altai Mountains; the other in the south, comprehending the peoples of China and Farther India, with their primitive home in the mountains of Tibet.

1. The Siberian branch of the yellow race includes a large variety of stocks. In the extreme north, on the borders of the Arctic Ocean, exist a handful of aboriginal groups, the survivors of numerous tribes which lived there in ancient times, destined themselves to speedy extinction. Such are the Yukaghirs, the Tchukchis, the Koriaks, and the Kamchatkans, numbering in all about 10,000. The results of the Jesup North Pacific Expedition (1900-13) suggest that the so-called "Palæo-Asiatic" group of Siberian peoples (i.e., the Tchukchis or Chukchees, Koriaks, Kamchatkans, Yukaghirs, etc.) belong properly with the American Indians, representing an overflow from the New World into the Old. Farther west is the great Ural-Altaic stock, consisting of a large number of families which are themselves subdivided into powerful tribes. These include the Samoyed group, which comprises the Yenisei and the Ostiaks, living near the shores of the Arctic; the Finno-Lapponic group, including the Votiaks, Mordwims, and Voguls, dwelling in the neighborhood of Tobolsk, Tomsk, and the Ural Mountains, as well as the Magyars of Hungary and some of the population of the Balkan region and European Russia, now Aryanized as to speech; the Turko-Tatar group, Yakuts, Uigurs, Turkomans, and Khirgiz, occupying a vast territory in southwestern Siberia and Central Asia; the Mongol group, subdivided geographically into North Mongols, East Mongols, and West Mongols (Kalmuks), with their centre of population around Lake Baikal, but found also in the region bounded by the Volga, the Don, the Caucasus, and the Caspian Sea, and in China; finally, the Tungus group, consisting of the

Tunguses proper, the Manchus, and the Orotong peoples which dwell in the forests of eastern Siberia and extend into northern China. To the Siberian branch also belong the Japanese, the Koreans in part, the natives of the Liu-Kiu Islands, etc. In Turkestan and the region of the Caucasus are minor people of mixed origin, who may belong by language or by blood to the Siberian branch of the yellow race.

2. The southern branch of the yellow race, the Sinitic or Tibeto-Chinese, embraces the Chinese proper, with many variations in language and much mixture of blood; the Tibetans, to whom should be added as related by blood more than by language, minor peoples of the southern slope of the Himalayas; the races of Farther India, comprising the Annamese, the Burmese, the Siamese, the Cambodians, the Karens, the Khamtis, and a number of others. In addition, some ethnologists make the Malays and Polynesians, and even the Amerinds, mere subdivisions of the yellow race. The two great branches of the yellow race diverge in the mode of inflecting their language, just as the two great branches of the white race in Asia, the Semites and the Aryans do, the Siberian peoples possessing polysyllabic agglutinative vernaculars, while those of the Chinese peoples are monosyllabic, isolating. The Japanese language is polysyllabic though its alphabet has been adopted from the Chinese. The theory which made the yellow race the first inhabitants of most of Europe and all of western Asia (Turaniens, Accado-Sumerians, etc.), seems no longer tenable; neither can it be asserted that the oldest culture of the yellow race in China, Korea, and Japan is either a copy of the old Babylonian civilization or the result of comparatively recent Aryan influence. Chinese civilization must be regarded as having originated with the removal of the prehistoric races from the plateau of Tibet to the rich river lands of eastern China, just as Aramaic civilization originated with the immigration of the Semites of Arabia into the plains of Mesopotamia. Chinese civilization, therefore, may be considered as the first great accomplishment of the yellow race. The characteristics of that civilization—inveterate conservatism, general apathy, and unlimited submissiveness—should not, however, be considered as inherent in the race, one great branch of which, the Japanese, have only recently demonstrated the possession of quite the opposite qualities. The Siberian members of the race are more notable for what they have done in Europe than for the part they have played in Asia; the mighty empires of Genghis Khan, Timur, and Baber were not enduring; on the other hand, the inroads of the Bulgarians, Finns, and Magyars into Europe have produced lasting results.

The Brown Race. The Malayan or Malayo-Polynesian peoples are denied by many ethnologists the position of a race, and are regarded as merely the insular and oceanic divisions of the yellow race. Their primitive home was somewhere in the neighborhood of the peninsula of Malacca, the situation of which favored the distribution of the stock over the islands of the Indian and Pacific oceans. Physically the Malays of the continent stand nearer to the Tibeto-Chinese branch of the yellow race, while the Polynesians come closer to the Siberians. The brown race includes the Malays proper of Malacca, the Sundanese and Javanese of Java, the tribes of Sumatra, Borneo, Celebes, and For-

mosa, and the inhabitants of the Philippines, where the most important family is that of the Tagals. Lastly, there are the Polynesians and the Micronesians, all over the Pacific, and the Ilovas of Madagascar. The presence of branches of the Malays in such widely scattered regions as the Philippines, Hawaii, Madagascar, and New Zealand evidences the wonderful power of expansion possessed by the race. Its capacities for culture have been demonstrated in New Zealand, where it has attained its highest development. There the Maoris are on terms of equality in every way with their white fellow-citizens, enjoying representation in Parliament and a share in the government. Malay elements are discernible in New Guinea, northern Australia, the interior of Farther India, southern Hindustan, and its adjacent islands, parts of China, and even Japan. Indeed, there is some reason to believe that the addition of the Malayan element may have made in great part the difference between the Japanese and the Chinese.

Other Races. *The Black Race.*—Examples are the Negritos of the Philippines, the Papuans and their Melanesian kindred, the Andaman islanders, and a few small tribes in the Malay Peninsula, such as the Sakai and the Semangs. Some ethnologists maintain that the white, yellow, and brown races were preceded all over southeastern Asia and a great part of the Malayo-Polynesian area by tribes of the black race, which they regard as nearer to the original human stock. It would seem, however, that the yellow race, from its nearness to the type of the child and for certain psychic reasons, has an equal claim to this distinction. *The Red Race.*—In the extreme northeast of the continent, about East Cape, dwell the Yuit, a people of Eskimo stock, whose numbers were much larger formerly. As immigrants from Arctic America, these Yuit represent the Amerinds or red race of America. Some of the Aleuts also, who belong to the Eskimo stock, have wandered from island to island until they have reached the Asiatic coast, while a few have been transferred thither by the Russians. *Peoples of Doubtful Affinities.*—Such are the Aino of Japan, the Miao-tse and perhaps some other primitive peoples of China, the Cambodian Khmers, the Veddás of Ceylon, and the Dravidian and Kolarian peoples of southern India. Of these, the Aino represent probably a very ancient mixture of primitive white and yellow races, and the same may be true of the Miao-tse and the Khmers. The Dravidians, more by language than by physical type, stand distinct from the mass of Indian natives, and though ethnologists are inclined to group them with the Australians, they represent, more probably, a mixture of early negroid, yellow, and white types. They are now considerably Aryanized in culture and assimilated more to the type of the white race in India. The Veddás, one of the most primitive peoples in existence, are an older, mixed people of similar ancestry. Some of the Dravidian peoples (Tamil, Telugu, etc.) have shown themselves capable of a high degree of culture, while others still linger in barbarism.

The Origin of Man. The oldest evidences of a high order of civilization in Asia (belonging, in all probability, to the white race) exist in Asia Minor; the most ancient remains of individual man may be looked for in the southeastern region of the continent. Man's precursor, the *Pithecanthropus*, was discovered in the Plio-

cene deposits of Trinil, in Java, in 1891, by Dr. Dubois. Somewhere in southeastern Asia, then, possibly, individual man was born, just as somewhere in southwestern Asia men in society laid the foundations of the first great civilizations.

GENERAL HISTORY

It was characteristic of the social groups of Asia that they early attained the limit of their development and settled into grooves in which their life ran for ages. (See under ASSYRIA; BABYLONIA; CHINESE EMPIRE.) After the rise of the great Medo-Persian Empire under Cyrus, southwestern Asia was brought into contact with the earliest European civilization, that of the Hellenic people, and a contest for supremacy took place. (See GREECE; PERSIA.) This was terminated by the triumphant march of Alexander the Great eastward to the Indus and the establishment of the Hellenistic kingdoms. Later the Roman Empire conquered most of these kingdoms, but was constantly menaced by Persia. The struggle of the two powers weakened both at the beginning of the seventh century. Then the rise of Mohammedanism created a new religio-secular power in the southwest which, when the warlike Turkish tribes from the interior became dominant in the Mohammedan world, wrested all of its Asiatic provinces from the weakened Eastern Empire. The Crusades (eleventh to thirteenth centuries) were the last mediæval struggle for possession between the West and the East. The rise of the Ottoman power made Asia once more a menace to Europe. (See MOHAMMED, CALIPH; ABASIDES; OMMIADS, SELJUKS; CRUSADES, TURKEY.) The march of events in the southwest cut off the rest of Asia completely from the western world, depriving the latter of even such incomplete knowledge of the vast Oriental continent as was possessed in antiquity, when there were trading routes to the farther East through Bactria. The stationary character of Asiatic civilization, and the lack of initiative among the mass of the people, prevented the great social and political changes that make the general continental history of Europe so full of meaning. Until the advent of the European powers there was little of this general history for Asia, except in connection with the great waves of conquest which rolled over the continent and frequently extended into Europe. These are treated in the articles GENGHIS KHAN; KUBLAI KHAN; MONGOL DYNASTIES; TIMUR, MOGUL, GREAT.

A new era opened with the rediscovery of the East by Europe in the fifteenth and sixteenth centuries. Portuguese navigators and traders followed in the path of Vasco da Gama (1497-98) and established factories at Goa and Macao and in other places. Spain took possession of the Philippines in 1565, as a result of Magellan's epochal voyage across the Pacific. The Dutch were also among the early comers. The pushing western nations, in pursuit of commercial advantage, thereafter steadily increased their influence and gradually acquired control of depots or considerable territory in India, the East Indies, and China. In the middle of the eighteenth century an apparently insignificant phase of the Seven Years' War was fought out in India between the English, led by Clive, and the French, under Dupleix. The fate of that country of ancient and warring nations was determined by the English triumph. The advance of European influence may be followed in this

work through the history of the different countries affected thereby. In the meantime the expedition of the Cossack partisan leader Yermak across the Urals (1580-82) into what is now Siberia began the steady movement of Russia into Central Asia and across the continent to the Pacific. (See RUSSIA; SIBERIA.) These latter movements brought the impulse of western life into the development of Asia, and with it the complications of European politics, the sharp rivalries for political influence in the interest of commercial expansion, and the active modern competition with railway and steamship. The rapid growth of world politics has given a new significance and unity to the history of Asia. The details of this later period of transformation may be followed in the histories of the several countries, especially CHINA, JAPAN, INDIA, and RUSSIA. See also the article FAR EASTERN QUESTION, and the references therewith.

Political Problems. In the political affairs of Asia, as in those of the African continent, the predominance of European influence has become marked during the last 200 years, though the power of the European nations has not been as completely established over the native races of Asia as over those of the Dark Continent. Still, reference to the table appended to this article will show that nearly two-thirds of the area of Asia and nearly one-half of its population are under the control of the European powers, and even in the unappropriated area and over the nominally independent peoples, the ascendancy of western culture, spreading mainly through the channels of commerce, is rapidly being established. While Siam and Persia are as yet autonomous, the play of European politics is rapidly becoming the guiding force of their national life. Ultimately Siam seems destined to be annexed to the Indo-Chinese Empire, which France has built up in Farther India; Persia at present is a stake in the political game going on between Great Britain and Russia; and China, by reason of its huge size and the immense opportunities it promises for exploitation, has awakened the ambitions of all the nations of Europe. Japan and China alone have safely grounded their national existence, because their people have shown an aptitude for adopting the civilization of the Europeans without falling under the power of their civilizers. The striking fact, then, about conditions in Asia at the present time is that the continent which first gave civilization to the world has in turn become subject to the higher state of civilization to which Europe, favored by many circumstances, has attained. The struggle for supremacy is much more acute in Asia than in Africa, because in the former country European culture has no free field to work in, and finds itself confronted by political and religious systems of great antiquity and of sufficient strength to render powerful resistance. In the southern part of Asia there is not any room for the influx of European colonization, as there is in the sparsely settled continent of Africa. With an area exceeding that of Africa by one-half, the Asiatic continent has about five times its population, and therefore the establishment of European domination must mean not so much the actual occupation of the soil by the western nations as the control of the native races by the European powers, acting through the long-established machinery of local government and ancient forms of life. The rôle played by Russia

in Siberia, however, must be distinguished from the part played by the other nations in southern Asia; for Siberia, the Russian provinces in Central Asia, and the Caucasus region are in reality not foreign possessions, but constitute an integral unit with the Russian Empire in Europe, from which the first two are separated by no considerable physical barriers. The plains of Siberia are a continuation of the South Russian steppes, and the nomad inhabitants of Siberia are closely akin to the Tatar peoples that dwell on the lower Volga and the Caspian. Finally, the vast stretches of Russian Asia, with their mere sprinkling of inhabitants, afford such an opportunity for European colonization as the southern part of the continent can never present.

Among the powers of Europe jealousy and dissension have appeared over the question of predominance in Asia, and, as in Africa, certain spheres of influence have been marked out in which individual powers are allowed a free hand in their dealings with the natives. The danger of conflict arises when the boundaries approach too near to each other. The supremacy of England is, of course, recognized in India and Burma. Russia is predominant over all of northern Asia. Persia and Afghanistan are at present neutral ground, or rather the battle-places of Russian and British influence. French influence is supreme in Indo-China, and the power of the Dutch is predominant in the East Indies. Germany is an important factor in the Turkish provinces of Asia Minor, and by the seizure of Kiaochau in 1897 gained a foothold in China. Much of that republic, also, although still intact, has been partitioned into certain spheres, and the most interesting question of the future is whether these spheres of influence in China are destined to become foreign dependencies in fact, or whether one power or a combination of powers will prove strong enough to preserve its integrity until such a time as China, inspired by the example of Japan, shall succeed in developing its resources to a point where it may openly challenge any attack on its existence. For the spread of Christianity, the establishment of the republic, and the civil war in Mongolia and China proper, see CHINA.

Political Divisions of Asia. More than one-third of Asia is included in the Russian Empire, the area of Siberia, Transcaucasia, and Russian Central Asia is stated at 6,294,121 square miles, and the population 25,645,000. About one-fourth of Asia is included in the Chinese dominions (China proper, Manchuria, Mongolia, Sinkiang, and Tibet), which have an area of about 4,278,000 square miles, with a population calculated at about 329,600,000. About one-ninth (India, Ceylon, Straits Settlements, Cyprus, Aden, etc.) is under the sway of England, whose subjects, including the inhabitants of the native states of India, number over 320,000,000. Independent Arabia embraces about 5 per cent of the area of Asia. An area of about 684,000 square miles is included in Asiatic Turkey, which comprises Asia Minor, Armenia, Kurdistan, Mesopotamia, Syria, and the Arabian territories of Hejaz and Yemen, with an estimated population of 17,000,000. Persia has an area of about 635,000 square miles, and its population is supposed to be upward of 9,000,000. French Indo-China (Annam, Tongking, Cambodia, Cochin China, etc.) embraces about 310,000 square miles, the population being in the neigh-

borhood of 17,000,000. The area of Siam is about 230,000 square miles, and its population 7,562,000. Afghanistan has an area of about 250,000 square miles, with a population estimated at about 5,000,000. The dominions of Japan (excluding Korea) embrace 174,700 square miles, with a population of about 55,990,000; Korea has an area of 84,106 square miles and about 13,460,000 inhabitants. Oman, in Arabia, has an area of about 82,000 square miles and a population of about 500,000. In the Himalayan region are the independent states of Nepal and Bhutan. The estimated area of the former is 54,000 square miles; its population is probably about 3,000,000, though some estimates are higher. The area of Bhutan is about 20,000 square miles, and its population about 250,000. In the Malay Peninsula there are several states under British protection; the Federated Malay States comprise 27,500 square miles, with 1,037,000 inhabitants. Portugal and France have small possessions in India, and Portugal, England, Germany, France, and Japan have establishments on the coast of China. The great archipelago which lies to the southeast of the Asiatic continent belongs mainly to the Netherlands; the Dutch East Indies (exclusive of Dutch New Guinea) embrace some 587,000 square miles, with upward of 37,700,000 inhabitants.

ASIA, IN THE BIBLE. The name "Asia" is not met with in the Old Testament, but occurs several times in the Apocrypha, where it is used as a general term to indicate the territory ruled over by the Seleucidae, i.e., the Tigris-Euphrates valley, eastern Asia Minor, Syria, Phœnicia, and Palestine. This was in harmony with Greek usage, according to which the term meant much the same as it does to-day. The Romans, however, used the word in a more restricted sense, to indicate the province of Asia, which was constituted in 133-130 B.C., after the death of Attalus III of Pergamum, having been ceded to the Romans in his will. It was comprised of Mysia, Lydia, Caria, and the islands of the coast. The western part of Phrygia (Phrygia Asiana) was annexed to Asia temporarily in 116 B.C., and, after being detached and assigned to Cilicia, was finally incorporated with it in 49 B.C. It was governed by the Senate, through a proconsul, with three legates and a quaestor under him. Its principal cities were Ephesus, Pergamum, and Smyrna. It was the wealthiest, and, with the exception of Africa, the most important of the imperial provinces. As such, it was conscious of the vital significance of its connection with the Empire, and maintained with great devotion the cult of Augustus, in which the Emperor came to be associated in worship with the Ephesian Diana. In 297 A.D., under Diocletian, it was broken up into several small provinces, one of which, having Ephesus as its capital, retained the Asian name. In the New Testament the word is used in its Roman sense. At Ephesus, its chief city, Paul labored for upward of two years, with the result that the whole province became permeated with the truth of Christianity (Acts xix. 10, 26). To the churches of this province the circular Epistle to the Ephesians was addressed by Paul (see reference to them in the closing salutation of 1 Corinthians, which was written from Ephesus, xvi. 19), and they were made the formal recipients of the message of John in the Book of

Revelation (i. 9-iii. 22). See EPHESIANS, EPISTLE TO; CHURCHES OF ASIA, THE SEVEN.

ASIA MINOR (Lat.). The ancient name of what is now called Anatolia. It was divided into Pontus, Paphlagonia, Bithynia, Mysia, Lydia, Caria, Lycia, Pisidia, Pamphylia, Isauria, Cilicia, Cappadocia, Galatia, Phrygia, and Lycania. Along the western coast were Troas, Æolis, Ionia, and Doris (in Caria), the last three a series of Greek colonies. Greek colonies were also numerous along the north coast, on the shores of the Hellespont, Propontis, Bosphorus, and Euxine. In the seventh century B.C. the Lydian Kingdom was the ruling power; but in the sixth century Asia passed under Persian rule. After the death of Alexander the Great Asia was portioned out among his generals, finally falling partly to the Seleucidæ and partly to the kingdom of Pergamum, which developed on the west coast. Under the Roman Emperors Asia Minor was generally prosperous, but suffered severely during the wars of the Byzantine Empire and has not recovered under Turkish rule. Consult Ramsay, *Historical Geography of Asia Minor* (London, 1890).

ASIARCH, ā'shī-ārk (Gk. Ἀσιάρχης, *Asiarchēs*, from *Asia*, *Asia* + *ἀρχεῖν*, *archein*, to govern). The title of the delegates from the individual cities of Asia to the provincial assembly (*Commune Asiæ*), which met annually to regulate the worship of Rome and the Emperor, to institute games and gladiatorial contests, and to deliberate on political matters affecting the province. The position of Asiarch, paralleled in the other provinces, *Galatarch*, *Lykiarch*, *Pamphylarch*, could be held in connection with any civil or religious office, even with the high-priesthood of an individual city, though the title of high priest of Asia was given alone to the officer who presided over the provincial assembly. The position was only for the year, though reelection was possible, and the title might be retained. The honor was much sought for and was necessarily confined to persons of wealth. The institution lasted until the disintegration of the province under Diocletian in the third century. (See ASIA, IN THE BIBLE.) Among those who perhaps had had the position formerly but still retained the title were the friends of Paul, who cautioned him for his safety on the occasion of the uproar in the theatre at Ephesus (Acts xix. 31). Consult Mommsen, *Provinces of the Roman Empire* (Eng. trans., London, 1895), and Ramsay, *Cities and Bishoprics of Phrygia* (2 vols., London, 1895-97).

ASIATIC (ā'shī-ā'tīk) BROTHERS. A secret society, with aims similar to those of the Rosicrucians, which was formed in 1780 in Austria and thence extended over all Germany.

ASIATIC SOCIETIES. Associations for the study of the languages, antiquities, and history of the Eastern continent. The first was founded by the Dutch in 1780. In 1784 the Royal Asiatic Society of Bengal was formed. A French society was organized at Paris in 1822, and the Royal Asiatic Society of Great Britain and Ireland in 1823. An American society (see ORIENTAL SOCIETY, AMERICAN) was formed in 1842, a German society in 1845, and an Italian society in 1887.

ASIMINA, ā-sīm'ī-nā or ās'ī-mī'nā. See PAPAW.

ASK, āsk (Ash Tree). The name in Norse mythology of the first man created by the gods. See also EMBLA.

ASKABAD. See ASHKABAD.

AS'KALON. See ASHKELON.

ASKEW, ās'kū, or ASCOUGH, ANNE (1521-46). An English Protestant zealot and martyr. She was born at Stallingborough, Lincolnshire. She was of gentle birth, and against her will was made to supply the place of a deceased elder sister, as wife of Thomas Kyme, by whom she had two children. She was highly educated and devoted to biblical study. Because she had offended the priests, her husband, a staunch Roman Catholic, put her out of his house, which she willingly left. She went to London, it is supposed, to sue for a separation, but was arrested on a charge of heresy in March, 1546. Examined by the Bishop of London and others on the doctrine of transubstantiation, she denied its truth. She was imprisoned, but released on bail and acquitted on June 13. Again she antagonized her persecutors by the steadfast profession of her faith, and was rearrested in June, 1546, tortured by the rack, and finally burned at the stake in Smithfield, July 16, 1546. Consult J. Bale, *The Latte Examination of Anne Askew, etc.* (Marburg, 1547), and M. Webb, *An Account of Anne Askew* (London, 1865).

ASKHABAD, ās'kā-bād' (Ar. and Pers. *askh*, love + *abad*, dwelling, town). A town of Russian Turkestan, the political centre of the Trans-Caspian territory, situated on the Trans-Caspian Railway, 290 miles southeast of Mikhailovsk, the seaward terminus of the railway (Map: Asia Central, G 2). It is a thriving town, owing its prosperity to its transportation facilities and its position near the Persian frontier, which has made of it a commercial entrepôt for goods exchanged between Russia, Persia, Khiva, Bokhara, and Turkestan. It has a garrison of 4000 soldiers. Pop., 1904, 36,286; 1908, 41,729.

ASKJA, āsk'yā. A volcano of Iceland, east of the centre of the island, in about lat. 65° N. and long. 16° 45' W. It is 4600 feet high, has the largest crater in Iceland, over 700 feet deep, 34 square miles in area, and is still active. Its last eruption took place in 1875, and traces of it are found in the large pumice-covered tract on the northeastern slope of the mountain. The volcano stands in the midst of a widespread lava plain.

ASMA'Ī, ās-mī' (ABU SAĪD ABD-AL-MALEK IBN KURĀIB AL-ASMA'Ī) (c.740-828 A.D.). The preceptor of Harun al-Rashid, and an important representative of Arabic literature. He was born in Bosra and after his career at Bagdad returned to his native city, where he died. Sir Henry Rawlinson calls Asma'ī's history of the kings of Persia and Arabia previous to Islam, "perhaps the most valuable and authentic historic volume in the whole range of Arabian literature." His romance of *Antar* has been called "the Iliad of the desert." Several of his pupils became celebrated. One of them, Abu Hatim al-Sejestani, collected his opinions on the greatest Arabic poets. Besides the great collection called al-Asma'iyat, most of the diwans that have been preserved go back to him. Numerous manuscripts of his works are known to exist in private libraries, but have not yet been made accessible to scholars. Consult Ahlwardt, *Sammungen alter arabischer Dichter, I, El Asma'ijjat* (Berlin, 1902); A. Haffner, *Tezte zur arabischen Lexikographie* (Leipzig, 1905).

ASMANNSHAUSEN, ās'māns-hou'zen. See ASMANNSHAUSEN.

ASMARA. Since 1900 the seat of govern-

ment in the Italian colony of Eritrea, northeast Africa, situated at an elevation of 7650 feet above sea level, about 50 miles southwest of the seaport of Massawa on the Red Sea (Map: Africa, H 3). The town is in the heart of a fertile region and is the centre of an active trade. It has had railway connection with Massawa since 1911, and extensions to the line have been proposed, those to Keren and Ghinda being the most important. There are gold mines in the vicinity. Asmara is strongly fortified and contains a garrison of Italian and native troops. The population, including Italians, Mohammedans, and natives (the latter chiefly), is about 10,000.

AS/MODE'US. Asmodeus figures largely in later Hebrew tradition, where he appears as the chief of the demons, just as Lilith was their queen (Talmud Babli, Erubin 100b). In Tobit (iii. 8, 17) he appears simply as an evil spirit possessed of great lust. Many scholars identify Asmodeus with *Aeshma daeva*; i.e., the demon of wrath who plays a prominent rôle in Mazdaism, the religion of Persia. In the Book of Tobit both have the same quality of lust and the same power of killing any one standing in their way. In the Book of Tobit Asmodeus is represented as having loved Sarah, the daughter of Raguel, and slain seven men in succession who were married to Sarah. When, however, Tobias came with the intention of marrying Sarah, he succeeded, with the help of his companion Raphael, in exorcising the demon by fumigating the heart and liver of a fish. Flying to Upper Egypt, the demon was pursued by Raphael, and bound, so that the couple henceforth had peace (Tobit vi. 14; vii. 2). In Talmudic legends Asmodeus is brought into association with Solomon, and while aiding him on certain occasions, notably in building the temple, he is regarded also as the cause of the offenses which history attaches to Solomon.

ASMONEANS. See HASMONÆANS.

ASNIERES, ä'nyär'. A northern suburb of Paris, France, 3 miles distant, on the left bank of the Seine (Map: Paris). It is the chief town of its canton, an important railway junction, has domestic industries, and is a favorite summer pleasure resort of the Parisians. It is the headquarters of Parisian yachtsmen, and regattas are held here in July, August, and September. Pop., 1896, 24,317; 1901, 31,336, 1906, 36,482; 1911, 42,583.

ASNYK, äs'nék, ADAM (1838-97). A Polish poet and dramatist, born at Kalsch. He studied medicine at Warsaw and Breslau, but finally turned to philosophy and took his degree at Heidelberg in 1866. During several years he was a political exile for participation in the insurrection of 1863, and about that time he began to publish poetry. He resided at Cracow from 1870 till his death. Several volumes of his "poetical" work appeared under the pseudonym of "El-y," and have given their author a high place in Polish lyric literature. As a dramatic writer, he produced, among other successful pieces, *Cola Rienzi*; *The Jew*; *The Friends of Job*, and a tragedy dealing with Lithuanian history, called *Kiejstut*.

ĀŚOKA, ā-sō'kā, written also **ĀÇOKA,** ā-shō'kā, **ASHOKA.** A renowned King of early India, famous as the patron of Buddhism, to which he stands in a similar relation to that of Constantine to Christianity. His full name was Āśoka Vardhana. He was the son of Bindu-

sāra Amitraghāta, of the Maurya line, and he ascended the throne of Magadha (modern Behar) about 264 B.C. as inheritor of the northern empire which his famous grandfather, Chandragupta, or Sandrocottus (q.v.), the contemporary of Alexander the Great, had founded. Through conquest he extended his power by bringing the kingdoms of Bengal and Orissa into his vast domain. At first he seems to have been of a cruel and savage nature, as is shown by his causing his own brothers to be assassinated when he succeeded to the crown; but he appears to have experienced a change of heart or to have undergone a transformation when he was converted from Brahmanism to Buddhism. He devoted himself zealously to spreading the faith of the Buddha, convoking great Buddhist councils and making Buddhism the state religion of his extensive realm. The numerous edicts which he caused to be inscribed upon rocks and pillars in various parts of India bear witness to his religious devotion and show his loving care for animals as well as for man; and they entitle him to the proud name, "Beloved of the Gods," by which he designated himself. They also shed much light upon the wisdom and justice of his administration and upon the condition of India at the time when he reigned. One column, which was discovered as recently as 1896, is especially interesting, because we learn from it that he had caused it to be erected upon the spot where, according to tradition, the Buddha was born. Āśoka died about 228 B.C. Consult: V. A. Smith, *Āśoka, the Buddhist Emperor of India* (London, 1901); *Edicts of Āśoka* (1909); E. Senart, *Les inscriptions de Piyadasi* (Paris, 1881-86); Hardy, *König Āśoka* (Mainz, 1902).

AS'OLAN'DO: FAN'CIES AND FACTS.

A volume of poems by Robert Browning, published on the day of his death, Dec. 12, 1889.

ASO'PUS (Gk. Ἀσπός, *Asōpos*). The god of the river Asopus. By Metope, daughter of the river god Ladon, he had numerous daughters, through whom he became the ancestor of many of the heroes of Greece. When his daughter Egina was carried away by Zeus, Asopus pursued, but was slain by a thunderbolt.

ASO'TUS. A character in Jonson's *Cynthia's Revels*; a hanger-on of Amorphus, whom he slavishly imitates.

ASP. The name applied in Europe to the *Vipera aspis*, a venomous serpent distributed all over southern Europe and the Alps region. It is the only poisonous snake that is found as far north as Sweden. The word *bethen* of the Bible, usually translated 'asp,' and the *aspis* of the Greeks (*ἀσπίς*) and the Romans, probably referred to several venomous snakes; at any rate, several poisonous serpents are found in Palestine and Egypt, but in some cases the biblical context seems to show that the much-dreaded cobra (*Naja haje*) of Egypt and Cyprus is referred to. This serpent is represented in the hieroglyphics of ancient Egypt, and is the snake which, after the poison fangs have been extracted, is used by modern Egyptian jugglers in their snake dances. It has loose skin on the neck that can be dilated into a hood much like that of the cobra di capello of India, but it does not have the spectacled markings. (See COBRA.) The asp of Cleopatra fame was probably the small-horned viper (*Aspis hasselquistii*, or *Cerastes cornutus*). Several other vipers are sometimes called asps, especially the south African puff-adder (q.v.).

ASPARAGINE $(\text{NH}_2)\text{CO}.\text{CH}(\text{NH}_2).\text{CH}_2\text{COOH}$. A crystalline substance which exists readily formed in common asparagus and in many other plants. Chemically it is, as the structural formula shows, an amide of aspartic (amido-succinic) acid; like the amide of any other acid, it yields the acid itself when boiled with dilute mineral acids or with alkalis. Asparagine is readily obtained from the expressed juice of the young shoots of asparagus, young vetches, etc., which, after filtration and evaporation to a sirup, soon deposits it in crystalline form. These crystals dissolve freely in boiling water, the cooled solution having a mawkish and cooling taste. That asparagine plays an important part in the physiology of plants is obvious from its wide distribution. It occurs in plants as a product of decomposition of protein.

ASPARAGUS (Gk. *ἀσπάργος*, *asparagos*, or *ἀσφάργος*, *aspharagos*). A genus of plants of the family Liliaceæ. The species of this genus are herbaceous or shrubby plants, natives chiefly of the south of Europe and of Africa. The most widely diffused species is the common asparagus (*Asparagus officinalis*), a native of Europe, which grows on the banks of rivers and on the seashore, in meadows and bushy places, especially in sandy soils, occurring in a few places in Great Britain, and is also in general cultivation as a garden vegetable; its young shoots, when they first sprout from the earth, form a much-esteemed article of food. These sprouts contain a peculiar crystalline substance called *asparagine* (q.v.). The peculiar odor asparagus imparts to the urine is due to methylmercaptan—a sulphur body—liberated when it is digested. The thick and tender kinds of asparagus are most esteemed for the table and much used, both fresh and canned. Asparagus has a very high water content, 94 per cent on an average, and so a low food value, resembling other green succulent vegetables in this respect. It contains a little carbohydrate and protein and a very little fat and ash. It is prized for its flavor and wholesomeness. It can be cooked in a great many ways, but is most commonly boiled and served hot, with butter or a sauce, or cold as a salad. It should be cooked only until tender, inasmuch as overcooking spoils the flavor and color. The preference for blanched or for green asparagus is a matter of taste, not of actual quality. Asparagus has been much increased in size and considerably altered in general appearance by cultivation, being seldom more than a foot high in its wild state, and not much thicker than a goose quill, whereas it is now obtained more than half an inch in diameter, with a stem 4 or 5 feet in height. Asparagus is grown from seed. When the plants are one year old, they are transplanted to rows from 2½ to 5 feet apart, according to method of cultivation, and set at distances varying from 1 to 2 feet in the row. The plant will grow on almost any soil, but gives the best results on deep, rich, sandy loams, with a south or east exposure. It requires heavy manuring each year if large yields are desired. Male plants are held to be more productive than female. The first sprouts may be gathered when the plants are three years old, but a full crop is not to be expected until the spring of the fourth year. Beds once established and cared for endure many years. The raising of asparagus for the market has become an important industry near the larger cities of Europe and the United States. Asparagus is

sometimes forced out of season. For this purpose mature roots may be placed under the greenhouse benches or in pits, cellars, or almost any place where there is sufficient heat. But little light is needed. The asparagus shoots thus obtained are formed from the reserve material already stored in the roots. Roots thus forced once are exhausted and thrown away.

In the open field, forcing trenches are sometimes dug between the rows, and filled with fermenting manure. The trenches may also be heated with hot-water pipes and with loose steam. The latter method has proved very effective at the Missouri Agricultural Experiment Station. Another method of forcing is to place sashes over the plants. At the Cornell Experiment Station, in New York, a low house was built over the bed, the frame of which was made of steam pipes and the top covered with canvas. Asparagus plants forced in place by any of these methods recuperate after one or two years, when they may be again forced. The young shoots of several other species of asparagus are also eaten, as those of *Asparagus tenuifolius*, *Asparagus acutifolius*, and *Asparagus albus*, natives of the south of Europe; the last of which is much used in Spain and Portugal as a salad, in soups, and as a boiled vegetable. On the other hand, the sprouts of the bitter asparagus (*Asparagus scaber*), which is very similar to the common asparagus, are not edible, on account of their bitterness. There are a number of species of asparagus grown in greenhouses as ornamentals. See LILIACEÆ; FLOWERS; also Plate of YAM, ETC.

Asparagus Diseases. The principal disease of which this plant is subject is a rust caused by the fungus *Puccinia asparagi*. The disease has been known for many years in Europe, but did not appear in the United States to a threatening degree until 1897. The leaves and stems are attacked and become covered with red blotches. Varieties seem to differ in the degree of susceptibility to disease, the variety Palmetto having been found fairly resistant in the East. In California the thorough application of sulphur has proved an efficient treatment.

ASPARAGUS INSECTS. Cultivated asparagus is remarkably free from insect pests. It is, however, preyed upon by two small chrysomelid beetles (*Crocera asparagi* and *Crocera duodecim-punctata*), the former introduced from Europe to Long Island, N. Y., about 1856, and the latter more lately. The common one is nearly half an inch long. "The head is black, the prothorax reddish, often with two black spots above; the elytra are yellow, with a sutural (median) stripe of black, from which stripe extend two black bands dividing the yellow part of each elytron into three portions. . . . Beneath, the beetle is nearly or entirely shining black." These beetles, as adults, attack the young growing shoots, and as larvæ destroy shoots, berries, and seeds. The heads of the asparagus should be cut off, after the eggs are laid, and boiled. Wild asparagus in the neighborhood of the cultivated beds should also be destroyed. Several other beetles are more or less injurious to this plant in Europe. The larvæ of several moths feed upon the plant, as do many species of plant bugs and aphides, but none does persistent damage. Consult Chittenden, United States Department of Agriculture *Year-Book* (Washington, 1896), and *Bulletin No. 10*, Division of Entomology, United States Department of Agriculture (Washington, 1898).

ASPARAGUS STONE. See APATITE.

ASPASIA, ās-pā'shī-ā (Gk. Ἀσπασία) (c.440 B.C.). A celebrated woman of ancient Greece, noted for her genius, beauty, and political influence; daughter of Axiochus, and born at Miletus. The circumstances of her removal to Athens are unknown, but the beginning of her connection with Pericles dates from about 460 B.C. Pericles finally divorced his first wife by her own consent and married Aspasia, by whom he had a son, also called Pericles. The real status of Aspasia in Athenian society has been a subject of much difference of opinion. The fact that at Athens marriage with any woman of foreign birth was held to be incomplete, and the offspring of such a union illegitimate, may have contributed to the notion that Aspasia was a courtesan. She was without doubt a woman of intelligence and wit; and this fact, combined with her freedom from the restraints which regularly confined the activity of women at Athens, naturally gave her prominence and brought upon her not a little obloquy. After her marriage with Pericles her house became the rendezvous of men of learning and distinction. The comic writers found her a convenient butt for their satire. Pericles is said to have been greatly influenced by her, but we can hardly consider as serious the charge that she was the cause of the Samian and the Peloponnesian wars. On one occasion the comic poet, Hermippus, charged Aspasia with impiety, but she was successfully defended by Pericles himself. When the two sons of Pericles by his first marriage died, Pericles obtained from the state the rights of full citizenship for his son by Aspasia. After the death of Pericles Aspasia married a sheepowner, with whom she lived but a single year and by whom she had one son. Her further career is unknown, but she continued to live in Athens and died there.

ASPASIA, or ASPATIA. The heroine in Beaumont and Fletcher's *Maid's Tragedy*, whom Amintor makes love to, and then deserts.

ASPASIA, THE YOUNGER. A Phœcean, at first, according to Plutarch, called Milto. She became the lawful wife of Cyrus the Younger, who named her Aspasia, perhaps after the wife of Pericles. Upon the death of Cyrus she was claimed by his brother Artaxerxes, with whom she lived until his son Darius was designated as his successor. Darius then claimed Aspasia, according to the custom of the Persians. Artaxerxes, to thwart Darius' desires, made her a priestess of Artemis at Ecbatana. In revenge Darius formed a plot to assassinate his father, but was detected and put to death.

ASPE, ās'pā. A town of Spain, in the province of Alicante, 16 miles west of the town of Alicante (Map: Spain, E 3). It manufactures oil, spirits, and soap, and coal is mined. Near it is Mount Rollo, famous for its marble quarries. Pop., 1900, 7927; 1910, 7961.

ASPE, āsp. A picturesque valley in the French department of Basses-Pyrénées, extending from the Spanish border to Aloron. It contains numerous mineral springs. The Pico d'Aspe is 8880 feet high.

ASPECTS (Lat. *aspectus*, a sight, appearance; from *ad*, to + *spicere*, to look). In astronomy and astrology, certain positions of planets with respect to one another, as seen from the earth. In the days of Ptolemy there were five aspects—conjunction, indicated by the symbol (Δ), sextile (*), quartile or quadrato (□), trine (♊), opposition (♋). Two planets are in

conjunction when they have the same longitude; the aspect is sextile when they are 60° apart; quartile or quadrato when the distance is 90°; trine, when it is 120°; and at 180° they are opposite to one another, or in opposition. Astrology ascribed to these aspects great influence over the fate of individuals and of nations. Later astrologers added other aspects, based on further subdivision of the circle. In addition to the five ancient aspects, Kepler at one time made use of semisextile (30°), semiquintile (36°), quintile (72°), sesquiquintile (108°), sesquiquadrato (135°), and biquintile (144°), but as the last three did not correspond to an exact division of the circle, they came to be regarded as having negligible influence and were consequently abandoned. Only two of the terms, *conjunction* and *opposition*, are now in general use.

ASPEN, or TREMULOUS POPLAR, *Populus tremula*. (See POPLAR.) A tree which grows plentifully in Europe and in Siberia, belonging to the family Salicacæ. It is a native of Great Britain and is frequent in Scotland, where it is found even at an elevation of 1500 feet above the sea. It has received the specific name *tremula* from the readiness with which its leaves are thrown into a tremulous motion by the slightest breath of wind—a property for which, indeed, the aspen leaf has become proverbial. The leaves are nearly orbicular, but are broadly toothed, so as almost to exhibit angles. The footstalks are compressed, and in part to this compression is due the sensitiveness of the leaves to the breeze. The aspen grows quickly, with a straight stem, reaching to a height of from 50 to 80, or even 100 feet. In unfavorable situations it becomes dwarfish. The wood is soft, porous, light, white, and smooth; it does not make good fuel, but is very fit for the turning lathe, and especially for manufacture of troughs, trays, pails, etc. It is deemed excellent for arrows. If the stem is peeled and allowed to dry before it has been cut down, the wood becomes harder, and it may then be used as timber for the interior of houses. On this account the tree is of great importance in many districts, the more so as it succeeds in any soil, although it prefers one that is moist and gravelly. The bark contains considerable quantities of the glucoside called salicin. The charcoal made from the tree is sometimes used in the manufacture of gunpowder. *Populus tremuloides*, a similar species (according to some, a mere variety of the ordinary aspen), is a native of North America, and is called the American aspen, commonly, "quakin' asp'." This is one of the widest-distributed trees of North America. It is found in Labrador and Alaska, and again as far south as Pennsylvania, Missouri, and even New Mexico. It lives in California also. Very similar also is another North American species, *Populus grandidentata*, which has a more restricted range. The wood of both these species is extensively used in the United States for the manufacture of wood pulp. *Populus grandidentata* has given rise to a number of forms with pendulous branches that are extensively grown as ornamentals. See also POPLAR.

ASPEN. A city and the county-seat of Pitkin Co., Colo., 25 miles west of Leadville, on the Denver and Rio Grande and the Colorado Midland railroads (Map: Colorado, C 2). It has an altitude of 7900 feet. Rich silver and lead mines are located here. Aspen was settled 1879-80 and incorporated in 1881. It is gov-

erned by a mayor, elected biennially, and a council, composed of the mayor and four aldermen. Pop., 1890, 5108; 1900, 3303; 1910, 1834.

AS'PER. A character meant to portray the author in Ben Jonson's *Every Man Out of His Humour*.

ASPERGIL'LUM. See WATERING-POT SHELL.

ASPERN, as'pĕrn, or GROSS ASPERN. A village of Austria, on the left bank of the Danube, 5 miles east-northeast of Vienna. Pop., about 1400. This village and the neighboring one of Essling are celebrated as the scene of a sanguinary battle in the summer of 1809, between the French army, under Napoleon I, and the Austrians, under Archduke Charles. After the battle of Eckmühl, in which the Austrians were defeated, the Archduke retired to the left bank of the Danube, leaving the road to Vienna open to the French. On May 12, 1809, the French army entered Vienna, when the Archduke concentrated his forces on the opposite bank of the river. Napoleon threw bridges over the river, from the island of Lobau, which he had occupied, and on the 21st the French army began crossing to the attack and seized Aspern and Essling. The Austrians at first seemed to give way; but when about half the French had crossed the river, they returned to the charge and almost surrounded the enemy in the narrow plain between the two villages. Here ensued the battle of Aspern, a terrible conflict, the grand object of the contending hosts being the possession of the villages, of which Aspern was thrice lost and retaken by the Austrians. At the close of the day it remained undecided, but next morning it was renewed with fury on either side. The French had almost snatched the victory, when fresh Austrian troops marched on the field and saved the day. After terrible slaughter Napoleon ordered a retreat, and his shattered ranks retired to the little island of Lobau, in the middle of the river, whence they afterward slowly withdrew to the right bank. The loss on the side of the Austrians was given at 4000 killed and 16,000 wounded; that of the French at double that number. Marshal Lannes, the most daring among the French generals, was among the slain. Both the villages were reduced to heaps of ruins. The French called this the battle of Essling, while the Austrians gave it the name of Aspern.

ASPER'ULA. See WOODRUFF.

ASPHALT, or **ASPHAL'TUM** (Gk. Ἀσφαλ-τος, -ov, *asphaltos*, -on, a loan-word of uncertain origin). A name applied to certain natural bitumens composed of unsaturated hydrocarbons (see HYDROCARBONS; CARBON COMPOUNDS) and their sulphur derivatives, together with some nitrogenous substances. Asphalt is probably formed from lighter hydrocarbons by condensation and polymerization in the presence of sulphur, and possibly under its influence. That the formation of asphalt is still going on in nature is shown by the continual evolution of sulphuretted hydrogen in the asphalt deposits of Trinidad and Bermudez. While there is a great similarity in natural asphalts, extending to both physical and chemical characters, we may find them in a great variety of forms and conditions of occurrence. They may be free bitumens, either liquids, or viscous, or brittle solids, containing little or no mineral matter; or they may be mixtures in various proportions, more or less intimate, of the bitumens with inorganic matter or with both inorganic and organic matter.

A *liquid bitumen*, under the name of "mineral tar," was first found at Bechelbronn in Alsace many years ago, and was studied by Boussingault, who described it as a viscid, tarry liquid of bituminous odor, having a specific gravity of 0.966, and containing, besides hydrocarbons, both sulphur and nitrogen. Liquid bitumens, known as malthas, are also found in California: in Kern, Ventura, and Santa Barbara counties. Those from California which have been chemically examined invariably contain nitrogen, present in the form of basic hydrocarbons. One of the most interesting of the occurrences of liquid bitumens is that at Las Conchas mine, 13 miles east of Santa Barbara, Cal., where there are numerous beds of shale, which appear to be saturated with it. A well sunk 400 feet in this material continues to ooze liquid asphalt at all points. The shale itself is not, however, worked to obtain the substance, because on top of the shale is an immense bed of sea sand, the locality being immediately on the beach, and this sand acts like a sponge in taking up and holding the liquid bitumen. After clearing off the surface soil, this beach sand has been exposed for considerable distances, and it is then dug up and transported to the factory, where it is treated with hot water and the bitumen allowed to rise to the surface, from which it is then skimmed off; the sand, being in this treatment completely cleansed, is thrown back upon the beach.

More important than the liquid asphalts, however, are the solid asphalts. The purest of the solid asphalts are sometimes known as "glance pitch" or gum asphaltum. Prominent among them is gilsonite, which is found in the Uintah Indian reservation, in Wasatch and Uintah counties, Utah. The purity of this product (some 90 to 98 per cent soluble in carbon disulphide) is such that it finds larger application in the manufacture of varnishes and insulating compounds than in paving and building construction, for which the commoner asphalts are generally used. This glance pitch is extremely brittle and friable, crumbling easily between the fingers, and has a bright lustre like anthracite coal. Notable quantities of this solid, relatively pure asphalt, are also found in Cuba, but because of its brittleness it is not of the same practical value for paving purposes as the softer, though less pure, varieties in common use.

Of the *solid asphalts* of commercial importance, by far the best known is asphalt from the island of Trinidad. Near the western border of the island is the so-called "lake," situated at an altitude of about 130 feet above the ocean and one mile from the shore of the Gulf of Paria. This lake is a level tract, nearly circular in shape, and about 114 acres in area, the surface of which shows a brownish material of a somewhat earthy appearance, sufficiently hard to bear the weight of carts and animals, moving across it, yet so plastic that excavations 15 feet in depth will be filled up and leveled in the course of a few months by the flow of adjacent material. This lake undoubtedly represents the crater of an extinct mud volcano, as the borings indicate that it is saucer-shaped and of greater depth toward the centre, where borings have shown uniformity of material to a depth of 78 feet. The amount of asphalt in the lake, judging from the excavations and depth indicated, must be about 6,000,000 tons. However, at some time in the past the asphalt very probably overflowed

the rim of the crater in many directions, so that extensive deposits of what is known as "land pitch" are now found all the way from the borders of the lake to the sea. This latter material, however, is not only of a more earthy character because of the included mineral matter, but has become more dry, presumably by long evaporation, and, therefore, is inferior for paving purposes to the tougher and more tenacious material known as "lake pitch." In the crude state, the Trinidad asphalt shows about 40 per cent of bitumen, 34 per cent of earthy matter, 9.3 per cent of organic non-bituminous matter, and 16.5 per cent of water. After refining, the water is eliminated and the bitumen is raised to about 60 per cent in amount. The mineral matter of this Trinidad asphalt is very finely divided, largely silicious, and not objectionable when the asphalt is to be used for paving purposes or the manufacture of mastic.

A second important natural asphalt of semi-solid character is that known as Bermudez asphalt, brought from the province of Bermudez in Venezuela, where it occurs near the coast in a large expanse of marsh, not entirely unlike the Trinidad lake, although at Bermudez there is no distinct indication of a crater. Bermudez asphalt contains 2.6 per cent of mineral matter and over 90 per cent of bitumen. It is, therefore, purer than Trinidad asphalt, containing less non-bitumen. It is of great value for paving purposes because of the plastic character of its bitumen as contrasted with the material of the glance pitch referred to above.

Considerable deposits of natural solid asphalts occur in the United States, notably in Indian Territory and on the Pacific coast. One of the best-known deposits in California is at La Patera, 12 miles west of Santa Barbara, where a rock asphalt is found containing on an average 60 per cent bitumen as it is mined, and a residue of fine silica free from clay and organic matter. Because of this relative purity of the mineral matter, it is possible to extract the bitumen from the rock after crushing, by the action of solvents, and by the recovery of these to obtain a solid asphalt in a very pure state.

In addition to these varieties of solid natural asphalt, there are natural mixtures of bitumen with large quantities of mineral matter. These may be classified as asphaltic limestones and asphaltic sandstones. The limestones are much better known and perhaps more widely distributed. They constitute what has long been known in Europe as "asphalt," extensive deposits being found, for instance, in the valley of the Rhône in France, in Switzerland, in Sicily, and at Hanover in Germany. These deposits form beds of fine, amorphous limestone naturally impregnated with bitumen, and have furnished the asphalt pavements of the various European cities. We may mention among them the asphaltic limestones of Val de Travers in the canton of Neuchâtel, Switzerland, the Seyssel on the lower Rhône, a few miles above Lyons in France, Ragusa in Sicily, and the Limmer and Vornohle mines in Germany.

These bituminous limestones contain from 5 to 15 per cent of bitumen, and from 67 to 91 per cent of calcium carbonate. The amount of bitumen in them is sufficient to cause the powdered rock to soften somewhat when heated, and they can therefore be utilized directly, in the form of heated powder, for laying asphalt pavements. In the United States a similar deposit

of limestone, largely fossil in character, is found in Uvalde Co., Texas. It contains from 15 to 25 per cent of bitumen. It has been brought into commerce under the name of "lithocarbon," when extracted for a variety of purposes, such as the manufacture of insulating material. Asphaltic sandstones are found on the coast of California and in numerous sections of Colorado, Utah, and New Mexico, containing from 15 to 20 per cent of bitumen. Still richer bituminous sandstones have in recent years been found in Kentucky.

Artificial Asphalts. Many natural petroleum are said to have an asphalt base. This means that the residuum, instead of containing paraffin, as is generally found in petroleum, contains a product which has many of the characteristics of a maltha or liquid asphalt. Thus the California petroleum yield malthas which can hardly be distinguished from the naturally occurring liquid asphalts. By heating these natural liquid asphalts with sulphur, the process of change whereby the natural solid asphalt was formed in nature is imitated, and artificial solid asphalts are obtainable. Large quantities of such solid asphalts, artificially prepared, are made from California and Texas petroleum. Again, by passing oxygen through heavy petroleum oils, a solid product known as *Byerlite* has been formed, which is a variety of artificial asphalt, although differing considerably from that produced by the action of sulphur. Finally, by the distillation of a mixture of fish remains and wood, and redistilling the resulting oil, William C. Day obtained a product which he named "artificial gilsonite" because of its close resemblance in both physical and chemical characters to natural gilsonite or glance pitch.

Technical Uses of Asphalt. As already stated, the purest varieties of asphalt are extensively used in the manufacture of asphalt varnish. For this purpose glance pitch and gilsonite are preferably taken, although a thoroughly refined Trinidad or Bermudez asphalt is also available. The product is a combination of asphalt, turpentine, and linseed oil, combined in varying proportions, such as 3 parts of asphalt to 4 of boiled oil with 15 to 18 of turpentine. These varnishes are very extensively used in coating metal and wood. A refined asphalt usually mixed with some petroleum residuum is used for saturating felt, the process being carried out with the aid of machinery, and a paint or varnish of similar composition is generally applied subsequently, after the asphalt felt is in place. The asphalt felting possesses an advantage over simple coal-tar felting, in that it does not become brittle under the influence of heat or with age.

Insulating paints are also made quite extensively from some of the extracted bitumens admixed with various substances, so as to produce a hard product corresponding to ebonite.

By far the most important application of asphalt, however, at the present day, is in the paving industry. We may distinguish here between sheet asphalt, in which the asphalt composition is spread so as to form large continuous sheets, as in street-paving, and asphalt block-paving, in which blocks of asphalt composition are first manufactured by machinery. The use of asphalt for street paving dates back to 1838, when sidewalks were laid in Paris with the bituminous limestone from Seyssel and Val de Travers, and, as before stated, almost all the

European asphalt-paving has been done with this asphaltic limestone. In the United States, however, an asphalt-paving composition is made up containing about 15 per cent of an asphaltic cement made by incorporating a small quantity of free liquid maltha or petroleum residuum with a refined solid asphalt, to which is then added some 60 to 70 per cent of clean sand, and 10 to 25 per cent of pulverized limestone. This makes the surface coating, and is usually put upon a prepared concrete foundation and smoothed and rolled with heavy road engines. Asphalt blocks are made from crushed stone and refined solid asphalts compacted and pressed into forms by suitable briquetting machinery. Mastic is another form of asphalt pavement used largely for the covering of sidewalks and lining of areas, and is manufactured of asphaltic limestone, such as the Seyssel or Neuchâtel, with which about 8 per cent of its weight of refined Trinidad asphalt has been incorporated, heated, and cast into blocks. When ready for use these blocks are broken up and again heated with the addition of a mixture of refined solid asphalt with petroleum residuums and then brought to the proper consistency by the addition of a certain proportion of sand and fine gravel. Mastic is poured hot upon the prepared foundation and spread by the aid of wooden trowels and afterward smoothed with wooden implements.

In 1911, 360,004 tons of asphalt and bituminous rock, valued at \$3,828,751, were produced in the United States. The amount imported in the same year was 165,288 tons, valued at \$789,236.

PRODUCTION OF ASPHALT, 1911, BY STATES

State	Short tons	Value
California	190,945	\$2,104,421
Oklahoma *	82,387	420,931
Texas	55,826	786,785
Utah	30,846	516,614
Total	360,004	\$3,828,751

* Includes a small production for Illinois and Kentucky.

Y., 1894); Richardson, *On the Nature and Origin of Asphalt* (London, 1899); Klein and Peckham, *Asphalt Paving* (Report of the Commissioners of Accounts of the City of New York, 1904); Köhler, *Die Chemie und Technologie der natürlichen und künstlichen Asphalte* (Braunschweig, 1904); Richardson, *Modern Asphalt Pavement* (New York, 1905, 2d ed., 1908), and *Asphalt Construction for Pavements and Highways* (New York, 1913); Eldridge, "The Asphalt and Bituminous Rock Deposits of the United States," *Twenty-Second Annual Report of the United States Geological Survey*, part i (Washington, 1901). See PAVEMENTS; DAMS AND RESERVOIRS; ASPHALTIC COAL; BITUMEN; BITUMINOUS LIMESTONE; BITUMINOUS SANDSTONE; PETROLEUM.

ASPHALTIC COAL, or **ASPHALTITE**. Solid forms of asphalt, originally derived from petroleum, which, through loss of their oil content, have assumed an appearance analogous to that of glance coal. Asphaltic coal occurs usually in fissures, into which it has flowed while in a liquid or viscous condition. Such fissure deposits have been found in rocks of Devonian,

Carboniferous, and Tertiary Age, and the contained material has received various names in different portions of the country. The chief uses of these asphaltic coals are as bases for varnishes, as insulators, and formerly, to a large extent, as gas-enrichers. The more important varieties, with the localities where mined, are: Albertite, Albert Co., N. B., Canada; gilsonite and untahite, in the Uintah Mountains of Utah; grahamite, originally from Wood Co., W. Va., but subsequently found in Colorado, Texas, and Mexico; wurtzilite, in Utah.

An allied substance is ozocerite, or mineral wax, obtained in Galicia (Austria) and in Utah. (See under special heads.) For descriptions of the various deposits and theories regarding the origin of the asphaltic coals, the reader is referred to the following papers: Bailey and Ellis, "Report on the Lower Carboniferous Belt of Albert and Westmoreland Counties, New Brunswick," in *Geological Survey of Canada, Report of Progress, 1876-77* (Montreal, 1878); Peckham, "The Probable Origin of Albertite and Allied Minerals," *American Journal of Science*, 2d series, vol. xlviii (New Haven, 1869); Lesley, "On an Asphaltic Coal Vein in West Virginia," *American Philosophical Society, Proceedings*, 1865 (Philadelphia, 1865); Wurtz, "On Grahamite," *American Journal of Science*, 2d series, vol. xlii; Blake, "Untahite, Albertite, etc.," *Transactions of the American Institute of Mining Engineers*, vol. xviii (New York, 1890); Eldridge, "The Untahite (Gilsonite) Deposits of Utah," *Seventeenth Annual Report of the United States Geological Survey*, part i (Washington, 1896); Taft, "An Albertite-like Asphalt in the Choctaw Nation, Indian Territory," *American Journal of Science*, vol. clviii (New Haven, 1899); Taft and Anderson, *United States Geological Survey, Bulletins* 285 (1905) and 380 (1908).

ASPHODEL (Gk. ἀσφδελος, *asphodelos*, king's spear, asphodel), *Asphodelus*. A genus of plants belonging to the family Liliaceæ. The roots of the asphodels are fleshy and thick. The species are not very numerous and are mostly natives of the countries around the Mediterranean. The yellow asphodel (*Asphodeline lutea*) and the white asphodel (*Asphodelus albus*) have long been known as garden flowers. The yellow asphodel has an unbranched stem 2 to 3 feet high, much covered by the sheathing bases of the long narrow leaves. The leaves of the white asphodel are all radical, and its flowers are in branched clusters. Both species flower about the time when spring passes into summer. *Narthecium ossifragum*, abundant in the moors of England and elsewhere in Europe, is the well-known bog asphodel. In the United States *Narthecium americanum* is known by the same name. False asphodel is a name given to some of the species of *Tofieldia*. All these plants are rather closely related. The asphodel often referred to by poets is *Narcissus Pseudo-Narcissus*. For illustration, see ARAUCARIA.

ASPHYXIA (Gk. ἀσφύξια, a stopping of the pulse, from ἀ, negat. σφύξις, *sphyxis*, pulse). A condition brought about in oxygen-breathing animals when any obstacle prevents the entrance of air into the pulmonary vesicles, and unconsciousness or death occurs. Aquatic animals may be asphyxiated either by depriving the water they inhabit of oxygen or impregnating it with noxious gases. Asphyxia may de-

velop suddenly, by strangulation, or throttling, by the lodgment of foreign bodies in the larynx or trachea, or spasm of the glottis, or growths in the same; or gradually as in close rooms or mines when the supply of oxygen is cut off; or by the inhalation of noxious gases, anæsthesia, or poisoning by strychnine or curare; and in many other ways. The most frequent cause is drowning.

In acute asphyxia there is an increase of carbon dioxid in the blood, which first stimulates the respiratory centre in the medulla and finally paralyzes it. Respiratory efforts are at first increased and then slowly cease; the blood pressure falls; the right side of the heart becomes engorged with blood, and unconsciousness takes place in two or three minutes. In the early stages the face becomes livid; later it becomes pale, the mucous membranes and skin become bluish, and the fine blood vessels injected. Small hemorrhages may occur. The heart, which at first beats strongly, becomes weaker and weaker and finally ceases to beat, and death occurs. In man, this occurs in from a minute and a half to five minutes. Some persons, no doubt, as pearl divers, can by habit do without a fresh supply of air for a longer period; and some diving animals have an arrangement of blood vessels by which they are enabled to remain under water for a long time. In the treatment of asphyxia the cause must be removed immediately, if possible. Tracheotomy saves many lives when the upper air passages are obstructed. In laryngeal diphtheria the insertion of a tube into the larynx is a common practice.

Ordinary restorative measures may be employed with hopes of success at a very long period after apparent death. Some have recovered after being submerged in water for two hours. The object of all methods is to supply fresh air to the lungs and to force the blood from the engorged right side of the heart—in other words, to supply an artificial respiration and an artificial circulation.

Asphyxia neonatorum. This is a condition of suspended animation in new-born infants, due to compression of the umbilical cord, or other obstetrical accident, cutting off the circulation which supplies the fœtus with oxygen, before natural respiration begins. Infants may be revived by stimulation and artificial respiration if the heart has not stopped beating. See RESPIRATION, ARTIFICIAL.

ASPHYXIANTS (for derivation, see ASPHYXIA). When applied to particular munitions of war, the term refers to shells or other projectiles containing chemical substances designed to produce a suffocating or poisonous effect. The Chinese have, from the earliest times, availed themselves of this device, and in their "stink-pot" secured such results. The use of asphyxiants has always been discouraged by the more enlightened authorities, both military and civil; so much so that The Hague Peace Conference of 1899 strongly condemned their employment. Lyddite shells were used by the British during the Anglo-Boer War of 1899–1902, and shimose and similar shells, opaque powders and hand grenades by both sides in the Russo-Japanese War. While not strictly asphyxiants, they render untenable a larger area of ground than would be accomplished by the projectile itself. These shells in exploding give rise to fumes and smoke which serve the double

purpose of enabling the gunners to locate the point where they strike and obscuring the sight of the forces among whom they fall. Other compositions that may be used are designed to burn fiercely, igniting whatever inflammable material they may come in contact with, such as the interior fittings of ships, forts, or other buildings.

AS'PIC (Fr. probably from *aspic*, an asp, alluding to its coolness). A savory meat jelly molded into a regular form and containing portions of fowl, game, fish, and the like, usually with hard-boiled eggs and sliced pickles. The term is used also in poetry for any venomous snake like the asp or viper. In botany it is sometimes used to designate the spikenard (*Lavandula spica*).

AS'PINWALL. See COLON.

ASPINWALL. A borough in Allegheny Co., Pa., about 3 miles northeast of Pittsburgh, on the Pennsylvania Railroad and on the Allegheny River. It is essentially a residential place. Aspinwall is governed by a council of seven members, elected by the people. The water works and light plant are owned by the borough. Pop., 1900, 1231; 1910, 2592.

ASPINWALL, WILLIAM (1743–1823). An American physician, born at Brookline, Mass. He received his education at Harvard and studied medicine in Philadelphia. He acted as a surgeon in the Revolutionary army and subsequently practiced his profession at Brookline. He is remembered for having introduced vaccination in this country.

ASPINWALL, WILLIAM H. (1807–75). An American railroad builder. He was born in New York City, and as early as 1837 was a partner in the firm of Howland and Aspinwall, then one of the largest shipping firms in New York. In 1850 he retired from the firm and devoted his entire attention to building the Panama Railroad, the eastern terminus of which was named after him. He was also active in the formation of the Pacific Mail Steamship Company.

AS'PIRATE (Lat. *aspiratus*, breathed upon). The term is applied by philologists to certain sounds, especially in Sanskrit and Greek, such as *kh*, *gh*, *χ* (*ch*), *θ* (*th*), *φ* (*ph*), accompanied by a breathing. The term may also include the English *f*, *th*, which are more properly called breathings or spirants. Its application to the sounds *ch* and *h* is popular and is not recognized by specialists. See PHONETICS.

AS'PIRA'TOR (Lat. *ad*, to + *spirare*, to breathe). An apparatus for drawing off air or other gases. The simplest form of aspirator consists of a tight receptacle filled with water, provided with a stopcock at each end. With both cocks open, the escape of the water draws the gas into the receptacle. A similar instrument is used by surgeons to draw fluid from a cavity.

AS'PIRIN. Acetyl-salicylic acid. An unofficial salicylate, thought to be more efficient than others and to cause less gastric disturbance because it passes through the stomach unchanged and liberates its salicylic acid in the intestine. It is a white powder, soluble in 100 parts of water. It is employed in rheumatism, gout, tonsillitis, pleurisy, chorea, neuralgia, and multiple neuritis.

ASPIROZ, às-pē-rōs, MANUEL DE (1836–1905). A Mexican statesman and diplomat. He was born at Puebla and graduated in 1855 at the University of Mexico. He fought in the war

against the French. Upon the capture of Maximilian he was appointed "fiscal" in the council of war chosen to try the Emperor. In this capacity he drew up the accusations and took the evidence against Maximilian. In 1867 he was appointed Assistant Secretary of State for Foreign Affairs in the newly established republic. From 1873 to 1875 he was Mexican Consul at San Francisco and in 1875 was elected to the Senate. He was professor of law in the College of Puebla from 1883 to 1890; again became Assistant Secretary of State for Foreign Affairs in 1890; and in 1899 succeeded Señor Romero as Mexican Ambassador to the United States. This post Aspfroz held for the six years preceding his death. Throughout his services in Washington his relations with the Austrian Ambassador were confined to official transactions, as the Austrian court held him responsible for the fate of Maximilian, the brother of the Emperor Francis Joseph. His works include *Código de extranjería de los Estados-Unidos Mexicanos* (1876) and *La libertad civil como base del derecho internacional privado* (1896).

ASPLENIUM (Gk. ἀσπληνιον, *asplēnon*, spleenwort, from ἀ, a euphonic + σπλήν, *splēn*, spleen). A genus of ferns of the family Polypodiaceae. The species are numerous, there being about 200, widely diffused both in the Northern and Southern hemispheres. Many of them are of great beauty; and the small size of some recommends them to cultivators of ferns who find themselves much limited as to space. The species of this genus may be readily recognized by their free veins and their elongated sori, which are covered by the indusium. Some of the species bear the English name "spleenwort," as *Asplenium trichomanes*, *viride*, *adiantum-nigrum*, etc., having been formerly supposed efficacious in removing obstructions of the viscera. They have now fallen completely into disuse, but were at one time very much employed, principally in the form of sirupy decoctions. Some of them, as *Asplenium trichomanes* and *Asplenium adiantum-nigrum*, are frequently called "maidenhair spleenwort." At least a dozen species are met with in the eastern United States, of which the tall-growing ones, 1 to 4 feet high, *Asplenium filix-femina*, *Asplenium angustifolium*, and *Asplenium thelypteroides* are the best known. They are often cultivated, especially the first named, of which there are said to be at least half a hundred varieties. See Plate of FERNS.

ASPRAMONTE, äs'prá-môn'tá. An Italian epic poem founded on the traditional defeat of the Saracens by Charlemagne near a place called in the legend "Aspramonte." Its author is unknown, but it was published in 1516, at Milan, a year after *Orlando Furioso*.

ASPRONTE, äs'pró-môn'tá (It. steep mount). A steep gneissic mountain ridge, over 30 miles long, near Reggio, in southwest Italy, abutting on the Strait of Messina (Map: Italy, K 9). It rises 6365 feet above the sea and is famous on account of the defeat and capture of Garibaldi by the forces of Victor Emmanuel, Aug. 29, 1862, which took place near it.

ASPROPOTAMO, äs'pró-pót'à-mó. See ACHELOUS.

ASQUITH, HERBERT HENRY (1852—). A distinguished lawyer and statesman, Prime Minister of Great Britain. He was born in Yorkshire, graduated from Oxford, and shortly afterward admitted to the bar. In 1887 Asquith

was chosen to defend Mr. John Burns for his participation in the so-called riot at Trafalgar Square, and two years later he took a prominent part as counsel before the Parnell Commission on behalf of the Irish Nationalists. Becoming a member of Parliament, he quickly won the favor of Gladstone, and in 1892 he was promoted to the post of Home Secretary. His activity and effectiveness during the Home Rule debates made him the most conspicuous figure in the House. The position he assumed during the labor troubles of 1893 led to his appointment as an arbitrator of the strike of the London cabmen in 1894. In 1894 he drew up the bill providing for the disestablishment of the Church of Wales and supported that measure until it was rejected by the House. In 1895, with the defeat of the Liberals, he resigned his cabinet position, but continued in Parliament as a member of the Opposition. During the period of Conservative ascendancy (1895-1905) his reputation steadily increased. Throughout the Boer War he stood steadily by the government, but with the raising of the protectionist banner by Chamberlain in 1903, he came forward as a defender of free trade. Among those who helped turn the Conservatives out of office in 1905 none took a more active part than he, and in the newly formed Liberal Ministry of Sir Henry Campbell-Bannerman he became Chancellor of the Exchequer, and, owing to the enfeebled health of the Prime Minister, the virtual head of the British government. The only bill of prime importance to be passed by the Upper House at this period was that providing for old-age pensions, a bill he presented in person as Chancellor of the Exchequer.

In 1908 Asquith became Prime Minister, and the formulation of the Liberal reform programme was immediately accelerated. The list of reform measures presented was a long one, including the famous Lloyd George budget (1909), the Parliament Act (1911), the Insurance Act, and the Irish Home Rule Bill. (See GREAT BRITAIN, *History*.) All of these proposals received Asquith's hearty approval, but the one which was passed under his especial guidance was the Parliament Act, which, in shearing the House of Lords of its veto power, virtually revolutionized the Constitution of Great Britain. The immediate cause of the passage of this act was the unprecedented rejection by the House of Lords of the budget of 1909; the underlying cause, the persistent refusal of the Lords for more than 50 years either to democratize their membership or to permit the House of Commons to enact long-delayed and much-needed social legislation.

Asquith obtained the King's consent to create a sufficient number of peers to pass the budget, and the Lords, rather than have their number doubled by 500 new Liberal peers, reluctantly yielded. Because of his attitude in this matter the Unionists in the House of Commons frequently treated Asquith with marked discourtesy. It has been said that he imposed upon a new and inexperienced King, overturning the work of the Magna Charta, and making himself simply a phonograph for radicalism. In addition, the more extreme members of the Labor party accused him of truckling, while the rage of the British "suffragettes," because of his attitude toward them, knew no bounds. Asquith finally consented to permit an equal-suffrage amendment to the government's electoral bill of 1912 to be voted upon, with the distinct proviso that said amendment should not be considered

a government measure. Owing to a technical ruling by the Speaker, it became necessary to withdraw the entire bill. Asquith was forthwith accused of betraying the suffrage cause, nor were his critics content with verbal attacks; on several occasions he was assaulted. Mr. Asquith is not noted for his oratory; his personality is said to be cold and unmagnetic; his statesmanship is held by many to be neither brilliant nor original. But this at least he has done: he has held together such divergent types as Lloyd George and Winston Churchill on the one hand, and Lord Grey and Chancellor Haldane on the other; he has controlled with great tact the discordant elements in his own party and has placated, but not surrendered to, the Labor members of Parliament and the Irish Nationalists. Consult Elias, *The Rt. Hon. H. H. Asquith, M.P.* (London, 1909). See GREAT BRITAIN, *History*.

ASS (AS. *assa*, Goth. *asilus*, Rus. *oselū*, Lat. *asinus*, probably of Eastern origin; cf. Heb. *āthōn*, she-ass), or **DONKEY**, when domesticated. A member of the family Equidae and genus *Equus*. Two species are recognized—one Asiatic and the other African. Asses resemble zebras in size, the presence of callosities on the fore legs alone, and the shortness of the hairs of the mane and tail. They differ from the zebras in color, in not having stripes (except as hereafter mentioned), and in having somewhat longer ears. Their colors are pale, and their voices are between the neighing of the horse and the braying of a donkey.

Asiatic Ass. The Asiatic asses are distributed over all the arid interior of Asia, from Syria to eastern Mongolia and northern India, although more restricted now than formerly by the encroachments of civilization. They were well known to the ancients, who called them *onager*, *hemionus*, etc., to which more recent writers have added confusing native names. There appear to be three species (or varieties, as some taxonomists are disposed to consider them), of these wild asses. One is the kiang, koulán, or dziggettai (*Equus hemionus*), of Tibet and Mongolia, which is the largest, reaching 4 feet in height at the shoulders. It is dark-reddish in color and has a narrow black stripe from (and including) the mane along the spine to the top of the tail; it inhabits mountains from 15,000 feet elevation up to the snow line. In adaptation to this environment its coat is thick and furry. The second is the ghorkhar, or onager (*Equus onager*), frequenting the plains of northwestern India, Afghanistan, and Baluchistan, which is smaller and paler, sometimes silvery white, and has a comparatively broad dorsal stripe. The third variety (*Equus hemippus*), less well marked, is the wild ass of Persia and Syria. All are white underneath and are likely to show obscure bars on the lower legs. This last-named ass, no doubt, is that known to the writers of the Old Testament, who use it as a type of wildness and freedom—"Whose house I have made the wilderness, and the barren land his dwellings. . . . The range of the mountains is his pasture" (Job xxxix. 6, 7, 8). It is, indeed, one of the freest, most agile, and perhaps the swiftest of wild quadrupeds. The kiang will rush over broken, rocky ground in an astonishing manner, and those of the plains are beyond the power of a single horseman to overtake. "In the Bakanir Desert the foals are captured during

the summer by parties of mounted Baluchis, who, by relieving one another, hunt them till they fall from sheer exhaustion, when they are taken and bound." These foals bring high prices in India, but are kept more as curiosities than for service. Another plan is to lie in wait at night by a drinking place and then run the animals down when heavy with water; but their keen scent and wariness make this difficult. Among the Persians the pursuit of asses with greyhounds is a favorite sport, and their flesh is esteemed by many and said to resemble venison. The kiangs of the mountainous wilderness of Tibet are less shy and will often approach one closely, with manifest curiosity, and even mingle with the horses of a train or enter the camp. "The food of these wild asses," says Lydekker, "consists in the lowlands of different kinds of grasses, which are frequently dry; but in Tibet it is chiefly composed of various woody plants, which form the main vegetation of these arid regions. In the hills to the west of the Indus these animals are to be found wandering pretty well throughout the year; but in the early summer, when the grass and the water in the pools have dried up from the hot winds, the greater number, if not all, of the ghorkhars migrate to the hills.

African Ass. The best known of the two species of African wild asses, the Nubian ass, is usually called *Equus africanus*, but the terms *asinus* and *tacnopus* have also been applied to it. It is very distinct from the Asiatic forms. It is larger than the Asiatic species, reaching 4 feet 8 inches, or 14 hands, in height, and in color is always bluish or else creamy, with no tinge of red; the muzzle, throat, and belly are white; and a dark stripe extends from the shoulders along the spine to the tail, and also down the withers, while the legs are barred; but the last two markings vary greatly. The ears are very long, and the mane and tail hairs are comparatively short and indistinct in color. This species ranges throughout the open regions of northeastern Africa, from Somaliland to the Red Sea, and westward throughout the desert, where its food and habits are much like those of the ghorkhar, except that its small troops do not congregate into herds. Sir Samuel Baker describes them in western Abyssinia as follows:

"Those who have seen donkeys in their civilized state have no conception of the wild and original animal. Far from the passive and subdued appearance of the English ass, the animal in its native desert is the perfection of activity and courage; there is a high-bred tone in the deportment, a high-actioned step when it trots freely over the rocks and sand with the speed of a horse. When it gallops freely over the boundless desert, no animal is more difficult to approach; and although they are frequently captured by the Arabs, those taken are invariably the foals, which are run down by fast dromedaries, while the mothers escape."

The rarer Somaliland ass (*Equus somalicus*) is grayer, lacks the shoulder stripe, but shows numerous cross stripes on the legs.

The Donkey. The domestic ass is undoubtedly, in its origin, the tamed African species (*africanus*). Its prevailing color is gray, varying to pure white or full black, and with the shoulder stripes and leg bars more or less preserved. It was known in Egypt long before the horse and probably was first domesticated in that region, where it is still a favorite ani-

mal, not only for riding, but for its milk; nevertheless, it is said to have been hated and abused by the ancient Egyptians in their flourishing period, and the prejudice against it was carried among the Romans. From Judg. iv. 10 we learn that at a very early period the great were accustomed to ride upon white asses, and a preference is still given to white asses in the East. Fine large breeds exist at the present day in Syria and Turkey. In Europe choice breeds are to be found in Italy, Malta, and especially in Spain. The animal seems not to have come into general use in Great Britain until after the time of Elizabeth, and now is chiefly employed there by peddlers and the poor, or for children's carriages. Its price is scarcely one-twentieth that of a good horse, and it can be kept at one-fourth of the expense, delighting in the coarse herbage which other animals reject and satisfied with comparatively scanty fare. The obstinacy ascribed to the ass seems to be very generally the result of ill treatment, and proverbial as it has become for stupidity, it is probably quite equal in intelligence to the horse. It was early brought to America, and the finest donkeys in the world are now said to be those in the United States, where some 60,000 are owned upon farms, chiefly in the southern central States, and used for the propagation of mules and hinnies (see MULE), the useful hybrids between the ass and the horse. Consult V. Hehn, *Wanderings of Plants and Animals*, Eng. trans. by Stallybrass (London, 1891).

The milk of the ass contains more sugar of milk and less caseine than that of the cow, and is therefore recommended as a nutritious diet in cases of weak digestion. Its usefulness in cases of consumption has long been known, and it was often prescribed as a kind of specific when that disease was treated on principles very different from those which now regulate its treatment. In some parts of the Sudan large herds of she-asses are kept solely for milking.

The leather called shagreen is made by a peculiar process from the skin of the ass, which also affords excellent leather for shoes and the best material for drums. The bones of the ass, which are very solid, were used by the ancients for making flutes. Consult Osborn, *New York Zoological Society Bulletin*, No. 55 (New York, 1913). See Colored Plate of HORSES and Plate of EQUINÆ.

ASS, FEAST OF THE. A religious carnival especially popular in northern France during the Middle Ages. It was of the nature of a parody on the service of the Church, but seems to have been instituted in good faith and without any intentional irreverence, to commemorate the biblical flight of Mary and her child into Egypt. It degenerated, however, into scurrilous indecency and was prohibited by the ecclesiastical authorities in the fifteenth century. It was variously celebrated in different places; thus, e.g., at Rouen it occurred shortly before Christmas and consisted in the representation of a little farce, in the principal scene of which Balaam's ass appeared before the altar of the cathedral (hence the name "Feast of the Ass") and uttered a prophecy of the early coming of Christ. See ABBOT OF JOY.

ASSAB, *äs-säb'*, or **SABA**, *sä'bä*. A sheltered bay and town in Eritrea, on the African coast, near the south end of the Red Sea (Map: Africa, J 3). The bay is about 16 miles long by

5 miles wide, and about 50 feet deep at Busna, the main anchoring place. Together with two small islands in front of it, Assab was ceded to the Italian government, in 1881, by an Italian steamship company, which had acquired it in 1869. The town of Assab is at the entrance to the bay, has a population of 5000, and is the export centre of the products of the Danakil coast, hides, pearls, and mother of pearl.

ASSAFETIDA. See ASAFETIDA.

ASSAI, *äs-si'* (from the native Brazilian name of the palm tree). A beverage much used at Pará and other places on the Amazon. It is prepared from the fruit of certain species of palm nearly allied to the cabbage palm of the West Indies. (See ARECA; CABBAGE PALM.) The assai palms are remarkably slender trees, the most common species (*Euterpe edulis*) rising to the height of 60 or 80 feet, with a smooth stem only about 4 inches in diameter. The fruit is small, but is produced in great quantity upon branched spadices, which are thrown out horizontally beneath the crown of leaves. It consists of a hard seed, with a very thin covering of a firm pulp or flesh. The tree grows in swamps flooded by the high tides. Warm water is poured upon the fruit; and by rubbing and kneading, a liquid is procured, consisting simply of the pulp of the fruit and water, which is constantly sold in the streets of Pará, and of which the inhabitants are extremely fond. This is assai. It is a thick, creamy liquid, of a purplish color, and a flavor like that of a freshly gathered nut. It is commonly used with the bread made from manioc, called farina, and either with or without sugar. The stem of the assai palm is sometimes used for poles and rafters, and its terminal bud as a cabbage or as a salad with oil and vinegar; but it is too much valued upon account of its fruit to be often cut down for these purposes. Another species, *Euterpe catinga*, is found in forests of a dry, sandy soil and very peculiar vegetation, known as catinga forests. The beverage made from it is sweeter than the common kind, but the product of the tree is much smaller.

ASSAL, *äs-säl'*. An important salt lake in the east of Africa, near the head of the Bay of Tajura, French Somaliland. It is over 8 miles in length and 4 miles broad, and its surface is over 530 feet below the sea level. Its shores are covered with salt, which is exported in considerable quantities to Abyssinia.

ASSAM. A province of British India, lying northeast of Bengal and bordering on China and Burma. In October, 1905, it was amalgamated with 15 districts of northern and eastern Bengal to form the province of Eastern Bengal and Assam. Prior to this amalgamation the area of Assam was 61,682 square miles, including the native State of Manipur (8456 square miles); and the population, including Manipur, was 6,126,343, according to the census of 1901. The area of the new province, Eastern Bengal and Assam, was 111,569 square miles, of which 12,542 square miles were included in the native states of Manipur and Hill Tipperah; and the total population, adjusted to the 1901 census, was 30,961,459, of whom only 457,790 were in the two native states. On April 1, 1912, Eastern Bengal and Assam ceased to exist as a political division, and Assam again became a separate province, under a chief commissioner. The area of the new province of Assam is stated at 61,471 square miles, and the population (1911 census)

7,059,857; these figures include Manipur state, with 8456 square miles and 346,222 inhabitants. The population is almost wholly rural. The province of Assam falls into three natural divisions: the valley of the Surma, the valley of the Brahmaputra, or Assam proper, and the intervening range of hills. Among the mountain districts are the Garo Hills, the Khasi Hills, and the Jaintia Hills. The streams are abundant, and the lower lands often suffer inundations. The annual rainfall is copious, but sometimes unfavorably distributed; in some sections it is perhaps the heaviest on the globe; at Sylhet, in the Surma valley, the annual average is 157 inches, and 458 inches at Chera-punji, where, in 1861, 905 inches are said to have fallen, of which 503 inches were recorded in June and July. The atmosphere is consequently extremely humid, but at no period of the year is the heat excessive. The frequent occurrence of earthquakes is a great hindrance to the development of the region. A large portion of the country is covered with jungle, in which elephants, tigers, leopards, rhinoceroses, bears, wild dogs, wild hogs, and other wild beasts are found in abundance. Large deposits of coal, iron, and petroleum are known to exist, but only the first is exploited to any extent. The soil is mostly very fertile, and the extensive forests contain numerous useful woods. The tea plant is indigenous, and tea culture has grown rapidly. The area under tea is over 300,000 acres, and the plantations are owned largely by Europeans. In 1901 there were over 700,000 immigrants from other parts of India employed as coolies in tea gardens in Assam. The great staple of agriculture is rice. The principal articles of export are rice, tea, silk, cotton, rubber, ivory, and gold. The commerce is mostly in the hands of the Jains.

The Assamese, or Ahoms, are probably a Hindu-Shan (Mongolian) mixed stock, with the Hindu element predominant. They are short and thickset, with coarse black hair and Mongoloid face. The two main indigenous languages are Bengali, spoken by 48 per cent of the population in 1901, and a sister language, Assamese, spoken by 22 per cent; altogether 167 different languages and dialects were reported. The Assamese literature is extremely scanty. The country contains a number of primitive peoples, especially the Lushai, accounts of whose language, customs, folk tales, etc., were published in 1894 and 1912 by John Shakespeare, an English army officer. In religion nearly three-fifths of the people of Assam are Hindu, about one-fourth Mohammedan, and one-sixth animist.

Consult: Hunter, *Statistical Account of Assam* (London, 1880); Reid, *Chin-Lushai Land* (Calcutta, 1894); Brown, *Grammatical Notes on the Assamese Language* (Nowgong, 1893); Bronson, *Dictionary in Assamese and English* (Sibsagar, 1867); Grierson, *Specimens of the Bengali and Assamese Languages (Linguistic Survey of India, vol. v. part i, Calcutta, 1903)*; Gait, *History of Assam* (Calcutta, 1906); article "Assam" in *Imperial Gazetteer of India* (Oxford, 1908).

ASSASSINATION. The act of taking the life of any one by surprise or treacherous violence, either by a hired emissary, as in the case of political plots, or by a fanatic who hopes to further his ideas through the death of his victim, as in the case of anarchists in recent times. Generally the term is applied to the

murder of a public personage by one who aims solely at the death of his victim. In ancient times assassination was not unknown, and was often even applauded, as in the scriptural instances of Ehud and Jael, and in the murder of Hipparchus by Harmodius and Aristogiton. The following list includes the most important assassinations: Philip of Macedon, 336 B.C.; Julius Cæsar, 44 B.C.; Thomas à Becket, 1170; Albert I, Emperor of Germany, 1308; James I of Scotland, 1437; Alessandro de' Medici, 1537; Cardinal Beaton, 1546; David Rizzio, 1566; Darnley, 1567; James, Earl of Murray, Regent of Scotland, 1570; William of Orange, 1584; Henry III of France, by Jacques Clément, 1589; Henry IV of France, by Ravaillac, 1610; Villiers, Duke of Buckingham, by Felton, 1628; Wallenstein, 1634; Archbishop Sharp, 1679; Gustavus III of Sweden, 1792; Marat, by Charlotte Corday, 1793; General Kléber, at Cairo, 1800; Paul, Czar of Russia, 1801; Perceval, English premier, by Bellingham, 1812; Kotzebue, the dramatist, 1819; Duc de Berry, 1820; Charles III, Duke of Parma, 1854; Abraham Lincoln, by Booth, 1865; Michael, Prince of Servia, 1868; Marshal Prim, 1870; Georges Darboy, Archbishop of Paris, by communists, 1871; Earl of Mayo, Governor-General of India, 1872; Abdul Aziz, 1876; Alexander II, Czar of Russia, 1881; President J. A. Garfield, at Washington, by Guiteau, 1881; Lord Frederick Cavendish and T. H. Burke, at Phoenix Park, Dublin, 1882; President Carnot of France, at Lyons, 1894; Stefan Stambuloff in Sofia, Bulgaria, 1895; Empress Elizabeth, of Austria, at Geneva, by an anarchist, 1898; King Humbert I, of Italy, at Monza, by an anarchist, Bresci, 1900; President William McKinley, at Buffalo, N. Y., 1901; M. von Plohe in St. Petersburg, 1904; Grand Duke Sergius in Moscow, 1905; M. Petkoff, Premier of Bulgaria, 1907; General von der Launitz, St. Petersburg, 1907; General Pavloff, St. Petersburg, 1907; Carlos I of Portugal, in Lisbon, 1908; Prince Ito, at Harbin, Manchuria, 1909; Premier Stolypin in Kieff, 1911; Premier Canalejas of Spain, in Madrid, 1912; King George I of Greece, in Salonica, 1913; Mahmud Shekhet Pasha, Grand Vizier of Turkey, in Constantinople, 1913. Consult Johnson, *Famous Assassinations* (Chicago, 1903). See ASSASSINS.

ASSASSIN-BUG. A bug of the bloodsucking family Reduviidæ. See CONE-NOSE; INSECT, *Poisonous Insects*.

ASSASSINS (Fr. *assassin*, OF. pl. *hassasis*, from Ar. *hashashin*, pl. of *hashash*, hashish-eater). A secret order of Islam, partly religious and partly secular in character, and an offshoot of the sect of Ismaili, which was in turn a branch of the great Shiite faction. The members of the Order of Ismaili derived their name from Ismail, a descendant of Ali, in whose line they considered the religious headship of the Mohammedan world to be rightfully vested. They united to this tenet the belief in the moral indifference of all actions and in the worthlessness of popular religion. Toward the middle of the eleventh century Hassan ben Sabbah, a Persian of gifted mind and energetic character, came to Cairo and attained a high rank among the Initiated of the Ishmaelite Order. Political reasons forced him to flee to Persia. In 1090 he acquired the fortress of Alamut, in the district of Rudba, and made it the home of a new organization, whose principles were in the main those of the Ismailites, with the addition of a

new feature, namely, the practice of the secret assassination of all enemies of the order. At the head of the new organization stood an absolute ruler, the Sheik-al-Jebal, or, as he became known in mediæval folk-lore, "The Old Man of the Mountain." Below him were three deputy-masters, in the provinces of Jebal, Kohistan, and Syria. Next in rank were the Dais, or Initiated, and the Refiks, or Students, who were only partially acquainted with the secrets of the order, but were graduated in time into the rank of Dais. Below these came the active members of the order, the Fedavis, or Fedais, meaning 'The Devoted Ones,' young men who were kept in absolute ignorance of the teachings of the order, but from whom complete obedience was expected. These were the blind instruments in the work of assassination planned by the leaders. Before they were assigned to their tasks these youths were stupefied by means of *hashish*, or the hemp plant, and while in an ecstatic condition they were plunged into all the pleasures of the senses as a foretaste of the bliss which awaited them in Paradise if they should faithfully execute the commands of their superiors. But the word *hashishin*, or hemp-eaters, was changed by the Europeans into *assassins*, and acquired the common meaning of murderers, which it bears at present. The novices, mechanics, and laborers formed the sixth and seventh classes of the order, and upon them the observance of Islam was strictly enjoined, though the Initiated were exempted from its precepts. For 150 years the Order of Assassins held Asia Minor and Persia in terror. More than one caliph fell a victim to their knives. Princes paid tribute to the "Old Man of the Mountain," and the services of his followers were even hired by contending political factions. In all, there were six Grand Masters of the order besides Hassan, who died in 1124. Of these, Hassan II, in 1163, extended the secret privilege of the Initiated (that is, exemption from the precepts of religion) to the people generally, and abolished Islam in his dominions; but he was speedily assassinated, and under his grandson, Hassan III, the old institutions were restored. Under Mohammed II, the Deputy Grand Master of Syria made himself independent, and during the wars of the Crusades, wielded a terrible power. The murder of Conrad of Montferrat and other distinguished victims of assassination was attributed to him. The Mongol rulers of Persia broke up the order in 1255. The Syrian branch was put down by the Mameluke Sultan Bibars; but remnants of the sect lingered in Kohistan, and are said still to exist in different parts of India, Persia, and Syria.

Consult: Hammer-Purgstall, *Geschichte der Assassinen* (Stuttgart and Tübingen, 1818); F. Walpole, *The Ansayrii, or Assassins* (London, 1851); Heckethorn's *Secret Societies of All Ages and Countries* (New York, 1897), which contains much curious information, but is ill-digested and unreliable; Bliss, *The Religions of Modern Syria and Palestine* (New York, 1912); Guyard, *Fragmentes relatifs à doctrine des Ismaélis* (Paris, 1847-77).

ASSAULT (Lat. *ad*, to, at + *saltare*, to jump, leap). A military term signifying 'to attack.' Until very recent times troops would be told off to assault a fortified post, or position, being divided into three divisions: "storming parties," "supports," and "firing parties."

It has always been a costly undertaking, now more so than ever, owing to the modern guns and magazine rifles with which all armies are equipped. In the assault on the fortified lines of the Confederate army at Cold Harbor (1864), in the Civil War, General Grant lost some 8000 men in about 15 minutes. The great losses suffered by the British in the Boer War of 1899-1902 were inflicted during the attack on the Boer *hoppes*; and the losses of the Japanese in their repeated assaults on Port Arthur were unparalleled. See **ATTACK**.

ASSAULT AND BATTERY (Fr. *batterie*, from *battre*, to beat, batter). An infringement of the common-law right to personal safety and freedom. The words "assault" and "battery" are commonly used together, for the reason that the two offenses which they indicate are usually committed together. But the offenses are separate and distinct.

An assault is an attempt or offer to inflict bodily injury upon another, accompanied by such circumstances as denote, at the time, an intention, coupled with the present ability, to do violence to the person. Battery is the actual infliction of threatened violence, the consummation of an assault. Mere words of abuse will not constitute an assault, nor will a threat or offer to do violence, when it clearly appears that he who makes the threat or offer has no intention or no present ability to carry it into execution. But an *actual* intent or an *actual* present ability to injure the person is not necessary. It is sufficient that these are apparent and that the circumstances are such as to cause the person threatened to believe, on reasonable grounds, that such apparent intent and ability are real. Thus the pointing of an unloaded gun at a person who is ignorant of the fact that it is not loaded, the circumstances indicating an intention to shoot, will amount to an assault. The least touching of another's person in anger or willfully or negligently, whether with the hand or with a stone or other weapon, is a battery.

To use, or to attempt or offer to use, violence upon the body of another is in some cases justifiable. Thus a father or a schoolmaster may chastise a child, within proper bounds and in the process of rightful discipline. So a person is justified in using all necessary means, even though obliged to resort to force, to protect and defend his person, the person of his servant, or of one of his family, or his real or personal property. The force employed in defense, however, must be no greater than the emergency requires; for any excess of violence the person using it will be responsible, as for an assault and battery.

Assault and battery are both civil and criminal offenses. As civil wrongs they are classified under the head of torts, and subject the wrongdoer to an action for damages; and as crimes, under that of misdemeanors. Certain criminal assaults are known as aggravated assaults and are followed by a more severe punishment. Such are assaults with intent to kill or with intent to commit rape, and assaults upon magistrates in courts of justice, with knowledge of the official character of the persons assaulted. See the authorities referred to under **CRIMINAL LAW**; **TORTS**.

ASSAYE, *as-si'*. A village 261 miles northwest of Hyderabad, south India, lat. 20° 18' N., and long. 75° 55' E., 43 miles northeast of

Aurangabad (Map: India, C 4). It claims notice chiefly as the scene of the first great victory of the Duke of Wellington, then Major-General Wellesley, won on Sept. 23, 1803. The British troops in action were about 9500, while the Mahrattas, under Scindia and the Rajah of Berar, numbered 50,000, of whom 10,000 were commanded by French officers. Ninety-eight pieces of cannon, seven standards, all the baggage, and a large part of the ammunition of the Mahrattas fell into the hands of the conquerors, whose casualties numbered 1560 in killed and wounded. The loss of their opponents was 12,000.

ASSAYING (OF. *assai*, Lat. *exagium*, a weighing, weight; *exigere*, to drive out, examine, from *ex*, out + *agere*, to drive, lead, guide; cf. *examen*, for *exagmen*, and *exact*). In its widest meaning, the term includes all those operations of analytical chemistry which have for their object the determination of the value of ores and their metallurgical products. In its more limited meaning, assaying is the process employed in determining the proportion of gold and silver in ores, coins, silver and gold plate, jewelry and other commercial alloys of the precious metals. In Great Britain each article of gold or silver is assayed at the Goldsmith's Hall previously to being sold, to determine its standard of purity, and at the various mints of the United States and foreign governments the bullion received for coinage is assayed for a similar purpose. Two general methods are employed for assaying metals and metal-bearing ores, which are commonly known as the wet method and the dry method. To the dry method belongs fire-assaying, and to the wet method belongs gravimetric and volumetric analysis, including colorimetric determinations. Any attempt to define or explain these methods of analysis without technicalities, understood only by the chemist, is always somewhat disappointing, but the following definitions will give a general notion of what is meant in each case.

Fire-assay Determinations involve the separation of the metal sought from the other constituents of the ore or alloy by the aid of heat and suitable fluxes to form a slag with the foreign matter, and its estimation by weighing in a state of purity. To illustrate, if the object is the determination of lead in an ore, the ore is mixed in a crucible with suitable fluxes and fused: the lead is returned to the metallic state, in which condition it is readily detached from the slag for weighing, the various non-metallic elements present in the original ore combining with the materials in the flux and forming new substances.

Gravimetric Determinations involve the separation of the substance sought from the other constituents of the ore, and its estimation by weighing the substance either in a state of purity or as a constituent of a chemical compound whose composition is accurately known. To illustrate, if the object is the determination of lime in a mineral, the latter may be treated in such a manner that the ultimate product of the treatment is pure lime, which can be weighed direct; or the treatment may be such that the product is calcium sulphate, whose weight may be determined, and as this salt is of invariable composition the contained lime can be readily calculated.

Volumetric Determinations are those which involve the separation of the substance to be

determined from all interfering constituents of the ore, and the final measuring of the quantity of a solution necessary to complete a certain chemical reaction; or, as in the case of colorimetric determinations, by measuring the color imparted to a definite quantity of the liquid by the constituent sought, in comparison with the color imparted to the same quantity of water, or other suitable fluid, by a known quantity of the constituent sought. Fire-assaying was formerly applied to gold, silver, copper, tin, and lead ores, but in recent years has been applied only to gold-silver ores and alloys of gold and silver, determining one or both metals from the same sample; in gravimetric analysis, frequently several or all of the constituents are determined from one sample; and in volumetric analysis a separate sample is often taken for each determination. To save time or when large numbers of samples are to be analyzed for the same ingredients it is customary to make more than one determination on each sample tested.

Sampling. The first operation in making an assay is to obtain a sample which represents in every respect the original material. In ore sampling the same percentage of coarse and fine ore as contained in the original lot should enter the sample, as the percentage of metal contained in the fine is generally higher than that contained in the coarse. Great care should be exercised, and one who is not thoroughly familiar with ores, metals, and the theory of sampling should not attempt to obtain an average sample for assay. Sampling may be subdivided under the two heads of ore sampling, and sampling of metallurgical products. Ore sampling may be done either by hand or machinery. The common method of hand sampling is known as coning and quartering. The method is as follows: As the ore is unloaded from the cars every third, fifth, or tenth shovelful, depending on the size, quantity, and value of the ore, is taken indiscriminately and thrown into a wheelbarrow as a sample. This sample is crushed to the proper size and shoveled into a conical pile. The coarse ore rolls down the sides and the fines, which are usually high grade, remain on the apex of the cone. If the location of the apex is changed a few inches from the centre during this process, the resultant sample will not be an average. The cone is then flattened into a circular cake working the pile down from the periphery and gradually advancing toward the centre containing the fine rich ore. In this operation the sample can be vitiated by unequal distribution of the fines. The cake thus formed is then divided diametrically into quarters, separated, two diagonal quarters rejected, and the two remaining diagonal quarters selected for a sample. These operations of coning and quartering are repeated several times, the ore being crushed between the several operations when necessary to obtain the proper size of ore, relative to the weight of the sample, until the resultant sample weighs from 10 to 50 pounds. The size of this ore should be under $\frac{1}{4}$ inch, depending on its character. From this point the weight of the sample is reduced by riffing, crushing to finer sizes when necessary between the operations. When the weight of the sample is reduced to about one pound, it is customary to pulverize it until it will fall through a screen of from 60 to 100 meshes to the inch, thoroughly mix, and separate into four samples. This powdered sample of ore is called

pulp. The samples, weighing about four ounces each, are placed in paper sample bags and sealed. If the work is being performed for a public smelter one sample goes to the buyer, one to the seller, and two are marked for umpiring in case of a dispute on the results. This method cannot be recommended, as it is exceedingly difficult to obtain by hand an average sample from the original ore shipped.

In most large smelting plants the sampling and preparing of the pulp are now done entirely by machinery.

Metallurgical products are sampled either by drilling, or dipping from the molten metal. Dip samples of bullion are more accurate than drillings, on account of the segregation of values which takes place in cooling when bullion is cast into bars.

When a sample is submitted to an assayer for analysis a preliminary examination with a magnifying glass, blowpipe, and sometimes qualitative tests, are made to determine its character and general composition. The formal analysis is then undertaken. The laboratory apparatus necessary for general assaying is quite extensive, consisting of a large variety of chemicals, balances, crucibles, cupels, furnaces, beakers, etc. A different mode of procedure is adopted in assaying different metals, and for illustration the method of assaying gold and silver by the fire-assay, and of silver by gravimetric analysis, will be described, the reader being referred to special treatises on assaying, metallurgy, and chemistry for details of the processes employed for other metals.

Assaying Gold and Silver Ores. Gold and silver generally occur together in ores, and such ores are universally determined by fire-assay, either by means of scorification or by the crucible method. If the ore contains volatile materials such as antimony, arsenic, etc., it should be assayed by scorification. If the ore is free from volatile materials it is usually assayed by the crucible method, which permits a much larger amount of ore being taken, thereby reducing errors in weighing the resultant button of gold or silver. The American practice is to use assay-ton weights where 1 milligram of gold or silver obtained from 1 assay-ton of ore represents 1 ounce of gold or silver per ton of 2000 pounds. This system of weights was devised by Prof. Charles F. Chandler to reduce assay computations. The fire-assay consists essentially in the collection of the gold and silver in a button of metallic lead. Large buttons tend to cause loss in cupelling and small buttons are liable not to collect all of the gold and silver in the sample. The lead button is freed from adhering slag, hammered into the form of a cube for convenience in handling, and cupelled; resulting in a button of gold and silver.

In the scorification assay the charge consists of a mixture of from 20 to 50 grams of granulated lead, from .1 to .4 assay-ton of ore dependent on the character, and about 1 gram or less of borax glass. This charge is placed in a scorifier, a shallow, unglazed, earthenware saucer, and covered with from 20 to 50 grams of granulated lead. The scorifier containing the charge of ore covered with lead is then placed in a muffle furnace, melted, oxidized by permitting a current of air to pass through the furnace, and fused until the slag, formed by the combination of the oxide of lead and silica

of the ore, forms a covering over the molten lead which now contains the gold and silver that was in the original ore. This is poured into an iron mold, cooled, and the lead separated from the slag for cupelling.

In the crucible assay various charges are used, depending on the character of the ore. Sulphide ores require less litharge and may require the addition of iron and nitre to the charge. Ores containing copper require large amounts of litharge to hold the copper in suspension or solution in the slag. The common fluxes used in the crucible assay are: litharge, bicarbonate of soda, potassium-carbonate, borax glass, iron in the form of nails, nitre, flour, and silica. The crucible charge consists of a mixture of from $\frac{1}{2}$ assay-ton to 2 assay-tons of ore and from 2 to 3 times as much flux. This mixture is placed in a fireclay crucible, covered with salt or borax, placed either in a muffle or pot furnace, heated slowly for half an hour to drive off the gases produced from the chemical reactions, and then heated at a high temperature for half an hour to form a complete fusion. The litharge, reduced to metallic lead, collects the gold and silver, and settles to the bottom of the crucible. The contents can be poured into an iron mold while hot or the crucible withdrawn from the furnace and allowed to cool. The lead containing the gold and silver is separated from the slag preparatory to cupellation.

Cupellation is conducted as follows: the cupel, a small basin-shaped vessel made of bone-ash, is placed in a muffle furnace thoroughly heated; the lead button is placed in the cupel, melted, and oxidized by the air passing through the furnace; the oxide of lead produced is either volatilized or absorbed by the cupel. Just before the last traces of lead are removed the melted button exhibits a play of color, darkens, and finally brightens, which is the completion of the operation. The cupel is taken from the furnace, cooled, the button removed, cleaned of adhering dirt, and weighed for gold and silver.

The gold is separated from the silver by *parting*, which consists of dissolving out the silver in a hot dilute nitric acid. To accomplish this it is necessary for the gold-silver button to contain at least $2\frac{1}{2}$ times as much silver as gold. If the ratio is less, the gold-silver button is wrapped in lead foil with a piece of pure silver and re-cupelled. The resultant gold, after the silver has been dissolved, is black and must be washed, dried, and annealed by heating to redness. After cooling, the gold button is weighed and the amount deducted from the weight of the gold-silver button.

Assaying Silver Bullion. Silver bullion may be assayed by cupellation with lead, as explained above, the process being exactly as described for gold and silver ore, except for the preliminary scorification or fusing. The method of assay for silver bullion adopted by the United States mints and assay offices, and in the mints of most foreign countries, is volumetric analysis. Briefly described, this consists in dissolving the silver compound in nitric acid and then adding sodium chloride (common salt) solution, which insures the precipitation of the chloride of silver. The salt solution is made of definite strength, and is poured out of a graduated vessel until further precipitation of the silver ceases, when the amount of salt solution used is read off the graduated vessel, and by a simple calculation its equivalent in pure silver is determined.

Assaying Gold Bullion. The assay of gold bullion requires the removal first of the base metals, and second of the contained silver. The base metal is removed by cupellation with lead, as described above, leaving a button of gold and silver. The silver is then removed from the gold by solution in nitric acid, the gold remaining behind in an insoluble state, when it is annealed and weighed. The mode of assaying gold described cannot always be followed out in the examination of jewelry and other manufactured articles, as, though only a few grains are required for the assay, yet the removal of such might entail the destruction of the article, and in such circumstances the *touch-stone* is resorted to. This stone was originally brought from Lydia, in Asia Minor, and consisted of a cross-grained quartz saturated with bituminous matter, but black basalt and other stones are now employed for the same purpose. The manner of using the stone is to draw a streak upon it with the auriferous article and on each side to draw similar streaks with gold points of known value; from the color of the streaks the richness of the gold can be very accurately determined by the practiced assayer. The subsequent action of nitric acid on the golden streaks serves also as a means of determining the purity of the metal, as the acid readily dissolves the copper and silver and leaves the gold. The assay of gold-silver ores is always reported in Troy ounces per ton of 2000 pounds. The value of gold is \$20.67 per Troy ounce. The assay of gold-silver bullion is always reported in fineness or the number of parts of metal in 1000 parts of bullion. Jewelers report the fineness in karats or the number of parts in 24. Gold marked 18 kt. should contain 75 per cent of gold and should be 750 fine. Consult: Low, *Technical Methods of Ore Analysis* (New York, 1905, 5th ed., 1911); Ricketts and Miller, *Fire-Assaying* (New York); Prest, *Manual of Chemical Analysis* (New York, 1905); Lodge, *Fire-Assaying* (New York, 1904; 3d ed., 1911); Aaron, *Assaying* (2 vols., San Francisco, 1906); Fulton, *Manual of Fire-Assaying* (2d ed., New York, 1911).

ASSAY OFFICE. A government bureau where gold and silver bullion is purchased, sold, assayed, and refined, but no coin produced. (See ASSAYING.) The assay offices of the United States are included in the Mint Service of the Treasury Department, and are located at New York; Charlotte, N. C.; Deadwood, S. D.; Helena, Mont.; Boise, Idaho; Salt Lake City, Utah; Carson, Nev.; New Orleans, La.; Seattle, Wash.; and at the coinage mints of Philadelphia, San Francisco, and Denver. From the gold and silver deposited at the mints and assay offices bars are manufactured which are graded as follows: Fine bars, mint bars, standard bars, and unparted bars. The value of all gold bullion, contained in original deposits at the mints and assay offices of the United States for 1912, amounted to \$151,929,881. During 1911 the San Francisco Mint received the largest amount by weight, about 80 per cent coming from California and Alaska. Deadwood, Seattle, and Denver received large amounts in the order named. About 70 per cent of the gold received at Seattle during 1911 came from Alaska. Of the more important gold-producing countries, Alaska sends most of its production to Seattle and San Francisco; South Dakota to Deadwood; Nevada to Denver, San Francisco, Carson, and

Salt Lake; California to San Francisco; and Colorado to Denver. The refining of bullion is carried on at the mints and the New York Assay Office. During 1912 the New York Assay Office received and refined more bullion than any one mint. For the enforcing of the stamping act governing the manufacture and sale of jewelry, marked with karat fineness, a large number of articles were assayed. The office was also called upon to make a large number of gold assays for the United States District Attorney. This office was established in 1854 in a building erected on Wall Street in 1823 for the Second National Bank of the United States, transferred to the Bank of the State of New York in 1836, and to the United States government in 1854. The building was vacated January, 1912, and the department moved to the refinery building in the rear pending the erection of a new and larger structure on the site of the old building.

Consult the *Annual Report* of the Director of the Mint. See MINT.

ASSE, *ās*. A fennec. See CAAMA.

ASSEGAI, *ā'sē-gā* (Sp. *azagaya*, Ar. *azaghāyah*, from *al*, the + Berber *zaghāyah*, spear). A short spear used by natives of south Africa, especially the warlike Zulus and other Kafir tribes, with a very thin shaft of hard wood of about 5 feet in length, and an iron blade secured by a strip of rawhide. When used for throwing, the blade is convex on one side and concave on the other, so as to transmit a rotary motion to it. A shorter form of the weapon with a very broad blade is used at close quarters for stabbing.

ASSEMANI, *ās'sē-mā'nē* (Ar. AL-SAMANI), GIUSEPPE ALOYSIO (1710-82). Brother of Giuseppe Simone Assemani, and professor of Oriental languages in Rome. He published *Codex Liturgicus ecclesiae universae* (1749-60); *Commentaria de catholicis seu patriarchis Chaldaeorum et Nestorianorum* (1775).

ASSEMANI, GIUSEPPE SIMONE (1687-1768). A Syrian Orientalist. He was born at Tripoli, Syria, and was educated at the Maronite College in Rome. During two journeys in the East, in 1717 and 1735, he collected a large number of Oriental manuscripts in Egypt and Syria for the library of the Vatican, of which he was the custodian. As a reward for his services, he was made titular Archbishop of Tyre. His principal works are: *Bibliotheca Orientalis Clementino-Vaticana* (4 vols., 1719-28); German abridgment, A. F. Pfeiffer, containing Syrian manuscripts in the library of the Vatican; *Opera Ephraemi Syri* (6 vols., 1732-46); *Italiae historiae Scriptores* (4 vols., 1751-53); *Kalendaria Ecclesiae Universae* (6 vols., 1755-57); *Bibliotheca Juris Orientalis Canonici et Civilis* (5 vols., 1762-66).

ASSEMANI, SIMONE (1752-1821). An Oriental scholar, grandnephew of Giuseppe Simone Assemani. He was born at Tripoli, Syria, was educated at Rome, worked for some time as a missionary in Syria, and in 1785 was appointed professor of Oriental languages at Padua. His principal works are: *Museo eufico Naniano illustrato* (2 vols., Padua, 1787), an important contribution to numismatics; and *Saggio sull'origine, culto, letteratura, e costumi degli Arabi avanti Maometto* (Padua, 1787). He was one of the scholars who detected the fraudulent character of the *Codice diplomatico di Sicilia sotto il governo degli Arabi*, published in 1789-92 by Alfonso Airoldi, and claiming to be a

correspondence between the Arabic governors of Sicily and their sovereigns in Africa, translated by Giuseppe Vella, after the first volume of the pretended Arabic text had been published by Vella under the title *Kitab diran Mizr* in 1793. See VELLA, GIUSEPPE.

ASSEMAMI, STEFANO EVODIO (1707-82). A Syrian Orientalist. He followed the studies of his uncle, Giuseppe Simone Assemani, whom he succeeded as custodian of the Vatican Library. He was titular Archbishop of Apamea and held several lucrative positions in Italy. His works include *Bibliotheca Mediceo-Laurentiana et Palatina Codd. Manusc. Orientalium Catalogus* (2 vols., Florence, 1742) and *Acta ss. Martyrum Orientalium et Occidentalium* (2 vols., Rome, 1748), and a part of *Bibliotheca Apostolica Vaticana Codd. Manusc. Catalogus* (3 vols., Rome, 1756-69), which he wrote in conjunction with his uncle.

ASSEMBLY (Fr. *assemblée*, ultimately from Lat. *ad*, to + *simul*, together). Any drum-beat or bugle-call designated to bring troops into ranks or to appointed stations. See BUGLE AND TRUMPET CALLS; DRUM.

ASSEMBLY, GENERAL. See PRESBYTERIANISM; also LEGISLATURE.

ASSEMBLY, NATIONAL (France). The States-General (q.v.), convoked by Louis XVI of France, and opened May 5, 1789, consisted of the two privileged orders, the clergy and the nobles, and of the *tiers-état*, or commons. The Third Estate, composed of representatives from the towns and rural communities, outnumbered the other orders, and demanded that the voting should be by heads, in united assembly, and not by orders sitting separately. Upon the refusal of the privileged orders to concede this demand the Third Estate, on June 17, assumed the title of *Assemblée Nationale*, and the right to act in the name of France. The court attempted to annul this resolution in a royal sitting, June 23, but the deputies of the Third Estate, together with the liberal members of the other two orders, had bound themselves three days before by the so-called Oath of the Tennis Court not to separate until they had given France a constitution, and declared every attempt at violence on the part of the court treason. The King yielded, commanding the nobles and clergy to join the National Assembly. The Revolution had begun. The Assembly proceeded with astounding rapidity to metamorphose old France. Feudal rights and hereditary privileges were abolished on August 4, and the Declaration of the Rights of Man followed. In February, 1790, succession by primogeniture was abolished; in March *lettres de cachet* and the oppressive salt tax were abolished; in June all orders and titles of nobility were annulled. In July the civil constitution of the clergy was decreed; at the same time non-Catholics were reinvested with the property forfeited by their ancestors on account of their faith; Jews were relieved from personal taxation, and the game laws done away with. In September the Parliaments were suppressed. A decree of October 18 abolished the cruel criminal penalties of Louis XIV. In January, 1791, all corporations and guilds were abolished and free trade introduced. In February political rights were conceded to Quakers and in September to all citizens, of whatever color or religion.

The principles on which the Assembly proceeded were the sovereignty of the People, the limitation of the royal power through a condi-

tional veto, the separation of the legislative and the executive powers, and the responsibility of ministers. Accordingly the Assembly, shortly after it was constituted, declared that to it alone, subject to the royal veto, belonged the legislative power. Several decrees in September, 1789, determined that the legislative body should form only one chamber, and should be renewed every two years; other decrees declared that the King was inviolable and the throne inalienable. A decree of November 7 forbade the deputies to undertake the place of ministers; and in December the new organization of the communes was begun. In January, 1790, France was divided into departments; in April trial by jury was introduced; in May it was declared that the right of war and peace belonged to the nation alone, i.e., to the Assembly.

The ecclesiastical and financial policies of the Assembly were closely connected. The bankruptcy of the State led to the confiscation in toto of the real estate of the Church; but the State, on the other hand, agreed to pay the Church debt and to provide also the salaries of both bishops and parish priests, lowering the former and raising the latter. The ecclesiastical policy, indeed, would have met with little opposition had it not been for the proposed method of electing priests and the oath of allegiance required from them. (See FRENCH REVOLUTION.) The financial policy of the Assembly was less felicitous. Certain reforms were, it is true, decreed; but they availed nothing in face of the slough of paper money into which the Assembly speedily sank. The first issue of assignats, based on Church lands, in the beginning circulated at par; but a second, floated on the guarantee that there would be no further issue; and a third, which broke the guarantee, soon brought about a state of chaos.

When the new constitution had been accepted by the King, and sworn to by the Assembly, that body closed its sittings, Sept. 30, 1791. From its having framed the constitution (which lasted only 12 months), this assembly is usually called the Constituent Assembly. It made way for the *Legislative Assembly*, which was to reform the civil and criminal laws in accordance with the spirit of the new constitution. A decree provided that no member of the Constituent should be returned to the Legislative Assembly; and, as a result, the only men whose experience made them fit to carry on the work of the Revolution were excluded, and the Legislative Assembly was captured by untried and hot-headed radicals. The Assembly, from the very first, began an attack upon the remnants of the royal authority, which culminated in the rising of Aug. 10, 1792, the suspension of the royal power, and the establishment of the Republic by the National Convention in September, 1792. The constitution had provided for an appeal to the nation in extreme cases, and the Legislative Assembly exercised that right by convoking a *National Convention*, which was invested with the powers of the sovereign, was to decide the fate of the monarchy, and remodel the whole political system.

The title of National Assembly has been assumed by various other parliamentary bodies, originating in popular commotions and aiming at radical political changes; as the French Assembly that met after the Revolution of February, 1848, followed, May, 1849, by a legislative assembly; the German National Assembly at

Frankfort, known as the Frankfort Parliament (1848); the Prussian National (Constituent) Assembly; and the legislative body in France, which was instituted in 1871 after the fall of the Empire. Under the existing French Republic, the Senate and the Chamber of Deputies unite to form the National Assembly for amending the constitution and electing the President of the Republic.

For further information, consult: H. Morse-Stephens, *History of the French Revolution* (London and New York, 1886-91); Buchez and Roux, *Histoire parlementaire de la révolution française* (Paris, 1834-38); Montigny, *Mémoires de Mirabeau* (8 vols., Paris, 1834-43); Oulard, *The French Revolution* (3d ed., trans. from the French, London, 1910). See FRANCE.

ASSEMBLY, RIGHT OF. The right of the people peaceably to assemble for any purpose not expressly prohibited by law is an essential principle of popular government as understood under the British and American constitutions. While there seems to be no explicit declaration of the right in any English statute, it is deemed to be implied in the right of petition affirmed in the Bill of Rights enacted by Parliament on the accession of William III (1689). In the Federal Constitution of the United States, as well as in the constitutions of the several States, it is expressly declared, usually in connection with the right of petition. In the Federal Constitution it forms a part of the first amendment, which provides that "Congress shall make no law . . . abridging . . . the right of the people peaceably to assemble and to petition the government for a redress of grievances."

It will be observed that these constitutional provisions are aimed only at congressional or legislative interference with the right of assembly and do not explicitly protect it against arbitrary interference on the part of administrative or judicial officers, and it is in the unauthorized use of the powers conferred on such officials that the danger to the due exercise of the right lies. Such interference is, of course, illegal, as is any arbitrary and unauthorized exercise of power by the authorities of the state or nation, the remedy afforded being an action at law for damages or a criminal proceeding under federal or state statutes. While these provisions are theoretically adequate to protect the rights, they have not in practice always proved sufficient to secure it against occasional infringement.

Unlawful assembly is a criminal offense at common law. It is defined as "an assembly of three or more persons, either with intent to commit a crime by open force, or intent to carry out a common purpose, lawful or unlawful, in such a manner as to give reasonable grounds to apprehend a breach of the peace in consequence of it." It is distinguished from the offense of *riot* (q.v.) by the fact that the latter involves an actual attempt to carry the unlawful purpose of the assembly into effect.

ASSEMBLY OF DIVINES. See WESTMINSTER ASSEMBLY.

ASSEN, a'sen. The capital of the province of Drenthe, in the Netherlands, 15½ miles by rail south of Groningen (Map: Netherlands, E 2). By a canal (Hoofdvart) it is connected with Meppel and the Zuider Zee. Assen contains an interesting set of buildings which, before the Reformation, were a nunnery, and which now contain the town hall, provincial offices,

and a museum. Near the town are the "Giants' Caves," mentioned by Tacitus, with huge glacial-boulders resembling the rocks at Stonehenge. Pop., 1900, 11,191; 1910, 13,000.

ASSENT', ROYAL (Lat. *assentari*, to agree with, assent, from *ad*, to + *sentire*, to feel). The official act by which the sanction of the crown is given to bills which have passed both houses of Parliament. Under the modern parliamentary system this assent is given as a matter of course, the veto of the crown on legislation being practically obsolete. But in theory, the royal assent is still necessary, all acts of Parliament being "by the King's majesty, by and with the advice and consent of the lords spiritual and temporal, and commons in Parliament assembled." By the recent Parliament Act (1911) the assent of the Lords which has been twice refused to a bill passed by the Commons becomes unnecessary if the bill is passed a third time by the Commons without substantial change, provided that at least two years have elapsed since the introduction of the bill. (See PARLIAMENT; LORDS, HOUSE OF.) The principle of the royal assent to legislation has been adopted in all countries which have adopted a parliamentary form of government as well as in the government of the United States and of the several States. Nowhere else has it been reduced to the shadow that it has become in Great Britain, the veto power of the crown, of the president, or the governor being freely and effectively exercised. (See VETO.) Consult Blackstone, *Commentaries on the Laws of England*, and Amos, *A Primer of the English Constitution and Government* (London, 1886).

ASSER, a'sēr, TOBIAS MICHAEL CAREL (1838-1913). A Dutch statesman, born in Amsterdam. He was appointed in 1862 professor of law in the Athenaeum of Amsterdam, and from 1876 to 1893 held a similar chair in the university. In 1875 he became counselor to the Foreign Office and in 1893 member of the Dutch Council of State. He was delegated to represent Holland in the Peace Conference at The Hague in 1899 and in the International Court of Arbitration in 1900. He received the Nobel peace prize in 1911. A profound student of international law, he published *Schets van het Nederlandsche Handelsrecht*, 'Outlines of Dutch Commercial Law' (1899); *Schets van het International Privatrecht*, 'Outlines of Private International Law' (1879); *La codification du droit international privé* (1901); *Arbitrage international entre les Etats-Unis d'Amérique et la Russie* (1902).

ASSESS'OR (Lat. *assessor*, one who sits beside, from *ad*, to + *sedere*, to sit). In Roman law, a person called in by those administering public justice to sit with them and give legal advice and assistance. The practice has continued in those European countries in which the Civil Law system prevails, and such assessors constitute a regular part of the judicial machinery. In Great Britain statutory provision is made for the employment of assessors in various courts. The House of Lords may call in the aid of one or more assessors in admiralty appeals; the Privy Council, in ecclesiastical cases; the Court of Appeal, in any cause or matter; and the county courts, on the application of either party. The admiralty division may call in nautical assessors, and in ecclesiastical courts the bishop or his representative (known as the "Ordinary") sits with assessors.

It is the practice in some of the United States district courts, sitting in admiralty, for the judge, even without statutory authority, to call in the assistance, in difficult negligence cases, of two experienced shipmasters, who sit with the judge during the trial and give their advice upon questions of seamanship or the weight of testimony. Except in admiralty causes, the employment of assessors by courts does not obtain in this country. Our foreign consuls exercising a judicial authority under treaty in certain Oriental countries, are authorized in criminal cases to summon associates, who act in the capacity of assessors. (U. S. Rev. Stat., sec. 4106.)

In this country, however, the term is applied generally to officers who assess or value property for taxation. Their functions are partly ministerial and partly quasi-judicial. Where acting in a quasi-judicial capacity, they are not liable to a civil action for errors of judgment, nor in some States, e.g., New York, for willful misconduct. The only redress for the taxpayer injured by such misconduct is by a proceeding to review and correct the assessment or by a criminal prosecution. (Consult the works referred to under CIVIL LAW; ADMIRALTY LAW; TAX.

ASSETEAGUE, *äs'sä-täg'*, **ISLAND**. A small island off the east coast of Virginia, forming a part of Northampton County (Map: Virginia, J 4). It is surmounted by a brick lighthouse 129 feet high.

ASSETS (Lat. *ad satis*, up to what is enough). One of those terms in the law of England which in itself bears evidence of a Norman origin. It is derived from the French word *assez*, or more exactly, in Norman-French, *assetz*, 'enough,' or 'sufficient,' signifying the property of a deceased person, which is sufficient in the hands of his executor and heir for the payment of his debts and legacies. In strictness, therefore, the term is not applicable to the property of a person who dies intestate or without any debts to be paid. In general acceptance, however, it is understood to mean the property left for distribution by a deceased person, whether testate or intestate; and in commerce, and also in bankruptcy and insolvency, the term is used to designate the stock in trade and entire property of all sorts belonging to a merchant or trading association, or to a bankrupt or insolvent.

Assets, in the law of administration, are either *personal* or *real*, the former comprehending such goods, chattels, and claims as devolve on the executor, and the latter including all real estate, whether devised or descending to the heir at law. Assets are also characterized as *legal* or *equitable*, according to the nature of the remedy which may be used by creditors against the executor or heir. These distinctions were important in connection with the common law rule that the realty of a deceased person was liable only for the payment of specialty debts (i.e., debts secured by a sealed instrument, as a bond), unless made liable for the payment of other debts by will. In the former case the specialty creditor was compelled to proceed against the heir or devisee; and in the latter case simple contract creditors might proceed against the executor to recover from either the real estate devised or from the personal property of the decedent. In the case of equitable assets courts of equity made no distinction in their

distribution between specialty and simple contract creditors. Under modern statutes sometimes certain classes of debts such as taxes or funeral expenses are given a preference, but generally all creditors are placed on an equal footing, and, where there are several creditors, no one can, by anything done after the death of the decedent, secure priority over any other. If, after exhausting the whole assets which have come into his hands, by the payment of debts in due order, the executor or administrator is afterward sued by a creditor remaining unpaid, he is entitled to protect himself by an allegation that he has fully administered, or, technically, by a plea of *plene administravit*; and upon this plea the creditor is entitled to judgment that he shall be paid out of any other assets that shall come to the defendants, which is called a judgment of assets *in futuro*.

Assets is not a technical term in Scots' law, but it is nevertheless much used in the legal business of that country. Consult the authorities referred to under ADMINISTRATION; BANKRUPTCY; DISTRIBUTION; INSOLVENCY.

AS'SIDE/ANS. See CHASIDIM.

ASSIENTO, *ä-syän'tó* (Sp. *asiento*, seat, contract, treaty). A word specially applied to a compact between Spain and some foreign nation, according to which the Spanish government conferred upon the latter, under certain conditions, the monopoly of the supply of negroes for its American colonies. It was Charles I of Spain who first concluded an *asiento* with the Flemings in 1517. Next, a similar compact was entered into with the Genoese (1580), the Portuguese (1696), and on the accession of Philip V to the Spanish throne, in 1701, with the French Guinea Company, which from that time took the name of the *Asiento* Company, upon the understanding that for 10 years it should have the exclusive right of annually importing 4800 negroes into the continent and islands of Spanish America. The *asiento* was next transferred to England at the Peace of Utrecht, in 1713, and made over by government to the South Sea Company for 30 years, permission being also granted to the company to send yearly, during the term of contract, a ship, carrying 500 tons of goods, to these Spanish colonies. The misunderstanding that grew out of this last clause, of which England took advantage to carry on an extensive contraband trade, contributed not a little to the war that broke out between the two nations in 1739. By the Treaty of Aix-la-Chapelle the South Sea Company was confirmed in its title to the *asiento* for a period of four years, but this right was surrendered in the Treaty of Madrid, Oct. 5, 1750 in return for £100,000.

ASSIER, *ä'syá'*, ADOLPHE D' (1828—). A French traveler and philologist, born at Labastide de Séron. He became professor of mathematics and member of the Academy of Sciences at Bordeaux, and made numerous voyages abroad, results of which are embodied in the works: *Le Brésil contemporain, races, mœurs, institutions, paysages* (1867); and *Souvenirs des Pyrénées* (1872; 3d ed., 1885). He also published various other important works, of which the following are devoted to philology: *Essai de grammaire générale, d'après la comparaison des principales langues indo-européennes* (1857); *Histoire naturelle du langage; Physiologie du langage phonétique* (1868); *Le langage graphique* (1868).

ASSIGN', ASSIGNEE'. In the most general sense "to assign" means 'to convey or transfer to another any property right or interest.' At the common law the term was specifically applied to the transfer of personal property and, in a still more limited sense, to the transfer of *choses in action* (i.e., claims for money due or to become due; negotiable paper after maturity, and the like). To-day the term is generally employed, especially in the United States, as equivalent to the grant, conveyance, or transfer of any property right, whether real or personal.

An assignee (sometimes shortened to "assign," as in the phrase "heirs and assigns") is a person to whom property or a right, as above defined, is transferred: the assignor or assignee becoming invested with the rights formerly belonging to his assignor. Under some circumstances a person in whom property is vested by operation of law, as an executor or administrator is known as an *assignee in law* as distinguished from the ordinary assignee above described, who is known as *assignee in fact*.

The term "assignee" has a special and distinctive use to designate one to whom under an insolvent or bankrupt law, the whole estate of a debtor is transferred to be administered for the benefit of creditors; thus, "Assignee for the benefit of creditors," "Assignee in bankruptcy." See BANKRUPTCY; INSOLVENCY.

AS'SIGNA'TION. A legal term in Scotch conveyancing, analogous in meaning to the English word "assignment" and "conveyance," signifying the process by which the holder of any property right, or the creditor in any obligation, or the proprietor of any property not strictly feudal, transfers his right or estate to another. See ASSIGNMENT; CONVEYANCE.

ASSIGNATIONS (Lat. *ad*, to + *signare*, to sign; cf. ASSIGNATS). The paper currency of Russia, issued by Catharine II, about 1770, to assist in carrying on the war against Turkey. Like similar experiments in other countries, before and afterward, the assignments started at par, but rapidly declined to less than 25 per cent. About 20 years later the assignments were the general currency; but traders began to refuse them, and the most stringent edicts of Paul failed to force them into good standing. In the war with Napoleon heavy issues were made, the value keeping steadily at about 4 rubles of paper to 1 of silver. The rate rose somewhat after the peace, and fluctuation became so troublesome that the government fixed the value by special law. In 1839 the silver ruble was made the unit, and the value of assignments fixed at 3½ for 1 of silver. At the same time bills of credit were issued which took the place of the assignments.

ASSIGNATS, *à'sé'nyá'* or *às'tig-náts* (Fr. *assignat*, from Lat. *p.p.* *assignatus*, assigned, from *ad*, to + *signare*, to sign). Paper money issued during the French Revolution, which derived its name from the public domain *assigned* for its ultimate redemption. One of the earliest acts of the Revolutionary authorities was the confiscation of lands belonging to the crown and the Church, to which later the estates of the *émigrés* were added. These lands were to be used as a source of income for the state, but the process of selling was too slow to meet the pressing needs of the treasury. The government therefore issued what were practically treasury notes (*q.v.*), bearing interest at 5 per cent, for the total amount of 400,000,000 livres (francs). They

were to be retired within five years from the proceeds of the sales of the national lands which were assigned to this purpose.

When first issued, the notes were sold in the market in the same way as treasury notes in our own history. They were in fact securities, the lowest denomination being of 200 livres (\$40), and on the first issue, in December, 1789, were well received and suffered no depreciation. By a decree of April, 1790, these notes acquired a legal tender character, and the interest upon them was reduced to 3 per cent. The payment of interest was suppressed in October, 1790, after the maximum issue had been increased in the preceding month to 1,200,000,000 francs.

After this date the successive issues of this paper money became more and more rapid. As early as 1791 notes of 5 francs appeared; and later, notes of 10 sous (one-half franc) were issued. So rapid was the issue of notes that the record of their amount is lost; the formality of passing laws was omitted, and the executive authorities increased the issues by simple decrees. By the year 1793 the circulation had reached nearly 4,000,000,000 francs, but the actual value of the notes had sunk to one-fifth their nominal value. Futile efforts were made to sustain the value of the notes. An effort, late in 1793, to fund them, and thus restrict their quantity, proved ineffective, while penal provisions, culminating in a decree of Sept. 23, 1793, punishing the refusal to take them in payment, or taking them at a discount, with death and confiscation of property, were equally powerless. The wholesale issue of paper money could only have the most disastrous results. In July, 1794, 100 francs in paper were valued at 34 francs in coin; but in January, 1795, the value had fallen to 18 francs, and in July of the same year was less than 3 francs. In February, 1796, when the issues were finally abandoned, 100 francs equaled about 30 centimes in coin. The whole issue of money had been upward of 45,000,000,000 francs. It was now proposed that the assignats be redeemed at the rate of 30 to 1 in a new form of paper money known as territorial *mandats*. The *mandats* had this advantage over assignats, that they enabled the holder to take possession of public lands immediately, while the assignats could be offered only in lieu of the purchase price at a sale. As much as 1,400,000,000 of this money was issued, but it soon lost any value which it might have had and was finally repudiated by the refusal of the government to receive it at its own treasuries. By a law passed in July, 1796, it was enacted that every one was entitled to transact business in whatever medium he pleased, and that *mandats* might be taken only at their current value in private transactions, as well as in the payment of taxes. On May 21, 1797, all outstanding assignats were declared void. This riotous issue of paper worked rank injustice and a complete redistribution of the national wealth. If its history is comparatively unknown except in generalities, it is because it was only one of a vast number of measures which reversed the whole order of society during the Revolutionary period. Consult René Stourm, *Les finances de l'ancien régime et de la révolution française* (Paris, 1885).

ASSIGN'MENT (from Lat. *ad*, to + *signare*, to sign). In law, a transfer or making over to another of any property, real or personal, or of any right therein. The term is usually,

although not with strict accuracy, applied to a transfer in writing, as distinguished from a transfer whose validity depends upon mere delivery or unwritten agreement; and it is more frequently applied to the transfer of personal property than of real property, which requires to be transferred by an instrument under seal, and which at early common law required other formalities, not referable to the doctrine of assignment, in order to effect the conveyance. The formal words of assignment are: *assign*, *transfer*, and *set-over*. At common law all personal property in being, and other property not yet in being, but having potential existence (as crops planted but not yet grown, the wool to be grown by the assignor's flock of sheep within the year, etc.) could be freely assigned, and the assignment vested a present property right in the assignee. Courts of equity also recognize assignments of property to be created *in futuro* when such assignments are made for value, and enforce them against the assignor whenever this property comes into existence. At common law, the assignment of a chose in action, other than commercial paper, was forbidden, as violating the rules against maintenance (q.v.) and champerty (q.v.). Such assignments, nevertheless, conferred upon the assignee the right to sue in the assignor's name, and, if the assignment was made for value, equity would restrain the assignor from interfering with the assignee's rights thereunder. To this rule, however, there were certain exceptions, based on grounds of public policy. Thus equity refused to protect the assignment of the salary of a public officer or judge, rights of action based on personal torts, etc. In the United States, generally, assignments of legal choses in action capable of manual delivery, such as bonds and insurance policies, when accompanied by delivery, are protected by courts of equity, although made without consideration. Equitable choses in action have always been held assignable, although the assignment is made without consideration; and in the United States to-day legal choses in action are generally made subject to the same rule by statute.

An assignment for the *benefit of creditors* is an assignment of real or personal property, or both, to a trustee, usually made by an insolvent debtor for the protection of his creditors and to obtain discharge from further obligations. These are regulated by special statutes in each jurisdiction. See BILL OF SALE; CHOSE IN ACTION; BANKRUPTCY; INSOLVENCY; CONTRACTS.

ASSIMILATION (Lat. *assimilare*, *assimulare*, to make like, from *ad*, to + *similis*, like, similar) IN PLANTS. The term "assimilation" is used in at least two ways by plant physiologists. Most of them include under the term all the processes involved in the transformation of inorganic materials (salts, carbon dioxide, and water) into the tissues themselves (cell walls and protoplasm). In this sense the term includes the synthesis of carbohydrates, fats, proteins, and other substances, along with the transformation of these into the tissues. The term thus used is synonymous with anabolism, and stands in contrast to digestion, fermentation, and respiration, or catabolism.

Sometimes the term is applied to the processes of changing the synthesized organic materials into the tissues—the carbohydrates, fats, proteins, etc., into walls and protoplasm. Concerning the process of transforming soluble carbo-

hydrates and allied substances into wall structures (cellulose, hemicellulose, pectin, etc.), it is now quite well established that enzymes (q.v.) are active, at least in the later stages. These enzymes are included under the general head of cytochrome. Concerning the transformation of proteins, carbohydrates, fats, and lipoids, all entering into the composition of protoplasm, into living protoplasm itself we know but little. Proteins constitute more than 50 per cent of protoplasm, but it is not known to what extent they are tied chemically to the carbohydrate, fat, and lipid constituents. It is known that physically the protoplasm is a colloidal gel or sol. (See COLLOID.) As a disperse system it is far less stable than the gels and sols of most proteins. This is shown by the fact that protoplasm is more quickly coagulated by heat, especially of medium intensity, than are most proteins. Unlike proteins, also, even pressure or mechanical agitation may coagulate protoplasm. Such coagulations may be incipient or reversible or they may be permanent. In the latter case death results. The instability of the protoplasmic colloidal system is one of the marks of living matter. This may be in part due to the nature of the proteins entering into its composition or in part to the combination of the proteins with other compounds. With the lack of definite knowledge concerning the chemical constitution of protoplasm, and in the absence of very definite knowledge concerning its physical state and structure, it is not strange that little that is definite can be said concerning the synthesis of protoplasm. See CELL; PROTOPLASM; PHOTOSYNTHESIS; CHEMOSYNTHESIS; NUTRITION; FOOD OF PLANTS. For assimilation in animals, see NUTRITION.

ASSING, äs'sing, LUDMILLA (1827-80). A German biographer and translator, the niece of Varnhagen von Ense. As an orphan she was adopted by her uncle and received a superior education. She wrote for newspapers and reviews and published in 1857 a biography of Elise, Countess von Ahlefeldt. She edited and published, after her uncle's death, Alexander von Humboldt's letters to him; also her uncle's memoirs and his diaries (14 vols., 1861-71). The political matter in the diaries so offended the court that she was prosecuted and sentenced to eight months' imprisonment. But she had gone to Florence, and the punishment could not be inflicted. She immediately published the remaining volumes of the obnoxious diary, to which the court answered by the form of a trial and sentence to further imprisonment for two years.

ASSINI, äs-sä'nē. A seaport village and trading centre in the Baule district, French Sudan, Africa. It lies between Lake Tando and the sea, on the Ivory Coast, about 80 miles west of Axim and 120 miles west of Cape Coast Castle. Logging is the principal industry, and much coffee is grown. Pop., 3000.

ASSINIBOIA, äs-sin'i-boi'a (Ojibwa, *asinini*, stone + *bea*, the Dakota). Formerly a district in Canada, formed in 1882 out of the Northwest Territories, containing 88,879 square miles (of which 600 square miles are water). It was bounded on the north by the former district of Saskatchewan, on the east by Manitoba, on the south by the United States, on the west by the former district of Alberta. The eastern third of the district belongs to the second or middle plateau and has an average elevation of about

1600 feet. The remainder of the district to the west belongs to the third or west plateau, with an average elevation approaching 3000 feet. The precipitation is light, and the temperature is subject to great extremes of heat and cold. The severity of the winters is often moderated by the warm chinooks from the west. The greater portion of the district consists of prairies. The eastern plateau is best adapted to agriculture, there being a great deal of very excellent wheat land, and mixed farming is practicable. In this section the agricultural industry has developed notably in recent years. On the western plateau there is a greater variety of soils, and it is not so well adapted to cultivation, but is excellent for grazing purposes. Lignite is found in a large portion of the district and is mined in the southeast corner. Regina was the capital of the district and also of the Northwest Territories. In 1905 the district of Assiniboia was divided between the newly created provinces of Alberta and Saskatchewan, by far the greater portion going to the latter. For further details see ALBERTA; SASKATCHEWAN.

ASSINIBOIN, äs-sin'-boin ('stone-boilers,' a name given by some of the Algonquian tribes, and supposed to allude to their former method of boiling water by dropping hot stones into it). A tribe of Siouan stock, formerly roving over the plains between the Missouri and the Saskatchewan, on both sides of the Canadian border. They are said to have been originally a seceded band from the Yankton Dakota, and speak a dialect of the Dakota language, but are generally considered as a distinct division. In 1904 there were 1234 on reservations at Fort Belknap and Fort Peck, in Montana, while the remainder, amounting, in 1902, to 1371, are on reservations on the other side of the line in British America. Consult R. H. Lowie, "The Assiniboine," *Anthropological Papers, American Museum of Natural History*, vol. iv (1910).

ASSINIBOINE. A Canadian river, with two large affluents, the Qu'Appelle and Souris rivers, rising in Saskatchewan, and flowing east into the Red River at the city of Winnipeg (Map: Manitoba, K 5). From the source of its principal headwater, the Qu'Appelle, in the southeast of Saskatchewan, to its outlet in the Red River, it has a course of 450 miles. Drainage basin, 52,600 square miles. The river derives its name from the Assiniboin Indians. See ASSINIBOIN.

ASSISI, äs-së'zë (anciently, Umbrian, *Assisium*). An episcopal city in Umbria, central Italy, 15 miles east of Perugia (Map: Italy, G 4). It is famous as the birthplace of St. Francis, whose body rests here in the crypt of the first monastery of the Franciscans, which he founded in 1208. The monastery was suppressed in 1866, and part of the building was converted by the government into a school for the sons of teachers. Its two churches, built one above the other, also date from the thirteenth century, and contain many old and valuable paintings and other objects of interest. Besides the "convento sacro," there are 11 other monasteries, of which the largest is the Portiuncula, which has a richly decorated church with a cupola by Vignola. Every year, at the beginning of August, Assisi is visited by great numbers of pilgrims. There are in evidence the remains of the ancient Assisium, including the forum, baths, and aqueducts. In the piazza stands a beautiful portico of the ancient temple of Minerva. There are

olive groves and mineral springs in the vicinity. Manufactures are insignificant. Pop., 1881, 6704; 1901 (commune), 17,378; 1911, 18,587. Consult Cruikshank, *The Umbrian Towns* (London, 1901), and Gordon, *Assisi* (1904).

ASSIST'ANCE, WRIT OF. The process issuing from a court of equity to a sheriff, marshal, or similar officer, for the enforcement of an order or decree for the possession of lands. In England this process is now styled a writ of possession. Formerly the latter term appears to have been confined to process for the enforcement of a decree for the possession of a leasehold interest in land; and in some of our States it is used to denote the process for enforcing a judgment in a common-law action for the possession of lands, while like process from a court of equity is called a writ of assistance. During our Colonial period writs of assistance were issued by the courts to officers of the customs, authorizing them to take a constable or other public officer, and to enter any building and there to seize, and thence to bring, goods upon which customs duties had not been paid. For a learned discussion of these writs, consult Quincy, *Reports, Superior Court of Judicature, Province of Massachusetts Bay, 1761-72; With an Appendix upon Writs of Assistance* (Boston, 1865). See OTIS, JAMES.

ASSIUT, or **SIUT**, äs'së-ööt'. A city of upper Egypt, situated near the west bank of the Nile, in lat. 27° 10' N., 248 miles south of Cairo (Map: Egypt, C 2). In very early times it was a place of importance, owing to its favorable situation in the midst of a fertile district at the starting point of the great caravan route leading to the oases of the Libyan desert and the Sudan, but it has lost some of its commercial greatness because much of its trade has been diverted. It was the seat of worship of the deity Wep-wat, who is represented in the form of a jackal or wolf, and hence in later times the city was called by the Greeks Lycopolis, or 'Wolfstown.' Under the twelfth dynasty the monarchs of Assiut seem to have maintained great state, and their rock-hewn tombs in the vicinity are richly adorned with sculptures and paintings and contain inscriptions of great historical value. Plotinus, the greatest of the Neo-Platonic philosophers, was born here, and about 205 A.D. the city and the adjacent district were converted to Christianity. Many anchorites took up their abode in the neighboring necropolis, and one of these, John of Lycopolis, is said to have predicted to Theodosius his victory over Eugenius in 394. The modern town is situated on the Nile Valley Railway. It has several fine mosques, a college, bazaars, good baths, and well-built houses. It is noted for its pottery and extensive manufactures of the best pipe bowls. There is trade in linen, embroidered leather goods, carved ivory, corn, and fruit, and fine tulle shawls are made. It is the residence of the Governor of Upper Egypt. Pop., 1882, 31,575; 1907, 39,442. Consult: *Description de l'Égypte* (Paris, 1809-29); Lepsius, *Denkmäler* (Berlin, 1849-58); Mariette, *Monuments of Upper Egypt* (London, 1877); Griffith, *The Inscriptions of Siût and Dêr Rîfeh* (ib., 1889).

ASSIZE' (Lat. *assidere*, to sit by, from *ad*, to + *sedere*, to sit). Originally, in English law, a jury sitting together for the trial of a cause. Later, the term came to signify the court which summoned the jury by a commission of assize.

In the plural form, "assizes," it is the equivalent of circuits, and is applied not only to the judicial assemblies of the superior courts in the various counties, for the trial of civil and criminal cases, but also to the sittings of such courts. The term is used, too, as synonymous with edict, or decree, or even with law. A writ of assize was an action to recover possession of land, so named because it commanded the sheriff to summon a jury, or assize. It was of great importance in the early history of the law of real property in England, but was superseded by the writ of ejectment and other simpler remedies. Rents of assize are the rents of freeholders or copyholders, which had been fixed in amount by the assize of the freeholders of a manor and continued by custom, as distinguished from arbitrary rents or rents fixed by agreement. Consult Blackstone, *Commentaries on the Laws of England*.

ASSIZE OF CLARENDON. See CLARENDON, ASSIZE OF.

ASSIZE OF JERUSALEM. The name given to a body of laws in the Latin kingdoms of Jerusalem and Cyprus, formerly supposed to have been compiled by Godfrey de Bouillon, but dating in reality from a later period. The assize consisted of two parts, the Assize of the High Court, and the Assize of the Court of Burgesses. In the "Key to the Assize," "assize" is defined as "everything which one has seen in use and customary in the kingdoms of Jerusalem and Cyprus." This aids in determining the much-debated question of its history. The Assize of the High Court was probably a body of customs, unwritten for the most part, until Jean d'Ibelin, about 1255, attempted to frame them into a code. In order to give importance to his compilation, he inserted at the beginning a historical sketch, in which he states that the assize had been framed by Godfrey de Bouillon and deposited by him in the church of the Holy Sepulchre, and that this code had been lost when Saladin conquered Jerusalem. This account is now recognized as fabulous. The book of Ibelin was reworked twice, in 1368 and in 1531, and the present text is based upon the latter redaction. The Assize of the Court of Burgesses was probably framed in the second half of the twelfth century, but the date is a disputed point. The two codes, together with the comments of jurists of the thirteenth century and later, throw much light upon the history of the kingdom of Jerusalem, but the Assize of the High Court must be used with great caution, as it is a document of the sixteenth century, and as it has been revised twice to suit the needs of principalities other than the Latin kingdom of Jerusalem: for the assize passed from Jerusalem to Cyprus, and later to the Morea, and was adapted to meet the needs of the later kingdoms. The best edition is by Beugnot in the *Recueil des historiens des Croisades* (1841-43). The Assizes of Antioch have been discovered, in an Armenian translation, and published, with a French version, at Venice, in 1876. Consult Dodu, *Institutions monarchiques dans le royaume latin de Jérusalem* (Paris, 1894).

ASSMANNSHAUSER, äs'mäns-hoi'zër. A village in the Prussian province of Hesse-Nassau, on the right bank of the Rhine, about 3 miles below Rüdesheim. It is celebrated for its red wine, made of a Burgundy grape and distinguished for its aromatic flavor, and its uncom-

mon strength and fire. There are mineral springs and baths. Pop., 1895, 1100; 1900, 1000.

ASSOCIATIONISM. See ASSOCIATION OF IDEAS.

ASSOCIATION OF IDEAS. The phrase "association of ideas" seems to have been first used by the English philosopher, John Locke, although the facts to which it gives expression were often discussed long before Locke's time. Even as early as the time of Aristotle, we find four classes of association described; that is, four ways in which the mind passes from one idea to another. These are association by similarity, by contiguity, by contrast, and by succession. It was not, however, till the time of Hume that the principles of association became "laws" which were intended to explain not only the way in which idea follows idea, but also the means by which the mind builds up all its knowledge of the world. Hume conceived of association as a "gentle force" arising in "original qualities of human nature," and "pointing out to every one those simple ideas which are most proper to be united into a complex one." Since the days of Hume the principle of association has played a very large part in various systems of philosophy, particularly among the writers of the empirical school of philosophy in England. It has been worked out most elaborately in the writings of James Mill, Alexander Bain, and Herbert Spencer. At times the advocates of the doctrine have gone so far as to speak of association as a law as universal in the mental world as that of gravity in the physical world. The theory thus developed is known as associationism; a theory which sees in the laws of association the fundamental modes of mental action.

Association has now a different significance among writers on psychology. In the works to which we have referred it had not so much a psychological as an epistemological significance (see EPISTEMOLOGY); i.e., it was regarded as a principle of explanation of our knowledge of things. As thus conceived, associationism implied an atomic arrangement of the mind, and furnished rather an external and mechanical means for putting the various elements of knowledge together than an intrinsic mode of synthesis. It is only very gradually that the association of ideas has come to lose its philosophical flavor within psychology, and to represent a grouping of mental processes instead of standing as an explanation of experience in general. But even within modern psychological systems it has received so many shades of meaning that it is hard to define. It has stood (a) as the one mode of connection of ideas; or (b) as the sole condition of reproduction, i.e., the way in which "past" ideas are brought again to mind; or (c) as reproduction itself—as when one is said to associate black with sorrow; finally, (d) it has signified a particular kind of grouping of mental elements. Let us see in what directions these conceptions are open to criticism.

First of all, we will examine association as

the one mode of connection of ideas. This definition of association is too narrow. Unless we are content to make association a perfectly arbitrary thing, we must extend it beyond ideas. When, e.g., we look at a stone, we seem to see a heavy, hard, rough, cold, resisting mass. What we actually see is, of course, only the "look" of the stone; the shape, the color, and the brightness. We "think in" the rest from what our past experience has told us of the "properties" of the stone. This "thinking in" is just the same kind of an operation as is to be found in association. We have a sense-experience completed by ideational elements. (See SENSATION; IDEA.) Since there is no successive "calling up" of the parts, and since we have not a grouping of idea with idea, it is plain that we cannot speak of an association of ideas. We must rather speak of this form of connection as a *simultaneous association*.

From this simplest form of associative grouping we pass by short stages to the *successive association*, the association in which part follows part. Even here it need not be a sequence of ideas which is experienced. A *perception* may start the train. The sight of the stone may bring the verbal idea "geology," and this, in turn, the idea of the Carboniferous period, and so on. It is only in cases of abstraction—as in reverie—that our primitive pilot, perception, is off duty, and we are guided by the central nervous processes underlying ideation.

We may dismiss the theory that association is the sole cause of reproduction (the second definition) by pointing out that the previous joining of ideas is not the only cause for the reproduction of one by another. This may be due—to mention only two exceptions—to mood (we are likely to recall melancholy events when we are in a melancholy mood); or to a similar relation which two ideas chance to have to a third (as when "dog" reminds us of "cat," both standing in the class of domestic animals). But neither is association satisfactorily considered as reproduction or recollection itself. It becomes in this case only a subheading under memory, and tells us nothing of the relation in consciousness of process to process. This leaves us with only our final definition, which says no more than that when sensational and ideational elements group themselves under certain conditions they may be said to associate. Association then becomes simply the form of grouping in which the elements stand united. Let us look more closely into this group. First, we must distinguish between the processes which do the associating and the materials united in association. In the simultaneous association, it is always the sensational elements which start the association. These it is in the case of the stone which make the perception a stone-perception instead of a table- or a wall-perception. It may happen, however, that a tendency toward reproduction of certain ideas wholly diverts the normal course of the association or the assimilation, as it may be called. Think, for example, of the apprehensive traveler who comes upon the stone in the dusk and takes it for a ghastly head. Or it may be mood, or sentiment, or temperament, or a violent emotion, which determines the course of the perception. Take, as an illustration, the transformation of the stone by poetic fancy into a treasure-casket or a plaything of the gods. When we look again, at the level of the successive associations, for the critical portion of the perception or idea, the part which does the

associating, we find that it may be a single element or the whole perception or idea which is the determining factor. The red (sensation) in a sunset may bring the idea of blood; or a geometrical figure (perception) may suggest the arrangement of petals in a flower; or a melody (perception) an opera in which it has been sung.

The consideration of association as a form of mental connection removes one more difficulty which the older associationism encountered. It makes a more intimate relation within a perception or a train of ideas than the latter could posit. There is a unity in the associated members. We may even speak of a whole perception or train of ideas as being "bright," "vivid," "pleasing," as if it were a single thing. This would hardly be appropriate if the connection were entirely external and simply brought the elements into juxtaposition.

If, now, we are to speak of "laws of association," we can mean only the conditions under which a given association is made. These conditions will stand in place of the regularity with which the environment brings together certain groups of stimuli and presents them to the organism. Conceiving our laws thus, we find that the old category of contiguity comes nearest to expressing the truth of the matter. Similarity is a very doubtful rubric. In the first place, the term is too indefinite to be of much service. Almost anything may be considered more or less similar to anything else, and it is very hard to see how simple likeness should determine an association. At least, greater likeness does not seem to mean greater associability. It seems to be possible, in every case, to reduce an apparent "association by similarity" to some other form; there may be partial identity, in which case the identical member of two groups is first experienced with the one and then with the other, as the red of the sunset passing over into the red of blood; or there may be simple contiguity, the similar objects having stood together in experience; or there may be an indirect association, such as we found above, where two things stand in the same relation to a third, as two objects to the name of the class to which they belong.

On the other hand, "contiguity" can be regarded as an explanation only when we think of it in terms of neural activity. It is true that we can state it in general psychological terms, saying that conscious connections once set up tend to persist, so that when a single item (sensation, fusion, perception) comes to consciousness, it tends to bring with it other items with which it has appeared before in consciousness. This formula, which may be regarded either as a law of habit—if we think of the tendency to persist—or as a law of reintegration—if we think of its results—receives, however, its full significance only when we translate it into physiological terms and state it as a tendency in the nervous system to do that which has been done before. Neural tracts which have once been excited together tend to functionate together again; hence if an excitation finds its way to one part of the brain, there is a tendency for the parts previously involved to be re-excited. Now, just what path an excitation will take in any particular case we cannot foretell; but we are able to name with a good deal of certainty the factors which contribute to association, i.e., to state the conditions under which the tendency to form old connections are realized. At this point

experiment comes to our aid. It enables us to invite association under first one set of conditions and then another and to watch the results. If a given process, *a*, has formed several connections, at various times, say, with *d*, *s*, and *z*, the one of these connections which is actually realized when *a* is brought to consciousness will depend upon the frequency of connection of each with *a*, the recency of connection, the relative vividness of *d*, *s*, and *z*, their relative positions in a series of processes, and their relative power to attract a wandering attention. The comparative values of these factors are determined by presenting to the observer simple stimuli (as colors, letters, or sounds), arranged in definite groups of two, and then asking him, when the one member of a group is given again, to recall the other member which was previously given with it. The series are so arranged as to bring into prominence, one after another, the various factors.

In investigating association, we have not only to give a quantitative measure of associability in terms of sensational elements; we must also study (1) the influence of other processes which chance to stand in consciousness, and (2) the nature of the associative consciousness: i.e., we must note what there is in mind when an association is being made. The first of these problems is illustrated by the overwrought traveler who "colors" his association by his apprehensiveness, or by the proof reader who becomes interested in his page and easily overlooks typographical errors. The case is brought under experimental conditions by giving an incentive to reproduction under the influence of a suggested idea. If the word "part" is seen an instant, for example, just after the word "wine" has been pronounced, it is likely to be read "port." The experiment shows us (a) within what wide limits an association may be influenced by the appropriate, momentary trend of consciousness, which thus becomes part-incentive, and (b) it also illustrates the last condition of association named above; the greater power to fascinate the attention and to start associations possessed by an idea when it bears a close relation to other contents of consciousness. The best way to solve our second problem—the analysis of associated contents—is to make the observer as much at his ease and free from distracting influences as possible (seat him, say, in a dark room), and ask him to report in outline the associative train which follows from a word or sentence repeated to him. After this experience he is able to fill in the outline by describing minutely the nature and the amount of the associative material, whether made up of visual, or auditory, or other imagery, whether intense or weak, whether clear or obscure, whether full or thin; the number and arrangement of the ideas, the elements which carry the association and the changes in affective disposition at the various stages of the process.

One other point connected with the analysis of associated contents deserves to be noticed. There is a well-marked tendency toward economy in mental functions. The mind becomes expert, as does the body, so that after carrying through laboriously a sequence of processes for some time, the operation becomes gradually curtailed. We think our thoughts out (if, indeed, we do not take them ready-made from our parents and neighbors), and then just use them as counters with a swift, shorthand review, without going through the trouble to "think" or "reason" every

time we want to know. This mental ellipsis is common in the process leading to association. It is, as John Stuart Mill says, "like a stream which, breaking through its banks, cuts off a bend in its course." If we have the sequence *a b c* given several times, we become able to pass directly to *c* from *a* without the intermediate link *b* being given at all; e.g. *alarm—fire—loss*, and then *alarm—loss*. This is only another evidence that contents in an association form a whole, and not a mere sequence of events. Some psychologists have gone so far as to say that associations may be held together by a link which has never entered into consciousness at all. The evidence for this is not good, although it is a fact that often the links are hard to find, either because they are fleeting or because they are not attended to. A speaker's facial expression or gesture may recall, for example, an event or a place, even if the listener's attention is kept on the discourse. Nevertheless, a full attention is an indispensable aid to the forming of permanent associative relations.

Beyond the search for conditions of association and the analysis of association, much work has been done on the duration of association and of its elements by the use of the reaction experiment. (See ACTION.) The time, for instance, is taken for the associating of an object seen or heard, with the idea of another object in the same class, as "cat"—"dog." The time depends both upon the factors in the association (each one of the conditions mentioned above exerting an influence), and upon the individual associating. The individual factor is resolvable into differences in ideational type (the kinds of ideas—visual, auditory, tactual, etc.—which the individual uses with greatest facility), and what have been called "differences in intellectual temperament," i.e., the tendency to associate general names to the names of individuals (the superordinating temperament), as man to Cæsar; or individual to generals (the subordinating temperament), as Cæsar to man; or to associate ideas upon the same level of generality (coordinating temperament), as plant to animal. Moreover, experiments have also revealed individual differences in associative furniture as conditioned upon age, sex, training, physical state, mental disposition, etc. The results show that, given the conditions, the normal individual tends to form associations in certain definite ways and within regular time intervals. It has been found possible, therefore, to devise "association-tests" which are of service in the study of insanity, feeble-mindedness, hysteria, and in the detection of crime (as in Jung's diagnostic association-tests). See MENTAL TESTS.

When we have made a full analysis of the mind during association, and when we have a complete tabulation of the conditions under which association takes place, and have measured the temporal course of association, we shall have solved the problem which association presents to psychology. Even now (and experiment on association is comparatively new) we know that frequency, recency, vividness, position, and ability to attract the attention are real conditions upon which association depends; they are the credentials, so to speak, which gain for processes a place in consciousness. We are not to understand by this that past experiences are waiting in the ante-chamber of the subconscious; but only that by reason of frequent repetitions, or recent excitations, or what not, there is a ten-

dency for nervous processes to discharge in such and such a way. So that neural disposition determines the direction of discharge, and this, in turn, the appearance in consciousness of the associated contents. This view of the matter makes it clear why there is no distinct bit of consciousness answering to the associative bond, but only conscious processes standing related, and hence more or less unified. The bond is a figure. More than this, we have set the time relations of the association and have learned that associated contents are now exceedingly rich and now a mere thread; that the mass is now intensive and now weak, now clear and now obscure, now directed by a single element and now by the union of two or more streams of influence, now run through with pleasantness and now affectively indifferent; that successive association is, like every consciousness, kaleidoscopic, picking up processes here and dropping others there, but carried always by a common core, so that there is never a jump from one stage to another, never an hiatus within the chain, but invariably a gradual transition from point to point. These facts make clear to us that the old contention regarding the "laws" of contiguity, similarity, contrast, etc., was, after all, a secondary matter, and that it is the analysis of the contents collected within the association and the factual conditions of association that are of prime importance.

ASSOCIATIONS FOR THE ADVANCEMENT OF SCIENCE. See **ADVANCEMENT OF SCIENCE**, **ASSOCIATIONS FOR THE**.

ASSOCIATIVE LAW. One of the fundamental laws governing certain elementary processes of mathematics. It is first met in addition, being stated thus: The sum is the same in whatever way the addends are grouped, e.g., $(2 + 3) + 5 = 2 + (3 + 5)$; or, in general, $a + (b + c) = (a + b) + c$. The associative law of multiplication may be stated thus: The product is the same in whatever way the factors are grouped, e.g., $2 \cdot (3 \cdot 5) = (2 \cdot 3) \cdot 5$; or in general, $a \cdot (b \cdot c) = (a \cdot b) \cdot c$. Exponents and vectors are subject to similar laws.

ASSOLLANT, äs'sö'län', JEAN-BAPTISTE ALFRED (1827-86). A French writer. He was born in Aubusson, in 1852 visited America, and on his return published *Scènes de la vie des États-Unis* (1858), a series of brilliant and skillful sketches. He wrote a number of stories and romances, such as *Branças* (1859), *Marcomir* (1873), and *Pendragon* (1881), and contributed to many of the leading Parisian journals. His political articles forcefully and bitterly attacked alike Imperialists and Opportunists. A charge of plagiarism was brought by him against Sardou on the ground that the latter's *L'Onole Sam* was copied from *Scènes de la vie*. A court of authors decided in favor of M. Sardou.

ASSOMMOIR, L', lä'sö'mwär' (Fr. the bludgeon). A novel by Emile Zola, belonging to his early "realistic" period, and dealing with the evils of drunkenness among the poor. It was published in 1878.

ASSONANCE (Fr. from Lat. *ad*, to +

sonare, to sound). A substitute for rhyme, consisting of a repetition of the same stressed vowels at the end of a line, without regard to the consonantal sounds of the syllable. It was common in the early verse of the Romance peoples, and it has survived in popular poetry, being, in English, usually styled "imperfect rhyme," as "man" and "dam." Examples of assonance, taken from George Eliot's *Spanish Gypsy*, are *blackness* and *dances*, and *roaming* and *floating*. Assonance is much employed in Spanish poetry. See **SPANISH LITERATURE**.

ASSOS. See **ASSUS**.

ASSUAN, ä-swän', or **ASWAN** (Ar. *al*, the + *souaan*, the opening—i.e., at the mouth of the Nile). The ancient *Syene* (Gk. Συήνη). A town, the capital of a province of the same name in upper Egypt, on the east bank of the Nile, near the borders of Nubia and at the first cataract, about 40 miles north of the Tropic of Cancer (Map: Egypt, C 3). In Assuan and vicinity are many ruins, among which are the remains of a Ptolemaic temple dedicated to Isis of Syene, tombs, etc. The town is a popular health resort and centre for tourists. Modern structures include the government building and hospital, an English church, bazaars, hotels, etc. In the environs are Arab cemeteries, an interesting Arab camp, and many granite quarries, which were worked under the earliest Egyptian dynasties. Some red granite—"Syenite" from Syene, so called by Pliny—is still found in the neighborhood. In the river just off the town and dividing the stream of the Nile is Elephantine Island, which is covered with verdant palm trees and which contains the ruins of the ancient town of Elephantine and several villages. On the west bank of the Nile there are many rock-hewn tombs of the Old and Middle Empires. The Roman poet Juvenal, whose keen satire was resented by the Imperial court, was banished to Syene, and lived there for some time as commander of the garrison. At one time Assuan had an important caravan trade which declined after the Mahdist revolt. It has gained considerably in commercial importance because of railway connection established with Alexandria, and the stimulus given to agricultural interests by the completion, in 1903, of the great Nile dam near this place (see **DAMS AND RESERVOIRS**). Its population, including the suburbs, is, 1907, 16,125.

ASSUMPSIT (Lat. 3d pers. sing. perf. of *assumere*, to undertake). The technical name of a form of action at common law. It was first used as a form of action on the case (see **CASE**) after the Statute of Westminster II (1285), in which the plaintiff pleaded that the defendant undertook to perform some act by doing or giving something, the breach of which undertaking resulted in damage to the plaintiff. If the defendant's promise or undertaking did not amount to the assumption of a common law duty, a breach of which would be a tort (q.v.), it was necessary for the plaintiff to allege and prove that he had given consideration—i.e., that he had given up a right or suffered a detriment in return for the defendant's promise—in order to show that he had suffered damage. This was the origin of the modern doctrine of consideration in the law of contracts. The action of *assumpsit* is now limited as an action on contract, and as quite distinct from actions on the case, notwithstanding their common origin. The term "*assumpsit*" is also applied, though less fre-

quently, to the promise, contract, or obligation of one against whom the action of *assumpsit* would lie. *Express* or *special* *assumpsit* is the form of the action employed to recover damages for the breach of a bilateral contract, either express or implied in fact—i.e., a contract in which the promise of one party to the contract is given in exchange for the promise of the other. It was not the proper form of action in which to recover on contracts under seal, the action in that case being in debt or covenant. *Common, general, or indebitatus assumpsit* is a form of *assumpsit* in which the use of that action was extended, for reasons now purely historical, so as to apply in nearly every case in which the common law action of debt would lie. It was used to recover a liquidated sum of money, as distinguished from mere damages, as in an action to recover the purchase price of goods sold and delivered, or for money lent. The obligation to pay the liquidated sum may arise from contract, express or implied; or, in the absence of contract, it may be an obligation imposed on the defendant by law, sometimes incorrectly termed a contract implied in law, and known to modern legal writers as a *quasi contract* (q.v.). Thus, *indebitatus assumpsit* was at common law the proper form of action in which to recover a penalty imposed by statute or money paid by mistake.

In modern times the use of this form of *assumpsit* has been still further extended, so as to cover nearly all cases where the defendant is under an obligation to pay a sum of money to the plaintiff, even though unliquidated, provided the money is not payable as damages. The various forms of declaration in *indebitatus assumpsit* were known as *common counts* (q.v.). The usual plea to the declaration in *assumpsit* is at common law *non assumpsit*, i.e., a general denial, under which the defendant may give in evidence any legal defense to the action which he may have. Consult Gould, *Treatise on the Principles of Pleading in Civil Actions* (Chicago, 1899).

ASSUMPTION, capital of Paraguay. See ASUNCION.

ASSUMPTION, SISTERS OF. 1. An order of French nuns devoted to the teaching of girls, founded in 1839. It aims to combine secular education with religious training. The mother house is in Autoul, a suburb of Paris, and is a famous school. The order has spread to other countries. 2. **LITTLE SISTERS OF THE ASSUMPTION**, an order for nursing the sick poor in their own homes and bringing to them the influences of religion. It was founded in Paris in 1865 and has spread to most of the countries of western Europe and to the United States.

ASSUMPTION OF MOSES. The title of an apocryphal book giving predictions of a glorious future for Israel and exhortations to prepare for it by repentance and obedience to the law, put in the mouth of Moses before his death. Jude, verse 9, is a quotation from it. It was written in Hebrew or Aramaic, by a Pharisee, in Palestine, between 7 and 30 A.D., and is preserved only in a Latin translation. A critical translation in English was made by Charles (London, 1897).

ASSUMPTION OF THE VIRGIN MARY. A festival of the Roman Catholic and Greek churches, celebrated before the sixth century, in both the East and the West, in commemoration of the assumption of the Virgin Mary into

heaven. Both churches keep August 15, in memory of Mary's translation into glory, body and soul, by Christ and the angels.

ASSUR, äs'soor. 1. The earliest capital of Assyria, situated on the western bank of the Tigris, about 37 miles below the place where the upper Zab enters the river, the modern Kal'at Sherkat. Before the Semitic conquest it seems to have had the Sumerian name A-usar, which was frequently used even in later times. On the lips of the invaders it became Assur, while Babylonians and Hebrews pronounced it Ashshur. It is probably referred to in Gen. ii. 14, where Tigris is said to go in front of, i.e., flow east of, Ashshur, which would be true of the city but not of the country. The ruins were visited by Rich in 1820 and Layard in 1840, but systematic excavations were not undertaken until 1903, when the Deutsche Orient-Gesellschaft began the work that has continued to the present day. Parts of the ancient walls, quays, streets, palaces, and temples have been laid bare; objects of art, including statues of kings, and numerous inscriptions of great importance have been found. The temple of the god Asur was founded, according to one of these inscriptions, by Uspia, a King who must have reigned a long time before Ilusuna, the contemporary of Sumuabu (2232-2217 B.C.). The city wall was built by Kikia, another King reigning probably in the earlier part of the third millennium B.C. Enlarged and beautified by the various priestly rulers and kings of Assyria, Assur never ceased to be a great centre of the religious and political life of the nation. Even after Calah (Kalehu, modern Nimrud) in the fourteenth century had been made the seat of the government, and this city had given place to Nineveh as capital of the Empire, the Assyrian monarchs still continued their building operations in Assur. The city was destroyed by the Medes and the Chaldeans in 606 B.C. Consult *Mitteilungen der deutschen Orient-Gesellschaft* (1903-13). W. Andrae, *Die Festungswerke von Assur* (1913).

2. The country of Assyria, the chief part of which was after its occupation by the Medes called Adiabene. The Hebrews always used the name Ashshur.

3. The chief god of the Assyrians. It is possible that the name originally was Anshar, as the identification with this Babylonian deity suggests. An assimilation to the name of the city would be natural. But it was also important to differentiate. Hence the god's name was generally written with only one sibilant, and that seems to have been pronounced by the Assyrians as an s, consequently Asur, a form conveying the idea that he was a 'helper,' 'savior.' In earlier inscriptions found at Assur and in the Cappadocian tablets, Asir also occurs. The worship of Asir and his spouse, Asirta, seems to have prevailed also among the Amorites of Syria. (See ASHER, ASHERA.) Asur was the tribal god of the Assyrians, as Chaldeis was of the Chaldeans; his relations to his people were as close as those of Chemosh to Moab, or Yahwe to Israel in earlier times. There were other gods besides him, but in the cult he was supreme. With his name those of numerous kings were compounded. To carry out his commands, to make his will respected, to spread the fear of his majesty, they went forth upon their expeditions. The trisagion sung in the temples of Assyria was "Asur, Asur, Asur!" Other gods had to contribute to his

glory. When Sennacherib had destroyed Babylon in 689, he ascribed to Asur the struggle with the chaos-monster Tiamat and the creation of the world which in Babylon were regarded as the achievements of Marduk. In Nineveh Istar was probably considered as his wife. Consult Zimmer, *Die Keilschriften und das Alte Testament* (1902); Jeremias, *Das Alte Testament im Lichte des alten Orients* (1906); Jastrow, *Die Religion Babyloniens und Assyriens* (1902-12); Sayce, "Cappadocian Cuneiform Tablets from Kara Eyuk," in *Babyloniaca*, vol. iv, p. 68 (1911).

4. The eponymous hero of Assyria, represented in Gen. x. 22 as a son of Shem, and a brother of Elam, Arpachshad, Lud, and Aram. The Arabs refer to him as al Athur.

ASSUR/ANCE. See **INSURANCE.**

ASSURBANIPAL, äs'sōor-bä'nē-päl'. See **SARDANAPALUS**; **ASSYRIA**.

AS/SUS, or **AS/SOS** (Gk. Ἀσσός). An ancient Hellenic seaport city in the Mysian Territory, Asia Minor, on the north shore of the Adramyttium Gulf, opposite, and 7 miles distant from, the coast of the island of Mitylene (ancient Lesbos), in existence as early as 1000 B.C. The city rose in terraces from the shore, on a trachyte cone, 700 feet high, crowned by a temple of Athene, commanding a magnificent view. The site, now partly occupied by the village and seaport of Behram or Bekhrum, is noted for its interesting archaeological remains and historical associations; the extant walls are concededly the finest known example of Greek fortification building; the larger part goes back to the fourth century B.C. Strabo mentions the independent attitude of Assus during the latter Persian invasion. During the governorship of the eunuch Hermias—a pupil of Plato—Xenocrates and Aristotle were invited guests at his court, and Aristotle married the ruler's niece. Later, Assus passed under the domination of Lysimachus and of the kings of Pergamum. On their way from Troas to Mitylene, St. Paul and St. Luke visited Assus, as recorded in Acts xx. 13. After the Byzantine period it sank into oblivion. From Assus came the Stoic philosopher Cleanthes. In ancient times Assus was famous for grain and for its building stone. In later times the city's remains became a prolific quarry of building stone, especially for the docks built at Constantinople after the Crimean War, but the scattered remains of the walls, the baths, the marketplace, the temple of Augustus, treasury, gymnasium, and the temple of Athene, attest the city's ancient magnificence. The American archaeological school at Athens has done much to make the treasures of Assus known. Consult J. T. Clarke, "Report on the Investigations at Assus" in *Papers, Classical, of the Archaeological Institute of America* (Boston, 1882-98).

ASSYRIA (Gk. Ἀσσυρία and Ἀσσυρία, *Aturia*; OPers. *Athura*; Aram. *Athur*, *Attur*, and *Athuriya*; Bab. and Heb. *Asshur*; Ass. *Assur*). The ancient name of the country between the Armenian mountains in the north and the alluvial plain of Babylonia in the south, the Tigris in the west, and the mountains of Kurdistan in the east, as well as of the Empire ruled by the Assyrian kings, which included a varying extent of adjacent territory. As Mesopotamia during a long period, Babylonia at various times, and a large part of Syria for a while, belonged to this Empire, the Jews seem to have continued to employ the term occasionally, after the de-

struction of Nineveh, to the Achaemenian (Ezra vi. 22) and the Seleucid (Zech. x. 10 f.) kingdoms. Some of the classical writers use Assyria in such a manner as plainly to include Mesopotamia and Babylonia; and it is altogether probable that Syria is an abbreviation of Assyria. After the fall of the Assyrian Empire, the name "Adiabene" (q.v.) came to be used for the chief part of Assyria proper. Trajan, in 115 A.D., created a Roman province of Assyria, but this attempt to restore the old name was abandoned by Hadrian. Athuria survived as the designation of a Nestorian diocese.

Topography. Assyria consists of a plain broken up by low ranges of hills into a number of shallow valleys. Through these the great tributaries of the Tigris flow—the upper Zab, the lower Zab, the Adhem, and the Diyala—and many smaller streams, such as the Husur, northwest of Nineveh. The Tigris itself forms the western border of Assyria proper. Because of its ample supply of water, the plain is very fertile. The rainfall is good, and in ancient times an extensive system of canals was kept up for irrigation. Cereals, olives, vines, citrons, and other fruits were cultivated. Vegetables of various kinds were grown. The land was in part covered with woods. Iron, copper, and lead were found in the hills; and limestone, sandstone, alabaster, and basalt could be cut in the neighboring mountains. The fauna was rich and varied, including lions, wild bulls, bears, foxes, jackals, boars, and deer, a large number of birds, and all the domestic animals.

Cities. Assur, the oldest capital, was situated on the western bank of the Tigris, near the modern Kal'at Sheikat, half-way between the upper and the lower Zab. Calah, which was made capital by Shalmaneser I (c.1320), stood on the site of the modern Nimrud just north of the upper Zab, on the eastern bank of the Tigris. Nineveh, which is mentioned in the prologue to the Code of Hammurapi (2124-2081), but does not seem to have been made a capital before Asurbelkala (c.1100) and not permanently until Sennacherib, was farther north in the angle between the Husur and the Tigris, east of the latter. Its site is represented by the mounds of Kuyunjik and Nebi Yunus opposite Mosul. The capital of Sargon II, Dur Sargina, was found at Khorsabad, north of Nineveh. The important city of Arbailu, the later capital of Adiabene, is the modern Arbela, and Imgur Bel corresponds to the mound called Balawat. Besides these there were many smaller towns.

Excavations. The destruction of the chief cities of Assyria by the Medes, avenging themselves for centuries of wrong and oppression, came suddenly and with terrible thoroughness. Their temples and palaces were given to the flames. They never rose from their ruins; in course of time they were completely buried by the earth, and other towns grew up around them. The mounds that covered them aroused no suspicions of hidden treasures. Not until 1842 were excavations begun. Paul Emile Botta undertook to examine a mound at Khorsabad and found that it contained the remains of a magnificent palace of Sargon II. Three years were spent there by Botta. During this time he unearthed numerous chambers of the palace, revealing an abundance of inscriptions, sculptured slabs, statues, and other objects of art. Meanwhile Sir Austen Henry Layard was making preparations for work in the mounds op-

posite Mosul. He began his excavations in 1845 and continued them at Kuyunjik and at Nimrud until 1850. Layard thus was the modern discoverer of Nineveh and Calah. No less than five palaces and several temples were found by him. He discovered a part of Asurbanipal's library, of which some 30,000 fragments were sent to the British Museum. The French excavations begun by Botta were continued at Khorsabad by Victor Place in 1855 and Jules Oppert (1859-62). Under the direction of Sir Henry Rawlinson, Hormuzd Rassam, a native of Mosul, began excavations at Kal'at Sherkat in 1852, and continued until 1854 at Nimrud and at Kuyunjik, where he discovered another large portion of Asurbanipal's library. In 1873 and 1874 George Smith conducted excavations at Kuyunjik and Nebi Yunus; and Rassam again was in the field from 1878 to 1882. From 1903 to 1913 extensive and methodical excavations have been carried on by the Deutsche Orient Gesellschaft at Kal'at Sherkat under the leadership of Andrae. The finds have been very rich, and the numerous inscriptions discovered have been promptly interpreted by Professor Delitzsch. See ASSUR.

Chronology. For the last 300 years of Assyrian history the chronology is in the main very well established. It is based chiefly upon what remains of the *limmu*-lists. In Assyria every year was named after a high official. From the Cappadocian tablets we know that this institution already existed in the third millennium B.C. Like the archontate in Athens and the consulate in Rome, this eponymate, or *limmu*, may be a sign of an original republican form of government, as Ed. Meyer has suggested, *Geschichte des Altertums*, i, 2, p. 539 (2d ed., 1909). We possess several *limmu*-lists, with or without notes, discovered by Rawlinson and Bezold, and last published by Rogers, *Cuneiform Parallels to the Old Testament* (1912). They cover the years from 893 to 666. Usually, though not always, the King held this position in the first year of his reign, and then in a certain rotation the governors of important cities and provinces. Chronologically the succession has been fixed by the reference to an eclipse of the sun in the month Sivan of the eponymate of Pirsagale, of Guzana, which took place on the 15th of June, 763. From the third year of Nabunassar (745), when Tiglath-pileser IV became King, the *Babylonian Chronicle* and the *Canon of Ptolemy* are of great importance, and for the earlier part of the period the *Synchronous History*, published by Peiser and Winckler in *Keilinschriftliche Bibliothek* (1889). Only the regnal years of the last three kings cannot be given. The accuracy of Assyrian chronology back to the end of the tenth century is of value also for that of the Syrian states in this period. See JEWS.

From c.1400 to 911 we are at present able to construct a fairly complete list of kings, but not to determine the exact date and regnal years of a single king. Nevertheless the margin of uncertainty is not in any case very wide. Two statements of Sennacherib, based no doubt upon accurate *limmu*-lists, help to fix the time of Tiglath-pileser I and of Tiglath Ninib I. The former is said to have suffered the loss of two gods, Adad and Sala, taken away from Ikallati by Marduknadinahi 418 years before Sennacherib destroyed Babylon, in 689, and brought back these deities to the Assyrian city (*Babylonian*

Inscription, 48-50), consequently in 1107. A seal of the latter was carried away by Sennacherib on the same occasion, and the conqueror of Babylon added that this conquest took place "after 600 years," evidently counted from the time of Tiglath Ninib (III *Rawlinson*, 4, 2, translated in *Keilinschriftliche Bibliothek* (1889), consequently in 1289. Unfortunately, these dates do not indicate when the two kings began to reign. The references to Babylonian kings whose dates are fixed (see BABYLONIA) and the *Synchronous History* are also of value. From the Amarna letters it is known that Asurbanipal II was a contemporary not only of Burnaburiash of Babylon but also of Amenhotep III and Amenhotep IV of Egypt, whose dates have been approximately determined by Egyptian documents.

More uncertainty prevails concerning the period from c.2250 to 1400. We have the names of about a score of kings, perhaps one-half of the whole number, but, in spite of apparently very precise chronological statements, it is extremely difficult to assign even an approximately correct date to more than a few of them. Among these must probably be reckoned the first King, Ilusuma, and his immediate successors, Irsum, Ikunum, and Sargon I, as Ilusuma's enemy, Suabu, in all probability is identical with Sumuabu, the founder of the first Babylonian dynasty (2232-17). Concerning the two important kings, Samsi Adad I and Samsi Adad II, there are several perplexing statements. Tiglath-pileser I (*Cylinder Inscription*, 60 ff.) says that Samsi Adad, son of Isme Dagan, built on the Anu and Adad temple in Assur, but that it fell into disrepair for 641 years, when it was torn down by Asurdan, after which it lay in ruins for 60 years until it was rebuilt in the beginning of his own reign. One year of his reign, 1107, is known, but that may have been his last, and we have no means of finding out when he began to reign. It may have been as early as 1140. If so, Samsi Adad, son of Isme Dagan, would have built on this temple c.1840. Shalmaneser I, on a stone tablet found at Assur, states that the Assur temple built by Irisu was rebuilt by Samsi Adad, after a period of decay lasting 159 years; after 580 years it was destroyed by a fire, and then was rebuilt by himself. On the other hand, Esarhaddon, in an inscription on a prism found at Assur in 1904, says that after Irisu there came 126 years of decay, then a rebuilding by Samsi Adad, son of Belkapi, and a destruction by fire 434 years later. If this son of Belkapi is the same as the Samsi Adad who reigned in the tenth year of Hammurapi (2124-2081), mentioned in a legal document from Sippara published by Ranke, *Babylonian Expedition*, vi, 1, p. 9, there would be room for 126 years, but not for 159, between him and Irsum. The conflict between Ilusuma and Sumuabu may have taken place at the end of the former's reign and in the beginning of the latter's. Irsum may then have built on the Assur temple c.2226, and Samsi Adad, son of Belkapi, c.2100. It is possible that the fire occurring 434 years later (c. 1666) was an earlier one than that referred to by Shalmaneser. If Tiglath Ninib I was defeated by the Babylonians at the beginning of his reign, and Shalmaneser I, his father, inscribed the stone tablet at the end of his, the 580-year period, counted from 1290, would give the date of 1870 for Samsi Adad. There can

scarcely be any doubt that this is Samsi Adad, son of Isme Dagan, referred to by Tiglath-pileser I. He seems to have rebuilt the Asur temple early in his reign, and restored the Anu and Adad temple some 30 years later. There may have been a confusion on the part of Shalmaneser's scribes of the two Samsi Adads, and a further mistake of 33 years in estimating the period from Irsum to Samsi Adad I. Though some uncertainty still exists, these data seem to indicate that Samsi Adad I, son of Belkapi (or Belkappapu) reigned c.2115-2095, and Samsi Adad II, son of Isme Dagan, c.1870-40. Concerning the time when Uspia built the Asur temple and Kikia the wall of Assur nothing is known, but it must have been many centuries before Ilusuma.

Ethnology. The Assyrians were a people of Semitic stock, akin to the Akkadians, Chaldeans, Arrapachians, Gutians, Lulubians, Amorites, Arameans, Hebrews, and Arabs. But on the monuments they exhibit a distinct and easily recognized type. The closeness of their relationship to the Akkadians has probably been exaggerated. There is no historic evidence that they were a colony sent forth from Babylonia. Language alone is not a sufficient criterium. Amorites, Kassites, Chaldeans, Gutians, and Lulubians spoke and wrote the language of Akkad. There were differences of pronunciation, however, notably in the case of the sibilants. While the cultural influence of Babylonia was at all times very great, and the worship of many gods, together with much mythological material, passed into Assyria from the south, it is significant that Asur was never worshiped in Babylonia, nor Marduk in Assyria. Adad and Dagan did not come from Babylonia, nor is it necessary to suppose that Samsu and Sin were derived from there. Distinctly Babylonian gods never occur in the proper names of Assyrian kings. The difference in physical environment, climate, and natural resources between the two countries is not so great as to account for the difference in national character. A certain fierceness characterizes the Assyrian, showing itself in the torture of prisoners, the impalement of rebels, and the mutilation of the slain. The Assyrians are generally regarded as having preserved their racial purity better than their southern neighbors, and maintained themselves as a more homogeneous people. This is quite possibly true. Yet the land was probably to some extent occupied when the Semites came in. No Sumerian inscriptions have yet been found in Assyria. But the earliest kings known, Uspia and Kikia, have names that certainly are not of a Semitic type. Winckler suggests that they are Mitannian (*Vorderasien im zweiten Jahrtausend*, p. 67 (1913)). Whoever the aborigines may have been, a process of assimilation is likely to have ensued. The Mitannian conquest of a large part of Assyria and the later conquest of Mesopotamia by the Assyrians must have affected the nature of the population. Amorites, Hittites, Iranians, and Arameans formed the largest constituent of the new province to the west of Assyria and poured into the capitals on the Tigris. The policy of deporting people from one end of the Empire to another likewise exercised its influence upon the ethnic character of the population.

History. The Assyrians do not seem to have drawn up lists of dynasties like those of the Babylonians. One reason for this may have

been the eponymate, another the apparent absence of any periods of foreign domination. There were indeed palace revolutions, usurpers, and founders of new families establishing themselves upon the throne. But until these changes are better known than they are to-day, it may be expedient to adopt some other method of division. Periods may be marked by the appearance of great rulers extending the power of Assyria and forcing the political development into new channels. Such a scheme is naturally subject to revision, since fresh discoveries may bring to light rulers of greater prominence or reveal epochal events now unknown, but it may be followed for the sake of convenience.

The First Period (?-c.2250 B.C.).—It is impossible at present even to conjecture when Assyria was first inhabited by man, to what race the original settlers belonged, and at what time Semites began to occupy the land. The earliest known rulers in Assur were Uspia, who built the Asur temple, and Kikia, who constructed the wall of the city. From the term employed it cannot be determined whether Uspia was the original builder or simply restored and enlarged an already existing shrine. These names have a Hittite rather than a Semitic sound, and the deity to whom the temple was built may not have been Semitic. As to their date there is not the slightest indication. Kate Asir and Salmahum are clearly Semites, but it is not known when they reigned. Semitic kings of the Gutians and the Lulubians were contemporaries of Sargon I of Akkad (see BABYLONIA), and Semitic tribes may have settled in Assyria at as early a time. It is not impossible that before the end of this period Assyria had already pushed her power into Asia Minor. Sulili and Belbani, son of Adasi, may belong to this epoch.

The Second Period (c.2250-1870).—Ilusuma is the first Assyrian monarch whose date can be approximately established. Toward the end of his reign, apparently, he came into conflict with Sumuabu, the founder of the first dynasty of Babylon (2232-17). His son Irsum seems to have built on the Asur temple c.2226. His son was Ikunum, and his grandson Sargon I of Assyria. Sayce has shown that this Sargon, vassal of the god Asir, is referred to on the Cappadocian tablets (*Babyloniaca*, p. 67, 1911). By this discovery the date of the tablets found at Kara Eyuk has been fixed, and the fact established that the authority of the Assyrian rulers was recognized in the twenty-second century in Cappadocia. It is probable that his successor was Belkapi, whose son Samsi Adad I was a contemporary of Hammurapi (2124-2081) and is known by his building enterprises in Asur. The Hittites fell upon Babylonia in the time of Samsuditana (1633-32) and probably put an end to the dynasty; cf. King, *Chronicles concerning Early Babylonian Kings*, vol. ii, pp. 113 ff. (1907). But they must have crushed the power of Assyria in Cappadocia, and are likely to have punished Assyria herself, before they invaded Babylonia. It may not have been long after Sargon's time, in the twenty-first century, that the expansion of Hittite power began which pushed the Hyksos into Egypt, drove new ethnic elements into Mesopotamia, conquered Babylonia, and reduced Assyria to weakness. There is a certain similarity of the names of the kings to those of the first Babylonian dynasty, and it is not improbable that

the Ilusuma dynasty was also of Amoritish origin.

The Third Period (c.1870–c.1500).—A reaction seems to have set in with Samsi Adad II, son of Isme Dagan, who probably reigned from 1870 to 1840. He was a strong and resourceful ruler, claiming to have held dominion over the land between the Tigris and the Euphrates, to have received tribute from the kings of Tugrish, and to have erected monuments to himself "in the land of Labana on the shore of the great sea," by which either Lebanon and the Mediterranean or a district in northern Asia Minor and the Black Sea is meant. An inscription of his has been found on the Euphrates, south of the Chabur, in Tirka, the capital of Chana, where he built a temple to Dagan. His building activities in Assur were very extensive. We know the names of some of his successors, such as Isme Dagan II, Asurnirari I, Asirresisi I, Kisru sa Asir, a group consisting of Samsi Adad III, Adadnirari I, and Asurdan I, and, toward the end of the period, Asirrabu I and Asurnirari II, father of Asurrimnisesu. No exact dates can be given to any of them. It is not impossible that they still maintained some suzerainty over Mesopotamia and other regions in the west. Manetho may be right in stating that the Hyksos, expelled from Egypt about 1580, fortified themselves in Palestine rather than pushing farther north "for fear of the Assyrians" (Josephus, *Against Apion*, i, 90, ed. Niese).

The Fourth Period (c.1500–c.1320).—The Mitannians in Mesopotamia, invigorated by the infusion of a strong Iranian element, the Mithras and Varuna worshipping Harri, or Arrians, of Armenia, seem to have forced the Assyrians and the Kassites in Babylonia into peace with each other and an alliance probably for defense. Asurrimnisesu, son of Asurnirari II, and Karaindash entered into a covenant (*biritu*). This may have been as early as 1500. To all appearances Asurrimnisesu was an able monarch, maintaining his independence of Assyria, beautifying his capital, and strengthening its walls. But the power of the Mitannians was growing apace, and in less than a century northern Assyria, including Nineveh, was in their hands or at least in a condition of vassalage. Erba Adad I, Asurnadinahi I, Asururballit I, and Adad . . . may have preceded Puzur Asur, who was a contemporary of Burnaburiash of Babylonia (c.1381–56). Asurnadinahi II corresponded with Amenhotep III (1411–1375), and Asuruballit II with Amenhotep IV (1375–50). Belnirari, Arikdenilu, and Adadnirari II reigned between c.1350 and 1320.

The Fifth Period (c.1320–c.1140).—Shalmaneser I, son of Adadnirari II (c.1320–1290), conquered northern Mesopotamia and may have invaded northern Syria. He moved his capital to Calah, which remained the residence of the Assyrian kings, except for brief intervals, until Sargon II. His son Tiglath Ninib I after long wars conquered Babylonia and reigned over this country seven years, but was murdered by his son Asurnazirpal I. Assyria takes the place of Mitanni as suzerain of Mesopotamia in the treaty between the Hittite King Tudhaliya and the son of the Amoritish King Benteshina (c.1250). During the time of Asurnirari III, Tiglath Asur, Belkuduruzur, Erba Adad II, Ninib-pileser, Asurdan II, Mutakkil Nusku, and Asurresisi II the power of Assyria seems to have declined.

The Sixth Period (c.1140–911).—A great conqueror appeared again in Tiglath-pileser I (c.1140–c.1105), son of Asurresisi II. He subdued the tribes of Commagene and Melitene, went into Armenia, placed his statue on the Supnat, a tributary of the Tigris, pushed into Syria, visited the island city of Arvad, and reduced Babylonia to vassalage. His son Asurbelkala moved the capital to Nineveh. Concerning his successors Samsi Adad IV, Asurnazirpal II, Shalmaneser II, Adadnirari III, Tiglath-pileser III, Asurrabi II, Asurresisi III, Tiglath-pileser III, and Asurdan III our information is scanty. Aside from occasional raids they seem to have allowed the Aramaeans to establish their kingdoms in the neighboring Mesopotamia and Babylonia to resume its independence.

The Seventh Period (911–745).—Adadnirari IV (911–890), son of Asurdan III, carried on successful wars with Babylonia. Tiglath Ninib II (890–885) waged war in Armenia (*Nairi*) and placed his stele on the Supnat. Extensive conquests were made in the north by Asurnazirpal III (885–860). In 882–881 he reduced the Zamua tribes in Media. He fought with the strong Aramaean kingdom of Bit Adini and captured its capital in 877, and received tribute from Hittite and Phœnician cities the following year. He resided at Calah, where he built the famous "North-West Palace." Shalmaneser III (860–825) defeated the King of Bit Adini and annexed his domain (859–856), whereupon he turned his attention to Damascus. In the great battle of Karkar (854) he met a coalition of Syrian princes led by Bar Hadad I of Damascus, among whom were Ahab of Israel and Gindibu, the Arab, and, in spite of his own assurances, the probability is that he was defeated. In 849, 846, 842, and 839 he made unsuccessful expeditions against Damascus, but Jehu of Israel sent him presents in 842. He was scarcely more fortunate in his wars with the Chaldeans in Armenia, but subdued some tribes in Media. Samsi Adad V (825–812) continued these wars in Armenia and Media as well as with Babylonia. Adadnirari V (812–783) defeated Bar Hadad II of Damascus, invaded Babylonia four times, and made raids into Media. The whole reign of Shalmaneser IV (783–773) seems to have been spent in attempts to check the growth of the Chaldian power in Armenia, which now held the leading place in western Asia. Asurdan III (773–755) still undertook invasions of Syria and Babylonia, but without marked success, and rapid decay characterized the reign of Asurnirari IV (755–745).

The Eighth Period (745–606).—Tiglath-pileser IV (745–728) was a usurper whose accession was probably due to a reaction of the military classes against the priests. The conflict with Sarduris II of Chaldia for supremacy in Syria ended in the victory of Assyria (743), and eight years later Turuspa on Lake Van was in part captured and destroyed. Ahaz of Judah became a vassal in 734; part of Galilee and Gilead were ceded by Israel in 733, and Damascus was taken in 732. In 729 Tiglath-pileser invaded Babylonia and seated himself on the throne, assuming the name of Pulu. It is not certain whether his successor Shalmaneser V (728–722) was his son. The chief event of his reign was the siege and capture of Samaria (Samarra) in 723; cf. Olmstead, *Western Asia in the Days of Sargon of Assyria*, pp. 45

ff. (1907), and see SAMARIA. Sargon II (722-705) was a usurper, probably raised to the throne by the priestly interests. In the battle of Durilu he was defeated by Humbanigash of Elam and the Chaldean Mardukapaliddin, and the latter reigned for 12 years over Babylonia (721-709). But Hamath was taken in 720 and Carchemish in 717. He invaded Arabia in 715 and brought a large number of people from Hejaz to Samaria, whence he had deported 27,290 Israelites to Mesopotamia and Media. An insurrection in Ashdod was quelled by his *turtanu*, or commander-in-chief, in 711, and Babylonia was conquered in 709. Wars were also fought, with more or less success, in Armenia, Militene, Comagene, Cilicia, Cappadocia, and Ellip. Sargon built a splendid palace in his new capital, Dur-Sargon, the modern Balawat. He seems to have fallen in a battle with the Cimmerians in Cappadocia. His son Sennacherib (705-681) moved the capital to Nineveh, which he beautified in many ways. A large part of his reign was occupied by his struggles with Babylon. Here Mardukapaliddin again established himself in 703, and appears to have headed a formidable coalition against Assyria. He was indeed driven away in 702, and his allies in Syria, among them Hezekiah of Judah and Luli of Tyre, were forced to pay heavy tribute in 701. But his son Asurnadinsum, whom he made King of Babylonia, was carried away to Susa as a captive by Hallus of Elam in revenge for an invasion of his territory by the fleet sent out from Nineveh in 594. The conflict with Nergalushezib and Mushezib Marduk ended in the terrible destruction of Babylon by Sennacherib in 689. A fruitless attempt seems to have been made to invade Egypt about 683: the outbreak of pestilence obliged the King to return. He was murdered in 681. A greater king than Sennacherib was Esarhaddon (681-668). His first act as ruler of Babylonia was to order the rebuilding of the city of Babylon. He had to conquer Assyria from his brothers, who had murdered their father. In 674 he destroyed Sidon, but he was unable to take Tyre, though his statue at Zinjirli represents him as having put his hook in the nose of Baal of Tyre as well as of Taharka of Egypt. The greatest achievement of his reign was the conquest of Egypt in 673. The 22 nomes were constituted as kingdoms, and their rulers were made Assyrian vassals. Taharka escaped to Napata, but returned; and even Esarhaddon's second expedition in 671, when Necho I was made vassal king of Sais, did not establish very securely the Assyrian control of the country. Esarhaddon made a campaign into the interior of Arabia, fought with Cimmerians and Medes. With Protothias (Bartatua), the Scythian King, he seems to have entered into an alliance. He died on his third expedition to Egypt. Esarhaddon gives the impression of having been a wise administrator and a humane ruler. Before his death he designated Asurbanipal as his successor in Assyria, and Samassumukin, a younger son, as regent in Babylonia. Asurbanipal (668-625) continued the Egyptian campaign, occupied Memphis, captured Thebes in 667, and restored, at least nominally, the authority of Assyria. In 663 he appointed Psammetichus I as vassal in Memphis and Sais in place of his father, Necho I. Some years later Psammetichus made himself independent with the aid of Gyges of Lydia, who apparently had

reasons to regret his request for Assyrian assistance against the Cimmerians. From 665 to c.645 the war with Elam continued. In 652 the great rebellion of his brother Samassumukin broke out. Filled with ambition to achieve for Babylon and himself what was to be accomplished a generation later by Nabopolassar, he entered into alliance with various nations, declared his independence, and forbade Asurbanipal to offer sacrifices in the sanctuaries of Babylonia. After four years of struggle the Assyrian monarch captured Babylon, and Samassumukin perished in the fire of his burning palace (648). Since that time Asurbanipal himself ruled in Babylon under the name of Kandalanu. The greatest military achievement of his reign was the capture of Susa (c.645). It put an end to the kingdom of Elam and enriched Nineveh with the vast treasures accumulated by a long line of kings. Sippar, Borsippa, and Cutha were punished for their participation in the rebellion of Samassumukin; some of the inhabitants were killed, others seem to have been carried away to Samaria (Ezra iv. 10). During the last 20 years of his reign Asurbanipal devoted himself to works of peace. He beautified Nineveh and other cities with palaces and temples, and he gathered a very great library in the capital. Numerous scribes were employed to copy tablets in Uruk and Sippar, and independent literary work was encouraged. The memory of his magnificence survived the fall of the Assyrian Empire, and the Greeks, who seem to have called him Sardanapalus (*Σαρδανάπᾰλλος*), exaggerated the luxury of his court and wrongly represented him as a weakling. It is true, however, that he allowed Egypt and Elam to slip out of his hands, and Phraortes to build up a powerful Median Empire with Ecbatana as its capital. His death brought about important changes. Nabopolassar, the Chaldean governor of Babylonia, made himself independent and founded a dynasty. Cyaxares of Media, according to a cuneiform inscription, his "ally and helper," besieged Nineveh. He was defeated, however, and driven away by Madyas, son of Protothias, the Scythian King (Herodotus, i, 103 ff.). By this timely assistance of the only ally Assyria had, the capital was saved, and the Syrian provinces were in a measure secured by the march of the Scythians to the border of Egypt to prevent Psammetichus from occupying Assyrian territory. Asurtilhianiukin (625-c.618) seems to have been succeeded by Asursumlisir (c.618-c.616), and Sinsariskun (c.616-606) was the last King of Assyria. At length the two allies, Cyaxares and Nabopolassar, accomplished their end, the Medes probably doing the larger part of the work, as Assyria proper was to be their share. All the cities were destroyed.

Government. It is possible, though it cannot yet be proved, that the earliest rulers were elected annually and bore the title of *limmu*. Before it became an honor assumed by kings and conferred on governors, the eponymate is likely to have implied supreme power. But the growth of the priesthood naturally developed a theocratic form of government. The *isakku*, or high priest, of Asur became the head of the state. As the vicegerent of Asur he was his king (*sarru*). It is now certain that one of these titles does not exclude the other; and that the use of *isakku* alone does not indicate dependence on a foreign power. The king

of Assyria always remained ruler by the grace of Asur. But his military and administrative occupations tended to put a limit to his priestly functions and to facilitate the growth of a well-organized Asur priesthood pursuing its own ends. The king was not worshiped as a god. Nominally he was an autocrat. He is represented as accomplishing everything himself; he commands his armies, defeats his enemies, disposes of the booty, subdues kingdoms, builds cities, temples, and palaces, puts to death whom he pleases, saves whom he favors. No council is mentioned, and we do not know whether there was a written law as in Babylonia; it is rarely that the name is recorded of a general, a statesman, an official, an artist, or a builder. Yet the tartan (*turtanu*) was practically a wazir; his position is no doubt correctly represented in the old Ahikar (q.v.) romance. Many of the great victories were won, many of the campaigns planned, by generals, while the king remained quietly at the capital. The work of government was carried on according to precedent or the judgment of powerful officials without his personal participation. The authority and influence of the rab-saris, the rab-sake, the rab-mag, the rab-dupsari, the rab-sangu, must have been very great. Occasional revolutions and insurrections throw a light on the operation of these military, priestly, and bureaucratic powers within the state. The cities were ruled by governors; extensive privileges and exemptions were enjoyed by Assur, Calah, Nineveh, and Arbela, by Haran in Mesopotamia, and by certain Babylonian cities when they formed a part of the Empire. No careful study has yet been made of the provincial government. But it is evident that, as in the Roman Empire, different principles were followed in the case of countries that were attached to Assyria by a sort of personal union, those that were ruled directly by governors, and those that were treated as vassal states, subject to tribute, but allowed to have their own kings.

Religion. The chief deity of the Assyrians was Asur. In our earliest inscriptions he is generally called Asir. Originally the local god of the city of Assur, he became, with the growth of the kingdom, the national deity, as truly as Chaldis of Chaldia, Chemosh of Moab, and Yahwe of Israel. Besides him Istar occupies the most prominent place. In Nineveh her character as the goddess of love seems to have been emphasized, while in Arbela she appears predominantly as the goddess of war. Some oracles given by priestesses at the sanctuary in Arbela have come down to us. (See AS-TARTE.) Dagan, probably an Amoritic deity (see DAGON), and Adad, who may have been of Aramean origin (see HADAD), appear at an early time. Samsu, the sun god, was worshiped in Assyria, as everywhere in the Semitic world. The same is true of the moon god, Sin, especially after the conquest of Mesopotamia, where he had a famous sanctuary at Haran, though no prominent king has a name compounded with his before Sennacherib (Sin ahi erba). Esarra is of Hittite origin, and the true pronunciation of Ninib is still uncertain. Adad shared his temple in Assur with Anu, and the Sumerian gods Ea, or Ac, Ellil (probably pronounced Bel in Assyria), and Nergal, the god of war, were recognized. Babylonia naturally exercised a very strong influence, though it may have been somewhat exaggerated. There

seems to have been a marked similarity between the forms of worship and the religious festivals in the two countries, and some Babylonian myths were evidently taken over by the Assyrians. Since no complete temple has been preserved, it is difficult to say whether Babylonia furnished the models. That some of the temples of Assyria were built of bricks may not be due to imitation but to practical considerations. It has been customary to look upon the large number of copies made by Asurbanipal's scribes from Babylonian temple archives as an evidence of the inferior culture of the Assyrian priesthood; but a considerable part of the library is evidently earlier than Asurbanipal's time, and it may be wise to await the results of more complete excavations before far-reaching conclusions are drawn. Such prayers as those offered to the sun god show genuine piety, and even the horror with which offenses against the majesty of Asur are regarded, and the pride with which his deeds are recorded, by the royal scribes reveal a sense of divine glory and transcendence as well as national feeling. Beyond a general trend toward monolatry and monotheism, there is no indication that Assyrian thought ever followed to the end the road that in Israel led to the worship of one god only. But the Assyrian gods were represented in human form, and Asur, the "father of the gods," was conceived of as the creator of heaven and earth. Concerning man's fate after death the Assyrians do not seem to have speculated much even before their acquaintance with the story of Istar's descent to the nether world; they are likely to have looked upon it as "the land of no return" which holds no attractions for the living.

ASSYRIAN ART. The historic inscriptions show that the earliest rulers of Assyria in the seventeenth century B.C. built monuments and enriched them with images, with colored decorations, and with hangings. None of these early works has yet been found, but it is probable that they resemble the art of Babylonia even more closely than later works, because at first the Assyrians, being cruder in their culture, were more imitative than when their national characteristics found artistic expression after Assyria became a great power. Roughly speaking, the following periods may be recognized: (1) Babylonian, seventeenth to twelfth centuries; (2) Archaic, twelfth to ninth centuries; (3) Developed or Epic, ninth to eighth centuries; (4) Picturesque, seventh century. The temple and all forms of religious art predominating during the earliest centuries, had taken second place by the time of Asurnazirpal III (ninth century), and the building and decorating of the royal palace, the celebrating of royal victories, exploits, and every-day life became and remained the principal theme of Assyrian art, in harmony with the despotic and secular character of Assyrian institutions. It is a help in tracing its history that nearly every King built at least one palace to commemorate his reign, in which everything was executed by his royal artists. Successive shiftings of the capital to Nineveh, Calah, and Ashur helped to multiply royal constructions. Beginning in the reign of Asurnazirpal III, Assyria came in touch with every phase of Oriental art—Egyptian, Phœnician, Hittite, Aægean. The result was a strong reciprocal influence. Between the ninth and seventh centuries Nineveh was the centre of the entire East for art as well as commerce; here colonies of foreign artists settled, and imitated or transformed the strongly marked character of Assyrian art, sending their works, by the hands especially of Phœnician traders, over the entire civilized world. This Assyrian supremacy did not cease until the fall of Nineveh, about 607 B.C. In describing the character of Assyrian art, it is not easy to detach the other arts from architecture, because the construction itself, being of brick, was necessarily so plain, so devoid of special features, such as colonnades or elaborate moldings, that both relief sculptures and

color decoration were used for effect and became an integral part of architecture. Cult images of the gods, often of precious metals, were placed in the temples, as well as reliefs with mythological subjects. Doors were covered with bronze-figured plaques or carved in wood; obelisks and stelæ were set up in the open air; but the favorite form of sculpture remained the low-relief frieze, and the favorite material, soft limestone. The industrial arts were highly developed. The King and his courtiers dressed in superbly embroidered and figured stuffs; horses were superbly caparisoned—arms and armor were highly finished; the King's throne was of carved ivory and gold, and the King was served out of gold, silver, and bronze vessels, with figures in relief. The Phœnicians and Syrians in particular were cunning workmen, who supplied all that Assyrian luxury demanded, and life was then as luxurious as under the Roman Empire. The bronze gates of Balawat, the dishes and ivories from Nimrud now in the British Museum, the carved cylinders and gems there and in the Louvre, Metropolitan Museum, and De Clercq Collection, show the character of the smaller arts.

Architecture. The Assyrians copied the Babylonians far more closely in architecture than in the other arts. They employed brick in similar fashion, though they occasionally faced their substructures and walls with stone slabs as the Babylonians never did. Their temples were of the same stepped shape; their palaces on a similar quadrangular plan, with chambers also grouped around three courts. Color decoration was used, both outside in the form of reliefs of glazed faience, and inside in wall paintings and in the coloring of the sculptured dadoes in all the large halls and passageways. But we cannot yet say that in these particular forms which the Assyrians gave to their colored decoration they were following Babylonian models. Certainly it seems as if they innovated in one very important particular, i.e., in the use of long lines of bas-reliefs for internal decoration. The alabaster and soft limestone which they quarried on their borders had not been available to their southern neighbors, the Babylonians; and in these materials the Assyrian sculptor reveled quite as much as had the Egyptian, and he carved on these slabs sculptures appropriate in subject for all the different parts of the palaces and temples. There is nothing to show how the Assyrians treated sepulchral or private architecture, though future excavations may do this. But their military architecture can be studied on several sites, especially at Dur-Sargina (Khor-sabad). The use of crude brick for the mass of all platforms, substructures, and bulk of walls subjected the buildings to the same disintegrating process through infiltration of water, as in Babylonia, which made constant repair necessary and led to the collapse of the vaults after the buildings had been abandoned. In fact, the Assyrian practice of using the crude bricks before they were dry produced a sort of brick amalgam far softer and more destructible than the Babylonian; nor were the Assyrians so careful to face this *pesé* with hard-burned and enameled bricks as were the Babylonians. In the interiors they usually protected it below by the dado of sculptured slabs and above only by a thin layer of painted stucco. In one way the Assyrians had the advantage, by using quarried stone blocks for facing their foundations; but, again, they

ASSYRIAN ARCHITECTURE
PALACE OF SARGON—RESTORATION

did not use the good lime-mortar or beds of bitumen with which the Babylonians cemented their courses of brick.

The immensely thick walls—sometimes 20 and 30 feet—were made necessary by the great weight of the massive vaults and flat roofs, which made a second story impossible in palaces and houses, and also made it necessary to admit light from above, as windows cut through such walls would be almost useless. Both these facts made the residences extremely cool—a most important item in such a hot climate. Of course the Assyrian use of the arch, vault, and dome was rudimentary; each unit being supported on its solid walls, so that there were no long lines of arcades, no grouping of domes supported on piers. But there was a type of lighter architecture in accessories, such as porches and pavilions, shrines and small temples, summer-houses and belvederes. Here small columns of stone or marble or wood sheathed in metal (e.g., bronze), supported architraves and decorated roofs. Where fancy could have play without regard to structural necessities, we see the Assyrian supporting his columns on the backs of lions or sphinxes, surmounting their capitals with gazelles and antelopes. They here used capitals of at least two orders—cubic and Ionic—of extremely well-proportioned and appropriate types. But in these rather ephemeral works there lay such a contrast to the main buildings, with their heavy, unrelieved masses, that no harmony could be established between them.

The royal palaces of Assyria are its best preserved as well as most characteristic monuments. The religious fanaticism of the Babylonians had given to their temples the same preponderance that the civil despotism of Assyria gave to its palaces, in comparison with which the temples were insignificant. Long before Nineveh, the capital of Assyria was Calah, the modern Nimrud (q.v.). Here most of the prominent Assyrian kings from the thirteenth to the seventh century built or rebuilt palaces. The palace of King Asurnazirpal (885-860 B.C.) has been most systematically excavated and was the most artistic. That of Esarhaddon shows how, notwithstanding the dread of the curses called down upon such sacrilegious work, the pernicious habit was indulged in by the later Assyrian kings of despoiling older palaces to decorate their own. Nineveh itself is represented by the mounds of Nebbi Yunas and Koyunjik; only the latter has been excavated, especially the palaces of Sennacherib and Asurbanipal, whose sculptures decorate the British Museum. That of Sennacherib was magnificent. One of its vaulted halls measured 176 × 40 feet; another 124 × 30 feet. Many other mounds conceal superb palaces. One of these has been excavated with scientific care, the city and palace of Sargon at Khorsabad (q.v.), called Dur-Sargina, 'City of Sargon.' Sargon's own official account of its construction has been preserved in several inscriptions, and the ruins help us to understand it. Nothing in palace architecture of any age—not even Nero's Golden House—could have surpassed this Assyrian palace. It was built during 721-705 B.C., as a sort of Versailles to the neighboring Nineveh; it was never disturbed by later monarchs, and represents the plans of a single architect. As for the city, it formed an almost perfect square; it was on flat ground as usual. Its walls are about 80 feet thick, and their present height of 40 to 60 feet is but a fraction of the

original height, which was, however, considerably less than the 348 feet given by Herodotus to the walls of Babylon. They were strengthened by about 167 towers. On each of three sides were two gates, one of which was the decorated state gateway for foot passengers, enriched with figured enameled bricks and sculptured bulls and winged genii. These gateways were immense edifices, covering 10,000 square yards, and their courts and vaulted halls and passages were the market places and forums of the city. The royal palace itself made a break in the city wall, being partly inside, partly outside the city line. Its plan includes 209 apartments. Its level was high above that of the city, and its outer wall was defended by towers. The area covered was nearly 25 acres (128,500 square yards). The arrangement of apartments in three general groups each around a main court, supplemented by other smaller courts, is the clearest commentary upon the conditions of ancient life in the East, which have been more or less handed down to modern times. First comes the *Seraglio* for the men, joined to the *Selamlık*, or state apartments. Second is the *Harem*, or private apartments of the King, his wives, and their attendants. Third is the *Khan*, or dependencies, offices, and storerooms. The Seraglio itself had 10 courts and 60 apartments. Each court, with its chambers and passages, was a separate unit. Even the largest state court could be used, by the help of awnings, for ceremonial occasions. The sculptures, enameled bricks, frescoes, colored stucco, marble pavements, and hangings made a gorgeous display.

Sculpture. When Layard, Botta, and Place made the first excavations in Assyria, it was the sculptures that excited the greatest amazement throughout the world. The colossal bulls and lions guarding the portals and the miles of scenes in low relief were unlike anything yet known in the history of art, and their interest was not merely artistic, since they furnished the most graphic information as to the life, costume, and history of the people. There are still gaps. A solitary female statue of the fourteenth century B.C. seems to hint that Babylonian models were then supreme, for its counterpart is found in earlier Babylonian terra-cottas and gems. But later works show that statuary was seldom produced, as the Assyrian artist never mastered its technique; the few remaining statues of kings—such as Asurnazirpal, Sennacherib, and Asurbanipal, or of divinities, like Nebo—when compared with the mass of relief work, show that the heart of the Assyrian sculptor was not in this branch of his art. He did not know how to model the figure under the drapery, nor had he learned to treat drapery in folds, but only as a smooth sheath. The colossal man-headed bulls and lions are in reality not works in the round, but in relief, standing out from a central block. Where the Assyrian sculptor showed his power was in the observation of Nature eye to eye, and his ability to reproduce his impressions with realism without descending to triviality. In the royal hunting scenes this is particularly striking. The lion standing regally in the royal park gazing down at the reclining lioness; the lioness shot through the spine and dragging along her paralyzed hind quarters; the mortally wounded lion gnawing his paws; the scene of the wild-ass hunt, with the various stages of watchfulness, panic, and flight, wounding and tearing down by hounds; the hunting hounds themselves led in

the leash—these and many more variations on similar themes are studies from life such as no other art has given us. Only the needlessly fastidious will carp at the amusingly primitive composition of some of these scenes, due to the entire absence of a knowledge of perspective. Each figure in itself is perfect; and when the artist confines himself to a simple frieze-like procession, as in the scenes of the return from the hunt with the dead animals, or the King in his chariot starting the game, his composition does not suffer even from this imperfection.

Up to the present no discoveries of relief sculptures have been made earlier than the time of Asurnazirpal in the early ninth century; but the art of his time, so powerful and complete, shows that probably even under the great Tiglath-pileser in the twelfth century Assyrian sculpture must have freed itself from its Babylonian swaddling-clothes. When this was happening, Babylonian sculpture, after a development of some 3000 years, had fallen into absolute decay, and such works as those of Merodach-idsmachi, lifeless and fussy, would have been incapable of inspiring a new art. In fact, the Assyrian sculptor found quite a new manner. Instead of the soft contours and delicate gradations of early Babylonian art, the Assyrian technique was sharp and clear-cut, the outlines distinct, the details given with accuracy. In the figures, the muscles, features, and hair; in the drapery, the patterns; and in the armor, harness, chariots, and other accessories—all the details are given with crisp touch. Doubtless the softness of the limestone that served as material helped the sculptor to realize his ideal, and to produce the immense quantity of contemporary annals in stone that amazes us. The realism was assisted by the use of color in figures, drapery, and accessories. The Assyrians in this polychromy of sculpture, as well as in the successful use of the frieze in low relief, were the worthy predecessors of Greek art. The sculptures themselves can be studied in European museums; there remain on Assyrian sites only the yet undiscovered works—probably numerous. Reliefs from Asurnazirpal's palace may be seen not only at the British Museum, whither the great bulk of them were taken, but also at the Gregorian Museum in the Vatican, at the Historical Society in New York, etc. They illustrate the simple, epic stage of Assyrian sculpture, and are mostly colossal figures arranged in a single row on the marble dado that decorated the rooms and corridors of the palaces. The figures are heavier and more strongly marked than later, and there are few or no accessories. What the course of development was during the next 150 years we can only surmise, for the next large group of stone reliefs is that of the palace of Sargon at Khorsabad, now in the Louvre, which shows the last stage of this epic style; it is still colossal and simple, but while the guardian lion of Asurnazirpal snarls and strikes terror, the man-headed bulls of Sargon are genteel colossi of colorless mien. The processions, also, have lost the early fire. The time was ripe for a change of style, which appeared under Sargon's successor, Sennacherib, whose reliefs show the advent of a novel picturesqueness. Figures are multiplied on a background often full of accessories, of landscape, and of buildings; in place of the majestic frieze of large personages, small figures are scattered everywhere. It is true that more respect is

shown to art by not allowing the rescriptive inscriptions which accompanied the reliefs to be run straight across the figures, as hitherto; but the defects consequent on ignorance of perspective are made far more conspicuous. This introduction of the pictorial element, in order to infuse new life into the art, seems to have been successful; for the art of the succeeding generation—that of Asurbanipal, whose sculptures form the most fascinating group in the British Museum—shows the good qualities of both the old and the new schools. There is a riot of many figures in the battle scenes of the Elamite War; there is the quiet simplicity of the antique frieze in many hunting and banquet scenes. If we miss the greater force of the time of Asurnazirpal, there is an added delicacy.

The subjects of the reliefs fall into several categories: 1. Religious and mythological scenes were rare and belonged mostly to the temples, which have not yet been as fully explored as the palaces; there were statues of the gods and heroes, and reliefs of the conflict of Merodach with the dragon, the labors of Gilgamesh, and the wars of the evil spirits. 2. Scenes of contemporary history were particularly numerous. There were court sculptors who were as much the King's historiographers as were the writers. Every incident in the long war was portrayed in a fashion similar to that of the later artists in such works as the columns of Trajan and Marcus Aurelius. In such scenes as the battle of Susa, which completed Asurbanipal's conquest of Elam, each successive incident of the battle, even each separate phase of the duel of the two leading warriors, is given separately and side by side. It is a sort of moving panorama, which proceeds *pari passu* with the descriptive text. The Assyrian official annals of each yearly campaign are thus illustrated at every point. We see exactly how the Assyrian soldiers were armed and fought, marched, encamped, crossed rivers, attacked cities, slaughtered and tortured enemies, cooked, and sacrificed to the gods. 3. Scenes of daily peaceful life are only less numerous. The King banqueting with his Queen in the palace garden, or hunting lions, gazelles, or wild asses; the construction of a royal palace; the royal horses led to the river to be watered; incidents of court life and glimpses of the royal parks—all show the versatility of the artist. It is, however, true that far less use is made of such material than was the case in Egypt, where many more details of manners and customs are portrayed. The Assyrian artist cared more for the official acts of his sovereign than for the life of the people or for the mysteries of religion. Consult the bibliography given in the preceding article.

AST, *ist*, GEORG ANTON FRIEDRICH (1778–1841). A German philologist and philosopher. He became professor of classical literature at Landshut (1805) and at Munich (1826). Among his works were a *System der Kunstlehre oder Lehr- und Handbuch der Aesthetik* (1805); *Grundlinien der Geschichte der Philosophie* (1807); *Wissenschaftliche Darstellung der Grammatik, Hermeneutik und Kritik* (1808); *Platos Leben und Schriften* (1816), and an edition of Plato in 11 volumes (1819–32) with Latin translation and extensive notes.

ASTARBOARD. See **HELM**.

ASTARTE, *as-tär'té*. The woman whom the hero of Byron's *Manfred* had guiltily loved, and whose lovely shade appears to him at the close of the second act.

ASTARTE, ASHTORETH. A goddess appearing frequently in the Old Testament (1 Kings xi. 5-33; 2 Kings xxiii. 13), where she is called the goddess of the Sidonians. The form of her name in the Masoretic text of the Old Testament appears to be due to intentional perversion, her real name being Ashtart, to the consonants of which late scribes assigned the vowels of Bosheth, 'shame,' thus producing the form Ashtoreth. Her worship was quite prevalent in the time of the Judges, and Solomon built a temple to her. Astarte was, however, not only the goddess of the Sidonians; the Bible mentions a temple of Astarte at Ashkelon (1 Sam. xxxi. 10), and from Semitic inscriptions we learn of a temple to Astarte at Citium in Cyprus, and at Eryx in Sicily, as well as in Carthage. It is fair to infer, then, that she was a Phœnician goddess. From Cyprus her cult was carried to Greece and appears as that of Aphrodite. Astarte herself is not original with the Phœnicians. In Assyria there is an Ishtar, "the Lady," "the Queen of the Gods," "the Goddess of War," the planet Venus; she, too, is the goddess of various localities, "Ishtar of Arbela," "Ishtar of Ninua," and she finally assumes a national position. In south Arabia there was a male deity Ashtar. The inscription of Mesha, King of Moab, mentions an Ashtar-Chemosh. This has been supposed to be a male Ashtar; but in all probability it is an abbreviated form of Ashtart-Chemosh, the goddess Astarte as spouse of the chief god of Moab. Astarte is represented as a female figure, generally naked, rather short and round, with hands holding the breasts. Recent excavations in Palestine have brought to light a number of representations of this goddess. Astarte was regarded as the goddess of fertility, fruitfulness, and love. She is sometimes represented with her symbol, the dove, or in the form of a cow. There can be no doubt that Astarte is meant by the designation "Queen of Heaven." The plural Ashtaroth is often used in the Old Testament as a general term for "goddesses." Consult Jeremias, *Das Alte Testament in Lichte des Orients*, pp. 107 ff. (1906), and Gressmann, *Altorientalische Texte und Bilder*, vol. ii, pp. 79 ff. (1909).

ASTATIC NEEDLE (unstable, from Gk. *á, a*, priv. + *statós, statos*, standing). A compound magnetic needle which has little if any directive power and is composed of two magnetic needles suspended parallel in the same system, but with their poles reversed. The effect of one needle is to neutralize the other, and the result is the same as if a very weak needle were placed in the magnetic field. The chief use of the astatic needle is in the astatic galvanometer, where great sensitiveness is required. Possessing but a slight directive power, it will deflect under the action of very weak currents of electricity in the surrounding coils. (See GALVANOMETER.) A simple description of the astatic needle and the astatic galvanometer will be found in Silvanus P. Thompson, *Elementary Lessons in Electricity and Magnetism* (New York, 1901).

ASTAY'. See ANCHOR.

ASTEN, *ás'ten*, FRIEDRICH EMIL VON (1842-78). A German astronomer. He was born at Cologne and studied at the University of Bonn. From 1870 he was connected with the observatory of Pulkova, Russia. He is chiefly known for his researches in connection with Encke's comet.

ASTER (Lat., Gk. *astér, astér*, star). A
VOL. II.—19

genus of plants of the family Compositæ. The genus contains a great number of species, both herbaceous and shrubby, mostly natives of the United States. A number of perennial species are in cultivation as garden flowers. They bloom from July to November and are among the most valuable hardy plants for border and roadside planting. The ray and the disk are of different colors. The New England aster (*Aster novæ-angliæ*) is one of the most showy native American asters. The best known and most valued of all the asters is the China aster (*Aster chinensis*), a summer annual, of which more than 250 varieties are in cultivation, and new ones are continually being introduced. The plant was brought from China in the early part of the eighteenth century and has been greatly improved by cultivation. The different varieties exhibit diversity of form and color. The plant prospers in a rich, free soil. *Aster argophyllus*, or *Hastonia argophylla*, a native of Van Diemen's Land, is a whitish shrub, smelling strongly of musk. A plant, known in the West as woody aster, *Xylorrhiza parryi*, is reported as very poisonous to sheep in Wyoming. For illustration, see ARAUCARIA.

ASTER, *is'tér*, ERNST LUDWIG VON (1778-1855). A German military engineer. While an officer in the Saxon army, then an ally of the French, he submitted to Napoleon in 1811 a plan for the fortification of Torgau. Napoleon became much interested in it, and the fortress was finished under Aster's superintendence. After the Russian campaign, in which he took part, he served in the Russian army for some time and then returned to the Saxon service. In 1815 he became colonel in the Prussian army, and after the battle of Waterloo, in which he was engaged, he was promoted to be general and made inspector of Prussian fortifications. He planned the elaborate defenses of Coblenz and Ehrenbreitstein and was made commander of both fortresses. In 1827 he was promoted to be lieutenant-general, and in 1842, general of infantry. He left essays and other works posthumously published.

ASTERABAD, *ás'tér-á-bád'*. See ASTRABAD.

ASTERIA. See SAPPHIRE.

ASTERISK (Gk. *astérophos, asteriskos*, a little star). A sign or symbol (*) used in writing and printing as a reference either to a note at the bottom or on the margin of the page. The obelisk or dagger (†) and many other marks are similarly employed; but when there are several references on the same page, it is now common to use the numerals 1, 2, 3, etc. The asterisk and other similar signs may have any arbitrary meaning assigned to them, at the will of the writer, their signification being previously explained. The Greek grammarians, or critics, used the asterisk to mark a passage that had been unjustly suspected but was to be held as genuine, or a passage in any way remarkable; the obelisk, again, marked an interpolated or an objectionable word or passage. See TEXTUAL CRITICISM.

ASTERN'. See BEARING.

ASTEROIDS. See PLANETOIDS.

ASTEROPHYLLITES (Gk. *astér, astér*, star + *phýllon, phyllon*, leaf, alluding to the arrangement of the leaves). Fossil plant remains, formerly considered as representing a distinct genus, but now known to be, together with *Annularia* and *Sphenophyllum*, the heteromorphous leaves of the large group of *Calamites*,

of Devonian, Carboniferous, and Permian time. See CALAMITES.

ASTHÉNIA (Gk. ἀσθένεια, *astheneia*, loss of strength, from ἀ, priv. + σθένος, *sthenos*, strength). 1. In medicine, a condition of weakness, general or local, resulting from disease. General asthenia is a depression of the vital forces, attended by emaciation, such as occurs in advanced tuberculosis or long-continued fevers. 2. A specific infectious disease of chickens, due to *Bacillus (Bacterium) asthenia*, a member of the colon group. Cultures of this germ are killed by immersion in a 1 per cent solution of carbolic acid for five minutes, though they can vegetate between the temperatures 40° and 55° C. (104° to 131° F.). The organism is killed at a temperature between 57° and 60° C. (134.6° to 140° F.). The most marked symptom of asthenia is extreme emaciation; the chief lesions are found in the duodenum; and in the contents of this part of the intestine the pathogenic organism occurs in large numbers. Thorough purgation followed by tonics has been recommended in the treatment of fowls suffering from asthenia. At present the disease is reported only in the United States and is popularly known as "going light."

AS'THENO'PLA (Gk. ἀ, priv. + σθένος, *sthenos*, strength + ὤψ, *ōps*, eye), or WEAK SIGHT. A very common affection of the eye, caused by fatigue of the muscles moving the eyeball or of the ciliary muscle. It occurs most often in debilitated or neurasthenic persons, and its chief symptom is pain in or around the eyes, or headache, which is increased by use of the eyes, particularly upon near objects and in artificial light. If the strain is prolonged, the results may be temporary dimness of vision, sometimes double vision, confusion of the lines in reading, photophobia, irritability, itching and burning of the margins of the lids, and lachrymation. Disturbances of the stomach and of menstruation may also result. The affection may be muscular, accommodative, or nervous.

Muscular Asthenopia. This is caused by weakness of some of the muscles moving the eyeball, and often depends upon defects of sight. The symptoms result from the prolonged strain upon the weaker muscles in the effort to keep the visual axes of the eyes in the proper plane, in opposition to the action of stronger muscles.

Accommodative Asthenopia. This is due to strain and subsequent fatigue of the ciliary muscle which regulates the curvature of the crystalline lens. It occurs in various forms of defects of sight, such as astigmatism and hyperopia (see SIGHT, DEFECTS OF), and is due to the efforts of the ciliary muscle to alter the degree of curvature of the lens so as to bring rays of light entering the eye to a focus upon the retina.

Nervous Asthenopia. This is a functional disorder of the normal eye, depending upon hysteria, neurasthenia, or debility.

ASTHMA, ās'mā or āz'mā (Gk. ἀσθμα, short-drawn breath, panting, from ἄνω, *ain*, to blow). A disorder of the function of respiration characterized by acute attacks of difficult breathing accompanied by coughing, wheezing, and, in severe paroxysms, by slight asphyxia. Asthma most often develops after some slight catarrhal inflammation of the bronchial mucous membrane. Only the physician can diagnose asthma from an attack of shortness of breath. The theories of its causation have been numerous, but the one that best explains the symptoms is that

asthma is due to spasm of the muscle fibres in the walls of the bronchi. In some cases it seems to be hereditary, and intensely nervous people seem to be more often affected. It occurs in men oftener than in women, and very frequently in children, especially after measles, bronchitis, or whooping cough. The attack may be set up by the inhalation of pollen, as in hay fever, by closure of the nostrils with polypi or other growths, causing intra-nasal pressure. In some people particular odors will bring on a paroxysm. An asthmatic attack usually begins suddenly, at night, with a preliminary sense of oppression. The patient wakes with much distress and anxiety, some pain in the chest, and great difficulty in breathing. The efforts to obtain air may necessitate great muscular exertion, and the patient may become covered with perspiration. The face may become purple and the eyes bloodshot. The attack may pass off and not reappear, but the disease is prone to be a chronic one. Treatment is mainly dietetic and hygienic, but many cases are cured by appropriate intra-nasal surgery. Dry inland climates are favorable. Bromides, iodides, nitrites, and opium, atropine, and adrenalin are the drugs most widely employed. Consult Osler, *Principles and Practice of Medicine* (New York, 1912).

ASTI, ās'tē (anciently, *Asta Pompeia*). An episcopal city in the province of Alessandria, north Italy, on the left bank of the Tanaro, 35 miles southeast of Turin (Map: Italy, C 3). The walls are dilapidated, the streets narrow and irregular, and the general appearance mediæval. The cathedral dates from 1348, and the church of San Giovanni, built over an ancient Christian basilica, has monolithic columns bearing sixth-century symbols. Asti is famous for its sparkling wine (*Asti spumante*). It has trade in leather, woolen goods, hats, wine, and agricultural produce, and manufactures of silk. It excelled in the manufacture of pottery in ancient times. In the Middle Ages it was a powerful republic and famous for its 100 towers, of which 30 still remain. It was burned by the Emperor Frederick I in 1155, and after a series of vicissitudes came into the possession of the Visconti of Milan, by whom it was ceded to the French, who held it till the middle of the sixteenth century, when it passed into the possession of the dukes of Savoy. The poet Alfieri was born here in 1749. Pop., 1881 (commune), 32,233; 1901, 38,045; 1911, 41,252.

ASTIE, ās'tyā', JEAN FRÉDÉRIC (1822-94). A Protestant theologian. He was born at Nérac, France, and studied at Geneva, Halle, and Berlin. He was a clergyman in New York from 1848 to 1853, when he removed to Paris. In 1855 he settled at Lausanne, Switzerland, where, in the following year, he was appointed professor of philosophy and theology. The influence of Kant, Schleiermacher, and Vinet is revealed in his numerous writings on theology. In 1868 he became the editor of the *Revue de Théologie et de Philosophie*, which he conducted for many years. He published *Histoire de la république des Etats-Unis* (2 vols., 1865); *Mélanges de théologie et de philosophie* (1878).

ASTIG'MATISM (Gk. ἀ, priv. + στίγμα, *stigma*, prick of a pointed instrument; spot, mark). A defect in vision caused by the refraction of light by the eye differently in different planes. To an eye thus affected, a pinhole in a paper may appear round, but when the paper is moved a little, the circular hole will seem to be

an ellipse. Irregular astigmatism is that form in which there is a difference of refraction in various parts of the same meridian, as after injuries of the cornea or congenital defects in the lens. Regular astigmatism is that variety in which the degree of refraction of the two principal meridians differs. Astigmatism is usually due to differences in the curvature of the cornea: less frequently, of the lens. It is either simple, in which one meridian is normal and the other hyperopic; compound, in which both meridians are unequally hyperopic or myopic; or mixed, in which one is hyperopic and the other myopic. Astigmatism causes diminution of vision and asthenopia, with the usual manifestations of eye strain. Drowsiness, congestion of the conjunctiva, or blepharitis, may be the only symptoms; but severe headaches, neuralgias, ocular pains, and nausea are often present. In persons of a neurotic tendency especially, a wide range of reflex disturbances may accompany even a low degree of astigmatism. It is corrected by glasses ground as cylinders, sphero-cylinders, or a combination of a spherical and a cylindrical lens; or by crossed cylinders, which are a combination of two cylindrical lenses, with their axes at right angles to each other.

ASTLE, ās'l, THOMAS (1735–1803). An English antiquary and paleographer. He wrote *The Origin and Progress of Writing* (1784; reprinted, 1876), an important contribution to English writings on the subject of paleography. He published also *An Account of the Scals of the Kings, Royal Boroughs, and Magnates of Scotland* (1792).

ASTLEY, HUGH JOHN DUKINFIELD (1856–). An English clergyman and anthropologist. Educated at Trinity College, Dublin, he was in 1881 ordained a clergyman in the Church of England. In 1894–96 he was incumbent of the parish of St. John the Evangelist, at Brixton, and from then on was vicar of East and West Rudham, Norfolk. He was Donellan lecturer at the University of Dublin (1906–07), honorary editorial secretary of the British Archaeological Association (1897–1906), and librarian of the British Numismatic Society (1903–06). Becoming noted for his researches in archaeology and anthropology, he was made a fellow of the Royal Historical Society and of the Royal Anthropological Institute, and a member of many other organizations. The degrees of M.A. and Litt.D were conferred upon him. His writings on theological, scientific, and social subjects include: *The Resurrection and Modern Thought* (1889); *The Date of the Samaritan Pentateuch* (1892); *The Higher Critics and Holy Writ* (1905); *Prehistoric Archaeology and the Old Testament* (1908); *Portuguese Parallels to the Clyde-side Discoveries* (1904); *The Saxon Church at Bradford-on-Avon* (1905); *Memorials of Old Norfolk* (1908); *The Housing Problem in the Country* (1901).

ASTLEY, āst'li, PHILIP (1742–1814). A noted English equestrian performer and manager. He was born at Newcastle-under-Lyne, and began work as a cabinetmaker, but enlisted as a cavalryman in the Seven Years' War, and after returning with an honorable discharge, gave exhibitions of horsemanship in Lambeth and elsewhere. At Lambeth he built, in 1770, a wooden circus, which grew, in course of prosperity and rebuilding after successive fires, into Astley's Royal Amphitheatre. This was the

scene of a variety of exhibitions under his direction; but the special attraction was the equestrian performances, in which he himself excelled. He opened a similar establishment in Paris, which was seized for a barracks at the time of the Revolution, but he afterward recovered possession of his property. He died in Paris and was buried in Père-la-Chaise.

ASTOLF. See AISTULF.

ASTOLFO. An English noble in Charlemagne's train—a boastful but generous character. In Ariosto's *Orlando Furioso* he cures Orlando's madness by bringing back from the moon the great Paladin's wits in a vial. He is renowned for his fairy gifts of a magic horn, through whose notes all living things are panic-stricken, and a book which tells everything.

ASTOLPHUS. See AISTULF.

ASTON, WILLIAM GEORGE (1841–1911). An Irish philologist and diplomat, born near Londonderry in 1841. He was educated (1859–63) at Queen's College, Belfast; one of his professors was Dr. James McCosh. He was appointed in 1864 student interpreter to the British Legation in Japan. He mastered the theory of the Japanese verb, and in Tokio began, with E. M. Satow, those profound researches into the Japanese language which laid the foundations of critical study in the Mikado's Empire. He held various offices in Japan until 1883; was made consul-general in Korea in 1884, and secretary of legation in Tokio in 1886. He retired on a pension in 1889. His publications include grammars of the Japanese language, spoken and written (1868 and 1872); a translation of the *Nihongi*, or *Annals of Ancient Japan* (1896), which show acute scholarship; *A History of Japanese Literature* (1899); and a great number of papers for learned societies on Korean and Japanese subjects, many of them in the *Transactions* of the Asiatic Society of Japan. In 1905 he published *Shinto*, a valuable study of primitive religion.

ASTON HALL. Supposedly the original of Irving's *Bracebridge Hall*. It was built of red brick in the Elizabethan style, by Sir Thomas Holte, in 1618–35. For some time before its purchase by the city of Birmingham in 1864, when it was turned into an art gallery and museum, it was in the possession of Charles Holt Bracebridge, of that city.

ASTON MAN'OR. A municipal borough in Warwickshire, England, adjoining Birmingham (q.v.), of which it is really a suburb, although it was separately incorporated in 1903 and returns one member to Parliament. The town is an industrial centre, its manufactures including beer, paper, and motor vehicles. A large athletic field in Aston is the scene of important football matches. Pop., 1891, 68,600; 1901, 77,300; 1911, 75,029.

ASTOR, JOHN JACOB (1763–1848). An American merchant. He was born in Waldorf, a village near Heidelberg, Germany, the son of a butcher. He followed his elder brother, first to London and then to New York, whither he went in 1783. He soon invested his small capital in furs, and by economy and industry he so increased his means that after six years he had acquired a fortune of \$200,000. He traded directly with the Indians, peddling gewgaws among them and buying their furs at a ridiculously low rate. At first he prepared the furs with his own hands and took them to the London market. He also became the New York agent of his brother's

house, which dealt in musical instruments. Although the increasing influence of the English fur companies in North America was unfavorable to his plans, he ventured to fit out two expeditions to the Oregon Territory—one by land and one by sea—the purpose of which was to open up regular commercial intercourse with the natives. After many mishaps, his object was achieved in 1811, and the fur-trading station of Astoria was established; but the War of 1812 stopped its prosperity for a time. From this period Astor's commercial connections extended over the entire globe, and his ships were found in every sea. He was especially successful in the China trade. He left property amounting to \$30,000,000, largely invested in real estate, which has since enormously increased in value. The Astor House, on lower Broadway, New York, was built by him. He left a legacy of \$350,000 for the establishment of a public library in New York. (Consult Washington Irving's *Astoria* (Philadelphia, 1836) and James Parton's *Life of John Jacob Astor*, 1865.) His wealth was mainly inherited by his son, WILLIAM BACKHOUSE, who continued to augment it till his death in 1875, when it had increased to about \$50,000,000. During his lifetime he made many gifts to the Astor Library, and at his death left it \$250,000 and books worth \$200,000. He was known as the "Landlord of New York," from the extent of his property in that city.

ASTOR, JOHN JACOB (1864–1912). An American capitalist, inventor, and soldier; the fourth of the name. He was born at Rhinebeck-on-Hudson, N. Y., graduated in 1888 at Harvard, traveled extensively, and afterward was occupied chiefly with the management of the Astor estate. The St. Regis and Knickerbocker hotels, and the Astoria (later part of the Waldorf-Astoria) in New York were built by him. In 1894–96 he was on the staff of Gov. L. P. Morton, and in 1898 was commissioned lieutenant-colonel of United States Volunteers. During the Spanish-American War he served as a staff officer in the Santiago campaign and presented to the government a fully equipped mountain battery, which was named for him, and which did effective work in the campaign before Manila. He became known as an inventor of several useful devices, such as a bicycle brake, a pneumatic road improver, improved marine turbines, a machine for the utilization of peat deposits, etc. He was director of many financial organizations and railroads, and was one of the founders of the New Theatre. Colonel Astor published *A Journey in Other Worlds* (1890) and *A Romance of the Future* (1894). He was drowned at sea when the *Titanic* sank.

ASTOR, WILLIAM WALDORF (1848—). The great-grandson of John Jacob Astor. He was born in New York City, and studied law in order to qualify himself for assuming the management of the Astor estate. He was elected to the New York State Assembly in 1877 and to the Senate in 1879. In 1881 he was defeated by Roswell P. Flower as a candidate for Congress. He was appointed by President Arthur Minister to Italy in 1882, a post which he held till March 1, 1885. As a result of studies made at Rome, he published two romances: *Valentino* (1886) and *Sforza* (1889). On the death of his father he became the head of the family and the inheritor of the estate, estimated at \$200,000,000, largely invested in real estate. He built three magnificent

hotels in New York City, the Netherland, the Waldorf, and the Astor. In 1890 he went to London to live and in 1899 became a British subject. He bought the *Pall Mall Gazette* in 1893 and founded the *Pall Mall Magazine*.

ASTORGA, às-tôr'gà (anciently, Lat. *Asturica*). A town of Spain near the river Tuerito in the province of Leon, still surrounded by massive Roman fortifications (Map: Spain, B 1). It was the ancient Asturica Augusta, a Roman provincial capital where four military roads met. In the neighborhood is a ruined castle which was a famous centre of Spanish resistance to Moorish onslaughts in the eighth century. The town was once known as the "City of Priests." It has been the see of a bishop since the third century, and its bishop is suffragan to the Archbishop of Valladolid. Pop., 1910, 5682.

ASTORGA, EMMANUELE, BARON D' (1681–1736). An Italian composer. He was born at Palermo, Dec. 11, 1681. His *Stabat Mater* is still regarded as a masterpiece. He wrote also an opera, *Dafne*, produced in Vienna in 1705. He derived his name from the Spanish convent of Astorga, where, after having studied with Scarlatti, he became a pupil. He died in Bohemia, Aug. 21, 1736. Consult H. Volkmann, *Emanuel d'Astorga* (Leipzig, 1910).

ASTORIA. A city, port of entry, and the county-seat of Clatsop Co., Oreg., 100 miles northwest of Portland, on the south bank of the Columbia River (Map: Oregon, B 1). It is on the Spokane, Portland, and Seattle Railroad, and has several steamship lines to domestic and foreign ports. There are now about 5 miles of water front within the city limits. Astoria is the centre of an extensive salmon-fishing and canning industry, one of the most important in the world, and contains iron works, can factories, lumber mills, and other industrial establishments. It controls, also, a large export trade in lumber, wheat, flour, etc. The United States custom house and post office, Astor Park, the public library, and St. Mary's Hospital (Roman Catholic) are among the more important features of the city. Here is located Fort Clatsop, established in 1805 by the Lewis and Clark Expedition. Astoria, founded as a fur-trading station in 1811 by John Jacob Astor, was the first settlement in the valley of the Columbia. In 1813 the English took possession, renamed it Fort St. George, and held it until 1818, though until 1845 the Northwest Company, English fur-traders, continued to occupy it. In 1876 it was chartered as a city. The water works are owned by the municipality. Pop., 1890, 6184; 1900, 8381; 1910, 9599. Consult Washington Irving, *Astoria; or, Anecdotes of an Enterprize beyond the Rocky Mountains* (Philadelphia, 1836).

ASTORIA. An account of Astoria, the settlement founded by John Jacob Astor on the Columbia River, by Washington Irving (1836).

ASTOR LIBRARY. See NEW YORK PUBLIC LIBRARY.

ASTOR PLACE RIOT, THE. In American history, a riot which occurred in Astor Place, New York City, on the evening of May 10, 1849, and which grew out of an attempt by partisans of the American actor Edwin Forrest, assisted by the rabid anti-English element of the lower classes in the city, to prevent the English actor William C. Macready from giving a performance of *Macbeth* in the Astor Place Opera House. A disorderly crowd assembled in

Astor Place early in the evening, and soon after the performance began, fiercely attacked the opera house and endeavored to force their way inside. The police proving unable to disperse the mob, the Seventh Regiment was called out; and before order could be restored, 34 of the rioters had been killed and many more wounded, while 141 of the militiamen had been more or less seriously injured by brickbats and stones. After the performance Macready was taken to a private house, and two days later proceeded secretly to Boston, where he took ship for England. Consult Wilson, *Memorial History of New York*, vol. iii (4 vols., New York, 1892-93), and Barrett, *Edwin Forrest* (Boston, 1882).

ASTRABAD, äs'trâ-bäd', or **ASTERABAD** (*Aster*, name of a river + Pers. *abad*, dwelling, town). A town of Persia; capital of the province of Astrabad, situated in about lat. 37° N., and long. 54° 30' E., about 20 miles from Astrabad Bay (Caspian Sea) (Map: Persia, E 3). It is surrounded by a ditch and a mud wall, and its streets and houses, once substantially built and well kept, are now little better than ruins. Astrabad contains an extensive bazaar, several fine mosques, and the remains of a palace built by Shah Abbas. It was long the residence of the Rajah princes, who are related to the present ruling house of Persia, and a number of whom are still living at Astrabad. The trade with Russia, which country has a naval station and a fort on the island of Ashurada in Astrabad Bay, has increased steadily. The chief articles of export are cotton, rice, silk, grain, carpets, salt, and caviar. The port of Astrabad is Gez, a little village with a population of about 1200. Astrabad is connected by a caravan route with Afghanistan, and is the seat of a Russian consulate. The city is in an unhealthy region and is known colloquially as the "City of the Plague." It was swept by a disastrous fire in 1898. The population is variously estimated from 10,000 to 30,000.

ASTRÆA (Gk. *Ἀστραία*, *Astraia*). The "Star Maiden," who, according to Greek stories reflected by Ovid in his *Metamorphoses*, dwelt among men during the Golden Age, but left the earth in the Iron Age, in grief at the wickedness of mortals, and returned to the gods. She was the last of the gods to quit the earth. Some writers made her a daughter of Zeus; others called her the daughter of the Titan Astræus and Eos, and identified her with Dike. On her return to heaven she became the constellation Virgo. Astræa is also the name of one of the planetoids.

ASTRÆA, THE DIVINE. Mrs. Aphra Behn, "the first Englishwoman to live by her pen." A vivacious and ingenious, though somewhat coarse, dramatist and novelist of the eighteenth century. Author of *Oroonoko*, the story of a "royal slave." Mrs. Behn and William Congreve were the first to oppose the vogue of heroic French romances, which were translated and imitated in England during the latter part of the seventeenth century.

ASTRÆA RE'DUX (Lat. *Astræa* brought back). A poem written by Dryden, commemorating the return of Charles II. It was published in 1660, only two years after the appearance of the same poet's obituary eulogy of Cromwell, "Heroic Stanzas." Admirers find in the later poem a line which they think explains the apparent contradiction in the poet's sympathies. According to them, the line, "To stanch the

blood by breathing of the vein," means that Cromwell was justified in the execution of Charles II's father, but that Charles II's speedy succession to Cromwell was equally advantageous for England.

AS'TRAGAL (Lat. *astragalus*, from Gk. *ἀστράγαλος*, *astragalos*, the ball of the ankle joint). In architecture, a rounded bead molding, either plain or divided into rounded sections; used especially to designate the small molding at the top of the shaft of a classic column, corresponding to the cincture at the bottom. Also, the molded strip applied to the meeting stiles of folding doors.

ASTRAG'ALUS (Lat., Gk. *ἀστράγαλος*, *astragalos*). A bone of the foot, which forms, with the leg bones, the hinge of the ankle joint. Its lower surface is concave, and rests on the *os calcis*, or heel bone, to which it is attached by a strong ligament. In front it has a round head, which rests in the concavity of the scaphoid, another bone of the tarsus, and upon an elastic ligament, its pressure upon which gives in a great measure the necessary elasticity to the foot. It is at this joint that inversion and eversion of the foot take place. The astragalus is a bone of great importance, as it supports the weight of the body in standing and enters into most of the movements of the foot.

ASTRAGALUS. A genus of shrubby or herbaceous plants belonging to the family Leguminosæ and embracing about 1000 species. They are found in almost all parts of the world except Australia. The leaves are pinnate and the pods more or less two-celled. They are commonly met with on dry soils. A number of species, among them *Astragalus gummifer* and *Astragalus microcephalus*, yield gum tragacanth. In the western United States many species abound, and poisonous properties are attributed to some, which are called "loco weeds." *Astragalus mollissimus* and *Aragallus lamberti* are very common "loco weeds," and horses or cattle eating them are said to lose appetite for anything else, become deranged, and finally die. If taken from pastures where these weeds abound and well fed, stock usually recover. The administering of Fowler's solution to horses and small doses of strychnine to cattle have proved valuable treatments. They should be given only under advice of a veterinarian, as locoed animals are very susceptible to the bad effects of overdosing. See GUMS.

ASTRAKHAN, äs'trâ-kân', or *Russian pron.* äs'trâ-kân'y'. A government in southeastern Russia; previous to 1554 a province of the Mongol Empire. It borders on the Caspian Sea (Map: Russia, J 5) and is the fourth government of Russia in order of size, having an area of 91,042 square miles, exclusive of inner waters. The capital is Astrakhan. The surface is almost entirely a barren waste, the only fertile portions being the banks of the Volga, which divides the province into two equal parts, the steppes of the Kalmuks on its right and of the Kirghiz on its left. The principal industry of the population is herring and sturgeon fishing, in which are also engaged about 30,000 persons from the adjacent governments. The annual catch of herring ranges from 21,000,000 in bad years to 78,000,000 in good. An auxiliary to this industry is the extraction of salt from the lakes and from the marshes of the steppes, to the amount of about 300,000 tons annually. Another industry of importance is

cattle breeding, the only means of subsistence of the Kalmuks, Kirghiz, and a considerable portion of the Tatars. Agriculture is undeveloped. The population, numbering 879,000 in 1892, 1,230,300 in 1909, and 1,262,000 in 1911, is composed of diverse elements—Russian, Tatar, Georgian, Armenian, Bokharese; the seminomadic Kalmuk (Buddhist) and Kirghiz (Mohammedan) tribes number over 300,000. There are also some Persians and Hindus.

ASTRAKHAN (named after the Khan *Aster*). The capital of the government of the same name in Russia, situated on an island of the Volga, 60 miles from the Caspian Sea and 933 miles southeast of Moscow (Map: Russia, G 5). It is the seat of a Greek and an Armenian archbishop; has Greek, Roman Catholic, Protestant, and Armenian churches, many mosques, an Indian temple, several museums, botanical gardens, technical schools, and a seminary for priests. The town is situated on very low ground, the average elevation reaching but 8½ feet above the level of the Volga, and its highest point not exceeding 46½ feet. It is irregularly built; the streets are filthy, since they are neither paved nor ever sprinkled or swept. There is no modern sewerage system, and cess-pools contaminate the air. The low situation of the town has made it necessary to surround it by a wall of earth rising about 14 feet above the ordinary water level of the Volga; all of which gives the place rather an Oriental appearance. The position of the town on the Volga, the greatest river in Europe, its proximity to the Caspian Sea, an advantage which has been further enhanced by the construction of the Trans-Caspian Railway, and the development of petroleum deposits in the vicinity of Baku, have made Astrakhan one of the most important commercial centres of Russia and the entrepôt for goods exchanged between Russia and western Europe on the one hand, and Persia, Bokhara, Khiva, and other Middle Asiatic countries on the other. The chief articles of import from the East are gold, embroidered silken goods, silk stuffs, woolen goods, raw silk, grain, timber, rhubarb, and drugs. The exports include cotton, fish, petroleum and petroleum products, linen, leather, paper, dry goods, glass, paints, salt, and sugar. The annual value of the imports and exports is about 68,000,000 rubles (about \$34,000,000). The industries show little progress and include chiefly the manufacture of silk goods, leather, machinery, tar, paper, and brick. There are over 70 docks, accommodating more than 4000 ships annually. The fisheries in the Volga employ a great number of the inhabitants, and the vine is cultivated in the environs. The town gives its name to a fine quality of fur, the product of a variety of sheep found in Bokhara, Persia, and Syria. There are many charitable institutions and hospitals. Pop., 1897, 113,000; 1908, 136,841; 1912, 149,630. Astrakhan was important during the Middle Ages. For several centuries it was in the hands of the Tatars and did not come into undisputed possession of Russia until 1554.

ASTRAL BODY. See THEOSOPHY.

ASTRAL SPIRITS. In ancient Oriental and Greek religious systems, the spirits which animated and controlled the heavenly bodies (Gk. *ἀστροα*, *astra*). When these notions, possibly handed down by the Gnostics, passed into the demonology of the Middle Ages, the astral spirits were sometimes adapted into fallen angels—the

transition being easy from the general belief that angels personally directed all physical manifestations, such as thunder-storms; sometimes they were conceived of as the souls of departed men, sometimes as spirits originating in fire, and hovering between heaven, earth, and hell, without belonging to any one of these provinces. Paracelsus and others attributed to every human being an astral spirit or sidereal element in which the human soul, or spirit proper, is thought to inhere, and which lives for a time after the person dies.

ASTREE, ās'trā'. A novel. See URFÉ.

ASTRIN'GENTS (Lat. *ad*, to + *stringere*, to bind fast, tight). Medicines which cause contraction of tissues, and thus prevent excessive discharges of blood, mucus, and other secretions. They are used to arrest diarrhœa, hemorrhage, and discharges from mucous membranes. They act locally, although gallic acid is thought to act as a remote astringent, tending to check hemorrhage in any part of the body when given by mouth. Astringents are of two classes, vegetable and mineral. The most important of the first class are tannic and gallic acids (derived from nut-gall), rhatany, catechu, kino, logwood and white-oak bark. Mineral astringents include nitrate of silver, the sulphates of copper, zinc, and iron, chloride of iron, acetate of lead, alum, sulphuric, nitric, and hydrochloric acids.

ASTROCARYUM (Gk. *ἀστρον*, *astron*, star + *κάρυον*, *karyon*, nut; referring to the arrangement of the fruits). A genus of palms, of which about 30 species are known, natives of tropical America, remarkable for the abundance of acute and formidable spines, in some cases a foot long, with which almost every part—stem, leaves, spathe, and fruit-stalk—is armed. They have beautiful pinnate leaves; some of them are lofty, others are of very moderate height, as 8 to 15 feet, while some are almost or altogether stemless, as *Astrocaryum acaule*, the lu palm. The fruit of some species is eatable—a juicy pulp covering a stony seed—as the fruit of the Murumurú palm (*Astrocaryum murumurú*), the pulp of which is said to resemble a melon in flavor, has a sort of musky odor, and is highly esteemed. It is a palm only about 8 to 12 feet high, abundant about Pará and elsewhere on the Amazon. Cattle roam the forests in quest of its fruit, and swine fatten on the seed, which they crush with their teeth, although in hardness it almost resembles vegetable ivory. Another edible fruit is that of the Tucumá palm (*Astrocaryum tucuma*), abundant in the same regions. These fruits are about an inch long, the Murumurú ovate, the Tucumá almost globular. The Tucumá palm is 30 to 40 feet high, the stem encircled with narrow rings of black spines, which are disposed with beautiful regularity. The Tucumá palm (*Astrocaryum vulgare*), a species quite distinct from the Tucumá, and more lofty, is of great importance to the Indians, and in places where it is not indigenous is cultivated with care for the sake of the epidermis of its unopened leaves, of which they make cordage, very useful for bowstrings, fishing nets, etc. The fibre is at once fine, strong, and durable, and may yet perhaps become important as an article of commerce. Beautiful hammocks are made of Tucum thread. The fibre is obtained by cutting down the terminal bud or column of unopened leaves which rises from the centre of the crown of foliage. The tender

leaflets are then carefully stripped of their epidermis, in pale, ribbon-like pellicles, which shrivel up almost to a thread. These are tied in bundles and dried, and are afterward twisted into thread, or made into thicker cords, by mere rolling and manipulation. The mature leaves yield a coarser fibre, which varies considerably with the different species. It is used for cordage, and the split stems of the new leaves are braided into hats and baskets.

ASTROGRAPHIC CONGRESS. See **ASTROPHOTOGRAPHY**.

ASTROLABE (Gk. *αστρολάβον*, *astrolabon*, star-taker). The name given by the Greeks to any circular instrument for observing the stars. Circular rings, arranged as in the armillary sphere, were used for this purpose. A projection of the sphere upon a plane, with a graduated rim and sights for taking altitudes, was known as an astrolabe in the palmy days of astrology, and was the badge of the astrologer. The astrolabe has been superseded by the more perfect instruments of modern astronomy.

ASTROLABE, THE, OR THE CONCLUSIONS OF. A fragmentary prose treatise by Chaucer, written in 1391 or shortly after, for the instruction of his son Lewis. It is an English rendering, from a Latin copy, of a work by the Arabian astronomer, Messahala.

ASTROLOGY (Gk. *ἄστρον*, *astron*, star + *λόγος*, *logos*, science). The term meant originally much the same as *astronomy*, "the knowledge of the stars," but was at length restricted to the science of predicting future events, especially the fortunes of men, from the positions of the heavenly bodies. This was considered the higher, the real science; while the mere knowledge of the stars themselves, their places and motions (*astronomy*), was, till a very recent period, cultivated mostly with a view to (judicial) astrology. Astrology is one of the most ancient forms of superstition, and is found prevailing among the nations of the East (Egyptians, Chaldeans, Hindus, Chinese) at the very dawn of history. The Jews became much addicted to it after the Captivity. It spread into the West and to Rome about the beginning of the Christian Era. Astrologers played an important part at Rome, where they were called Chaldeans and "mathematicians"; and though often banished by the Senate and emperors under pain of death, and otherwise persecuted, they continued to hold their ground. The Roman poet, Manilius, author of an astronomical poem still extant, was addicted to astrology; and even Ptolemy, the astronomer, did not escape the infection, which in his time had become universal. It accords well with the predestinarian doctrines of Mohammedanism, and was therefore cultivated with great ardor by the Arabs from the seventh to the thirteenth century. Some of the early Christian Fathers argued against the doctrines of the earlier astrology, while others received them in a modified form; and indeed it formed part of the basis of their religion in the Gospel narrative of the visit to Bethlehem of the Wise Men from the East, who were Chaldean magi or astrologers. In its public capacity the Church several times condemned the study as tending to fatalism, superstition, and unlawful prying into the future; but many zealous Catholics—even churchmen—have cultivated it. The fourteenth and fifteenth centuries were the palmy days of the science; chairs for its teaching were founded

in the two oldest universities—those of Bologna and Padua—and no prince's court was complete without its official astrologer. After the Renaissance the study was vigorously opposed from diametrically opposite points of view—such as those of Savonarola and Pico della Mirandola. But for centuries the most learned men still remained devoted to its teachings, including among astronomers Cardan, Tycho Brahe, and Kepler; Wallenstein absolutely, and Napoleon partly, believed in it, though the frequent references of the latter to his "star" seem to have been made largely for effect. Bacon maintained the reality of an underlying basis of truth at least, while discrediting the practitioners of his day. Burton and Sir Thomas Browne also retained a belief in its possibilities. William Lilly was the last astrologer in England who had any great public influence; he asserted and partly proved his wonderful success in foretelling both public and private events. But the acceptance of the Copernican system and new fashions in science tended to destroy the older beliefs; and by the following century the study had so far lost its hold that the merciless ridicule of Swift, applied to the unfortunate almanac-maker Partridge, was sufficient to discredit it. But believers in it are still found, even among educated men. In Germany J. M. Pfaff published a notable treatise in its favor entitled *Astrologie* (Bamberg, 1816). The natural tendency of the ignorant and credulous to seek for insight into the future has allowed a multitude of quacks to trade upon the name of astrology and to give the impression that it is beneath contempt. It is well to point out, however, that the predictions of the better class of astrologers are not mere haphazard guesses, as is frequently supposed, but are based upon rigidly scientific determination from observed phenomena, according to definite rules of interpretation; and also that astrology lays no claim to absolute prediction of future events, undertaking merely to point out the direction which affairs are likely to take, other things being equal—according to the old saying: "*Astra regunt homines; sed regit astra Deus.*"

The ordinary method of applying judicial, or, as it is sometimes called, mundane, astrology to the decision of a question was to calculate the moment when the question was asked or at the birth of the "querent." Then the circle of the heavens was divided into twelve equal parts, six above and six below the horizon. These are the twelve "houses," through which the planets pass in their regular movements. The first house, that which lay in the east from 5° above the horizon to 25° below, called the ascendant, was considered of the most importance, as it contained that part of the heavens which was about to rise. The planet which was "lord" of this house was usually taken as the "significator" of the "querent." Each house, however, had one of the heavenly bodies as its lord, who was considered to be strongest in his own house. The first was called the house of life; the second, that of fortune or riches; the third, of brethren; the fourth, of relations; the fifth, of children; the sixth, of health; the seventh, of marriage; the eighth, of death; the ninth, of religion; the tenth, of dignities; the eleventh, of friends and benefactors; the twelfth, of enemies or of captivity. Besides the positions of the planets in the different houses, it was necessary to consider their position in relation to

each other—in conjunction, in opposition, and so on through a variety of technical descriptions. Each planet was supposed to rule some special part of the world and of the human body, so that according to its position it might bring on certain conditions for the countries under its influence and cause or avert certain diseases. Persons born under particular planets were believed to be endowed with temperamental characteristics corresponding to the nature of the planet. From this belief the epithets *mercurial*, *jovial*, *saturnine* have passed into common speech; in fact, a larger number of expressions than would be generally supposed come from astrology. *Disastrous* and its Saxon equivalent *ill-starred*, *ascendancy*, *consider*, are examples of words which are relics of this once universal belief; and many passages in our older writers are unintelligible without some knowledge of it.

The accompanying figure shows the positions of the planets at the time of the signing of the

Declaration of Independence. According to astrological interpretation, the newly formed nation was destined to enjoy success in war and to develop an extensive commerce with every country of the earth, while fecundity and prosperity were to reign among its people.

ASTRONOMICAL AND ASTROPHYSICAL SOCIETY OF AMERICA. A national organization with membership limited to persons possessing technical attainments in astronomical and astrophysical science. The society was founded in 1899. It has about 235 members.

ASTRONOMY (Gk. *αστρον*, *astron*, a star + *νομος*, *nomos*, law). The science which deals with the celestial bodies. These comprise all the various bodies distributed throughout the universe, such as the earth (considered as a whole) and the moon, the sun, the planets and their satellites, the planetoids or minor planets,

the comets and meteors, the fixed stars, and the nebulae. Of these, all but the fixed stars and the nebulae, which are immeasurably remote, belong to the solar system.

In the eyes of the ancients certain celestial bodies, seven in number, early assumed an importance from the fact that they changed their positions relatively to the stars and quite independently of the diurnal motion of the heavens. For this reason they were called planets, or "wanderers." They were believed to revolve round the earth, which was regarded as fixed in space and was thought to be the centre of the universe. The two brightest, and apparently the largest, of these wandering bodies were the sun and the moon, the rest, much less bright than these and apparently of diminutive size, but still distinguished by their brilliancy in comparison with all but a few of the stars, came to be known by the names Mercury, Venus, Mars, Jupiter, and Saturn. We now know that the ideas of the ancients regarding the constitution of the universe were erroneous; that, in fact, it is the earth which revolves round the sun, and not vice versa, and that its path or orbit is an ellipse, while the moon moves round the earth in a similar orbit and is carried along with the earth in its annual journey round the sun. We know, moreover, that the five remaining bodies, like the earth, travel in ellipses round the sun. This aggregation of celestial bodies constituted the solar system as known at the beginning of the seventeenth century. The telescope has since added to the sun's family two other planets, Uranus and Neptune, revolving far beyond the orbit of Saturn, and an ever-increasing number of small planetary bodies, known as minor planets or planetoids, lying between Mars and Jupiter, and has further disclosed the fact that all of the major planets with the exception of Venus and Mercury have attendant moons, or satellites, which vary in number from one in the case of Neptune to 10 in that of Saturn. When we come to consider the distances of the planets from the sun, we find that they are approximately connected by a remarkable empirical law, known as Bode's Law (q.v.). The distance of the earth from the sun is, roughly, 92,500,000 miles. Between the earth and the sun revolve the two so-called "inferior" planets, Mercury and Venus, while the remaining planets, known as the superior planets, lie outside the earth's orbit, Neptune, the outermost, revolving round the sun at the enormous distance of nearly 3,000,000,000 miles. In addition to the planets, the solar system also contains certain somewhat erratic bodies called comets. Nothing definite is known as to their origin; but it is certain that they move, under the influence of gravitation, in orbits that admit of calculation. In appearance comets vary greatly. At times they are so tenuous that they can barely be glimpsed in the telescope and allow the stars to be seen easily through them on the background of the sky. At other times they form magnificent objects, very conspicuous to the naked eye, and often possess tails which extend over a large part of the celestial vault. There is good reason to suppose that comets occasionally become completely disintegrated, subsequently changing into swarms of small particles. When the earth passes through such a swarm, friction with our atmosphere heats the particles until they become incandescent. They are then plainly visible as meteors,

and even quite large ones have at times been found actually to fall upon the earth's surface.

From a terrestrial point of view, being the source of our light and heat, the sun is certainly the most important of all the heavenly bodies. But considered as a cosmic body the sun is simply a blazing star, and not even a very great one as compared with the average of all the stars. One of the most interesting questions in connection with the sun is the probable source of its great and continuing heat. Why does it not become completely consumed as a result of continuous combustion? This question was answered by Helmholtz, who showed that the energy required to generate the sun's heat could be derived from a gradual contraction or shrinkage of its bulk. So great is this bulk that a contraction sufficient to produce the heat in question might go on for 10,000 years without producing a diminution in the sun's apparent diameter large enough to be perceived even by our greatest telescopes.

Far beyond the confines of the solar system, and, indeed, at a distance almost inconceivably great, is situated the universe of stars. According to the accepted theory these stars, which to us appear merely as points of light, are really great blazing suns, in many cases, doubtless, attended by systems of planets analogous to our own. The stars are usually called "fixed stars." It is known, however, that they are not really immovable, but are in continuous motion through space in orbits so vast that we have as yet been unable to do more than guess at their dimensions. Even the sun, regarded as a star, is known to be moving through space toward a point in the constellation Lyra with a velocity of about 12 miles per second. The whole solar system of course partakes of this motion.

Many attempts have been made to measure the distances of the stars. But as we can actually observe only their directions in space, the sole method open to us is to note whether such directions suffer any change when the earth is situated at opposite sides of its orbit around the sun. So great, however, are the stellar distances that no star has yet been found for which this change of direction is greater than about one second of arc. (See PARALLAX.) With reference to their brilliancy, the stars have been classified in groups, and the term "magnitude" has been used to designate brilliancy. Thus by a star of the first magnitude is meant one whose light is so brilliant as to place it among, say, the 20 brightest stars. Of course, the number of stars of each magnitude increases very rapidly as we come to the classes of lower brilliancy. Strangely enough, the magnitudes of the stars are not constant. There is, for instance, one star in the constellation Argo that has diminished so much in brightness that it is at present no longer visible to the naked eye, though about the middle of the past century it was at least the equal of any star in the sky. To this class of variable stars belong also the "temporary stars," which blaze up now and then like a great conflagration, only again to subside into invisibility after a short time.

Frequently we find a couple of stars very close together on the sky. Indeed, often they are so near that the eye fails to distinguish them, and it requires a powerful telescope to separate their light. It was thought at first that these double stars were accidental merely, and that while the two stars had nearly the same direction in space,

they might nevertheless be separated by an immense linear distance. But it has been found that many double stars are true *binaries*, showing an orbital revolution about the common centre of gravity of the two component stars. Sometimes such stellar systems have three or more components. Even entire clusters may have a physical connection within themselves, and it is not improbable that the forces of gravitational attraction compel and control the complex movements of such aggregations of stars, just as they do the lesser intricacies of our own solar system. A magnificent field for speculation is opened by a consideration of the vast possibilities of such mighty stellar groups—true universes within the universe.

In addition to the stellar systems, we have in the sky another interesting class of objects, the nebulae. These appear in the telescope as hazy clouds of light, usually condensing here and there into brighter nuclei. It is impossible to escape the conviction that these nebulae are gaseous, and that they furnish a sort of key to the life history of the ordinary stars. Indeed, spectroscopic evidence tends to show that many of the nebulae are composed of matter in the form of incandescent gas. What, then, can be more plausible than to see in the stars the result of a gradual process of cooling in nebulous matter? One can imagine readily that condensation and contraction might result in the formation of a single central sun, or that there might be two or more such centres. Indeed, the sky actually does show some cases of "double nebulae." Mathematical research has indicated that the tidal effects seen on a small scale in the case of the earth and moon would play a much more important part in double nebulae while still in the plastic condition. The mighty cosmic tides that would there be set up might undoubtedly produce perturbations great enough to account for the most complete changes in the character of motion within the system. An account of this study of the past and future history of cosmic systems may be found in the article COSMOGONY.

The whole subject of astronomy is so extensive that it is convenient to consider it from several different standpoints. What is termed Practical Astronomy, for example, treats of the manipulation of astronomical instruments and is concerned with the observing and recording of the positions and motions of the heavenly bodies and with the determination of their distances and dimensions. Theoretical Astronomy, on the other hand, deals with the computation of orbits, and with the prediction of the positions of the heavenly bodies at any subsequent time; it includes also the application of spherical trigonometry to astronomy, which regards these bodies simply as points on the surface of the celestial sphere. In Gravitational Astronomy, or Celestial Mechanics, we have the application of the principles of dynamics to account for the motions of the celestial bodies. One of the most important developments of astronomy is found in what is known as Physical Astronomy, or Astrophysics, which deals with the determination of the physical and chemical characteristics of the celestial bodies. The study of the physics and chemistry of the heavenly bodies originated during the nineteenth century and has already resulted in the development of astronomy along lines scarcely deemed possible by the older astronomers; and it is along these lines that our

knowledge of the heavens seems destined to progress most rapidly. No hard and fast lines can be drawn separating these divisions of astronomy, which overlap to a greater or less degree. Moreover, each has many subdivisions which are frequently so extended in their range as to rank almost as divisions of the first order; thus, solar physics has now attained a position of such importance that observatories have been established with the sole object of the prosecution of that branch of astrophysics. Theoretical Astronomy and Celestial Mechanics are largely mathematical in their treatment.

Astronomy is the oldest of the sciences. Its early history is perhaps more important than that of any other science; indeed, it may be said that a study of the state of scientific culture among the early peoples amounts to little more than an examination of their notions on astronomy. The science had its beginning with the Chaldeans and Chinese, working, of course, independently of each other. The former, according to Greek historians, were able to predict eclipses with considerable accuracy; they were also acquainted with the year of 365 $\frac{1}{4}$ days, and we owe to them the invention of the sun-dial and the clepsydra for the purpose of measuring time. The Chinese, on the other hand, were acquainted with certain elementary forms of the calendar and have left authentic observations of eclipses, comets, etc., extending back at least 1000 years before our era; their most notable achievement seems to have been a determination of the obliquity of the ecliptic about 1100 B.C. confirming the secular diminution of that constant. Other early peoples who cultivated astronomy were the Hindus and the Egyptians, but their observations were connected mainly with religious ritual.

It was to the Greeks, more than all other peoples of antiquity, that the rise of astronomy to the position of an exact science was due. Among them we find various names conspicuous at a very early date. Thales of Miletus (c.640-546 B.C.), who is generally called the Founder of Greek Astronomy, taught that the stars shone by their own light, but that the light of the moon was derived from the sun; he also held that the earth is a sphere. Among his successors, Anaximander, Anaxagoras, Democritus of Abdera, Pythagoras (c.580-497 B.C.), Meton, Eudoxus of Cnidus, and Aristotle are all mentioned by later writers as distinguished astronomers. It is true that some of these occupied themselves principally with imaginary systems of the universe based upon abstract speculation rather than accurate observation, but others made real contributions to knowledge. Thus, to Pythagoras we owe the first suggestion that the earth revolves round the sun; to Meton, the introduction of the Metonic cycle of 19 years which displaced the old Chaldean Saros as a means of calculating the recurrence of eclipses; and to Eudoxus, the first attempt to express the motions of the planets with the aid of geometry. About the end of the third century B.C. a noted school of astronomers grew up at Alexandria under the patronage of the Ptolemaic dynasty, and the development of astronomy received a fresh impulse. Aristyllus and Timocharis, who flourished under Ptolemy Soter, the first of the dynasty and the founder of the famous Alexandrian library, left observations of the relative positions of the stars in the zodiac which later led to the discovery of the precession

of the equinoxes by Hipparchus. Aristarchus of Samos (c.275 B.C.) calculated the distances and magnitudes of the sun and moon, and Eratosthenes (c.275-195 B.C.) determined the obliquity of the ecliptic by means of the armillary sphere which he invented. The latter held that the earth was a sphere, and, by measuring an arc of the meridian between Alexandria and Syene, deduced from it the first estimate of the earth's circumference, viz., 250,000 stadia, or 24,662 miles, a surprisingly accurate value under the circumstances. But by far the greatest of the Greek astronomers was Hipparchus (c.161-126 B.C.), a native of Bithynia, who has been justly called the Father of Astronomy. He was the author of the first star catalogue, from which, by comparing his own observations with those of Aristyllus and Timocharis, he was able to infer the precession of the equinoxes, with an accuracy which came within 5 per cent of the truth. Believing in the fixity of the earth in space, he was led to explain the inequality of the sun's motion by supposing that the earth was not situated exactly at the centre of the sun's orbit, and he proceeded to find the positions of perigee and apogee, and the eccentricity or distance of the earth from the centre of the orbit. He also constructed the first tables giving the position of the sun among the stars at any time. His contributions to lunar astronomy were no less important. He investigated the mean motion of the moon, the regression of her nodes, and the revolution of the line of apsides, and he detected the lunar inequality known as the evection. He was the first to use the eclipses of the moon in determining longitudes. After Hipparchus a gap of nearly three centuries occurs, in which the only notable astronomical advance was the reform of the calendar, which was carried out by Julius Cæsar with the aid and advice of Sosigenes of Alexandria. Second only in importance to Hipparchus was Ptolemy, who flourished at Alexandria about 130 A.D., and to whom was due a brief revival of the glories of the Alexandrian school. He wrote the *Almagest*, a compendium of the astronomical knowledge of his time, but his chief claim to fame rests on his invention of the Epicyclic System of the Universe, the germ of which was found in the teachings of Eudoxus. The Ptolemaic System, as it is generally called, makes the sun and planets move in circles whose centres are themselves in motion upon other circles, the earth being considered at rest. (See PTOLEMY; EPICYCLE; ECCENTRIC.) With Ptolemy the Alexandrian school practically ceased to exist, and no names of importance are found during the five centuries which elapsed before its final extinction in 640 A.D., when Alexandria was captured by the Caliph Omar.

During the next eight centuries, Europe was sunk in the gloom of the Dark Ages, and the flame of scientific learning was kept alive by the Arabs and the nations which came under their influence through the spread of Islam. Their knowledge of astronomy was derived from the writings of Ptolemy and the earlier Greek astronomers, and, while they made few positive contributions to the science, their improved methods of observation resulted in the greatly increased accuracy of their astronomical tables as compared with those of the ancients. The most important names are those of Al Battani, or Albategnius (c.900 A.D.) and Ulugh Beg, who lived about five centuries later. The latter, a

Tatar prince and grandson of Tamerlane, established an observatory at Samarcand and constructed the second known catalogue of stars.

Modern European astronomy begins with Purbach and Regiomontanus in the fifteenth century. Copernicus (1473-1543) stands out conspicuously as the author of a system of the universe nearly the same as that now accepted. (See COPERNICAN SYSTEM.) Copernicus was followed by Tycho Brahe of Denmark (1546-1601), who left a most important collection of solar and planetary observations as well as a catalogue of 777 stars far superior in precision to those of Hipparchus and Ulugh Beg. It was upon a discussion of Tycho's observations that his famous pupil Kepler (1571-1630) built his well-known laws of planetary motion, which are now accepted and which will be stated below. Galileo (1564-1642), one of the first constructors of the telescope, made with it unprecedented observations. To his gaze were first disclosed the moons of the planet Jupiter, and his clear mental vision saw in that planetary system a true miniature of our solar system itself—an ocular demonstration of the Copernican plan of the universe. To Galileo we owe also the discovery of the pendulum, perhaps the most important astronomical instrument. This was adapted to the astronomical clock by Huygens (1629-95), whereby observation in the modern sense was first rendered possible.

We come now to the great name of Newton (1642-1727). With him we may say that astronomy really begins; it is no longer purely a science of observation, but, by his transcendent powers of mathematical analysis, is elevated to its true position among the exact sciences. Newton's conception of the universe makes all phenomena of motion subject to a single law—the law of gravitation. (See GRAVITATION; FORCE; FALLING BODIES; PROJECTILES; NEWTON.) According to this, every material body attracts or draws every other material body with a force which varies directly as the product of the masses of the two bodies and inversely as the square of the distance between them. It is possible by mathematical reasoning to prove from Newton's Law just how a system of planetary bodies would move under the influence of the attraction of some larger central sun. We thus find mathematically that such motion must follow these three laws: 1. Each planet must revolve in an elliptic orbit having the sun in one focus. 2. The straight line joining the sun and planet must pass over equal areas in equal times. 3. The square of the time of revolution of each planet must be proportional to the cube of its mean distance from the sun. Now, these are precisely the laws found by Kepler from the actual observations of Tycho Brahe. Newton's law of gravitation is therefore seen to lead by deduction to the general facts actually observed by astronomers, and hence the mechanical construction of the solar system in which we live may be regarded as fully explained by Newton. Later investigators, among whom may be mentioned Euler (1707-83), Clairaut (1713-65), D'Alembert (1717-83), and Lagrange (1730-1813), elaborated his theory and carried the mathematical explanation of visible phenomena down to the minutest precision attainable with the most powerful modern observational machinery. The work of Newton may be said to have been crowned by that of Laplace (1749-

1827), who analytically demonstrated the stability of the solar system, and whose *Mécanique céleste* was a worthy successor to Newton's *Principia*. The question now suggests itself as to whether this same law of Newton holds sway even to the most distant confines of the visible universe. Does it control the motions of stars whose vast distance allows us barely to glimpse them in our largest telescopes? The answer in the present state of astronomical knowledge is not quite so certain for the distant stellar systems as it is within our immediate neighborhood in space. Yet we may say that observations so far made have brought to light no phenomena positively contradicting the universality of Newton's Law.

With the invention of the telescope the progress of observational astronomy was profoundly stimulated. As already mentioned, Galileo's first great achievement with the new instrument was the detection of the four moons of Jupiter. He also discovered that Venus exhibited phases like those of the moon and noticed with astonishment that the planet Saturn at times appeared triple. Gassendi observed a transit of Mercury in 1631, and in 1639 Horrocks and Crabtree saw the first recorded transit of Venus. In 1655 Huygens found that the triple appearance of Saturn which had so puzzled Galileo was due to the presence of a flat bright ring surrounding the planet, and he also discovered the first of the Saturnian moons. This period saw the foundation of the Paris Observatory in 1671 under the direction of Giovanni Domenico Cassini, to whom we owe the detection of four more satellites of Saturn and the division in Saturn's ring which bears his name. He also determined the periods of rotation of Jupiter, Venus, and Mars. In the same year, Roemer, a Danish astronomer, deduced from the irregularity in the times of the eclipses of Jupiter's satellites the important conclusion that light travels with finite, though very great, velocity. Four years later, Greenwich Observatory was founded, and, under the direction of John Flamsteed, the first Astronomer Royal, began its long career of systematic observation of the heavens in which its supremacy was not seriously challenged for at least a century. Flamsteed's work was hampered for a long time by the lack of reliable instruments, but his catalogue of stars, *Historia Cælestis*, the compilation of which is his chief claim to fame, showed a marked advance on previous works of a similar nature. Flamsteed's immediate successors in the post of Astronomer Royal were Edmund Halley and James Bradley. Halley devised the method of determining the sun's parallax from observations of the transits of Mercury and Venus and discovered the long inequality of Jupiter and Saturn, the elucidation of which called forth some of the most acute investigations in the field of gravitational astronomy on the part of Euler, Clairaut, and D'Alembert. Among his other important discoveries may be mentioned the variation of the compass, the acceleration of the moon's mean motion, and the proper motions of the stars. To Halley was also due the recognition of the periodic character of the comet which bears his name and the prediction of its return about 1759. Bradley's great contributions to astronomy were the discoveries of the aberration of light and the nutation of the pole. He left, moreover, a large mass of painstaking and accurate observations of the stars which formed

the basis of Bessel's epoch-making catalogue, *Fundamenta Astronomiæ*, published in 1813.

Little was done before the middle of the eighteenth century toward charting the southern heavens. Halley, indeed, had made a beginning during a visit to St. Helena in 1676, but his catalogue was hastily prepared and suffered in consequence. Seventy-five years elapsed before the work was taken up in earnest by the French astronomer, Lacaille. In 1751 he proceeded to the Cape of Good Hope, and during the next four years catalogued upwards of 10,000 stars, and outlined 14 new constellations of the southern sky. It was not, however, until the advent of Sir William Herschel (q.v.) that the thorough and systematic sweeping of the heavens was inaugurated. With the aid of larger and larger reflecting telescopes constructed by himself, he made four complete surveys of the northern skies, in the course of which he discovered the planet Uranus and two of its four satellites and added two more satellites of Saturn to those previously known. In his observation of nebulae and double stars he was *facile princeps*, discovering no less than 2500 of the former and 800 of the latter; and his many contributions to the science have justly caused him to be called the founder of sidereal astronomy.

By his discovery of Uranus in 1781, Herschel simply confirmed the law of planetary distances, announced by Titius in 1772 and since known as Bode's Law, but there still remained a gap between Mars and Jupiter untenanted by any known planet. However, on the first day of the nineteenth century, Piazzi of Palermo announced the discovery of a small planetary body which was found to lie between those two planets and thus to conform to the law. The name "Ceres" was given to this minor planet. The discovery of Ceres was followed by the detection of three similar bodies in the course of the next seven years; these were Pallas and Vesta, discovered by Olbers in 1802 and 1807 respectively, and Juno, first detected by Harding in 1804. No others came to light until 1845, when Hencke found Astræa, and in 1847 three more were discovered—Hebe by Hencke, and Iris and Flora by Hind. Since then no year has passed without the detection of one or more of these bodies, and by 1890 about 300 had been found, but so long as visual methods only were employed their numbers remained relatively small. In 1891 Wolf of Heidelberg called in photography to his aid, and since that time the number has increased by leaps and bounds until in 1913 nearly 800 had been definitely catalogued and numbered. The minor planets, or planetoids as they are called, form a group of bodies which, with few exceptions, travel in orbits lying entirely between Mars and Jupiter. The most notable of these exceptions is Eros, which was discovered in 1898 by Witt. Part of its orbit lies between the earth and Mars, so that, with the single exception of the moon, it is our nearest celestial neighbor. On this account it has acquired a special importance, since it affords astronomers another means of determining the solar parallax and consequently the sun's distance from the earth. The supreme achievement in the field of planetary discovery, however, was the prediction and immediate discovery of Neptune in 1846. This was due to the genius of two young men—one a Frenchman, Urbain Jean Joseph Leverrier, the other an Englishman, John Couch Adams. It had long been observed that the motion

of Uranus, the latest of the larger planets to be discovered, was subject to perturbations which could not be accounted for on the theory of disturbance by the other known planets, and as an explanation an unknown exterior planet had been suggested. To the solution of the difficult inverse problem of finding the mass and position of such a disturbing body from the perturbations of the disturbed, Leverrier and Adams devoted their powers of mathematical analysis with such complete success that, when the former announced the result of his investigations, the unknown planet was found without trouble on Sept. 23, 1846. Seventeen days later Lassell found Neptune's only satellite, and in 1851 the two remaining moons of Uranus, while Bond in 1846 added an eighth member to Saturn's family of satellites. It was not until 1877 that any further discoveries of satellites were made. In that year Hall of Washington discovered Phobos and Deimos, the only known satellites of Mars. Barnard in 1892 found the fifth satellite of Jupiter. In 1898 Pickering of Harvard succeeded in detecting Phœbe, the ninth, and in 1905 Themis, the tenth, satellite of Saturn. In the latter year also two more satellites of Jupiter were discovered by Perrine of the Lick Observatory, and another, making eight in all, was found by Melotte at Greenwich in 1908; all three are remarkable for the great distance at which they revolve about the primary. Certain unexplained anomalies in the motion of Mercury led Leverrier in 1859 to suggest the possibility of the existence of a planet lying between Mercury and the sun, but in spite of the most careful search no such body has yet been found. Whether there exist other planets beyond the orbit of Neptune is uncertain, but the "residual errors" of Uranus and the slight perturbations in the motion of Neptune which cannot be attributed to the known planets have induced astronomers to consider at least such a possibility. Pickering has arrived at the conclusion that an ultra-Neptunian planet, which he terms "O," is revolving round the sun at a distance 52 times as great as that of the earth, while Gaillot has suggested that there may be two such bodies—one lying between the orbit of Neptune and that of Pickering's hypothetical "O," and the other at a distance of more than twice the radius of Neptune's orbit.

The labors of Sir William Herschel and his predecessors in systematically observing the positions of the stars resulted in the accumulation of a large mass of material which was to prove of the utmost service to the astronomers of the nineteenth century, but instrumental imperfections made it impossible to take the fullest advantage of these observations. It was by Friedrich Wilhelm Bessel that the necessary step was taken which rendered the observations of the astronomers of the eighteenth century fully available. Before his time increased accuracy of observation had been largely sought by effecting mechanical improvements in the instruments used, and corrections for precession, nutation, and aberration, due, in the first case, to the slow secular, and, in the others, to the periodical shifting of the points of reference, had been applied by astronomers in somewhat haphazard fashion and with varying degrees of success. Bessel at once placed the whole matter on a firm foundation by his elaboration of a theory of instrumental errors which he applied to the

observations, left by Bradley. Bessel's labors were not confined to the reduction of Bradley's observations which covered only 3222 stars, but by his own careful and industrious work he brought the number of accurately known stars up to more than 50,000. Not the least important of Bessel's services to sidereal astronomy was the training of Argelander, to whom was due the compilation of the great Bonn *Durchmusterung*, which raised the number of accurately known stars of the northern hemisphere to more than 300,000, and, if the stars of the southern hemisphere observed by Schönfeld are included, to more than 400,000. The work of mapping the stars of the southern hemisphere was completed by Sir David Gill in his *Cape Photographic Durchmusterung*, which was begun in 1885, and completed in 1900 by the reduction of the negatives by Professor Kapteyn of Groningen. The value of the camera as an adjunct to a survey of the heavens was strikingly shown in this case, for the entire work was carried out twice in less than six years. This work, which did for the southern heavens what Argelander's work had done for the northern, gives the places of more than 450,000 southern stars. But all previous catalogues will be eclipsed by the *International Star Chart and Catalogue* which was initiated by the International Astrophographic Congress which met at Paris in 1887.

Until Bessel's time the question of stellar distances which had long vexed astronomers remained unsolved. The fixed stars are so immeasurably more remote than the members of the solar system that, although the base line for the measurement of their parallaxes is the radius of the earth's orbit, the parallactic angle is found to be so small that a new unit of distance, the "light-year," or the distance traveled by light in one year, has been adopted for the purpose of expressing the distance of the stars in suitable terms. In general, it may be said that brightness and the possession of a large proper motion are the criteria of the nearness of any star. In 1792 Piazzi had discovered that the star 61 Cygni had a large proper motion of about five seconds annually, indicating its comparative proximity to the earth. Twenty years later Bessel confirmed Piazzi's determination of the motion of this star, but not until the end of 1838 was he in a position to announce its parallax, which he found to be about a third of a second. Only a few weeks after this epoch-making announcement, Henderson announced that α Centauri had a parallax of a second, an amount which has since been reduced somewhat by later observers. The work of Bessel and Henderson opened up a field of investigation in which Gill, Elkin, Kapteyn, Pritchard, Peter, and others have since labored with conspicuous success. Between 200 and 300 stars have had their parallaxes determined, but so far none has been found to be nearer than α Centauri, which is situated at a distance of about four and a half light-years from us.

Reference has already been made to the great stimulus given to the study of astronomy by the invention of the telescope. The first telescopes were refractors, i.e., the image was formed by refraction through a lens and consequently suffered from the defect of being chromatic. Gregory in 1663, and later Newton, in 1669, introduced new designs in which the image was formed by reflection instead of refraction, and for a long time this form of telescope was pre-

ferred. It was steadily improved in both size and power until at the hands of Sir William Herschel it attained a diameter of 4 feet and a focal length of 40 feet. This remained for 60 years the limit for instruments of this type, but in 1845 it was eclipsed when a reflector of 6 feet diameter and 54 feet focal length was constructed by Lord Rosse at Parsonstown, Ireland. The largest reflectors in actual use at present are the 5-foot instruments of the Harvard and Mount Wilson observatories. A still larger one, with an aperture of 100 inches, is being constructed for the Mount Wilson Solar Physics Observatory. The development of the refracting telescope may be said to date from 1758, when Dollond of London succeeded by the use of two lenses—one of flint, the other of crown glass—in overcoming the defect of chromatism. But the difficulty of making flint-glass lenses of any considerable size proved a serious obstacle to the growth of the refractor, which was removed only when Guinand and Fraunhofer, during the early years of the nineteenth century, succeeded in manufacturing disks up to 15 inches in diameter. These were surpassed by the Clarks of Cambridgeport, Mass., whose efforts during more than 50 years culminated in the construction of the 36-inch refractor of the Lick Observatory and the 40-inch Yerkes telescope, with both of which results commensurate with the size of the instruments have been obtained.

While the large instruments of the nineteenth century have resulted in the sounding of the heavens to an extent not dreamt of by the earlier observers, other instruments have contributed in no less degree to the progress of the science, and the chief advances of the nineteenth century have come from the application of the spectroscope, the photometer, and the camera to astronomical research.

One of the latest and most interesting developments of astronomy is the inauguration of international coöperation in astronomical research. We have already alluded to the great *Star Chart and Catalogue*, first projected by the International Astrophographic Congress in 1887 and now approaching completion. Another important undertaking of this body was the determination of the solar parallax from observations of Eros at its opposition in 1900, and a still more formidable attack on this problem is planned for 1931, when the next opposition takes place. Mention may also be made of the work of the International Latitude Service in determining the variation of latitude due to the "wandering" of the pole, and the investigation of the period of rotation of the sun by the International Union for Coöperation in Solar Research. The huge scale on which it is possible to plan undertakings like those mentioned above, and the completeness with which they can be carried out, have already led to important discoveries and indicate that international coöperation is destined to result in even greater gains to astronomical science.

Bibliography. The following books will be

found useful in a more detailed study of the science of astronomy: Grant, *History of Physical Astronomy* (London, 1852); Chauvenet, *Manual of Spherical and Practical Astronomy* (Philadelphia, 1863); Young, *The Sun* (New York, 1881); Newcomb, *Popular Astronomy* (New York, 1882); Oppolzer, *Lehrbuch zur Bahnbestimmung* (Leipzig, 1882); Doolittle, *Treatise on Practical Astronomy Applied to Geodesy and Navigation* (New York, 1885); Young, *Text-book of General Astronomy* (New York, 1888); Tisserand, *Traité de mécanique céleste* (4 vols., Paris, 1889-96); Lockyer, *Dawn of Astronomy* (London, 1894); Ball, *Atlas of Astronomy* (New York, 1893); Valentiner, *Handwörterbuch der Astronomie* (Karlsruhe, 1896); Berry, *Short History of Astronomy* (London, 1898); Darwin, *The Tides, and Kindred Phenomena in the Solar System* (Boston, 1898); Ambronn, *Handbuch der astronomischen Instrumentenkunde* (2 vols., Berlin, 1899); Ball, *Story of the Heavens* (New York, 1900); Lockyer, *Recent and Coming Eclipses* (New York, 1900); Newcomb, *Elements of Astronomy* (New York, 1900); Comstock, *Text-book of Astronomy* (New York, 1901); Newcomb, *The Stars* (New York, 1901); Krisch, *Astronomisches Lexikon* (Vienna, 1902); Jacoby, *Practical Talks by an Astronomer* (New York, 1902); Newcomb, *Astronomy for Everybody* (New York, 1903); Lowell, *The Solar System* (Boston, 1903); Pickering, *The Moon* (New York, 1903); Fahie, *Galileo: His Life and Work* (London, 1903); Pickering, *Photographic Atlas of the Moon* (London, 1904); Turner, *Astronomical Discovery* (New York, 1904); Macpherson, *Astronomers of To-day: Their Work* (London, 1905); Baly, *Spectroscopy* (London, 1905); Ball, *Popular Guide to the Heavens* (London, 1905); Clerke, *The System of the Stars* (London, 1905); Dreyer, *History of the Planetary System* (Cambridge, 1906); Bryant, *A History of Astronomy* (London, 1907); Gore, *Astronomical Essays, Historical and Descriptive* (London, 1907); Hale, *Study of the Stellar Evolution* (Chicago, 1908); Poor, *The Solar System* (New York, 1908); Clerke, *Popular History of Astronomy in the Nineteenth Century* (London, 1908); Schuster, *Solar Research* (Manchester, 1909); Chambers, *The Story of the Comets* (Oxford, 1909); Turner, *Modern Astronomy* (London, 1909); Lowell, *The Evolution of Worlds* (New York, 1910); Abbot, *The Sun* (New York, 1911); Dreyer, *A Short Account of Sir William Herschel's Life and Works* (London, 1912); Campbell, *Stellar Motions* (New Haven, 1913); Jacoby, *Astronomy* (New York, 1913).

ASTROPALIA (It. *Stampalia*), the modern Greek name for the classical *Astypalæa*. An island of the Sporades (q.v.), 20 miles southeast of Amorgos (Map: Greece, H 5). It is mountainous, consists of an eastern and western half connected by the isthmus, and has good harbors. Its area is 62 (according to others, 84) square miles. Its population is about 2000, mostly residing in the town of Astropalia, on the isthmus. By imperial edict it held the rank of a free state under the Roman emperors. A Venetian possession in the Middle Ages, it has belonged to the Turks since the sixteenth century.

ASTROPHEL. The name under which Sir Philip Sidney disguised his identity in writing the sonnets to "Stella," 1575-83. These poems appeared in 1591 and are considered the author's most remarkable achievement. Also the title of Spenser's elegy on Sidney.

ASTROPHOTOGRAPHY (Gk. *αστρον*, *astron*, star + *photography*). In no department of astronomy has development in recent years been so marked as in the application of photographic processes of observation. If photography could accomplish nothing more than what it has done and is doing for descriptive astronomy alone, we should still rank it among the most powerful weapons in the armory of the astronomer. It is but necessary, for instance, to examine a series of eye and hand drawings of some total eclipse, executed by different skilled observers at the same time, to come at once to the conclusion that it is well-nigh impossible to obtain correct information in this way; even the outlines of the corona and prominences will sometimes differ so greatly that one would scarcely believe an attempt had been made to delineate the same objects. Photography, of course, gives us a far more faithful picture, and thus furnishes observational material of specially high value. But even more important, perhaps, are the services it is capable of rendering to the astronomy of precise measurement, and photographic processes seem to be destined to replace the less facile visual methods which were employed exclusively until a few years ago. The heliometer (q.v.) is generally known as the most exact instrument for executing measurements on the sky. Yet, in the opinion of some of the highest authorities, the equality of photographic results with those of the heliometer may now be considered as conclusively demonstrated. The year 1892 saw the first complete publication of an extensive series of results. These were derived from excellent photographs of the cluster Pleiades, made in 1872 and 1873 by Rutherford, in New York. These results have been followed in the last few years by many other star-cluster measures, so that an extensive mass of material is being gathered by photography—material of the highest precision and of the last importance in stellar astronomy.

It is only by the study of minute inter-stellar changes in the star-clusters that we may hope, within the bounds of human time, to throw some light upon the problems of motion within the greater universe that lies beyond our own solar system; and it is to photography that we must look for our observational material. Generalizations of science can be secured only by the discussion of very large masses of observations; but although the heliometer can give us sufficient precision, it involves so much labor that by its exclusive use astronomy could not hope to do more than touch the surface of those great problems.

An account of the immense advances made, since the introduction of photography, in our knowledge of planetoids is given in a special article concerning these bodies. Suffice it to mention here that the photographic revelations in this important field have culminated in the discovery of the planet Eros (q.v.), now known to be, with the exception of the moon, our nearest neighbor in space. Many comets, too, have been discovered, and many doubtless will be discovered with the aid of photography; and it is photography again that furnishes the means of determining their positions and measuring their orbits with greater facility than could be obtained by any other method at present known. There is no doubt, further, that photography will greatly increase the list of known distances between the earth and remote

heavenly bodies (see PARALLAX), and that before many years it will replace the eye even in noting the instant of a star's transit across the meridian of an observatory. See TRANSIT INSTRUMENT.

But decidedly the most complete triumph of astrophotography is Gill and Kapteyn's Cape of Good Hope photographic *Durchmusterung*, the results of which are comprised in a remarkably complete catalogue of the southern heavens. In the year 1882 a very bright comet appeared in the sky, and was especially conspicuous in the southern hemisphere. Its brightness led Gill, at the Cape of Good Hope Observatory, to attempt to photograph it. In examining the negative, Gill's attention was attracted to the large number of stars appearing on the plate as minute points or dots, and it was these that first suggested to him the possibility of making a complete examination of the heavens with the aid of photography.

The German term *Durchmusterung*, now naturalized in scientific English, was first applied to Argelander's great catalogue of stars in the northern half of the sky, a work which has rendered possible many statistical and other researches of far-reaching importance in stellar astronomy. But Argelander and his successor, Schönfeld, observing at Bonn, in Germany, were able to carry on their survey only a short distance beyond the northern half of the sky. Gill, in his observatory at the Cape of Good Hope, far south of the equator, saw the possibility of extending Argelander's work, by means of photography, to the South Pole. To have so extended it by the visual methods that were used by Argelander would have required an enormous expenditure of time and labor; but a small photographic telescope was procured, and, in the hands of C. Ray Woods, a scientific photographer who was summoned from England, a complete collection of plates of the southern sky was made. The negatives were sent to Groningen, Holland, and were there measured by Kapteyn. The resulting catalogue, published in three large volumes by the British government, is found to possess even greater completeness than Argelander's; for the fallible human eye could not avoid omitting a star now and then, while the photographic plate is of course subject to no such error.

The Cape *Durchmusterung* is, however, not the only great result to which Gill's 1882 comet photograph has led. The *Durchmusterung* was carried out much on the same lines as Argelander's older work in the northern hemisphere, the idea being to make a census of all the stars in the sky down to a given magnitude, even if it should be impossible to give more than a rough approximation of their positions in the sky. But the success of the first enterprise led Gill to conceive the idea of preparing a new star catalogue that should satisfy the condition of high precision as well as that of completeness as to numbers. So vast an undertaking could be rendered possible only by the combined efforts of many astronomers and many observations, and, as the result of preliminary correspondence, a meeting to consider the subject was called at Paris by the French government in 1887. Delegates from all the civilized nations attended this Astrographic Congress, as it was called, and it was decided that the proposed photographic catalogue of precision should really be made, that it might stand for all time

as the foundation of research in sidereal astronomy. Eighteen observatories have since been engaged in carrying out this astronomical enterprise, the greatest the world has ever seen. To make error of any kind practically impossible, the photographs are taken in duplicate, the total number of plates required being 44,108, each representing a surface of four square degrees. All stars down to the fourteenth magnitude, to the estimated number of 20,000,000, will be shown on the charts, while all stars down to the eleventh magnitude, numbering about 2,000,000, will be subjected to precise measurement and will have their places recorded in the catalogues which are to be published with the charts. Already considerable progress has been made with the publication of the charts and catalogues, many of the volumes having appeared since 1900. In 1909, however, it was found that while some of the observatories to which the work was originally allotted had practically completed their share, others, for various reasons, were far in arrears, and the work still remaining to be done was assigned to the more active observatories by the permanent committee of the Astrographic Congress. It is now highly probable that the year 1920 will see the completion of this great international undertaking.

Besides Rutherford and other American astronomers have distinguished themselves in the new methods of observation. Probably the first really successful celestial photograph was made in 1840 by J. W. Draper. He was able to obtain negatives of the moon, showing the principal formations of her surface. Ten years later, in 1850, Bond and Whipple made still better moon pictures at Harvard College, Cambridge, Mass. Coming down to more recent years we find among American photographic astronomers, Pickering, who has done much in the photography of stellar spectra and in other departments of astrophysical photography; Hale, who has succeeded in photographing the solar prominences and faculae in full sunlight and who, by his detection of the Zeeman effect in sun-spot spectra, has established the existence of strong magnetic fields in sun-spots; Campbell, who has determined photographically the velocities of motion in many of the stellar systems; Adams, who has made an exhaustive study of the rotation of the sun; St. John, whose spectro-photographic investigations have disclosed the circulatory system of the sun-spot vapors; and Ritchey, whose photographs of nebulae and globular clusters have thrown new light on the constitution of these bodies. See ASTRONOMY.

More detailed information on the subject of astrophotography may be found in the *Bulletin du comité permanent de la carte du ciel*, vols. i, ii (Paris, Institut de France), Scheimer, *Photographie der Gestirne* (Leipzig, 1898), and Turner, *The Great Star Map* (London, 1912).

ASTROPHYSICS. The branch of astronomy which deals with the nature, physical condition, temperature, and chemical constitution of the celestial bodies. Owing to the inaccessibility of the heavenly bodies by ordinary means, the astronomer is entirely dependent for his knowledge of their physical and chemical properties on the energy which is radiated from them in the form of light and heat. The instruments which enable him to acquire this knowledge are the spectroscope, the bolometer, the photometer, and the camera. Of these the most important is the spectroscope, which depends for its operation

on Newton's discovery of the composite nature of sunlight and the possibility of separating it into its components by refraction through a prism. Melvill, in 1753, discovered that various chemical substances when burnt in an alcohol flame imparted a distinctive color to it, and that the spectra of such flames were not continuous but were made up of a few colors only. Fifty years later, Wollaston, using a narrow slit instead of a round hole for the admission of light, made the discovery that the solar spectrum was traversed by seven dark lines, but the significance of these lines escaped him. It was reserved for Fraunhofer, in 1815, to show that the dark lines were far more numerous than Wollaston had supposed, in fact, he found that the solar spectrum was crossed by hundreds of these lines and that many of them coincided in position with the bright lines due to glowing metallic vapors. Many theories were brought forward to account for the phenomenon, but it was not until 1859 that Kirchhoff showed that when sunlight is passed through glowing sodium vapor, the dark lines corresponding to that element are not effaced but, on the contrary, darkened. In this way he came to the conclusion that sodium, iron, calcium, and other terrestrial elements were actually present in the atmosphere of the sun, and thus laid the foundation of solar and stellar chemistry, the study of which has since been so fruitful in results.

Although the development of astrophysics has been almost entirely due to the use of the spectroscope, the foundation of the science may be said to date from the year 1826, when Schwabe began his study of the sun-spots, those great temporary breaks or openings which appear from time to time in the surface of the sun, and which are often 100,000 miles in diameter. He found that in some years the number of spots observed was very large, while in others only a few were seen, and in 1843 he was in a position to announce that the years of maximum sun-spot activity recur at intervals of 10 years. Later investigators have fixed this period at 11.11 years, and have shown that it coincides with the period which governs magnetic disturbances on the earth as well as the occurrence of the aurora borealis. Modern sun-spot research is largely spectroscopic, and has established the fact that the sun-spots are the seats of intense cyclonic action in the photosphere, while Hale, by his detection of the Zeeman effect in their spectra, has conclusively proved that they are also magnetic fields of great intensity.

The application of the spectroscope to the study of the sun and the stars may be regarded as the second stage in the development of astrophysics. The third great advance was made when the principle of the effect of motion on the refrangibility of light, first enunciated by Christian Doppler in 1842, was applied to the study of stellar motions. The telescope had enabled astronomers to determine the velocities of stars at right angles to the line of sight, because such a motion gave rise to a displacement of the positions of the stars on the celestial sphere, but it was unable to reveal any movement which might be taking place along the line of sight. Doppler's principle is briefly this: When a body emitting light is in motion towards us, the number of vibrations reaching us in a second is increased by an amount depending on the relative velocity of approach, and consequently the corresponding spectrum lines are shifted toward the violet
